ANNEX VIII: Product Quality Review (PQR) requirements for generic
pharmaceutical products

For an established generic product a product quality review may satisfy the requirements of
sections 3.2.P.2.2.1 (a), 3.2.P.2.3 (a) and 3.2.P.3.5 of the PD and QOS-PD.

A product quality review should be submitted with the objective of verifying the consistency
of the quality of the FPP and its manufacturing process.

Rejected batches should not be included in the analysis but must be reported separately
together with the reports of failure investigations, as indicated below.

Reviews should be conducted with not less than 10 consecutive batches manufactured over
the period of the last 12 months, or, where 10 batches were not manufactured in the last 12
months, not less than 25 consecutive batches manufactured over the period of the last 36
months and should include at least:

1. A review of starting and primary packaging materials used in the FPP, especially those from
new sources.
2. A tabulated review and statistical analysis of quality control and in-process control results.
3. A review of all batches that failed to meet established specification(s).
4. A review of all critical deviations or non-conformances and related investigations.
5. A review of all changes carried out to the processes or analytical methods.
6. A review of the results of the stability-monitoring programme.
7. A review of all quality-related returns, complaints and recalls, including export- only
medicinal products.
8. A review of the adequacy of previous corrective actions.
9. A list of validated analytical and manufacturing procedures and their revalidation dates.

Notes
Reviews must include data from all batches manufactured during the review period. Data
should be presented in tabular or graphical form (i.e. charts or graphs), when applicable.

110
PART II:

GUIDELINES ON STABILITY TESTING REQUIREMENTS FOR ACTIVE
PHARMACEUTICAL INGREDIENTS (APIs) AND FINISHED PHARMACEUTICAL
PRODUCTS (FPPs)

111
Abbreviations and Acronyms

APIs: Active Pharmaceutical Ingredient

EAC: East Africa Community

FDC: Fixed Dose Combination

FPP: Finished Pharmaceutical Product

FPPs: Finished Medicinal Products

ICH: International Conference on Harmonization

LVPs: Large Volume Parenterals

NMT: Not More Than

RH: Relative Humidity

SVPs: Small Volume Parenterals

112
1. INTRODUCTION

1.1 Objective

The guideline describes the core stability data package required for active pharmaceutical
ingredients (APIs) and finished medicinal products (FPPs). However, alternative approaches
can be used when they are scientifically justified. The guideline is adopted from WHO

Technical Report Series, No. 953, Annex II. Further guidance can be found in International Conference on Harmonisation (ICH) guidelines (3) and in the WHO guidelines on the active pharmaceutical ingredient master file procedure (4).

It is recommended that the guideline should also be applied to products that are already being marketed, with allowance for an appropriate transition period, e.g. upon re-registration or upon re-evaluation.

1.2 Scope

The guideline applies to new and existing APIs and addresses information to be submitted in original and subsequent applications for marketing authorization of their related FPP for human use. The guideline is not applicable to stability testing for biologicals (for details on vaccines please see WHO guidelines for stability evaluation of vaccines (5)).

1.3 General principles

The purpose of stability testing is to provide evidence of how the quality of an API or FPP varies with time under the influence of a variety of environmental factors such as temperature, humidity and light. The stability programme also includes the study of product-related factors that influence its quality, for example, interaction of API with excipients, container closure systems and packaging materials. In fixed-dose combination FPPs (FDCs) the interaction between two or more APIs also has to be considered.

As a result of stability testing a re-test period for the API (in exceptional cases, e.g. for unstable APIs, a shelf-life is given) or a shelf-life for the FPP can be established and storage conditions can be recommended.

2. GUIDELINE

2.1 Active pharmaceutical ingredient

2.1.1 General

Information on the stability of the API is an integral part of the systematic approach to stability evaluation. Potential attributes to be tested on an API during stability testing are listed in the examples of testing parameters (Annex I).

113

The re-test period or shelf-life assigned to the API by the API manufacturer should be derived from stability testing data.

2.1.2 Stress testing

Stress testing of the API can help identify the likely degradation products, which, in turn, can help establish the degradation pathways and the intrinsic stability of the molecule and validate the stability-indicating power of the analytical procedures used. The nature of the stress testing will depend on the individual API and the type of FPP involved.

For an API the following approaches may be used:-

- when available, it is acceptable to provide the relevant data published in the scientific literature to support the identified degradation products and pathways;

- when no data are available, stress testing should be performed.

Stress testing may be carried out on a single batch of the API. It should include the effect of temperature (in 10 °C increments (e.g. 50 °C, 60 °C, e.t.c.) above the temperature used for accelerated testing), humidity (e.g. 75% relative humidity (RH) or greater) and, where appropriate, acid stress, alkaline stress, oxidation and photolysis on the API. The testing should also evaluate the susceptibility of the API to hydrolysis across a justified range of pH values when in solution or suspension (10).

Assessing the necessity for photostability testing should be an integral part of a stress testing strategy. More details can be found in other guidelines (3).

Results from these studies will form an integral part of the information provided to regulatory authorities.

2.1.3 Selection of batches

Data from stability studies on at least three primary batches of the API should normally be provided. The batches should be manufactured to a minimum of pilot scale by the same synthesis route as production batches, and using a method of manufacture and procedure that simulates the final process to be used for production batches. The overall quality of the batches of API placed on stability studies should be representative of the quality of the material to be made on a production scale.

For existing active substances that are known to be stable, data from at least two primary batches should be provided.

2.1.4 Container closure system

114

The stability studies should be conducted on the API packaged in a container closure system that is the same as, or simulates, the packaging proposed for storage and distribution.

2.1.5 Specification

Stability studies should include testing of those attributes of the API that are susceptible to change during storage and are likely to influence quality, safety and/or efficacy. The testing should cover, as appropriate, the physical, chemical, biological and microbiological attributes. A guide as to the potential attributes to be tested in the stability studies is provided in Appendix 1.

Validated stability-indicating analytical procedures should be applied. Whether and to what extent replication should be performed will depend on the results from validation studies (11).

2.1.6 Testing frequency

For long-term studies, frequency of testing should be sufficient to establish the stability profile of the API.

For APIs with a proposed re-test period or shelf-life of at least 12 months, the frequency of testing at the long-term storage condition should normally be every three months over the first year, every six months over the second year, and annually thereafter throughout the proposed re-test period or shelf-life.

At the accelerated storage condition, a minimum of three time points, including the initial and final time points (e.g. 0, 3 and 6 months), from a six month study is recommended. Where it is expected (based on development experience) that results from accelerated studies are likely to approach significant change criteria, increased testing should be conducted either by adding samples at the final time point or by including a fourth time point in the study design.

2.1.7 Storage conditions

In general an API should be evaluated under storage conditions (with appropriate tolerances) that test its thermal stability and, if applicable, its sensitivity to moisture. The storage conditions and the lengths of studies chosen should be sufficient to cover storage and shipment.

Storage condition tolerances are defined as the acceptable variations in temperature and relative humidity of storage facilities for stability studies. The equipment used should be capable of controlling the storage conditions within the ranges defined in these guidelines. The storage conditions should be monitored and recorded. Short-term environmental changes due to opening the doors of the storage facility are accepted as unavoidable. The effect of excursions due to equipment failure should be assessed, addressed and reported if judged to affect stability results. Excursions that exceed the defined tolerances for more than 24 hours should be described in the study report and their effects assessed.

115

The long-term testing should normally take place over a minimum of 12 months for the number of batches specified in section 2.1.3 at the time of submission, and should be continued for a period of time sufficient to cover the proposed re-test period or shelf-life. For existing substances that are known to be stable, data covering a minimum of six months may be submitted. Additional data accumulated during the assessment period of the registration application should be submitted to the authorities upon request.

Available information on the stability of the API under accelerated and long term storage conditions should be provided, including information in the public domain or obtained from scientific literature. The source of the information should be identified.

The required long-term storage conditions for APIs are either 30°C ± 2 °C/65% ± 5% RH or 30 ± 20°C/75% ± 5% RH. Alternative conditions should be supported with appropriate evidence, which may include literature references or in-house studies, demonstrating that storage at 300C is inappropriate for the API. For APIs intended for storage in a refrigerator and those intended for storage in a freezer, refer section 2.1.7.1.

APIs intended for storage below -20 °C should be treated on a case-by-case basis. To establish the retest period, data should be provided on not less than three batches of at least pilot scale. The batches should be manufactured by the same synthesis route as production batches and using a method of manufacture and a procedure that simulates the final process to be used for production batches.

2.1.7.1 General case

Study Storage condition Minimum time period covered by data at submission

Long-term

30 °C ± 2 °C/65% RH ± 5% RH or

30 °C ± 2 °C/75% RH ± 5% RH

12 months or 6 months as described in point 2.1.7

Accelerated

40 °C ± 2 °C/75% RH ± 5% RH 6 months

2.1.7.2 Active pharmaceutical ingredients intended for storage in a refrigerator

Study Storage condition Minimum time period covered by data at submission

Long-term

5 °C ± 3 °C 12 months

Accelerated

25 °C ± 2 °C/60% RH ± 5% RH or

30 °C ± 2 °C/65% RH ± 5% RH or

116

30 °C ± 2 °C/75% RH ± 5% RH

6 months

Whether accelerated stability studies are performed at 25 ± 2 °C/60% RH ± 5% RH or 30 °C ± 2 °C/65% RH ± 5% RH or 30 °C ± 2 °C/75% RH ± 5% RH is based on a risk-based evaluation.

Testing at a more severe long term condition can be an alternative to storage testing at 25 °C/60%RH or 30 °C/65%RH. Data on refrigerated storage should be assessed according to the evaluation section of this guideline, except where explicitly noted below. If significant change occurs between three and six months' testing at the accelerated storage condition, the proposed re-test period should be based on the data available at the long-term storage condition. If significant change occurs within the first three months' testing at the accelerated storage

condition a discussion should be provided to address the effect of short-term excursions outside the label storage condition, e.g. during shipping or handling. This discussion can be supported, if appropriate, by further testing on a single batch of the API for a period shorter than three months but with more frequent testing than usual. It is considered unnecessary to continue to test an API for the whole six months when a significant change has occurred within the first three months.

2.1.7.3 Active pharmaceutical ingredients intended for storage in a freezer

Study Storage condition Minimum time period covered by data at submission

Long-term

-20 °C ± 5 °C 12 months

In the rare case of any API of non-biological origin being intended for storage in a freezer, the re-test period or shelf-life should be based on the long-term data obtained at the long-term storage condition. In the absence of an accelerated storage condition for APIs intended to be stored in a freezer, testing on a single batch at an elevated temperature (e.g. 5 °C ± 3 °C or 25 °C ± 2 °C or 30 °C ± 2 °C) for an appropriate time period should be conducted to address the effect of short-term excursions outside the proposed label storage condition, e.g. during shipping or handling.

2.1.7.4 Active pharmaceutical ingredients intended for storage below -20°C

APIs intended for storage below -20 °C should be treated on a case-by-case basis.

2.1.8 Stability commitment

When the available long-term stability data on primary batches do not cover the proposed re-test period granted at the time of approval, a commitment should be made to continue the stability studies post-approval in order to firmly establish the re-test period or shelf-life.

117

Where the submission includes long-term stability data on the number of production batches specified in section 2.1.3 covering the proposed re-test period, a post-approval commitment is considered unnecessary. Otherwise one of the following commitments should be made:-

■ If the submission includes data from stability studies on the number of production batches specified in section 2.1.3, a commitment should be made to continue these studies through the proposed re-test period.

■ If the submission includes data from stability studies on fewer than the number of production batches specified in section 2.1.3, a commitment should be made to continue these studies through the proposed re-test period and to place additional production batches, to a total of at least three, in long-term stability studies through the proposed re-test period.

■ If the submission does not include stability data on production batches, a commitment should be made to place the first two or three production batches (see section 2.1.3) on long-term stability studies through the proposed re-test period.

The stability protocol used for long-term studies for the stability commitment should be the same as that for the primary batches, unless otherwise scientifically justified.

2.1.9 Evaluation

The purpose of the stability study is to establish, based on testing a minimum of the number of batches specified in section 2.1.3, unless otherwise justified and authorized, of the API and evaluating the stability information (including, as appropriate, results of the physical, chemical, biological and microbiological tests), a re-test period applicable to all future batches of the API manufactured under similar circumstances. The degree of variability of individual batches affects the confidence that a future production batch will remain within specification throughout the assigned re-test period.

The data may show so little degradation and so little variability that it is apparent from looking at them that the requested re-test period will be granted. Under these circumstances it is normally unnecessary to go through the statistical analysis; providing a justification for the omission should be sufficient.

An approach for analysing the data on a quantitative attribute that is expected to change with time is to determine the time at which the 95% one-sided confidence limit for the mean curve intersects the acceptance criterion. If analysis shows that the batch-to-batch variability is small, it is advantageous to combine the data into one overall estimate. This can be done by first applying appropriate statistical tests (e.g. p values for level of significance of rejection of more than 0.25) to the slopes of the regression lines and zero time intercepts for the individual batches. If it is inappropriate to combine data from several batches, the overall re-test period should be based on the minimum time a batch can be expected to remain within acceptance criteria.

118

The nature of any degradation relationship will determine whether the data should be transformed for linear regression analysis. Usually the relationship can be represented by a linear, quadratic or cubic function on an arithmetic or logarithmic scale. As far as possible, the choice of model should be justified by a physical and/or chemical rationale and should also take into account the amount of available data (parsimony principle to ensure a robust prediction). Statistical methods should be employed to test the goodness of fit of the data on all batches and combined batches (where appropriate) to the assumed degradation line or curve.

Limited extrapolation of the long-term data from the long-term storage condition beyond the observed range to extend the re-test period can be undertaken if justified. This justification should be based on what is known about the mechanism of degradation, the results of testing under accelerated conditions, the goodness of fit of any mathematical model, batch size and existence of supporting stability data. However, this extrapolation assumes that the same

degradation relationship will continue to apply beyond the observed data.

Any evaluation should cover not only the assay but also the levels of degradation products and other appropriate attributes. Where appropriate, attention should be paid to reviewing the adequacy of evaluation linked to FPP stability and degradation "behaviour" during the testing.

2.1.10 Statements and labelling

A storage statement should be established for display on the label based on the stability evaluation of the API. Where applicable specific instructions should be provided, particularly for APIs that cannot tolerate freezing or excursions in temperature. Terms such as "ambient conditions" or "room temperature" should be avoided.

The recommended labelling statements for use if supported by the stability studies are provided in Appendix 2.

A re-test period should be derived from the stability information, and a retest date should be displayed on the container label if appropriate.

2.1.11 On-going stability studies

The stability of the API should be monitored according to a continuous and appropriate programme that will permit the detection of any stability issue (e.g. changes in levels of degradation products). The purpose of the on-going stability programme is to monitor the API and to determine that the API remains, and can be expected to remain, within specifications under the storage conditions indicated on the label, within the re-test period in all future batches.

The on-going stability programme should be described in a written protocol and the results presented in a formal report.

119

The protocol for an on-going stability programme should extend to the end of the re-test period and shelf-life and should include, but not be limited to, the following parameters:-

- i. number of batch (es) and different batch sizes, if applicable;
- ii. relevant physical, chemical, microbiological and biological test methods;
- iii. acceptance criteria;
- iv. reference to test methods;
- v. description of the container closure system(s);
- vi. testing frequency;
- vii. description of the conditions of storage (standardized conditions for long-term testing as described in these guidelines, and consistent with the API labelling, should be used);
- and
- viii. other applicable parameters specific to the API.

At least one production batch per year of API (unless none is produced during that year) should be added to the stability monitoring programme and tested at least annually to confirm the stability (12). In certain situations additional batches should be included in the on-going stability programme. For example, an on-going stability study should be conducted after any significant change or significant deviation to the synthetic route, process or container closure system which may have an impact upon the stability of the API (13).

Out-of-specification results or significant atypical trends should be investigated. Any confirmed significant change, out-of-specification result, or significant atypical trend should be reported immediately to the relevant finished product manufacturer. The possible impact on batches on the market should be considered in consultation with the relevant finished product manufacturers and the competent authorities.

A summary of all the data generated, including any interim conclusions on the programme, should be written and maintained. This summary should be subjected to periodic review.

2.2 Finished medicinal product

2.2.1 General

The design of the stability studies for the FPP should be based on knowledge of the behaviour and properties of the API, information from stability studies on the API and on experience gained from pre-formulation studies and investigational FPPs.

2.2.2 Selection of batches

Data from stability studies should be provided on at least three primary batches of the FPP. The primary batches should be of the same formulation and packaged in the same container closure system as proposed for marketing. The manufacturing process used for primary batches should simulate that to be applied to production batches and should provide product of the same quality and meeting the same specification as that intended for marketing. In the case of

120
conventional dosage forms with APIs that are known to be stable, data from at least two primary batches should be provided.

Two of the three batches should be at least pilot-scale batches and the third one can be smaller, if justified. Where possible, batches of the FPP should be manufactured using different batches of the API(s).

Stability studies should be performed on each individual strength, dosage form and container type and size of the FPP unless bracketing or matrixing is applied.

2.2.3 Container closure system

Stability testing should be conducted on the dosage form packaged in the container closure system proposed for marketing. Any available studies carried out on the FPP outside its

immediate container or in other packaging materials can form a useful part of the stress testing of the dosage form or can be considered as supporting information, respectively.

2.2.4 Specification

Stability studies should include testing of those attributes of the FPP that are susceptible to change during storage and are likely to influence quality, safety, and/or efficacy. The testing should cover, as appropriate, the physical, chemical, biological and microbiological attributes, preservative content (e.g. antioxidant or antimicrobial preservative) and functionality tests (e.g. for a dose delivery system). Examples of testing parameters in the stability studies are listed in Appendix 1. Analytical procedures should be fully validated and stability-indicating. Whether and to what extent replication should be performed will depend on the results of validation studies.

Shelf-life acceptance criteria should be derived from consideration of all available stability information. It may be appropriate to have justifiable differences between the shelf-life and release acceptance criteria based on the stability evaluation and the changes observed on storage. Any differences between the release and shelf-life acceptance criteria for antimicrobial preservative content should be supported by a validated correlation of chemical content and preservative effectiveness demonstrated during development of the pharmaceutical product with the product in its final formulation (except for preservative concentration) intended for marketing. A single primary stability batch of the FPP should be tested for effectiveness of the antimicrobial preservative (in addition to preservative content) at the proposed shelf-life for verification purposes, regardless of whether there is a difference between the release and shelf-life acceptance criteria for preservative content.

2.2.5 Testing frequency

For long-term studies, frequency of testing should be sufficient to establish the stability profile of the FPP.

121

For products with a proposed shelf-life of at least 12 months, the frequency of testing at the long-term storage condition should normally be every three months over the first year, every six months over the second year and annually thereafter throughout the proposed shelf-life.

At the accelerated storage condition, a minimum of three time points, including the initial and final time points (e.g. 0, 3 and 6 months), from a six-month study is recommended. Where an expectation (based on development experience) exists that results from accelerated testing are likely to approach significant change criteria, testing should be increased either by adding samples at the final time point or by including a fourth time point in the study design.

Reduced designs, i.e. matrixing or bracketing, where the testing frequency is reduced or certain factor combinations are not tested at all, can be applied if justified (3).

2.2.6 Storage conditions

In general an FPP should be evaluated under storage conditions with specified tolerances that test its thermal stability and, if applicable, its sensitivity to moisture or potential for solvent loss. The storage conditions and the lengths of studies chosen should be sufficient to cover storage, shipment and subsequent use with due regard to the climatic conditions in which the product is intended to be marketed.

Photostability testing, which is an integral part of stress testing, should be conducted on at least one primary batch of the FPP if appropriate. More details can be found in other guidelines (3).

The orientation of the product during storage, i.e. upright versus inverted, may need to be included in a protocol where contact of the product with the closure system may be expected to affect the stability of the products contained, or where there has been a change in the container closure system.

Storage condition tolerances are usually defined as the acceptable variations in temperature and relative humidity of storage facilities for stability studies. The equipment used should be capable of controlling the storage conditions within the ranges defined in these guidelines. The storage conditions should be monitored and recorded. Short-term environmental changes due to opening of the doors of the storage facility are accepted as unavoidable. The effect of excursions due to equipment failure should be assessed, addressed and reported if judged to affect stability results.

Excursions that exceed the defined tolerances for more than 24 hours should be described in the study report and their effects assessed. The long-term testing should cover a minimum of six or 12 months at the time of submission and should be continued for a period of time sufficient to cover the proposed shelf-life. For an FPP containing an API that is known to be stable and where no significant change is observed in the FPP stability studies at accelerated and long-term conditions for at least 6 months data covering a minimum of six months should be submitted.

122

Additional data accumulated during the assessment period of the registration application should be submitted to the authorities if requested. Data from the accelerated storage condition can be used to evaluate the effect of short-term excursions outside the label storage conditions (such as might occur during shipping). Long-term and accelerated storage conditions for FPPs are detailed in the sections below. The general case applies if the FPP is not specifically covered by a subsequent section (2.1.7.1). Alternative storage conditions can be used if justified.

2.2.6.1 General case

Study Storage condition Minimum time period covered by data at submission

Long-term

30 °C ± 2 °C/75% RH ± 5% RH

12 months or 6 months as referred to in section 2.2.6

Accelerated
40 °C ± 2 °C/75% RH ± 5% RH 6 months

In general “significant change” for an FPP is defined as:

- i. A change from the initial content of API(s) of 5% or more detected by assay, or failure to meet the acceptance criteria for potency when using biological or immunological procedures. (Note: Other values may be applied, if justified, to certain products, such as multivitamins and herbal preparations.)
- ii. Any degradation product exceeding its acceptance criterion.
- iii. Failure to meet the acceptance criteria for appearance, physical attribute and functionality test (e.g. colour, phase separation, resuspendability, caking, hardness, and dose delivery per actuation). However, some changes in physical attributes (e.g. softening of suppositories, melting of creams, and partial loss of adhesion for transdermal products) may be expected under accelerated conditions. Also, as appropriate for the dosage form:
- iv. failure to meet the acceptance criterion for pH; or
- v. failure to meet the acceptance criteria for dissolution for 12 dosage units.

2.2.6.2 FPPs packaged in impermeable containers

Parameters required to classify the packaging materials as permeable or impermeable depend on the characteristics of the packaging material, such as thickness and permeability coefficient. The suitability of the packaging material used for a particular product is determined by its product characteristics. Containers generally considered to be moisture impermeable include glass ampoules.

Sensitivity to moisture or potential for solvent loss is not a concern for FPPs packaged in impermeable containers that provide a permanent barrier to passage of moisture or solvent.

123

Thus stability studies for products stored in impermeable containers can be conducted under any controlled or ambient relative humidity condition.

2.2.6.3 FPPs packaged in semi-permeable containers

Aqueous-based products packaged in semi-permeable containers should be evaluated for potential water loss in addition to physical, chemical, biological and microbiological stability. This evaluation can be carried out under conditions of low relative humidity, as discussed below. Ultimately it should be demonstrated that aqueous-based FPPs stored in semi-permeable containers could withstand environments with low relative humidity.

Other comparable approaches can be developed and reported for non-aqueous, solvent-based products.

Study Storage condition Minimum time period covered by data at submission

Long-term
30 °C ± 2 °C/35% RH ± 5% RH
12 months

Accelerated
40 °C ± 2 °C/not more than
(NMT) 25% RH
6 months

Products meeting the long-term storage conditions and the accelerated conditions, as specified in the table above, have demonstrated the integrity of the packaging in semi-permeable containers.

A 5% loss in water from its initial value is considered a significant change for a product packaged in a semi-permeable container after an equivalent of three months' storage at 40 °C not more than (NMT) 25% RH. However, for small containers (1 ml or less) or unit-dose products, a water loss of 5% or more after an equivalent of three months' storage at 40 °C/NMT 25% RH may be appropriate, if justified.

An alternative approach to studies at the low relative humidity as recommended in the table above (for either long-term or accelerated testing) is to perform the stability studies under higher relative humidity and deriving the water loss at the low relative humidity through calculation. This can be achieved by experimentally determining the permeation coefficient for the container closure system or, as shown in the example below, using the calculated ratio of water loss rates between the two humidity conditions at the same temperature. The permeation coefficient for a container closure system can be experimentally determined by using the worst-case scenario (e.g. the most diluted of a series of concentrations) for the proposed FPP.

124

2.2.6.4 FPPs intended for storage in a refrigerator

Study Storage condition Minimum time period covered by data at submission

Long-term
5 °C ± 3 °C 12 months

Accelerated
25 °C ± 2 °C/60% RH ± 5% RH or
30 °C ± 2 °C/65% RH ± 5% RH or
30 °C ± 2 °C/75% RH ± 5% RH
6 months

Whether accelerated stability studies are performed at 25 ± 2 °C/60% RH ± 5% RH or 30 °C ± 2 °C/65% RH ± 5% RH or 30 °C ± 2 °C/75% RH ± 5% RH is based on a risk-based evaluation. Testing at a more severe accelerated condition can be an alternative to the storage condition at

25 °C/60% RH or 30 °C/65% RH.

If the FPP is packaged in a semi-permeable container, appropriate information should be provided to assess the extent of water loss.

Data from refrigerated storage should be assessed according to the evaluation section of these guidelines, except where explicitly noted below.

If significant change occurs between three and six months' testing at the accelerated storage condition, the proposed shelf-life should be based on the data available from the long-term storage condition.

If significant change occurs within the first three months' testing at the accelerated storage condition, a discussion should be provided to address the effect of short-term excursions outside the label storage condition, e.g. during shipment and handling. This discussion can be supported, if appropriate, by further testing on a single batch of the FPP for a period shorter than three months but with more frequent testing than usual. It is considered unnecessary to continue to test a product throughout six months when a significant change has occurred within the first three months of accelerated studies at the specific condition chosen in accordance with the risk analysis.

2.2.6.5 FPPs intended for storage in a freezer

Study Storage condition Minimum time period covered by data at submission

Long-term

-20 °C ± 5 °C 12 months

125

For FPPs intended for storage in a freezer, the shelf-life should be based on the long-term data obtained at the long-term storage condition. In the absence of an accelerated storage condition for FPPs intended to be stored in a freezer, testing on a single batch at an elevated temperature (e.g. 5 °C ± 3 °C or 25 °C ± 2 °C or 30 °C ± 2 °C) for an appropriate time period should be conducted to address the effect of short-term excursions outside the proposed label storage condition.

2.2.6.6 FPPs intended for storage below -20 °C

FPPs intended for storage at temperatures below -20 °C should be treated on a case-by-case basis.

2.2.7 Stability commitment

When the available long-term stability data on primary batches do not cover the proposed shelf-life granted at the time of approval, a commitment should be made to continue the stability studies post-approval to firmly establish the shelf-life.

Where the submission includes long-term stability data from the production batches as specified in section 2.2.2 covering the proposed shelf-life, a post-approval commitment is considered unnecessary. Otherwise, one of the following commitments should be made:-

1. If the submission includes data from stability studies on at least the number of production batches specified in section 2.2.2, a commitment should be made to continue the long-term studies throughout the proposed shelf-life and the accelerated studies for six months.
2. If the submission includes data from stability studies on fewer than the number of production batches specified in section 2.2.2, a commitment should be made to continue the long-term studies throughout the proposed shelf-life and the accelerated studies for six months, and to place additional production batches, to a total of at least three, on long-term stability studies throughout the proposed shelf-life and on accelerated studies for six months.
3. If the submission does not include stability data on production batches, a commitment should be made to place the first two or three production batches (see section 2.2.2) on long-term stability studies throughout the proposed shelf-life and on accelerated studies for six months.

The stability protocol used for studies on commitment batches should be the same as that for the primary batches, unless otherwise scientifically justified.

2.2.8 Evaluation

A systematic approach should be adopted to the presentation and evaluation of the stability information, which should include, as appropriate, results from the physical, chemical,

126

biological and microbiological tests, including particular attributes of the dosage form (for example, dissolution rate for solid oral dosage forms).

The purpose of the stability study is to establish, based on testing a minimum number of batches of the FPP as specified in section 2.2.2, a shelf-life and label storage instructions applicable to all future batches of the FPP manufactured under similar circumstances. The degree of variability of individual batches affects the confidence that a future production batch will remain within specification throughout its shelf-life.

Where the data show so little degradation and so little variability that it is apparent from looking at the data that the requested shelf-life will be granted, it is normally unnecessary to go through the statistical analysis. However, a provisional shelf-life of 24 months may be established provided the following conditions are satisfied:

1. The API is known to be stable (not easily degradable).
2. Stability studies, as outlined above in section 2.1.11, have been performed and no significant

changes have been observed.

3. Supporting data indicate that similar formulations have been assigned a shelf-life of 24 months or more.

4. The manufacturer will continue to conduct long-term studies until the proposed shelf-life has been covered, and the results obtained will be submitted to the national medicines regulatory authority.

An approach for analysing the data on a quantitative attribute that is expected to change with time is to determine the time at which the 95% one-sided confidence limit for the mean curve intersects the acceptance criterion. If analysis shows that the batch-to-batch variability is small, it is advantageous to combine the data into one overall estimate. This can be done by first applying appropriate statistical tests (e.g. p values for level of significance of rejection of more than 0.25) to the slopes of the regression lines and zero time intercepts for the individual batches. If it is inappropriate to combine data from several batches, the overall shelf-life should be based on the minimum time a batch can be expected to remain within acceptance criteria.

The nature of any degradation relationship will determine whether the data should be transformed for linear regression analysis. Usually the relationship can be represented by a linear, quadratic or cubic function on an arithmetic or logarithmic scale. As far as possible, the choice of model should be justified by a physical and/or chemical rationale and should also take into account the amount of available data (parsimony principle to ensure a robust prediction).

Statistical methods should be employed to test the goodness of fit of the data on all batches and combined batches (where appropriate) to the assumed degradation line or curve.

127

Limited extrapolation of the long-term data from the long-term storage condition beyond the observed range to extend the shelf-life can be undertaken, if justified. This justification should be based on what is known about the mechanism of degradation, the results of testing under accelerated conditions, the goodness of fit of any mathematical model, batch size and the existence of supporting stability data. However, this extrapolation assumes that the same degradation relationship will continue to apply beyond the observed data.

Any evaluation should consider not only the assay but also the degradation products and other appropriate attributes. Where appropriate, attention should be paid to reviewing the adequacy of evaluation linked to FPP stability and degradation "behaviour" during the testing.

2.2.9 Statements and labelling

A storage statement should be established for the label based on the stability evaluation of the FPP. Where applicable, specific instructions should be provided particularly for FPPs that cannot tolerate freezing. Terms such as "ambient conditions" or "room temperature" must be avoided.

There should be a direct link between the storage statement on the label and the demonstrated stability of the FPP. An expiry date should be displayed on the container label. The recommended labelling statements for use, if supported by the stability studies, are provided in Appendix 2.

In principle, FPPs should be packed in containers that ensure stability and protect the FPP from deterioration. A storage statement should not be used to compensate for inadequate or inferior packaging. Additional labelling statements could be used in cases where the results of the stability testing demonstrate limiting factors (see also Appendix 2).

2.2.10 In-use stability

The purpose of in-use stability testing is to provide information for the labelling on the preparation, storage conditions and utilization period of multi-dose products after opening, reconstitution or dilution of a solution, e.g. an antibiotic injection supplied as a powder for reconstitution.

As far as possible the test should be designed to simulate the use of the FPP in practice, taking into consideration the filling volume of the container and any dilution or reconstitution before use. At intervals comparable to those which occur in practice appropriate quantities should be removed by the withdrawal methods normally used and described in the product literature.

The physical, chemical and microbial properties of the FPP susceptible to change during storage should be determined over the period of the proposed in-use shelf-life. If possible, testing should be performed at intermediate time points and at the end of the proposed in-use shelf-life on the final amount of the FPP remaining in the container. Specific parameters, e.g. for liquids and semi-solids, preservatives, per content and effectiveness, need to be studied.

128

A minimum of two batches, at least pilot-scale batches, should be subjected to the test. At least one of these batches should be chosen towards the end of its shelf-life. If such results are not available, one batch should be tested at the final point of the submitted stability studies.

This testing should be performed on the reconstituted or diluted FPP throughout the proposed in-use period on primary batches as part of the stability studies at the initial and final time points and, if full shelf-life, long term data are not available before submission, at 12 months or the last time point at which data will be available.

In general this testing need not be repeated on commitment batches (see 2.2.10).

2.2.11 Variations

Once the FPP has been registered, additional stability studies are required whenever variations that may affect the stability of the API or FPP are made, such as major variations (13).

The following are examples of such changes:

- change in the manufacturing process;
- change in the composition of the FPP;
- change of the immediate packaging;
- change in the manufacturing process of an API.

In all cases of variations, the applicant should investigate whether the intended change will or will not have an impact on the quality characteristics of APIs and/or FPPs and consequently on their stability.

The scope and design of the stability studies for variations and changes are based on the knowledge and experience acquired on APIs and FPPs.

The results of these stability studies should be communicated to the regulatory authorities concerned (14).

2.2.12 On-going stability studies

After a marketing authorization has been granted, the stability of the FPP should be monitored according to a continuous appropriate programme that will permit the detection of any stability issue (e.g. changes in levels of impurities or dissolution profile) associated with the formulation in the container closure system in which it is marketed. The purpose of the On-going stability programme is to monitor the product over its shelf-life and to determine that the product remains, and can be expected to remain, within specifications under the storage conditions on the label.

129

This mainly applies to the FPP in the container closure system in which it is supplied, but consideration should also be given to inclusion in the programme of bulk products. For example, when the bulk product is stored for a long period before being packaged and/or shipped from a manufacturing site to a packaging site, the impact on the stability of the packaged product should be evaluated and studied. Generally this would form part of development studies, but where this need has not been foreseen, inclusion of a one-off study in the on-going stability programme could provide the necessary data. Similar considerations could apply to intermediates that are stored and used over prolonged periods.

The on-going stability programme should be described in a written protocol and results formalized as a report.

The protocol for an on-going stability programme should extend to the end of the shelf-life period and should include, but not be limited to, the following parameters:

1. Number of batch(es) per strength and different batch sizes, if applicable;
2. The batch size should be recorded, if different batch sizes are employed;
3. Relevant physical, chemical, microbiological and biological test
4. Methods;
5. Acceptance criteria;
6. Reference to test methods;
7. Description of the container closure system(s);
8. Testing frequency;
9. Description of the conditions of storage (standardized conditions for long-term testing as described in these guidelines, and consistent with the product labelling, should be used); and
10. Other applicable parameters specific to the FPP.

The protocol for the on-going stability programme can be different from that of the initial long-term stability study as submitted in the marketing authorization dossier provided that this is justified and documented in the protocol (for example, the frequency of testing, or when updating to meet revised recommendations).

The number of batches and frequency of testing should provide sufficient data to allow for trend analysis. Unless otherwise justified, at least one batch per year of product manufactured in every strength and every primary packaging type, if relevant, should be included in the stability programme (unless none is produced during that year). The principle of bracketing and matrixing designs may be applied if scientifically justified in the protocol (15).

In certain situations additional batches should be included in the on-going stability programme. For example, an on-going stability study should be conducted after any significant change or significant deviation to the processor container closure system. Any reworking, reprocessing or recovery operation should also be considered for inclusion (13).

Out-of-specification results or significant atypical trends should be investigated. Any confirmed significant change, out-of-specification result, or significant atypical trend should be reported

130 immediately to the relevant competent authorities. The possible impact on batches on the market should be considered in consultation with the relevant competent authorities.

A summary of all the data generated, including any interim conclusions on the programme, should be written and maintained. This summary should be subjected to periodic review.

3. GLOSSARY

The definitions provided below apply to the words and phrases used in this guideline. Although an effort has been made to use standard definitions as far as possible, they may have different meanings in other contexts and documents. The following definitions are provided to facilitate interpretation of the guidelines. The definitions are consistent with those published in other WHO quality assurance guidelines.

Accelerated testing

Studies designed to increase the rate of chemical degradation and physical change of an API or FPP by using exaggerated storage conditions as part of the stability testing programme. The data thus obtained, in addition to those derived from long-term stability studies, may be used to

assess longer term chemical effects under non-accelerated conditions and to evaluate the impact of short-term excursions outside the label storage conditions, as might occur during shipping. The results of accelerated testing studies are not always predictive of physical changes.

Bracketing

The design of stability schedule such that only samples at the extremes of certain design factors, e.g. strength and package size, are tested at all-time points as in a full design. The design assumes that the stability of any intermediate levels is represented by the stability of the extremes tested.

Where a range of strengths is to be tested, bracketing is applicable if the strengths are identical or very closely related in composition (e.g. for a tablet range made with different compression weights of a similar basic granulation, or a capsule range made by filling different plug fill weights of the same basic composition into different size capsule shells). Bracketing can be applied to different container sizes or different fills in the same container closure system.

Commitment batches

Production batches of an API or FPP for which the stability studies are initiated or completed post-approval through a commitment made in a regulatory application.

Impermeable containers

131

Containers that provide a permanent barrier to the passage of gases or solvents e.g. sealed aluminium tubes for semisolids, sealed glass ampoules for solutions and aluminium/aluminium blisters for solid dosage forms.

In use

See Utilization period

Long-term stability studies

Experiments on the physical, chemical, biological, biopharmaceutical and microbiological characteristics of an API or FPP, during and beyond the expected shelf-life and storage periods of samples under the storage conditions expected in the intended market. The results are used to establish the re-test period or the shelf-life, to confirm the projected re-test period and shelf-life, and to recommend storage conditions.

Matrixing

The design of a stability schedule such that a selected subset of the total number of possible samples for all factor combinations is tested at a specified time point. At a subsequent time point, another subset of samples for all factor combinations is tested. The design assumes that the stability of each subset of samples tested represents the stability of all samples at a given time point. The differences in the samples for the same FPP should be identified as, for example, covering different batches, different strengths, different sizes of the same container closure system, and, possibly in some cases, different container closure systems.

On-going stability study

The study carried out by the manufacturer on production batches according to a predetermined schedule in order to monitor, confirm and extend the projected re-test period (or shelf-life) of the API, or confirm or extend the shelf-life of the FPP.

Pilot-scale batch

A batch of an API or FPP manufactured by a procedure fully representative of and simulating that to be applied to a full production-scale batch. For example, for solid oral dosage forms, a pilot scale is generally, at a minimum, one-tenth that of a full production scale or 100 000 tablets or capsules, whichever is the larger; unless otherwise adequately justified.

Provisional shelf-life

A provisional expiry date which is based on acceptable accelerated and available long-term data for the FPP to be marketed in the proposed container closure system.

Re-test date

132

The date after which an active API should be re-examined to ensure that the material is still in compliance with the specification and thus is still suitable for use in the manufacture of an FPP.

Re-test period

The period of time during which the API is expected to remain within its specification and, therefore, can be used in the manufacture of a given FPP, provided that the API has been stored under the defined conditions. After this period a batch of API destined for use in the manufacture of an FPP should be re-tested for compliance with the specification and then used immediately. A batch of API can be re-tested multiple times and a different portion of the batch used after each re-test, as long as it continues to comply with the specification. For most substances known to be labile, it is more appropriate to establish a shelf-life than a re-test period. The same may be true for certain antibiotics.

Significant change (See section 2.2.6.1.)

In general "significant change" for an FPP is defined as:-

1. A 5% or more change in assay from its initial content of API(s), or failure to meet the acceptance criteria for potency when using biological or immunological procedures. (Note: other values may be applied, if justified, to certain products, such as multivitamins and herbal preparations.)

2. Any degradation product exceeding its acceptance criterion.

1. Failure to meet the acceptance criteria for appearance, physical attribute and functionality test (e.g. colour, phase separation, re-suspendability, caking, hardness, dose delivery per actuation). However, some changes in physical attributes (e.g. softening of suppositories, melting of creams or partial loss of adhesion for transdermal products) may be expected under accelerated conditions. Also, as appropriate for the dosage form.

4. Failure to meet the acceptance criterion for pH.

Or

5. Failure to meet the acceptance criteria for dissolution for 12 dosage units.

Stability indicating methods

Validated analytical procedures that can detect the changes with time in the chemical, physical or microbiological properties of the API or FPP, and that are specific so that the content of the API, degradation products, and other components of interest can be accurately measured without interference.

133

Stability studies (stability testing)

Long-term and accelerated (and intermediate) studies undertaken on primary and/or commitment batches according to a prescribed stability protocol to establish or confirm the re-test period (or shelf-life) of an API or the shelf-life of an FPP.

Stress testing (of the API)

Studies undertaken to elucidate the intrinsic stability of API(s). Such testing is part of the development strategy and is normally carried out under more severe conditions than those used for accelerated testing.

Stress testing (of the FPP)

Studies undertaken to assess the effect of severe conditions on the FPP. Such studies include photo stability testing and specific testing on certain products (e.g. metered dose inhalers, creams, emulsions, refrigerated aqueous liquid products).

Supporting stability data

Supplementary data, such as stability data on small-scale batches, related formulations, and products presented in containers not necessarily the same as those proposed for marketing, and scientific rationales that support the analytical procedures, the proposed re-test period or the shelf-life and storage conditions.

Utilization period

A period of time during which a reconstituted preparation of the finished dosage form in an unopened multi-dose container can be used.

DEFINITIONS

Absorption - the uptake of substance from a solution into or across tissues. As a time dependent process; absorption can include passive diffusion, facilitated passive diffusion (with a carrier molecule), and active transport. A Pharmaceutical product is considered to be highly absorbed when the measured extent of absorption of the highest therapeutic dose is greater or equal to (≥) 85%. High absorption: ≥ 85% of the administered dose absorbed.

Active moiety (Active): is the term used for the therapeutically active entity in the final formulation of a medicine, irrespective of the form of the API. The active is alternative terminology with the same meaning. For example, if the API is propranolol hydrochloride, the active moiety (and the active) is propranolol.

Active Pharmaceutical Ingredient (API): A substance or compound that is intended to be used in the manufacture of a pharmaceutical product as a therapeutically active ingredient.

Bioavailability: refers to the rate and extent to which the API, or its active moiety, is absorbed from a pharmaceutical product and becomes available at the site of action. It may be useful to distinguish between the "absolute bioavailability" of a given dosage form as compared with that (100 %) following intravenous administration (e.g. oral solution vs. intravenous), and the "relative bioavailability" as compared with another form administered by the same or another non-intravenous route (e.g. tablets vs. oral solution).

Bioequivalence: Two pharmaceutical products are bioequivalent if they are pharmaceutically equivalent or pharmaceutical alternatives and if their bioavailabilities in terms of peak (Cmax and Tmax) and total exposure (AUC) after administration of the same molar dose under the same conditions are similar to such a degree that their effects with respect to both efficacy and safety can be expected to be essentially the same. Bioequivalence focuses on the equivalence of release of the active pharmaceutical ingredient from the pharmaceutical product and its subsequent absorption into the systemic circulation. Comparative studies using clinical or pharmacodynamic end points may also be used to demonstrate bioequivalence.

Biopharmaceutics Classification System (BCS)-based biowaivers are meant to reduce the need for establishing in vivo bioequivalence in situations where in vitro data may be considered to provide a reasonable estimate of the relative in vivo performance of two products. The BCS is a scientific approach designed to predict medicinal absorption based on the aqueous solubility and intestinal absorptive characteristics of the Pharmaceutical product.

Biowaiver: The term biowaiver is applied to a regulatory drug approval process when the dossier (application) is approved based on evidence of equivalence other than through in vivo equivalence testing.

Comparator product: is a pharmaceutical product with which the generic product is intended to be interchangeable in clinical practice. The comparator product will normally be the innovator product for which efficacy, safety and quality have been established.

140

Critical dose medicinal - Medicinal product where comparatively small differences in dose or concentration lead to dose- and concentration-dependent, serious therapeutic failures and/or serious adverse medicinal reactions which may be persistent, irreversible, slowly reversible, or life threatening, which could result in hospitalization or prolongation of existing hospitalization, persistent or significant disability or incapacity, or death. Adverse reactions that require significant medical intervention to prevent one of these outcomes are also considered to be serious.

Dose solubility volume (DSV) - the highest therapeutic dose [milligram (mg)] divided by the solubility of the substance [milligram/milliliter (mg/mL)] at a given pH and temperature. For example, if a Pharmaceutical product has a solubility of 31 mg/mL at pH 4.5 (37°C) and the highest dose is 500 mg, then DSV = 500 mg/31 mg/mL = 16 mL at pH 4.5 (37°C).

Fixed-dose combination (FDC): A combination of two or more active pharmaceutical ingredients in a fixed ratio of doses. This term is used generically to mean a particular combination of active pharmaceutical ingredients irrespective of the formulation or brand. It may be administered as single entity products given concurrently or as a finished pharmaceutical product.

Generic Pharmaceutical Product is a pharmaceutically equivalent product that may or may not be therapeutically equivalent or bioequivalent. Generic pharmaceutical products that are therapeutically equivalent are interchangeable.

High solubility: A Pharmaceutical product is classified as highly soluble if the highest therapeutic dose of the Pharmaceutical product is completely soluble in 250 mL or less of solvent over the pH range of 1.2-6.8 at 37 ± 1°C, that is (i.e.), DSV ≤ 250 mL over the pH range.

Highest dose - highest approved therapeutic dose for the Pharmaceutical product in Tanzania. If not currently approved in Tanzania, the highest proposed dose is applicable.

Low absorption: less than (<) 85% of the administered dose absorbed.

Low solubility: A Pharmaceutical product is classified as a low solubility compound if the highest therapeutic dose of the Pharmaceutical product is not completely soluble in 250 mL of solvent at any pH within the pH range of 1.2-6.8 at $37 \pm 1^\circ\text{C}$, i.e., DSV greater than ($>$) 250 mL at any pH within the range.

Metabonate - a substance which appears to be a metabolite but is actually an artefact formed during experimental conditions [for example (e.g.), isolation and storage].

Pharmaceutical alternatives: Pharmaceutical products are pharmaceutical alternatives if they contain the same active moiety but differ either in chemical form (e.g. salt, ester) of that moiety or in the dosage form or strength, administered by the same route of administration but are

141

otherwise not pharmaceutically equivalent. Pharmaceutical alternatives do not necessarily imply bioequivalence.

Pharmaceutical Dosage Form: A pharmaceutical dosage form is the form of the completed pharmaceutical product e.g. tablet, capsule, injection, elixir, suppository.

Pharmaceutical Equivalence: Pharmaceutical products are pharmaceutically equivalent if they contain the same amount of the same API(s) in the same dosage form, if they meet the same or comparable standards and if they are intended to be administered by the same route. Pharmaceutical equivalence does not necessarily imply bioequivalence as differences in the excipients and/or the manufacturing process can lead to changes in dissolution and/or absorption.

Pharmaceutical Product: Any preparation for human (or animal) use, containing one or more APIs with or without pharmaceutical excipients or additives, that is intended to modify or explore physiological systems or pathological states for the benefit of the recipient.

Proportionally Similar Dosage Forms/Products: Pharmaceutical products are considered proportionally similar in the following cases:-

Rapidly dissolving product - a product in which not less than 85% of the labelled amount is released within 30 minutes or less during a product dissolution test under the conditions specified in these guidelines.

Solution - a homogenous mixture in a single phase with no precipitate.

Therapeutic Equivalence: Two pharmaceutical products are therapeutically equivalent if they are pharmaceutically equivalent or are pharmaceutical alternatives and, after administration in the same molar dose, their effects with respect to both efficacy and safety are essentially the same, as determined from appropriate bioequivalence, pharmacodynamic, clinical or in vitro studies.

Very rapidly dissolving product - not less than 85% of the labelled amount is released within 15 minutes or less during a product dissolution test under the conditions specified in this guidelines.

142

1.0 INTRODUCTION

The objective of this guideline is to specify the requirements for the design, conduct, and evaluation of bioequivalence studies for immediate release and modified release dosage forms with systemic action.

Two medicinal products containing the same active substance are considered bioequivalent if they are pharmaceutically equivalent or Pharmaceutical alternatives and their bioavailabilities (rate and extent) after administration in the same molar dose lie within acceptable predefined limits. These limits are set to ensure comparable in vivo performance, i.e. similarity in terms of safety and efficacy.

In bioequivalence studies, the plasma concentration time curve is generally used to assess the rate and extent of absorption. Selected pharmacokinetic parameters and pre-set acceptance limits allow the final decision on bioequivalence of the tested products. The absorption rate of a drug is influenced by pharmacokinetic parameters like AUC, the area under the concentration time curve, reflects the extent of exposure, C_{max} , the maximum plasma concentration or peak exposure, and the time to maximum plasma concentration, t_{max} . In applications for generic medicinal products to TMDA, the concept of bioequivalence is fundamental.

The purpose of establishing bioequivalence is to demonstrate equivalence in biopharmaceutics quality between the generic medicinal product and a comparator medicinal product in order to allow bridging of preclinical tests and of clinical trials associated with the comparator medicinal product. The definition for generic medicinal products is a product that has the same qualitative and quantitative composition in active substances and the same pharmaceutical form as the comparator medicinal product, and whose bioequivalence with the comparator medicinal product has been demonstrated by appropriate bioavailability studies. The different salts, esters, ethers, isomers, mixtures of isomers, complexes or derivatives of an active substance are considered to be the same active substance, unless they differ significantly in properties with regard to safety and/or efficacy. Furthermore, the various immediate-release oral pharmaceutical forms shall be considered to be one and the same pharmaceutical form. Other types of applications may also require demonstration of bioequivalence, including variations, fixed combinations, extensions and generic applications.

The recommendations on design and conduct given for bioequivalence studies in this guideline may also be applied to comparative bioavailability studies evaluating different formulations used during the development of a new medicinal product containing a new chemical entity and to comparative bioavailability studies included in extension or generic applications that are not based exclusively on bioequivalence data.

Generally, results from comparative bioavailability studies should be provided in support of the safety and efficacy of each proposed product and of each proposed strength included in the

submission. In the absence of such studies, a justification supporting a waiver of this requirement should be provided in this section for each product and each strength. For

example, if there are several strengths of the proposed product, and comparative bioavailability data has not been submitted for all strengths, the applicant should provide a scientific justification for not conducting studies on each strength. This justification may address issues such as the nature of the kinetics of the drug (e.g., linear versus non-linear), and the proportionality of the strengths for which a waiver is sought to the strength on which a comparative bioavailability study was conducted.

The statement of justification for waiver will include supporting data (e.g. comparative dissolution data) which should be provided in the relevant module(s) of the CTD submission (i.e., Modules 2-5). For example, comparative dissolution profiles should be provided in Module 3, Section 3.2.P.2 of the main Guidelines on Submission of Documentation for Marketing Authorization of Human Pharmaceutical Products (Pharmaceutical Development).

144

2.0 SCOPE

This guideline focuses on recommendations for bioequivalence studies for immediate release formulations and modified release with systemic action. The scope is limited to chemical entities. Biological products are not covered by these guidelines.

In case bioequivalence cannot be demonstrated using drug concentrations, in exceptional circumstances pharmacodynamic or clinical endpoints may be needed.

Exemptions for carrying out bioequivalence studies

Omission of BE studies must be justified except if a product fulfills one or more of the following conditions:-

- a) Solutions, complex or simple, which do not contain any ingredient which can be regarded as a pharmacologically active substance;
- b) Simple aqueous solutions intended for intravenous injection or infusion containing the same active substance(s) in the same concentration as currently registered products. Simple solutions do not include complex solution such as micellar or liposomal solutions;
- c) Solutions for injection that contain the same active ingredients and excipients in the same concentrations as currently registered products and which are administered by the same route(s);
- d) Products that are powder for reconstitution as a solution and the solution meets either criterion (b) or (c) above;
- e) Oral immediate release tablets, capsules and suspensions containing active pharmaceutical ingredients eligible for BCS based biowaivers.
- f) Oral solutions containing the same active ingredient(s) in the same concentration as a currently registered or innovator oral solution and not containing excipients that may significantly affect gastric passage or absorption of the active ingredient(s);
- g) Products for topical use provided the product is intended to act without systemic absorption when applied locally;
- h) Products containing therapeutic substances, which are not systemically or locally absorbed i.e. an oral dosage form which is not intended to be absorbed (e.g., barium sulphate enemas, Antacid, Radioopaque Contrast Media, or powders in which no ingredient is absorbed etc.). If there is doubt as to whether absorption occurs, a study or justification may be required;

145

- i) Otic or ophthalmic products prepared as aqueous solutions and containing the same active pharmaceutical ingredient(s) in the same concentration;
- j) The product is an oral solution, syrup, or other similarly solubilized form;
- k) The product is oro-dispersable product is eligible for a biowaiver application only if there is no buccal or sublingual absorption and the product is labelled to be consumed with water;
- l) The product is an inhalant volatile anaesthetic solution, Inhalation and nasal preparations;
- m) The product is a reformulated product by the original manufacturer that is identical to the original product except for colouring agents, flavouring agents or preservatives, which are recognized as having no influence upon bioavailability;

- n) Gases;

146

3.0 MAIN GUIDELINE TEXT

3.1 Design, conduct and evaluation of bioequivalence studies

The design, conduct and evaluation of the Bioequivalence study should comply with ICH GCP requirements (E6).

In the following sections, requirements for the design and conduct of comparative bioavailability studies are formulated. Investigator(s) should have appropriate expertise, qualifications and competence to undertake a proposed study and is familiar with pharmacokinetic theories underlying bioavailability studies. The design should be based on a reasonable knowledge of the pharmacodynamics and/or the pharmacokinetics of the active substance in question.

The number of studies and study design depend on the physico-chemical characteristics of the substance, its pharmacokinetic properties and proportionality in composition, and should be justified accordingly. In particular it may be necessary to address the linearity of pharmacokinetics, the need for studies both in fed and fasting state, the need for enantioselective analysis and the possibility of waiver for additional strengths (see Sections 3.1.4, 3.1.5 and 3.1.6).

Module 2.7.1 should list all relevant studies carried out with the product applied for, i.e. bioequivalence studies comparing the formulation applied for (i.e. same composition and manufacturing process) with a Comparator medicinal product approved in the EAC. Studies should be included in the list regardless of the study outcome. Full study reports should be provided for all studies, except pilot studies for which study report synopses (in accordance with ICH E3) are sufficient. Full study reports for pilot studies should be available upon request. Study report synopses for bioequivalence or comparative bioavailability studies conducted during formulation development should also be included in Module 2.7. Bioequivalence studies comparing the product applied for with non-EAC Comparator products should not be submitted and do not need to be included in the list of studies.

3.1.1 Study design

Standard design

If two formulations are compared, a randomized, two-period, two-sequence single dose crossover design is recommended. The treatment periods should be separated by a wash out period sufficient to ensure that drug concentrations are below the lower limit of bioanalytical quantification in all subjects at the beginning of the second period. Normally at least 5 elimination half-lives are necessary to achieve this. The study should be designed in such a way that the treatment effect (formulation effect) can be distinguished from other effects. In order to reduce variability a cross over design usually is the first choice.

147

Alternative designs

Under certain circumstances, provided the study design and the statistical analyses are scientifically sound, alternative well-established designs could be considered such as parallel design for substances with very long half-life and replicate designs e.g. for substances with highly variable pharmacokinetic characteristics (see Section 3.1.10). The study should be designed in such a way that the formulation effect can be distinguished from other effects.

Other designs or methods may be chosen in specific situations, but should be fully justified in the protocol and final study report. The subjects should be allocated to treatment sequences in a randomized order. In general, single dose studies will suffice, but there are situations in which steady-state studies may be required:-

(a) If problems of sensitivity preclude sufficiently precise plasma concentration measurement after single dose;

(b) If the intra-individual variability in the plasma concentrations or disposition rate is inherently large;

(c) in the case of dose- or time-dependent pharmacokinetics;

(d) in the case of extended release products (in addition to single dose studies)

In such steady-state studies, the administration scheme should follow the usual dosage recommendations.

Conduct of a multiple dose study in patients is acceptable if a single dose study cannot be conducted in healthy volunteers due to tolerability reasons, and a single dose study is not feasible in patients.

In the rare situation where problems of sensitivity of the analytical method preclude sufficiently precise plasma concentration measurements after single dose administration and where the concentrations at steady state are sufficiently high to be reliably measured, a multiple dose study may be acceptable as an alternative to the single dose study. However, given that a multiple dose study is less sensitive in detecting differences in C_{max}, this will only be acceptable if the applicant can adequately justify that the sensitivity of the analytical method cannot be improved and that it is not possible to reliably measure the parent compound after single dose administration taking into account also the option of using a supra-therapeutic dose in the bioequivalence study (see also Section 3.1.6). Due to the recent development in the bioanalytical methodology, it is unusual that parent drug cannot be measured accurately and precisely. Hence, use of a multiple dose study instead of a single dose study, due to limited sensitivity of the analytical method, will only be accepted in exceptional cases.

In steady-state studies, the washout period of the previous treatment can overlap with the

148
build-up of the second treatment, provided the build-up period is sufficiently long (at least 5 times the terminal half-life).

3.1.2 Comparator and test products

Comparator Product

Test products in an application for a generic product or an extension of a generic product are normally compared with the corresponding dosage form of a comparator medicinal product, if available on the market. The product used as comparator product in the bioequivalence study should meet the criteria stipulated in Annex IV.

In an application for extension of a medicinal product which has been initially approved by TMDA and when there are several dosage forms of this medicinal product on the market, it is recommended that the dosage form used for the initial approval of the concerned medicinal product (and which was used in clinical efficacy and safety studies) is used as comparator

product, if available on the market.

The selection of the Comparator product used in a bioequivalence study should be based on assay content and dissolution data and is the responsibility of the Applicant. Unless otherwise justified, the assayed content of the batch used as test product should not differ more than 5% from that of the batch used as comparator product determined with the test procedure proposed for routine quality testing of the test product. The Applicant should document how a representative batch of the comparator product with regards to dissolution and assay content has been selected. It is advisable to investigate more than one single batch of the Comparator product when selecting Comparator product batch for the bioequivalence study. (to be removed and moved to guideline on comparator).

Test product

The test product used in the study should be representative of the product to be marketed and this should be discussed and justified by the applicant. For example, for oral solid forms for systemic action:-

a) The test product should usually originate from a batch of at least 1/10 of production scale or 100,000 units, whichever is greater, unless otherwise justified.

b) The production of batches used should provide a high level of assurance that the product and process will be feasible on an industrial scale.

In case of a production batch smaller than 100,000 units, a full production batch will be required.

c) The characterization and specification of critical quality attributes of the finished pharmaceutical product, such as dissolution, should be established from the test batch, i.e. the clinical batch for which bioequivalence has been demonstrated.

d) Samples of the product from additional pilot and/or full-scale production batches, submitted to support the application, should be compared with those of the bioequivalence study test batch, and should show similar in vitro dissolution profiles when employing suitable dissolution test conditions.

Comparative dissolution profile testing should be undertaken on the first three production batches.

If full scale production batches are not available at the time of submission, the applicant should not market a batch until comparative dissolution profile testing has been completed.

The results should be provided at a Competent Authority's request or if the dissolution profiles are not similar together with proposed action to be taken.

For other immediate release pharmaceutical forms for systemic action, justification of the representative nature of the test batch should be similarly established.

Impact of excipients

Identify any excipients present in either product that are known to impact on in vivo absorption processes. Provide a literature-based summary of the mechanism by which these effects are known to occur should be included and relevant full discussion enclosed, if applicable.

Comparative qualitative and quantitative differences between the compositions of the test and comparator products

Identify all qualitative (and quantitative, if available) differences between the compositions of the test and comparator products. The data obtained and methods used for the determination of the quantitative composition of the comparator product as required by the guidance documents should be summarized here for assessment.

Impact of the differences between the compositions of the test and comparator products

Provide a detailed comment on the impact of any differences between the compositions of the test and comparator products with respect to drug release and in vivo absorption

Packaging of study products

The comparator and test products should be packed in an individual way for each subject and period, either before their shipment to the trial site, or at the trial site itself. Packaging (including labelling) should be performed in accordance with good manufacturing practice.

150

It should be possible to identify unequivocally the identity of the product administered to each subject at each trial period. Packaging, labelling and administration of the products to the subjects should therefore be documented in detail. This documentation should include all precautions taken to avoid and identify potential dosing mistakes. The use of labels with a tear-off portion is recommended.

Subjects

Number of subjects

The number of subjects to be included in the study should be based on an appropriate sample size calculation. The number of evaluable subjects in a bioequivalence study should not be less than 12.

The number of subjects should be determined using appropriate methods taking into account the error variance associated with the primary parameters to be studied (as estimated for a pilot experiment, from previous studies or from published data), the significance level desired and

the deviation from the comparator product compatible with bioequivalence ($\pm 20\%$) and compatible with safety and efficacy. For a parallel design study a greater number of subjects may be required to achieve sufficient study power.

Applicants should enter a sufficient number of subjects in the study to allow for dropouts. Because replacement of subjects could complicate the statistical model and analysis, dropouts generally should not be replaced.

Selection of subjects

The subject population for bioequivalence studies should be selected with the aim of permitting detection of differences between pharmaceutical products. The subject population for bioequivalence studies should be selected with the aim to minimise variability and permit detection of differences between pharmaceutical products. In order to reduce variability not related to differences between products, the studies should normally be performed in healthy volunteers unless the drug carries safety concerns that make this unethical. This model, in vivo healthy volunteers, is regarded as adequate in most instances to detect formulation differences and to allow extrapolation of the results to populations for which the comparator medicinal product is approved (the elderly, children, patients with renal or liver impairment, etc.).

The inclusion/exclusion criteria should be clearly stated in the protocol. Subjects to be enrolled in a crossover bioequivalence study should be between 18-50 years in age, preferably have a Body Mass Index between 18.5 and 30 kg/m².

The subjects should be screened for suitability by means of clinical laboratory tests, a medical history, and a physical examination. Depending on the drug's therapeutic class and safety profile, special medical investigations and precautions may have to be carried out before, 151 during and after the completion of the study.

Subjects could belong to either sex; however, the risk to women of childbearing potential should be considered. Subjects should preferably be non-smokers and without a history of alcohol or drug abuse. Phenotyping and/or genotyping of subjects may be considered for safety or pharmacokinetic reasons.

In parallel design studies, the treatment groups should be comparable in all known variables that may affect the pharmacokinetics of the active substance (e.g. age, body weight, sex, ethnic origin, smoking status, extensive/poor metabolic status). This is an essential pre-requisite to give validity to the results from such studies.

Inclusion of patients

If the investigated active substance is known to have adverse effects and the pharmacological effects or risks are considered unacceptable for healthy volunteers, it may be necessary to include patients instead, under suitable precautions and supervision. In this case the applicant should justify the alternative.

3.1.4 Study conduct

Standardisation of the bioequivalence studies

The test conditions should be standardized in order to minimize the variability of all factors involved except that of the products being tested. Therefore, it is recommended to standardize diet, fluid intake and exercise.

The time of day for ingestion should be specified. Subjects should fast for at least 8 hours prior to administration of the products, unless otherwise justified. As fluid intake may influence gastric passage for oral administration forms, the test and comparator products should be administered with a standardized volume of fluid (at least 150 ml). It is recommended that water is allowed as desired except for one hour before and one hour after drug administration and no food is allowed for at least 4 hours post-dose. Meals taken after dosing should be standardized in regard to composition and time of administration during an adequate period of time (e.g. 12 hours).

In case the study is to be performed during fed conditions, the timing of administration of the finished pharmaceutical product in relation to food intake is recommended to be according to the SmPC of the originator product. If no specific recommendation is given in the originator SmPC, it is recommended that subjects should start the meal 30 minutes prior to administration of the finished pharmaceutical product and eat this meal within 30 minutes.

As the bioavailability of an active moiety from a dosage form could be dependent upon gastrointestinal transit times and regional blood flows, posture and physical activity may need to be standardized.

152

The subjects should abstain from food and drinks, which may interact with circulatory, gastrointestinal, hepatic or renal function (e.g. alcoholic drinks or certain fruit juices such as grapefruit juice) during a suitable period before and during the study. Subjects should not take any other concomitant medication (including herbal remedies) for an appropriate interval before as well as during the study. Contraceptives are, however, allowed. In case concomitant medication is unavoidable and a subject is administered other drugs, for instance to treat adverse events like headache, the use must be reported (dose and time of administration) and possible effects on the study outcome must be addressed. In rare cases, the use of a concomitant medication is needed for all subjects for safety or tolerability reasons (e.g. opioid antagonists, anti-emetics). In that scenario, the risk for a potential interaction or bioanalytical interference affecting the results must be addressed.

Medicinal products that according to the originator SmPC are to be used explicitly in combination with another product (e.g. certain protease inhibitors in combination with ritonavir) may be studied either as the approved combination or without the product recommended to be administered concomitantly.

In bioequivalence studies of endogenous substances, factors that may influence the endogenous

baseline levels should be controlled if possible (e.g. strict control of dietary intake).

Sampling times

Several samples of appropriate biological matrix (blood, plasma/serum, urine) are collected at various time intervals post-dose. The sampling schedule depends on the pharmacokinetic characteristics of the drug being tested. In most cases, plasma or serum is the matrix of choice. However, if the parent drug is not metabolized and is largely excreted unchanged and can be suitably assayed in the urine, urinary drug levels may be used to assess bioequivalence, if plasma/serum concentrations of the drug cannot be reliably measured.

A sufficient number of samples are collected during the absorption phase to adequately describe the plasma concentration-time profile should be collected. The sampling schedule should include frequent sampling around predicted T_{max} to provide a reliable estimate of peak exposure. Intensive sampling is carried out around the time of the expected peak concentration. In particular, the sampling schedule should be planned to avoid C_{max} being the first point of a concentration time curve. The sampling schedule should also cover the plasma concentration time curve long enough to provide a reliable estimate of the extent of exposure which is achieved if $AUC(0-t)$ covers at least 80% of $AUC(0-\infty)$. At least three to four samples are needed during the terminal log-linear phase in order to reliably estimate the terminal rate constant (which is needed for a reliable estimate of $AUC(0-\infty)$). AUC truncated at 72 h [$AUC(0-72h)$] may be used as an alternative to $AUC(0-t)$ for comparison of extent of exposure as the absorption phase has been covered by 72 h for immediate release formulations. A sampling period longer than 72 h is therefore not considered necessary for any immediate release formulation irrespective of the half-life of the drug. Sufficient numbers of samples should also be collected in the log-linear elimination phase of the drug so that the terminal elimination rate constant and half-life of the drug can be accurately determined. A sampling period extending to at least five terminal elimination half-lives of the drug or five the longest half-life of the pertinent analyte (if more than one analyte) is usually sufficient. The samples are appropriately processed and stored carefully under conditions that preserve the integrity of the analyte(s).

In multiple -dose studies, the pre-dose sample should be taken immediately before (within 5 minutes) dosing and the last sample is recommended to be taken within 10 minutes of the nominal time for the dosage interval to ensure an accurate determination of $AUC(0-\tau)$.

If urine is used as the biological sampling fluid, urine should normally be collected over no less than three times the terminal elimination half-life. However, in line with the recommendations on plasma sampling, urine does not need to be collected for more than 72 h. If rate of excretion is to be determined, the collection intervals need to be as short as feasible during the absorption phase (see also Section 3.1.5).

For endogenous substances, the sampling schedule should allow characterization of the endogenous baseline profile for each subject in each period. Often, a baseline is determined from 2-3 samples taken before the finished pharmaceutical products are administered. In other cases, sampling at regular intervals throughout 1-2 day(s) prior to administration may be necessary in order to account for fluctuations in the endogenous baseline due to circadian rhythms (see Section 3.1.5).

Washout period

Subsequent treatments should be separated by periods long enough to eliminate the previous dose before the next one (wash-out period). In steady-state studies wash-out of the last dose of the previous treatment can overlap with the build-up of the second treatment, provided the build-up period is sufficiently long (at least five(5) times the dominating half-life).

Fasting or fed conditions

In general, a bioequivalence study should be conducted under fasting conditions as this is considered to be the most sensitive condition to detect a potential difference between formulations. For products where the SmPC recommends intake of the innovator medicinal product on an empty stomach or irrespective of food intake, the bioequivalence study should hence be conducted under fasting conditions. For products where the SmPC recommends intake of the innovator medicinal product only in fed state, the bioequivalence study should generally be conducted under fed conditions.

However, for products with specific formulation characteristics (e.g. microemulsions, prolonged modified release, solid dispersions), bioequivalence studies performed under both fasted and fed conditions are required unless the product must be taken only in the fasted state or only in the fed state.

154

In cases where information is required in both the fed and fasted states, it is acceptable to conduct either two separate two-way cross-over studies or a four-way cross-over study.

In studies performed under fed conditions, the composition of the meal is recommended to be according to the SmPC of the originator product. If no specific recommendation is given in the originator SmPC, the meal should be a high-fat (approximately 50 percent of total caloric content of the meal) and high -calorie (approximately 800 to 1000 kcal) meal. This test meal should derive approximately 150, 250, and 500-600 kcal from protein, carbohydrate, and fat, respectively. The composition of the meal should be described with regard to protein, carbohydrate and fat content (specified in grams, calories and relative caloric content (%)).

Characteristics to be investigated

Pharmacokinetic parameters (Bioavailability Metrics)

In bioavailability studies, the shape and area under the plasma concentration versus time curves are mostly used to assess rate (C_{max} , t_{max}) and extent (AUC) of exposure. Sampling points or periods should be chosen such that the concentration versus time profile is sufficiently defined to allow calculation of relevant parameters.

For single-dose studies, the following parameters should be measured or calculated:

- a) Area under the plasma, serum or blood concentration–time curve from time zero to time t (AUC_{0-t}), where t is the last sampling time point with a measurable concentration of the API in the individual formulation tested. The method of calculating AUC values should be specified. Non-compartmental methods should be used for pharmacokinetic calculations in bioequivalence studies;
- b) C_{max} is the maximum or peak concentration observed representing peak exposure of API (or metabolite) in plasma, serum or whole blood.

Usually AUC_{0-t} and C_{max} are considered to be the most relevant parameters for assessment of bioequivalence. In addition it is recommended that the following parameters be estimated:

- c) area under the plasma, serum or blood concentration–time curve from time zero to time infinity ($AUC_{0-\infty}$) representing total exposure, where $AUC_{0-\infty} = AUC_{0-t} + C_{last} / K_e$; C_{last} is the last measurable analyte concentration and K_e is the terminal or elimination rate constant calculated according to an appropriate method;
- d) t_{max} is the time after administration of the FPP at which C_{max} is observed.

For additional information the elimination parameters can be calculated:

155

- $T_{1/2}$ is the plasma (serum, whole blood) half-life.

For multiple-dose studies conducted with modified-release products, the following parameters should be calculated:

- AUC_{τ} is AUC over one dosing interval (τ) at steady state;
- C_{max} ;
- C_{min} (C_{τ}) is concentration at the end of a dosing interval;
- peak trough fluctuation is percentage difference between C_{max} and C_{min} .

As release mechanisms of pharmaceutical products become more complex, e.g. products with an immediate-release and a modified-release component, additional parameters such as partial AUC measures may be necessary to ensure the bioequivalence of two products. When urine samples are used, cumulative urinary recovery (A_e) and maximum urinary excretion rate are employed instead of AUC and C_{max} .

Parent compound or metabolites

In principle, evaluation of bioequivalence should be based upon measured concentrations of the parent compound. The reason for this is that C_{max} of a parent compound is usually more sensitive to detect differences between formulations in absorption rate than C_{max} of a metabolite.

Inactive pro-drugs

Also for inactive pro-drugs, demonstration of bioequivalence for parent compound is recommended. The active metabolite does not need to be measured. However, some pro-drugs may have low plasma concentrations and be quickly eliminated resulting in difficulties in demonstrating bioequivalence for parent compound. In this situation it is acceptable to demonstrate bioequivalence for the main active metabolite without measurement of parent compound. In the context of this guideline, a parent compound can be considered to be an inactive pro-drug if it has no or very low contribution to clinical efficacy.

Use of metabolite data as surrogate for active parent compound

The use of a metabolite as a surrogate for an active parent compound is not encouraged. This can only be considered if the applicant can adequately justify that the sensitivity of the analytical method for measurement of the parent compound cannot be improved and that it is not possible to reliably measure the parent compound after single dose administration taking into account also the option of using a higher single dose in the bioequivalence study. Due to recent developments in bioanalytical methodology it is unusual that parent drug cannot be measured accurately and precisely. Hence, the use of a metabolite as a surrogate for active parent compound is expected to be accepted only in exceptional cases. When using metabolite data as a substitute for active parent drug concentrations, the applicant should present any available data supporting the view that the metabolite exposure will reflect parent drug and that the metabolite formation is not saturated at therapeutic doses.

156

Enantiomers

The use of achiral bioanalytical methods is generally acceptable. However, the individual enantiomers should be measured when all the following conditions are met:-

- a) the enantiomers exhibit different pharmacokinetics;
- b) the enantiomers exhibit pronounced difference in pharmacodynamics;
- c) the exposure (AUC) ratio of enantiomers is modified by a difference in the rate of absorption.

The individual enantiomers should also be measured if the above conditions are fulfilled or are unknown. If one enantiomer is pharmacologically active and the other is inactive or has a low contribution to activity, it is sufficient to demonstrate bioequivalence for the active enantiomer.

The use of urinary data

If drug/API concentrations in blood are too low to be detected and a substantial amount (> 40 %) of the drug/API is eliminated unchanged in the urine, then urine may serve as the biological fluid to be sampled.

If a reliable plasma C_{max} can be determined, this should be combined with urinary data on the extent of exposure for assessing bioequivalence. When using urinary data, the applicant should present any available data supporting that urinary excretion will reflect plasma exposure.

When urine is collected:-

- a) The volume of each sample should be measured immediately after collection and included in the report.
- b) Urine should be collected over an extended period and generally no less than seven times the terminal elimination half-life, so that the amount excreted to infinity (Ae_∞) can be estimated.
- c) Sufficient samples should be obtained to permit an estimate of the rate and extent of renal excretion. For a 24-hour study, sampling times of 0 to 2, 2 to 4, 4 to 8, 8 to 12, and 12 to 24 hours post-dose are usually appropriate.
- d) The actual clock time when samples are collected, as well as the elapsed time relative to API administration, should be recorded.

Urinary Excretion Profiles:-

157

In the case of API's predominantly excreted renally, the use of urine excretion data may be advantageous in determining the extent of drug/API input. However, justification should also be given when this data is used to estimate the rate of absorption.

Sampling points should be chosen so that the cumulative urinary excretion profiles can be defined adequately so as to allow accurate estimation of relevant parameters.

The following bioavailability parameters are to be estimated:-

- a) A_{et}, Ae_∞ as appropriate for urinary excretion studies.
- b) Any other justifiable characteristics.
- c) The method of estimating AUC-values should be specified.

Endogenous substances

If the substance being studied is endogenous, the calculation of pharmacokinetic parameters should be performed using baseline correction so that the calculated pharmacokinetic parameters refer to the additional concentrations provided by the treatment. Administration of supra-therapeutic doses can be considered in bioequivalence studies of endogenous drugs, provided that the dose is well tolerated, so that the additional concentrations over baseline provided by the treatment may be reliably determined. If a separation in exposure following administration of different doses of a particular endogenous substance has not been previously established this should be demonstrated, either in a pilot study or as part of the pivotal bioequivalence study using different doses of the comparator formulation, in order to ensure that the dose used for the bioequivalence comparison is sensitive to detect potential differences between formulations.

The exact method for baseline correction should be pre-specified and justified in the study protocol. In general, the standard subtractive baseline correction method, meaning either subtraction of the mean of individual endogenous pre-dose concentrations or subtraction of the individual endogenous pre-dose AUC, is preferred. In rare cases where substantial increases over baseline endogenous levels are seen, baseline correction may not be needed.

In bioequivalence studies with endogenous substances, it cannot be directly assessed whether carry-over has occurred, so extra care should be taken to ensure that the washout period is of an adequate duration.

3.1.6 Strength to be investigated

If several strengths of a test product are applied for, it may be sufficient to establish bioequivalence at only one or two strengths, depending on the proportionality in composition between the different strengths and other product related issues described below. The strength(s) to evaluate depends on the linearity in pharmacokinetics of the active substance.

158

In case of non-linear pharmacokinetics (i.e. not proportional increase in AUC with increased dose) there may be a difference between different strengths in the sensitivity to detect potential differences between formulations. In the context of this guideline, pharmacokinetics is considered to be linear if the difference in dose-adjusted mean AUCs is no more than 25% when comparing the studied strength (or strength in the planned bioequivalence study) and the strength(s) for which a waiver is considered. In order to assess linearity, the applicant should consider all data available in the public domain with regard to the dose proportionality and review the data critically. Assessment of linearity will consider whether differences in dose-adjusted AUC meet a criterion of $\pm 25\%$.

If bioequivalence has been demonstrated at the strength(s) that are most sensitive to detect a potential difference between products, in vivo bioequivalence studies for the other strength(s) can be waived.

General bioequivalence criteria

The following general requirements must be met where a waiver for additional strength(s) is claimed:-

- a) the pharmaceutical products are manufactured by the same manufacturing process,
- b) the qualitative composition of the different strengths is the same,
- c) the composition of the strengths are quantitatively proportional, i.e. the ratio between the amount of each excipient to the amount of active substance(s) is the same for all strengths

(for immediate release products coating components, capsule shell, colour agents and flavours are not required to follow this rule),

If there is some deviation from quantitatively proportional composition, condition c is still considered fulfilled if condition i) and ii) or i) and iii) below apply to the strength used in the bioequivalence study and the strength(s) for which a waiver is considered:-

i. the amount of the active substance(s) is less than 5 % of the tablet core weight, the weight of the capsule content.

ii. the amounts of the different core excipients or capsule content are the same for the concerned strengths and only the amount of active substance is changed.

iii. the amount of a filler is changed to account for the change in amount of active substance. The amounts of other core excipients or capsule content should be the same for the concerned strengths.

d) An appropriate in vitro dissolution data should confirm the adequacy of waiving additional in vivo bioequivalence testing (see Section 3.2).

159

Linear pharmacokinetics

For products where all the above conditions a) to d) are fulfilled, it is sufficient to establish bioequivalence with only one strength.

The bioequivalence study should in general be conducted at the highest strength. For products with linear pharmacokinetics and where the active pharmaceutical ingredient is highly soluble based on BCS Biowaiver, selection of a lower strength than the highest is also acceptable. Selection of a lower strength may also be justified if the highest strength cannot be administered to healthy volunteers for safety/tolerability reasons. Further, if problems of sensitivity of the analytical method preclude sufficiently precise plasma concentration measurements after single dose administration of the highest strength, a higher dose may be selected (preferably using multiple tablets of the highest strength). The selected dose may be higher than the highest therapeutic dose provided that this single dose is well tolerated in healthy volunteers and that there are no absorption or solubility limitations at this dose.

Non-linear pharmacokinetics

For drugs with non-linear pharmacokinetics characterized by a more than proportional increase in AUC with increasing dose over the therapeutic dose range, the bioequivalence study should in general be conducted at the highest strength. As for drugs with linear pharmacokinetics a lower strength may be justified if the highest strength cannot be administered to healthy volunteers for safety/tolerability reasons. Likewise a higher dose may be used in case of sensitivity problems of the analytical method in line with the recommendations given for products with linear pharmacokinetics above.

For drugs with a less than proportional increase in AUC with increasing dose over the therapeutic dose range, bioequivalence should in most cases be established both at the highest strength and at the lowest strength (or strength in the linear range), i.e. in this situation two bioequivalence studies are needed. If the non-linearity is not caused by limited solubility but is due to e.g. saturation of uptake transporters and provided that conditions a) to d) above are fulfilled and the test and comparator products do not contain any excipients that may affect gastrointestinal motility or transport proteins, it is sufficient to demonstrate bioequivalence at the lowest strength (or a strength in the linear range).

Selection of other strengths may be justified if there are analytical sensitivity problems preventing a study at the lowest strength or if the highest strength cannot be administered to healthy volunteers for safety/tolerability reasons.

Bracketing approach

Where bioequivalence assessment at more than two strengths is needed, e.g. because of deviation from proportional composition, a bracketing approach may be used. In this situation it can be acceptable to conduct two bioequivalence studies, if the strengths selected represent the extremes, e.g. the highest and the lowest strength or the two strengths differing most in

160 composition, so that any differences in composition in the remaining strengths is covered by the two conducted studies.

Where bioequivalence assessment is needed both in fasting and in fed state and at two strengths due to nonlinear absorption or deviation from proportional composition, it may be sufficient to assess bioequivalence in both fasting and fed state at only one of the strengths. Waiver of either the fasting or the fed study at the other strength(s) may be justified based on previous knowledge and/or pharmacokinetic data from the study conducted at the strength tested in both fasted and fed state. The condition selected (fasting or fed) to test the other strength(s) should be the one which is most sensitive to detect a difference between products.

Fixed combinations

The conditions regarding proportional composition should be fulfilled for all active substances of fixed combinations. When considering the amount of each active substance in a fixed combination the other active substance(s) can be considered as excipients. In the case of bilayer tablets, each layer may be considered independently.

3.1.7 Bioanalytical methodology

The bioanalysis of bioequivalence samples should be performed in accordance with the principles of Good Laboratory Practice (GLP). However, as human bioanalytical studies fall outside the scope of GLP, the sites conducting the studies are not required to be monitored as part of a national GLP compliance programme.

The bioanalytical methods used to determine the active principle and/or its biotransformation

products in plasma, serum, blood or urine or any other suitable matrix must be well characterized, fully validated and documented to yield reliable results that can be satisfactorily interpreted. Within study validation should be performed using Quality control samples in each analytical run.

The main objective of method validation is to demonstrate the reliability of a particular method for the quantitative determination of analyte(s) concentration in a specific biological matrix. The main characteristics of a bioanalytical method that is essential to ensure the acceptability of the performance and the reliability of analytical results includes but not limited to: selectivity, sensitivity, lower limit of quantitation, the response function (calibration curve performance), accuracy, precision and stability of the analyte(s) in the biological matrix under processing conditions and during the entire period of storage.

The lower limit of quantitation should be 1/20 of C_{max} or lower, as pre-dose concentrations should be detectable at 5% of C_{max} or lower (see Section 3.1.8 Carry-over effects).

Reanalysis of study samples should be predefined in the study protocol (and/or SOP) before the actual start of the analysis of the samples. Normally reanalysis of subject samples because of a pharmacokinetic reason is not acceptable. This is especially important for bioequivalence studies, as this may bias the outcome of such a study.

Analysis of samples should be conducted without information on treatment.

The validation report of the bioanalytical method should be included in Module 5 of the application.

3.1.8 Evaluation

In bioequivalence studies, the pharmacokinetic parameters should in general not be adjusted for differences in assayed content of the test and comparator batch. However, in exceptional cases where a comparator batch with an assay content differing less than 5% from test product cannot be found (see Section 3.1.2 on Comparator and test product) content correction could be accepted. If content correction is to be used, this should be pre-specified in the protocol and justified by inclusion of the results from the assay of the test and comparator products in the protocol.

Subject accountability

Ideally, all treated subjects should be included in the statistical analysis. However, subjects in a crossover trial who do not provide evaluable data for both of the test and comparator products (or who fail to provide evaluable data for the single period in a parallel group trial) should not be included.

The data from all treated subjects should be treated equally. It is not acceptable to have a protocol which specifies that 'spare' subjects will be included in the analysis only if needed as replacements for other subjects who have been excluded. It should be planned that all treated subjects should be included in the analysis, even if there are no drop-outs.

In studies with more than two treatment arms (e.g. a three period study including two comparators, one from EU and another from USA, or a four period study including test and comparator in fed and fasted states), the analysis for each comparison should be conducted excluding the data from the treatments that are not relevant for the comparison in question.

Reasons for exclusion

Unbiased assessment of results from randomized studies requires that all subjects are observed and treated according to the same rules. These rules should be independent from treatment or outcome. In consequence, the decision to exclude a subject from the statistical analysis must be made before bioanalysis.

In principle any reason for exclusion is valid provided it is specified in the protocol and the decision to exclude is made before bioanalysis. However the exclusion of data should be avoided, as the power of the study will be reduced and a minimum of 12 evaluable subjects is required.

Examples of reasons to exclude the results from a subject in a particular period are events such as vomiting and diarrhoea which could render the plasma concentration-time profile unreliable. In exceptional cases, the use of concomitant medication could be a reason for excluding a subject.

The permitted reasons for exclusion must be pre-specified in the protocol. If one of these events occurs it should be noted in the CRF as the study is being conducted. Exclusion of subjects based on these pre-specified criteria should be clearly described and listed in the study report.

Exclusion of data cannot be accepted on the basis of statistical analysis or for pharmacokinetic reasons alone, because it is impossible to distinguish the formulation effects from other effects influencing the pharmacokinetics.

The exceptions to this are:-

1) A subject with lack of any measurable concentrations or only very low plasma concentrations for comparator medicinal product. A subject is considered to have very low plasma concentrations if its AUC is less than 5% of comparator medicinal product geometric mean AUC (which should be calculated without inclusion of data from the outlying subject). The exclusion of data due to this reason will only be accepted in exceptional cases and may question the validity of the trial.

2) Subjects with non-zero baseline concentrations > 5% of C_{max}. Such data should be excluded from bioequivalence calculation (see carry-over effects below).

The above can, for immediate release formulations, be the result of subject non-compliance and an insufficient wash-out period, respectively, and should as far as possible be avoided by

mouth check of subjects after intake of study medication to ensure the subjects have swallowed the study medication and by designing the study with a sufficient wash-out period. The samples from subjects excluded from the statistical analysis should still be assayed and the results listed (see Presentation of data below).

As stated in Section 3.1.4, AUC(0-t) should cover at least 80% of AUC(0-∞). Subjects should not be excluded from the statistical analysis if AUC(0-t) covers less than 80% of AUC(0-∞), but if the percentage is less than 80% in more than 20% of the observations then the validity of the study may need to be discussed. This does not apply if the sampling period is 72 h or more and AUC(0-72h) is used instead of AUC(0-t).

Parameters to be analysed and acceptance limits

In studies to determine bioequivalence after a single dose, the parameters to be analysed are AUC(0-t), or, when relevant, AUC(0-72h), and C_{max}. For these parameters the 90% confidence interval for the ratio of the test and comparator products should be contained within the acceptance interval of 80.00-125.00%. To be inside the acceptance interval the lower bound should be ≥ 80.00% when rounded to two decimal places and the upper bound should be ≤ 125.00% when rounded to two decimal places.

For studies to determine bioequivalence of immediate release formulations at steady state, AUC(0-t) and C_{max,ss} should be analysed using the same acceptance interval as stated above.

In the rare case where urinary data has been used, A_e(0-t) should be analysed using the same acceptance interval as stated above for AUC(0-t). R_{max} should be analysed using the same acceptance interval as for C_{max}.

A statistical evaluation of t_{max} is not required. However, if rapid release is claimed to be clinically relevant and of importance for onset of action or is related to adverse events, there should be no apparent difference in median T_{max} and its variability between test and comparator product.

In specific cases of products with a narrow therapeutic range, the acceptance interval may need to be tightened (see Section 3.1.9). Moreover, for highly variable finished pharmaceutical products the acceptance interval for C_{max} may in certain cases be widened (see Section 3.1.10).

Statistical analysis

The assessment of bioequivalence is based upon 90% confidence intervals for the ratio of the population geometric means (test/comparator) for the parameters under consideration. This method is equivalent to two one-sided tests with the null hypothesis of bioequivalence at the 5% significance level.

The pharmacokinetic parameters under consideration should be analysed using ANOVA. The data should be transformed prior to analysis using a logarithmic transformation. A confidence interval for the difference between formulations on the log-transformed scale is obtained from the ANOVA model. This confidence interval is then back-transformed to obtain the desired confidence interval for the ratio on the original scale. A non-parametric analysis is not acceptable.

The precise model to be used for the analysis should be pre-specified in the protocol. The statistical analysis should take into account sources of variation that can be reasonably assumed to have an effect on the response variable. The terms to be used in the ANOVA model are usually sequence, subject within sequence, period and formulation. Fixed effects, rather than random effects, should be used for all terms.

Carry-over effects

A test for carry-over is not considered relevant and no decisions regarding the analysis (e.g. analysis of the first period only) should be made on the basis of such a test. The potential for carry-over can be directly addressed by examination of the pre-treatment plasma concentrations in period 2 (and beyond if applicable).

If there are any subjects for whom the pre-dose concentration is greater than 5 percent of the C_{max} value for the subject in that period, the statistical analysis should be performed with the data from that subject for that period excluded. In a 2-period trial this will result in the subject being removed from the analysis. The trial will no longer be considered acceptable if these exclusions result in fewer than 12 subjects being evaluable. This approach does not apply to endogenous drugs.

Two-stage design

It is acceptable to use a two-stage approach when attempting to demonstrate bioequivalence. An initial group of subjects can be treated and their data analysed. If bioequivalence has not been demonstrated an additional group can be recruited and the results from both groups combined in a final analysis. If this approach is adopted appropriate steps must be taken to preserve the overall type I error of the experiment and the stopping criteria should be clearly defined prior to the study.

The analysis of the first stage data should be treated as an interim analysis and both analyses conducted at adjusted significance levels (with the confidence intervals accordingly using an adjusted coverage probability which will be higher than 90%). For example, using 94.12% confidence intervals for both the analysis of stage 1 and the combined data from stage 1 and stage 2 would be acceptable, but there are many acceptable alternatives and the choice of how much alpha to spend at the interim analysis is at the company's discretion. The plan to use a two-stage approach must be pre-specified in the protocol along with the adjusted significance levels to be used for each of the analyses.

When analyzing the combined data from the two stages, a term for stage should be included in the ANOVA model.

Presentation of data

All individual concentration data and pharmacokinetic parameters should be listed by formulation together with summary statistics such as geometric mean, median, arithmetic mean, standard deviation, coefficient of variation, minimum and maximum. Individual plasma concentration/time curves should be presented in linear/linear and log/linear scale. The method used to derive the pharmacokinetic parameters from the raw data should be specified. The number of points of the terminal log-linear phase used to estimate the terminal rate constant (which is needed for a reliable estimate of AUC_∞) should be specified.

For the pharmacokinetic parameters that were subject to statistical analysis, the point estimate and 90% confidence interval for the ratio of the test and comparator products should be presented.

The ANOVA tables, including the appropriate statistical tests of all effects in the model, should be submitted.

The report should be sufficiently detailed to enable the pharmacokinetics and the statistical analysis to be repeated, e.g. data on actual time of blood sampling after dose, drug concentrations, the values of the pharmacokinetic parameters for each subject in each period and the randomization scheme should be provided.

Drop-out and withdrawal of subjects should be fully documented. If available, concentration data and pharmacokinetic parameters from such subjects should be presented in the individual listings, but should not be included in the summary statistics.

The bioanalytical method should be documented in a pre-study validation report. A bioanalytical report should be provided as well. The bioanalytical report should include a brief description of the bioanalytical method used and the results for all calibration standards and quality control samples. A representative number of chromatograms or other raw data should be provided covering the whole concentration range for all standard and quality control samples as well as the specimens analysed. This should include all chromatograms from at least 20% of the subjects with QC samples and calibration standards of the runs including these subjects.

If for a particular formulation at a particular strength multiple studies have been performed some of which demonstrate bioequivalence and some of which do not, the body of evidence must be considered as a whole. Only relevant studies, as defined in Section 3.0, need be considered. The existence of a study which demonstrates bioequivalence does not mean that those which do not can be ignored. The applicant should thoroughly discuss the results and justify the claim that bioequivalence has been demonstrated. Alternatively, when relevant, a combined analysis of all studies can be provided in addition to the individual study analyses. It is not acceptable to pool together studies which fail to demonstrate bioequivalence in the absence of a study that does.

Narrow therapeutic index drugs

In specific cases of products with a narrow therapeutic index, the acceptance interval for AUC should be tightened to 90.00-111.11%. Where C_{max} is of particular importance for safety, efficacy or drug level monitoring the 90.00-111.11% acceptance interval should also be applied for this parameter. For a list of narrow therapeutic index drugs (NTIDs), refer to the table below:-

Aprindine Carbamazepine
Clindamycin Clonazepam
Clonidine Cyclosporine
Digitoxin Digoxin
Disopyramide Ethinyl Estradiol
Ethosuximide Guanethidine
Isoprenaline Lithium Carbonate

166
Methotrexate Phenobarbital
Phenytoin Prazosin
Primidone Procainamide
Quinidine Sulfonylurea compounds
Tacrolimus Theophylline compounds
Valproic Acid Warfarin
Zonisamide Glybuzole

Highly variable drugs or finished pharmaceutical products

Highly variable finished pharmaceutical products (HVDP) are those whose intra-subject variability for a parameter is larger than 30%. If an applicant suspects that a finished pharmaceutical product can be considered as highly variable in its rate and/or extent of absorption, a replicate cross-over design study can be carried out.

Those HVDP for which a wider difference in C_{max} is considered clinically irrelevant based on a sound clinical justification can be assessed with a widened acceptance range. If this is the case the acceptance criteria for C_{max} can be widened to a maximum of 69.84 – 143.19%. For the acceptance interval to be widened the bioequivalence study must be of a replicate design where it has been demonstrated that the within-subject variability for C_{max} of the comparator compound in the study is >30%. The applicant should justify that the calculated intra-subject variability is a reliable estimate and that it is not the result of outliers. The request for widened interval must be prospectively specified in the protocol.

The extent of the widening is defined based upon the within-subject variability seen in the bioequivalence study using scaled-average-bioequivalence according to $[U, L] = \exp [\pm k \cdot \text{SWR}]$, where U is the upper limit of the acceptance range, L is the lower limit of the acceptance range, k is the regulatory constant set to 0.760 and SWR is the within-subject standard deviation of the log-transformed values of C_{max} of the comparator product. The table below gives examples of

how different levels of variability lead to different acceptance limits using this methodology.

Within-subject CV (%)* Lower Limit Upper Limit

30 80 125
35 77.23 129.48
40 74.62 134.02
45 72.15 138.59
≥50 69.84 143.19

167

The geometric mean ratio (GMR) should lie within the conventional acceptance range 80.00-125.00%.

The possibility to widen the acceptance criteria based on high intra-subject variability does not apply to AUC where the acceptance range should remain at 80.00 – 125.00% regardless of variability.

It is acceptable to apply either a 3-period or a 4-period crossover scheme in the replicate design study.

3.2 In vitro dissolution tests

General aspects of in vitro dissolution experiments are briefly outlined in (annexe I) including basic requirements how to use the similarity factor (f_2 -test).

3.2.1 In vitro dissolution tests complementary to bioequivalence studies

The results of in vitro dissolution tests at three different buffers (normally pH 1.2, 4.5 and 6.8) and the media intended for finished pharmaceutical product release (QC media), obtained with the batches of test and comparator products that were used in the bioequivalence study should be reported. Particular dosage forms like ODT (oral dispersible tablets) may require investigations using different experimental conditions. The results should be reported as profiles of percent of labelled amount dissolved versus time displaying mean values and summary statistics.

Unless otherwise justified, the specifications for the in vitro dissolution to be used for quality control of the product should be derived from the dissolution profile of the test product batch that was found to be bioequivalent to the comparator product (see Annex I).

In the event that the results of comparative in vitro dissolution of the biobatches do not reflect bioequivalence as demonstrated in vivo the latter prevails. However, possible reasons for the discrepancy should be addressed and justified.

3.2.2 In vitro dissolution tests in support of biowaiver of strengths

Appropriate in vitro dissolution should confirm the adequacy of waiving additional in vivo bioequivalence testing. Accordingly, dissolution should be investigated at different pH values as outlined in the previous sections (normally pH 1.2, 4.5 and 6.8) unless otherwise justified. Similarity of in vitro dissolution (see Annex I) should be demonstrated at all conditions within the applied product series, i.e. between additional strengths and the strength(s) (i.e. batch(es)) used for bioequivalence testing.

At pH values where sink conditions may not be achievable for all strengths in vitro dissolution may differ between different strengths. However, the comparison with the respective strength of the comparator medicinal product should then confirm that this finding is active

168

pharmaceutical ingredient rather than formulation related. In addition, the applicant could show similar profiles at the same dose (e.g. as a possibility two tablets of 5 mg versus one tablet of 10 mg could be compared).

3.3 Study report

3.3.1 Bioequivalence study report

The report of a bioavailability or bioequivalence study should follow the template format as provided in the Comprehensive Bioequivalence Information Summary (CBIS), Annex V) in order to submit the complete documentation of its conduct and evaluation complying with GCP-rules.

The report of the bioequivalence study should give the complete documentation of its protocol, conduct and evaluation. It should be written in accordance with the ICH E3 guideline and be signed by the investigator.

Names and affiliations of the responsible investigator(s), the site of the study and the period of its execution should be stated. Audits certificate(s), if available, should be included in the report.

The study report should include evidence that the choice of the comparator medicinal product is in accordance with the list of comparator products. This should include the comparator product name, strength, pharmaceutical form, batch number, manufacturer, expiry date and country of purchase.

The name and composition of the test product(s) used in the study should be provided. The batch size, batch number, manufacturing date and, if possible, the expiry date of the test product should be stated.

Certificates of analysis of comparator and test batches used in the study should be included in an Annex to the study report.

Concentrations and pharmacokinetic data and statistical analyses should be presented in the level of detail described above (Section 3.1.8 Presentation of data).

3.3.2 Other data to be included in an application

The applicant should submit a signed statement confirming that the test product has the same quantitative composition and is manufactured by the same process as the one submitted for authorization. A confirmation whether the test product is already scaled-up for production should be submitted. Comparative dissolution profiles (see Section 3.2) should be provided.

The validation report of the bioanalytical method should be included in Module 5 of the application.

169

Data sufficiently detailed to enable the pharmacokinetics and the statistical analysis to be repeated, e.g. data on actual times of blood sampling, drug concentrations, the values of the pharmacokinetic parameters for each subject in each period and the randomization scheme, should be available in a suitable electronic format (e.g. as comma separated and space delimited text files or Excel format) to be provided upon request.

3.4 Variation applications

If a product has been reformulated from the formulation initially approved or the manufacturing method has been modified in ways that may impact on the bioavailability, an in vivo bioequivalence study is required, unless otherwise justified. Any justification presented should be based upon general considerations, e.g. as per Annex III.

In cases where the bioavailability of the product undergoing change has been investigated and an acceptable level A correlation between in vivo performance and in vitro dissolution has been established, the requirements for in vivo demonstration of bioequivalence can be waived if the dissolution profile in vitro of the new product is similar to that of the already approved medicinal product under the same test conditions as used to establish the correlation (see Annex I).

For variations of products approved on full documentation on quality, safety and efficacy, the comparative medicinal product for use in bioequivalence and dissolution studies is usually that authorized under the currently registered formulation, manufacturing process, packaging etc.

When variations to a generic product are made, the comparative medicinal product for the bioequivalence study should normally be a current batch of the reference medicinal product. If a valid reference medicinal product is not available on the market, comparison to the previous formulation (of the generic product) could be accepted, if justified. For variations that do not require a bioequivalence study, the advice and requirements stated in other published regulatory guidance should be followed.

4 OTHER APPROACHES TO ASSESS THERAPEUTIC EQUIVALENCE

4.1 Comparative pharmacodynamics studies

Studies in healthy volunteers or patients using pharmacodynamics measurements may be used for establishing equivalence between two pharmaceuticals products. These studies may become necessary if quantitative analysis of the drug and/or metabolite(s) in plasma or urine cannot be made with sufficient accuracy and sensitivity. Furthermore, pharmacodynamics studies in humans are required if measurements of drug concentrations cannot be used as surrogate end points for the demonstration of efficacy and safety of the particular pharmaceutical product e.g., for topical products without intended absorption of the drug into the systemic circulation.

4.2 Comparative clinical studies

170

If a clinical study is considered as being undertaken to prove equivalence, the same statistical principles apply as for the bioequivalence studies. The number of patients to be included in the study will depend on the variability of the target parameters and the acceptance range, and is usually much higher than the number of subjects in bioequivalence studies.

4.3 Special considerations for modified – release finished pharmaceutical products

For the purpose of these guidelines modified release products include:-

- i. Delayed release
- ii. Sustained release
- iii. Mixed immediate and sustained release
- iv. Mixed delayed and sustained release
- v. Mixed immediate and delayed release

Generally, these products should:-

- i. Acts as modified –release formulations and meet the label claim.
- ii. Preclude the possibility of any dose dumping effects.
- iii. There must be a significant difference between the performance of modified release product and the conventional release product when used as reference product.
- iv. Provide a therapeutic performance comparable to the reference immediate – release formulation administered by the same route in multiple doses (of an equivalent daily amount) or to the reference modified – release formulation.
- v. Produce consistent Pharmacokinetic performance between individual dosage units and
- vi. Produce plasma levels which lie within the therapeutic range (where appropriate) for the proposed dosing intervals at steady state.

If all of the above conditions are not met but the applicant considers the formulation to be acceptable, justification to this effect should be provided.

i. Study Parameters

Bioavailability data should be obtained for all modified release finished pharmaceutical products although the type of studies required and the Pharmacokinetics parameters which should be evaluated may differ depending on the active ingredient involved. Factors to be considered include whether or not the formulation represents the first market entry of the active

pharmaceutical ingredients, and the extent of accumulation of the drug after repeated dosing.

If formulation is the first market entry of the APIs, the products pharmacokinetic parameters should be determined. If the formulation is a second or subsequent market entry then the comparative bioavailability studies using an appropriate reference product should be performed.

ii. Study design

171

Study design will be single dose or single and multiple dose based on the modified release products that are likely to accumulate or unlikely to accumulate both in fasted and non-fasting state. If the effects of food on the reference product is not known (or it is known that food affects its absorption), two separate two-way cross-over studies, one in the fasted state and the other in the fed state, may be carried out.

iii. Requirement for modified release formulations unlikely to accumulate

This section outlines the requirements for modified release formulations which are used at a dose interval that is not likely to lead to accumulation in the body ($AUC_{0-v}/AUC_{0-\infty} \geq 0.8$)

When the modified release product is the first marketed entry type of dosage form, the reference product should normally be the innovator immediate-release formulation. The comparison should be between a single dose of the modified release formulation and doses of the immediate-release formulation which it is intended to replace. The latter must be administered according to the established dosing regimen.

When the release product is the second or subsequent entry on the market, comparison should be with the reference modified release product for which bioequivalence is claimed.

Studies should be performed with single dose administration in the fasting state as well as following an appropriate meal at a specified time.

The following pharmacokinetic parameters should be calculated from plasma (or relevant biological matrix) concentration of the drug and/or major metabolites(s) AUC_0-t , AUC_0-t , $AUC_0-\infty$, C_{max} (where the comparison is with an existing modified release product) and K_{el} .

The 90% confidence interval calculated using log transformed data for the ratios (Test vs Reference) of the geometric mean AUC (for both AUC_0-t and AUC_0-t) and C_{max} (Where the comparison is with an existing modified release product) should generally be within the range 80 to 125% both in the fasting state and following the administration of an appropriate meal at a specified time before taking the drug.

The Pharmacokinetic parameters should support the claimed dose delivery attributes of the modified release – dosage form.

iv. Requirement for modified release formulations likely to accumulate

This section outlines the requirement for modified release formulations that are used at dose intervals that are likely to lead to accumulation ($AUC/AUC \leq 0.8$).

When a modified release product is the first market entry of the modified release type, the reference formulation is normally the innovator's immediate-release formulation. Both a single dose and steady state doses of the modified release formulation should be compared with doses

172
of the immediate-release formulation which it is intended to replace. The immediate-release product should be administered according to the conventional dosing regimen.

Studies should be performed with single dose administration in the fasting state as well as following an appropriate meal. In addition, studies are required at steady state. The following pharmacokinetic parameters should be calculated from single dose studies; AUC_0-t , AUC_0-t , $AUC_0-\infty$, C_{max} (where the comparison is with an existing modified release product) and K_{el} . The following parameters should be calculated from steady state studies; AUC_0-t , C_{max} , C_{min} , C_{pd} , and degree of fluctuation.

When the modified release product is the second or subsequent modified release entry, single dose and steady state comparisons should normally be made with the reference modified release product for which bioequivalence is claimed.

90% confidence interval for the ratio of geometric means (Test/Reference drug) for AUC, C_{max} and C_{min} determined using log-transformed data should generally be within the range 80 to 125% when the formulation are compared at steady state.

90% confidence interval for the ratio of geometric means (Test/Reference drug) for AUC_0-t , C_{max} , and C_{min} determined using log-transferred data should generally be within the range 80 to 125% when the formulation are compared at steady state.

The Pharmacokinetic parameters should support the claimed attributes of the modified-release dosage form.

The Pharmacokinetic data may reinforce or clarify interpretation of difference in the plasma concentration data.

Where these studies do not show bioequivalence, comparative efficacy and safety data may be required for the new product.

Pharmacodynamic studies;

Studies in healthy volunteers or patients using pharmacodynamics parameters may be used for establishing equivalence between two pharmaceutical products. These studies may become necessary if quantitative analysis of the drug and/or metabolites (s) in plasma or urine cannot be made with sufficient accuracy and sensitivity. Furthermore, pharmacodynamic studies in humans are required if measurement of drug concentrations cannot be used as surrogate endpoints for the demonstration of efficacy and safety of the particular pharmaceutical product

e.g. for topical products without an intended absorption of the drug into the systemic circulation.

In case, only pharmacodynamic data is collected and provided, the applicant should outline what other methods were tried and why they were found unsuitable.

The following requirements should be recognized when planning, conducting and assessing the results from a pharmacodynamic study;

173

i. The response measured should be a pharmacological or therapeutically effects which is relevant to the claims of efficacy and /or safety of the drug.

ii. The methodology adopted for carrying out the study the study should be validated for precision, accuracy, reproducibility and specificity.

iii. Neither the test nor reference product should produce a maximal response in the course of the study, since it may be impossible to distinguish difference between formulations given in doses that produce such maximal responses. Investigation of dose – response relationship may become necessary.

iv. The response should be measured quantitatively under double – blind conditions and be recorded in an instrument – produced or instrument recorded fashion on a repetitive basis to provide a record of pharmacodynamic events which are suitable for plasma concentrations. If such measurement is not possible recording on visual – analog scales may be used. In instances where data are limited to quantitative (categorized) measurement, appropriate special statistical analysis will be required.

v. Non – responders should be excluded from the study by prior screening. The criteria by which responder –are versus non –responders are identified must be stated in the protocol.

vi. Where an important placebo effect occur comparison between products can only be made by a priori consideration of the placebo effect in the study design. This may be achieved by adding a third period/phase with placebo treatment, in the design of the study.

vii. A crossover or parallel study design should be used, appropriate.

viii. When pharmacodynamic studies are to be carried out on patients, the underlying pathology and natural history of the condition should be considered in the design.

ix. There should be knowledge of the reproducibility of the base – line conditions.

x. Statistical considerations for the assessments of the outcomes are in principle, the same as in Pharmacokinetic studies.

xi. A correction for the potential non – linearity of the relationship between dose and area under the effect – time curve should be made on the basis of the outcome of the dose ranging study.

The conventional acceptance range as applicable to Pharmacokinetic studies and bioequivalence is not appropriate (too large) in most cases. This range should therefore be defined in the protocol on a case – to – case basis.

174

Comparative clinical studies

The plasma concentration time – profile data may not be suitable to assess equivalence between two formulations. Whereas in some of the cases pharmacodynamic studies can be an appropriate to for establishing equivalence , in other instances this type of study cannot be performed because of lack of meaningful pharmacodynamic parameters which can be measured and comparative clinical study has be performed in order to demonstrate equivalence between two formulations. Comparative clinical studies may also be required to be carried out for certain orally administered finished pharmaceutical products when pharmacokinetic and pharmacodynamic studies are no feasible. However, in such cases the applicant should outline what other methods were why they were found unsuitable.

If a clinical study is considered as being undertaken to prove equivalence, the appropriate statistical principles should be applied to demonstrate bioequivalence. The number of patients to be included in the study will depend on the variability of the target parameter and the acceptance range, and is usually much higher than the number of subjects in bioequivalence studies.

The following items are important and need to be defined in the protocol advance:-

a. The target parameters which usually represent relevant clinical end –points from which the intensity and the onset, if applicable and relevant, of the response are to be derived.

b. The size of the acceptance range has to be defined case taking into consideration the specific clinical conditions. These include, among others, the natural course of the disease, the efficacy of available treatment and the chosen target parameter. In contrast to bioequivalence studies (where a conventional acceptance range is applied) the size of the acceptance in clinical trials cannot be based on a general consensus on all the therapeutic clinical classes and indications.

c. The presently used statistical method is the confidence interval approach. The main concern is to rule out t Hence, a one – sided confidence interval (For efficacy and/or safety) may be appropriate. The confidence intervals can be derived from either parametric or nonparametric methods.

d. Where appropriate, a placebo leg should be included in the design.

e. In some cases, it is relevant to include safety end-points in the final comparative assessments.

General aspects of dissolution testing as related to bioavailability

During the development of a medicinal product a dissolution test is used as a tool to identify formulation factors that are influencing and may have a crucial effect on the bioavailability of the drug. As soon as the composition and the manufacturing process are defined a dissolution test is used in the quality control of scale-up and of production batches to ensure both batch-to-batch consistency and that the dissolution profiles remain similar to those of pivotal clinical trial batches. Furthermore, in certain instances a dissolution test can be used to waive a bioequivalence study. Therefore, dissolution studies can serve several purposes:-

(a) Testing on product quality:-

- To get information on the test batches used in bioavailability/bioequivalence studies and pivotal clinical studies to support specifications for quality control.
- To be used as a tool in quality control to demonstrate consistency in manufacture.
- To get information on the comparator product used in bioavailability/bioequivalence studies and pivotal clinical studies.

(b) Bioequivalence surrogate inference

- To demonstrate in certain cases similarity between different formulations of an active substance and the reference medicinal product (biowaivers e.g., variations, formulation changes during development and generic medicinal products; see Section 3.2 and Annex III)
- To investigate batch to batch consistency of the products (test and comparator) to be used as basis for the selection of appropriate batches for the in vivo study.

Test methods should be developed product related based on general and/or specific pharmacopoeial requirements. In case those requirements are shown to be unsatisfactory and/or do not reflect the in vivo dissolution (i.e. biorelevance) alternative methods can be considered when justified that these are discriminatory and able to differentiate between batches with acceptable and non-acceptable performance of the product in vivo. Current state-of-the-art information including the interplay of characteristics derived from the BCS classification and the dosage form must always be considered.

Sampling time points should be sufficient to obtain meaningful dissolution profiles, and at least every 15 minutes. More frequent sampling during the period of greatest change in the dissolution profile is recommended. For rapidly dissolving products, where complete dissolution is within 30 minutes, generation of an adequate profile by sampling at 5- or 10-minute intervals may be necessary.

If an active substance is considered highly soluble, it is reasonable to expect that it will not cause any bioavailability problems if, in addition, the dosage system is rapidly dissolved in the physiological pH-range and the excipients are known not to affect bioavailability. In contrast, if

an active substance is considered to have a limited or low solubility, the rate limiting step for absorption may be dosage form dissolution. This is also the case when excipients are controlling the release and subsequent dissolution of the active substance. In those cases a variety of test conditions is recommended and adequate sampling should be performed.

Similarity of dissolution profiles

Dissolution profile similarity testing and any conclusions drawn from the results (e.g. justification for a biowaiver) can be considered valid only if the dissolution profile has been satisfactorily characterised using a sufficient number of time points.

For immediate release formulations, further to the guidance above, comparison at 15 min is essential to know if complete dissolution is reached before gastric emptying.

Where more than 85% of the drug is dissolved within 15 minutes, dissolution profiles may be accepted as similar without further mathematical evaluation.

In case more than 85% is not dissolved at 15 minutes but within 30 minutes, at least three time points are required: the first time point before 15 minutes, the second one at 15 minutes and the third time point when the release is close to 85%.

For modified release products, the advice given in the relevant guidance should be followed.

Dissolution similarity may be determined using the f_2 statistic as follows:

In this equation f_2 is the similarity factor, n is the number of time points, $R(t)$ is the mean percent reference drug dissolved at time t after initiation of the study; $T(t)$ is the mean percent test drug dissolved at time t after initiation of the study. For both the reference and test formulations, percent dissolution should be determined.

The evaluation of the similarity factor is based on the following conditions:

- A minimum of three time points (zero excluded)
- The time points should be the same for the two formulations
- Twelve individual values for every time point for each formulation
- Not more than one mean value of > 85% dissolved for any of the formulations.
- The relative standard deviation or coefficient of variation of any product should be less than 20% for the first point and less than 10% from second to last time point.

An f_2 value between 50 and 100 suggests that the two dissolution profiles are similar.

When the f_2 statistic is not suitable, then the similarity may be compared using model-dependent or model-independent methods e.g. by statistical multivariate comparison of the parameters of the Weibull function or the percentage dissolved at different time points.

Alternative methods to the f_2 statistic to demonstrate dissolution similarity are considered acceptable, if statistically valid and satisfactorily justified.

The similarity acceptance limits should be pre-defined and justified and not be greater than a 10% difference. In addition, the dissolution variability of the test and reference product data should also be similar; however, a lower variability of the test product may be acceptable.

Evidence that the statistical software has been validated should also be provided.

A clear description and explanation of the steps taken in the application of the procedure should be provided, with appropriate summary tables.

178

Annex II: Bioequivalence study requirements for different dosage forms

Although this guideline concerns immediate release formulations, Annex II provides some general guidance on the bioequivalence data requirements for other types of formulations and for specific types of immediate release formulations.

When the test product contains a different salt, ester, ether, isomer, mixture of isomers, complex or derivative of an active substance than the comparator medicinal product, bioequivalence should be demonstrated in in vivo bioequivalence studies. However, when the active substance in both test and comparator products is identical (or contain salts with similar properties as defined in Annex III, Section III), in vivo bioequivalence studies may in some situations not be required as described below and in Annex III.

Oral immediate release dosage forms with systemic action

For dosage forms such as tablets, capsules and oral suspensions, bioequivalence studies are required unless a biowaiver is applicable (see Annex III). For oral dispersible tablets and oral solutions specific recommendations apply, as detailed below.

Oral dispersible tablets

An oral dispersible tablet (ODT) is formulated to quickly disperse in the mouth. Placement in the mouth and time of contact may be critical in cases where the active substance also is dissolved in the mouth and can be absorbed directly via the buccal mucosa. Depending on the formulation, swallowing of the e.g. coated substance and subsequent absorption from the gastrointestinal tract also will occur. If it can be demonstrated that the active substance is not absorbed in the oral cavity, but rather must be swallowed and absorbed through the gastrointestinal tract, then the product might be considered for a BCS based biowaiver (see Annex III). If this cannot be demonstrated, bioequivalence must be evaluated in human studies.

If the ODT test product is an extension to another oral formulation, a 3-period study is recommended in order to evaluate administration of the orodispersible tablet both with and without concomitant fluid intake. However, if bioequivalence between ODT taken without water and comparator formulation with water is demonstrated in a 2-period study, bioequivalence of ODT taken with water can be assumed.

If the ODT is a generic to an approved ODT comparator medicinal product, the following recommendations regarding study design apply:-

■ if the comparator medicinal product can be taken with or without water, bioequivalence should be demonstrated without water as this condition best resembles the intended use of the formulation. This is especially important if the substance may be dissolved and partly absorbed in the oral cavity. If bioequivalence is demonstrated when taken without water, bioequivalence when taken with water can be assumed.

179

■ if the comparator medicinal product is taken only in one way (e.g. only with water), bioequivalence should be shown in this condition (in a conventional two-way crossover design).

■ if the comparator medicinal product is taken only in one way (e.g. only with water), and the test product is intended for additional ways of administration (e.g. without water), the conventional and the new method should be compared with the comparator in the conventional way of administration (3 treatment, 3 period, 6 sequence design).

In studies evaluating ODTs without water, it is recommended to wet the mouth by swallowing 20 ml of water directly before applying the ODT on the tongue. It is recommended not to allow fluid intake earlier than 1 hour after administration.

Other oral formulations such as orodispersible films, buccal tablets or films, sublingual tablets and chewable tablets may be handled in a similar way as for ODTs. Bioequivalence studies should be conducted according to the recommended use of the product.

180

Annex III: BCS-based Biowaiver

I. Introduction

The BCS (Biopharmaceutics Classification System)-based biowaiver approach is meant to reduce in vivo bioequivalence studies, i.e., it may represent a surrogate for in vivo bioequivalence. In vivo bioequivalence studies may be exempted if an assumption of equivalence in in vivo performance can be justified by satisfactory in vitro data.

Applying for a BCS-based biowaiver is restricted to highly soluble active pharmaceutical ingredients with known human absorption and considered not to have a narrow therapeutic index (see Section 3.1.9). The concept is applicable to immediate release, solid pharmaceutical products for oral administration and systemic action having the same pharmaceutical form. However, it is not applicable for sublingual, buccal, and modified release formulations. For oral dispersible formulations the BCS-based biowaiver approach may only be applicable when absorption in the oral cavity can be excluded.

BCS-based biowaivers are intended to address the question of bioequivalence between specific test and reference/comparator products. The principles may be used to establish bioequivalence in applications for generic medicinal products, extensions of innovator products, variations that require bioequivalence testing, and between early clinical trial products and to-be-marketed products.

In situations where multiples strength formulations have been submitted for BCS based biowaiver, comparative dissolution should be provided for all the strength.

II. Summary Requirements

BCS-based biowaiver are applicable for an immediate release finished pharmaceutical product if:-

- the active pharmaceutical ingredient has been proven to exhibit high solubility and complete absorption (BCS class I; for details see Section III) and

- either very rapid (> 85 % within 15 min) or similarly rapid (85 % within 30 min) in vitro dissolution characteristics of the test and reference product has been demonstrated considering specific requirements (see Section IV.1) and

- excipients that might affect bioavailability are qualitatively and quantitatively the same. In general, the use of the same excipients in similar amounts is preferred (see Section IV.2).

BCS-based biowaiver are also applicable for an immediate release finished pharmaceutical product if:-

181

- the active pharmaceutical ingredient has been proven to exhibit high solubility and limited absorption (BCS class III; for details see Section III) and

- very rapid (> 85 % within 15 min) in vitro dissolution of the test and reference product has been demonstrated considering specific requirements (see Section IV.1) and

- excipients that might affect bioavailability are qualitatively and quantitatively the same and

- other excipients are qualitatively the same and quantitatively very similar (see Section IV.2).

Generally the risks of an inappropriate biowaiver decision should be more critically reviewed (e.g. site-specific absorption, risk for transport protein interactions at the absorption site, excipient composition and therapeutic risks) for products containing BCS class III than for BCS class I active pharmaceutical ingredient.

III. Active Pharmaceutical Ingredient

Generally, sound peer-reviewed literature may be acceptable for known compounds to describe the active pharmaceutical ingredient characteristics of importance for the biowaiver concept.

Biowaiver may be applicable when the active substance(s) in test and reference products are identical.

Biowaiver may also be applicable if test and reference contain different salts provided that both belong to BCS-class I (high solubility and complete absorption; see Sections III.1 and III.2). Biowaiver is not applicable when the test product contains a different ester, ether, isomer, mixture of isomers, complex or derivative of an active substance from that of the comparator product, since these differences may lead to different bioavailabilities not deducible by means of experiments used in the BCS-based biowaiver concept.

The active pharmaceutical ingredient should not belong to the group of 'narrow therapeutic index' drugs (see Section 4.1.9 on narrow therapeutic index drugs).

III.1 Solubility

The pH-solubility profile of the active pharmaceutical ingredient should be determined and discussed. An API is considered highly soluble when the highest single therapeutic dose as determined by the relevant regulatory authority, typically defined by the labeling for the innovator product, is completely dissolved in 250 ml of buffers within the range of pH 1 – 6.8 at 37±1 °C. This demonstration requires the investigation in at least three buffers within this range (preferably at pH 1.2, 4.5 and 6.8) and in addition at the pKa, if it is within the specified pH range. Replicate determinations at each pH condition may be necessary to achieve an unequivocal solubility classification (e.g. shake-flask method or other justified method). Solution pH should be verified prior and after addition of the active pharmaceutical ingredient to a buffer.

182

III.2 Absorption

The demonstration of complete absorption in humans is preferred for BCS-based biowaiver applications. For this purpose complete absorption is considered to be established where measured extent of absorption is ≥ 85 %. Complete absorption is generally related to high permeability.

Complete drug absorption should be justified based on reliable investigations in human. Data from either:-

- absolute bioavailability or

- mass-balance

studies could be used to support this claim.

When data from mass balance studies are used to support complete absorption, it must be ensured that the metabolites taken into account in determination of fraction absorbed are formed after absorption. Hence, when referring to total radioactivity excreted in urine, it should be ensured that there is no degradation or metabolism of the unchanged active pharmaceutical ingredient in the gastric or intestinal fluid. Phase 1 oxidative and Phase 2 conjugative

metabolism can only occur after absorption (i.e. cannot occur in the gastric or intestinal fluid). Hence, data from mass balance studies support complete absorption if the sum of urinary recovery of parent compound and urinary and faecal recovery of Phase 1 oxidative and Phase 2 conjugative drug metabolites account for $\geq 85\%$ of the dose.

In addition highly soluble active pharmaceutical ingredients with incomplete absorption, i.e. BCS-class III compounds, could be eligible for a biowaiver provided certain prerequisites are fulfilled regarding product composition and in vitro dissolution (see also Section IV.2 Excipients). The more restrictive requirements will also apply for compounds proposed to be BCS class I but where complete absorption could not convincingly be demonstrated.

Reported bioequivalence between aqueous and solid formulations of a particular compound administered via the oral route may be supportive as it indicates that absorption limitations due to (immediate release) formulation characteristics may be considered negligible. Well performed in vitro permeability investigations including reference standards may also be considered supportive to in vivo data.

IV. Finished pharmaceutical product

IV.1 In vitro Dissolution

IV.1.1 General Aspects

Investigations related to the medicinal product should ensure immediate release properties and prove similarity between the investigative products, i.e. test and reference show similar in vitro

dissolution under physiologically relevant experimental pH conditions. However, this does not establish an in vitro/in vivo correlation. In vitro dissolution should be investigated within the range of pH 1 – 6.8 (at least pH 1.2, 4.5, and 6.8). Additional investigations may be required at pH values in which the drug substance has minimum solubility. The use of any surfactant is not acceptable.

Test and reference products should meet requirements as outlined in Section 3.1.2 of the main guideline text. In line with these requirements it is advisable to investigate more than one single batch of the test and reference products.

Comparative in vitro dissolution experiments should follow current compendial standards.

Hence, thorough description of experimental settings and analytical methods including validation data should be provided. It is recommended to use 12 units of the product for each experiment to enable statistical evaluation. Usual experimental conditions are e.g.:-

- Apparatus: paddle or basket
- Volume of dissolution medium: 900 ml or less
- Temperature of the dissolution medium: 37 ± 1 °C
- Agitation:
 - paddle apparatus - usually 50 rpm
 - basket apparatus - usually 100 rpm
- Sampling schedule: e.g. 10, 15, 20, 30 and 45 min
- Buffer: pH 1.0 – 1.2 (usually 0.1 N HCl or SGF without enzymes), pH 4.5, and pH 6.8 (or SIF without enzymes); (pH should be ensured throughout the experiment; Ph.Eur. buffers recommended)
- Other conditions: no surfactant; in case of gelatin capsules or tablets with gelatin coatings the use of enzymes may be acceptable.

Complete documentation of in vitro dissolution experiments is required including a study protocol, batch information on test and reference batches, detailed experimental conditions, validation of experimental methods, individual and mean results and respective summary statistics.

IV.1.2 Evaluation of in vitro dissolution results

Finished pharmaceutical products are considered 'very rapidly' dissolving when more than 85 % of the labelled amount is dissolved within 15 min. In cases where this is ensured for the test and reference product the similarity of dissolution profiles may be accepted as demonstrated without any mathematical calculation.

Absence of relevant differences (similarity) should be demonstrated in cases where it takes more than 15 min but not more than 30 min to achieve almost complete (at least 85 % of labelled amount) dissolution. F2-testing (see Annex I) or other suitable tests should be used to demonstrate profile similarity of test and reference. However, discussion of dissolution profile differences in terms of their clinical/therapeutic relevance is considered inappropriate since the investigations do not reflect any in vitro/in vivo correlation.

184

IV.2 Excipients

Although the impact of excipients in immediate release dosage forms on bioavailability of highly soluble and completely absorbable active pharmaceutical ingredients (i.e., BCS-class I) is considered rather unlikely it cannot be completely excluded. Therefore, even in the case of class I drugs it is advisable to use similar amounts of the same excipients in the composition of test like in the comparator product.

If a biowaiver is applied for a BCS-class III active pharmaceutical ingredient excipients have to be qualitatively the same and quantitatively very similar in order to exclude different effects on membrane transporters.

As a general rule, for both BCS-class I and III active pharmaceutical ingredients well-established excipients in usual amounts should be employed and possible interactions affecting drug bioavailability and/or solubility characteristics should be considered and discussed. A description of the function of the excipients is required with a justification whether the amount of each excipient is within the normal range. Excipients that might affect bioavailability, like e.g. sorbitol, mannitol, sodium lauryl sulfate or other surfactants, should be identified as well as their possible impact on:-

- gastrointestinal motility
- susceptibility of interactions with the active pharmaceutical ingredient (e.g. complexation)
- drug permeability
- interaction with membrane transporters

Excipients that might affect bioavailability should be qualitatively and quantitatively the same in the test product and the comparator product.

V. Fixed Combinations (FCs)

BCS-based biowaiver are applicable for immediate release FC products if all active substances in the FC belong to BCS-class I or III and the excipients fulfil the requirements outlined in Section IV.2. Otherwise in vivo bioequivalence testing is required.

185

Biowaiver Application Form: Biopharmaceutics Classification System (BCS)

This application form is designed to facilitate information exchange between the Applicant and the Tanzania Medicines and Medical Devices Authority (TMDA) if the Applicant seeks to waive bioequivalence studies based on the Biopharmaceutics Classification System (BCS). For further information, please study the respective biowaiver guidance documents. This form is not to be used if a biowaiver is requested for additional strength(s) of a submitted product(s), in which case a separate "Biowaiver Application Form: Additional Strengths" should be used.

General Instructions:

Please review all the instructions thoroughly and carefully prior to completing the current Application Form.

- Provide as much detailed, accurate, and final information as possible.
- Please enter the data and information directly following the greyed areas.
- Please enclose the required documentation in full and state in the relevant sections of the Application Form the exact location (Annex number) of the appended documents. For example, in section 2.5 indicate in which Annex the Certificate of Analysis can be found.
- Please provide the document as an MS Word file.
- Do not paste snap-shots into the document.
- The appended electronic documents should be clearly identified in their file names, which should include the product name and Annex number.
- Before submitting the completed Application Form, kindly check that you have provided all requested information and enclosed all requested documents.
- Should you have any questions regarding this procedure, please contact Tanzania Medicines and Medical Devices Authority (TMDA).

The signed paper version of this Biowaiver Application Form together with Annexes (and their electronic copies on CD-ROM) should be included to the bioequivalence part of the submitted dossier and sent by surface mail to the following address:

Director General,
Tanzania Food and Drugs Authority,
Off Mandela Road, Mabibo-External
P.O. Box 77150
Dar es Salaam
Tanzania

187

1. Justification for a BCS Biowaiver

1.1.Active Pharmaceutical Ingredient (API)

Please confirm that the proposed product contains the same active substance (e.g. salt, ester, ether, isomer) as the comparator.

<< Please enter information here >>

1.2. Therapeutic Index of the API

Please enclose a copy of the comparator product labelling and literature references employed to support that the drug does not exhibit a narrow therapeutic index for all authorised indications

<< Please enter information here >>

1.3. Pharmacokinetic properties of the API

Please enclose a copy of the literature references employed to document the PK properties (PK linearity or reasons for non-linearity).

<< Please enter information here >>

1.4.Dosage form

Please confirm that:

- the dosage form is an immediate release product for systemic action
- the posology is limited to oral administration
- the administration without water is not included in the proposed posology

<< Please enter information here >>

2. Solubility

(Completion of this section is not necessary if the API(s) are included on the list of biowaiver-eligible APIs in the PQTM document General notes on Biopharmaceutics Classification System (BCS)-based biowaiver applications.)

2.1. Maximum therapeutic dose of the API

Please enclose a copy of the labelling of the comparator product to document the maximum single dose that can be administered in a single administration (e.g. two tablets together).

<< Please enter information here >>

188

2.2.Stability of the drug in the physiological pH range

Please discuss stability of the API in the pH range from 1.2 to 6.8 and in the gastrointestinal tract.

Please discuss the ability of the analytical method to distinguish the API from its degradation products.

<< Please enter information here >>

2.3.Method of solubility determination

Please describe method and conditions (e.g. shake flask method at 37±1°C)

Please indicate also location of the solubility study protocol.

<< Please enter information here >>

2.4.Solubility study dates

Please indicate dates of study protocol, study conductance and study report

<< Please enter information here >>

2.5. Analytical method validation

Please summarise the results and indicate location in the documentation.

<< Please enter information here >>

2.6. Results

Please indicate location of the solubility study report.

Please fill in the following table for the necessary pH values. Add as many rows as necessary to create a solubility – pH profile

Theoretical Observed pH Adjusted pH Individual Cs (mean and Amount
pH concentration CV(%)) that can be
at saturation dissolved in

Annex IV: Selection of a comparator product to be used in establishing interchangeability

I Introduction

This annex is intended to provide applicants with guidance with respect to selecting an appropriate comparator product to be used to prove therapeutic equivalence (i.e. interchangeability) of their product to an existing medicinal product(s) in the context of applying for marketing authorization.

II Comparator product

A product with which a generic product is intended to be interchangeable in clinical practice.

III Guidance on selection of a comparator product

General principles for the selection of comparator products are described in the Guidelines on Therapeutic Equivalence Requirements.

The innovator pharmaceutical product, which was first authorized for marketing, is the most logical comparator product to establish interchangeability, because its quality, safety and efficacy has been fully assessed and documented in pre-marketing studies and post-marketing monitoring schemes.

A generic pharmaceutical product should not be used as a comparator as long as an innovator pharmaceutical product is available, because this could lead to progressively less reliable similarity of future multisource products and potentially to a lack of interchangeability with the innovator.

Comparator products should be purchased from a well regulated market with stringent regulatory authority, i.e. from countries participating in the International Conference on Harmonization (ICH)¹

The applicant has the following options which are listed in order of preference:-

1. To choose an innovator product;
2. To choose a product which is approved and has been on the market in any of the SRA countries. The definition of an SRA is rephrased as follows. A regulatory authority that is:
a) a member of ICH prior to 23 October 2015, namely: the US Food and Drug Administration, the European Commission and the Ministry of Health, Labour and Welfare of Japan also represented by the Pharmaceuticals and Medical Devices Agency;
or b) an ICH observer prior to 23 October 2015, namely: the European Free Trade Association, as represented by Swissmedic and Health Canada; or c) a regulatory authority

191

associated with an ICH member through a legally-binding, mutual recognition agreement prior to 23 October 2015, namely: Australia, Iceland, Liechtenstein and Norway

3. To choose the WHO recommended comparator product (as presented in the list of international comparator pharmaceutical products);

In case no recommended comparator product is identified; or in case the recommended comparator product cannot be located in a well regulated market with stringent regulatory authority as noted above, the applicant should consult TMDA regarding the choice of comparator before starting any studies.

IV Origin of the comparator product

Comparator products should be purchased from a well regulated market with stringent regulatory authority, i.e. from countries participating in the International Conference on Harmonization (ICH)¹. Within the submitted dossier, the country of origin of the comparator product should be reported together with lot number and expiry date, as well as results of pharmaceutical analysis to prove pharmaceutical equivalence.

Further in order to prove the origin of the comparator product the applicant must present all of the following documents:-

1. Copy of the comparator product labelling. The name of the product, name and address of the manufacturer, batch number, and expiry date should be clearly visible on the labelling.
2. Copy of the invoice from the distributor or company from which the comparator product was purchased. The address of the distributor must be clearly visible on the invoice.
3. Documentation verifying the method of shipment and storage conditions of the comparator product from the time of purchase to the time of study initiation.
4. A signed statement certifying the authenticity of the above documents and that the comparator product was purchased from the specified national market. The certification should be signed by the company executive responsible for the application for registration of pharmaceutical product.

In case the invited product has a different dose compared to the available acceptable

comparator product, it is not always necessary to carry out a bioequivalence study at the same dose level; if the active substance shows linear pharmacokinetics, extrapolation may be applied by dose normalization.

The bioequivalence of fixed-dose combination (FDC) should be established following the same general principles. The submitted FDC product should be compared with the respective innovator FDC product. In cases when no innovator FDC product is available on the market, individual component products administered in loose combination should be used as a comparator.

11 Countries officially participating in ICH are the ICH members European Union, Japan and USA; and the ICH observers Canada and Switzerland.

193
ANNEX V: Bioequivalence Trial Information (BTIF)

GENERAL INSTRUCTIONS:

Please review all the instructions thoroughly and carefully prior to completing the Bioequivalence Trial Information Form (BTIF).

Provide as much detailed, accurate and final information as possible.

Please state the exact location (Annex number) of appended documents in the relevant sections of the BTIF. For example, in section 3.4.3.1 under point b), indicate in which Annex (number) the Certificate of Analysis can be found. This procedure must be followed throughout the entire document where location of annexed documents is requested.

Before submitting the completed BTIF, kindly check that you have provided all requested information and enclosed all requested documents.
Should you have any questions regarding this Form, please contact Tanzania Medicines and Medical Devices Authority (TMDA)

A properly filled out and signed original copy of the BTIF with all its annexes (including a copy on CD-ROM) must be submitted to TMDA together with the bioequivalence part of the dossier to the address below

Director General,
Tanzania Medicines and Medical Devices Authority,
Off Mandela Road, Mabibo-External,
P.O. Box 77150,
Dar es Salaam

(please delete the wrong entries)

195
Name and complete address of the supplier *..
(Applicant of the dossier)
Name and address of the Contract Research *..
Organisation(s) where the clinical studies
proving efficacy and safety of the product
were conducted.
(Add as much rows as necessary)

This product assessment report should be written in clear unambiguous language referring to deficiencies or lack of data submitted, as communication with the manufacturer may result from the assessment.

The report should be completed by at least two evaluators from different countries excluding whenever possible evaluators from the country of manufacturer/applicant responsible for assessing product quality including pharmaceutical and analytical aspects.

The assessment report should be typed with "Bookman Old Style 12" fonts.

The format of tables must not be changed.

196

BIOEQUIVALENCE TRIAL INFORMATION

1 SUMMARY

1.1 Summary of bioequivalence studies performed

(Provide a brief description of each comparative bioavailability study included in the submission)

1.2 Tabulation of the composition of the formulation(s) proposed for marketing and those used for bioequivalence studies

(State the location of the master formulae in the quality part of the submission)

(Tabulate the composition of the biobatch using the table below. For solid oral dosage forms the table should contain only the ingredients in tablet core /contents of a capsule. A copy of the table should be filled in for the film coating / hard capsule, if any.

Important: If the formulation proposed for marketing and those used for bioequivalence studies are not identical, copies of this table should be filled in for each formulation with clear identification in which

bioequivalence study the respective formulation was used.)

197

Composition of the batches used for bioequivalence studies

Batch number

Batch size (number of unit doses)¹

Comments, if any

Comparison of unit dose compositions and of clinical FPP batches

(duplicate this table for each strength, if compositions are different)

Ingredients (and quality Function Unit Unit Biobatch Biobatch

standard) dose dose (%) (kg) (%)

(mg)

Total

Equivalence of the compositions or justified differences

Maximum intended commercial batch size

¹ Bioequivalence batches should be at least of pilot scale (10% of production scale or 100,000 capsules/tablets whichever is the greater) and manufacturing method should be the same as for production scale.

198

2 CLINICAL STUDY REPORT

a) Study number:

b) Study title:

c) Location of study protocol:

d) Start and stop dates for each phase of the clinical study:

e) Dates of product administration:

2.1 ETHICS

a) State the name of review committee, date of approval of protocol and consent form and the location of approval letter in the submission

b) State location of a reference copy of the informed consent form

2.2 INVESTIGATORS AND STUDY ADMINISTRATIVE STRUCTURE

a) Name of principal investigator(s) (State location of c.v. in the submission)

b) Clinical Facility (Name and full mailing address)

c) Clinical Laboratories (Name and full mailing address)

d) Analytical Laboratories (Name and full mailing address)

e) Company performing pharmacokinetic/statistical analysis (Name and full mailing address)

2.3 STUDY OBJECTIVES

Briefly state the study objectives.

2.4 INVESTIGATIONAL PLAN

2.4.1 Overall study design and plan — description

(Describe the type of study design employed in 1-2 sentences)

2.4.2 Selection of study population

199

2.4.2.1 Inclusion Criteria

(List the inclusion criteria applied to subjects)

2.4.2.2 Exclusion Criteria

(List the exclusion criteria applied to subjects)

2.4.2.3 Health Verification

(State location of the individual data included in the submission)

a) List criteria used and all tests performed in order to judge health status

b) Indicate when tests were performed

c) Study site normal values

(State location in submission of study site normal values for blood clinical chemistry, haematology, and urinalysis clinical screen)

d) Report any results that were outside of study site normal values

(State location in submission of the summary of anomalous values)

2.4.2.4 Removal of Trial subjects from Trial or Assessment

a) Number of subjects enrolled in the study

(All subjects including alternates, withdrawals, and dropouts)

b) Alternates

(Please note: Generally all subjects enrolled in the study should be included in the data set i.e., alternate

subjects are strongly discouraged. However, in cases where there are alternate subjects, describe the procedure of including/excluding the alternates and whether alternates have been included in the study)

c) Withdrawals/dropouts

(Identify each withdrawal/dropout by subject and provide the reason for withdrawal/dropout and at what point in the study the withdrawal/dropout occurred)

2.4.3 Products Administered

200

2.4.3.1 Test Product

a) Batch number, size, date of manufacture and expiry date for the test product

b) Potency (measured content) of test product as a percentage of label claim as per validated assay method

(This information should be cross-referenced to the location of the certificate of analysis in the submission)

2.4.3.2 Comparator (Reference) Product

(Append to this template a copy of product labelling (snap shot of the box, on which the name of the product, name and address of the manufacturer, batch number, and expiry date are clearly visible on the labelling)

a) Name and manufacturer of the comparator product and market where the comparator product was purchased

b) Batch number and expiry date for the comparator product

c) Purchase, shipment, storage of the comparator product

(Indicate from which company/pharmaceutical distributor the comparator product has been obtained.

Clearly indicate in chronological order the steps and dates of shipment/transport from company of purchase to the study site. In addition, the storage conditions should be given. This information should be

cross-referenced to location in submission of documents (e.g. receipts) proving conditions)

d) Potency (measured content) of the comparator product as a percentage of label claim, as measured by the same laboratory and under the same conditions as the test product

(This information should be cross-referenced to the location of the certificate of analysis in the submission)

e) Justification of choice of comparator product

(Provide short summary here and cross-reference to location of comprehensive justification in study protocol)

2.4.4 Selection of doses in the study

a) State dose administered

(Indicate the number of dosage units comprising a single dose, e.g., 400 mg as 1 x 400 mg or 2 x 200 mg tablets)

2.4.5 Selection and Timing of Dose for Each Subject

201

a) State volume and type of fluid consumed with dose

b) Interval between doses (i.e., length of washout)

c) Protocol for the administration of food and fluid

d) Restrictions on posture and physical activity during the study

2.4.6 Blinding

2.4.6.1 Identify which of the following were blinded. If any of the groups were not blinded, provide a justification for not doing so

a) study monitors: Yes ☐ / No ☐ If No, justify:

b) subjects: Yes ☐ / No ☐ If No, justify:

c) analysts: Yes ☐ / No ☐ If No, justify:

2.4.6.2 Identify who held the study code and when the code was broken

2.4.7 Drug Concentration Measurements

2.4.7.1 Biological fluid(s) sampled

2.4.7.2 Sampling protocol

a) Number of samples collected per subject

b) Volume of fluid collected per sample

c) Total volume of fluid collected per subject per phase of the study

d) List the study sampling times

e) Identify any deviations from the sampling protocol

(State location of summary in the submission)

(Describe and explain reasons for deviations from sampling protocol. Comment on impact on study.

Indicate whether the deviations were accounted for in the pharmacokinetic analysis)

202

2.4.7.3 Sample Handling

a) Describe the method of sample collection

b) Describe sample handling and storage procedures

203

3 TRIAL SUBJECTS

3.1 Demographic and other baseline characteristics

a) Identify study population (i.e., normal, healthy adult volunteers or patients)

b) Summary of ethnic origin and gender of subjects

c) Identify subjects noted to have special characteristics and state notable characteristics

(e.g. fast acetylators of debrisoquine)

d) Range and mean age ■ SD of subjects

e) Range and mean height and weight ■ SD of subjects

f) Identify subjects whose ratio is not within 15% of the values given on a standard height/weight table

3.2 Subjects who smoke

a) Number of smokers included in the study

b) Indicate how many cigarettes smoked per day per subject

c) Comment on the impact on study

204

4 PROTOCOL DEVIATIONS

4.1 Protocol deviations during the clinical study

(Describe any such deviations and discuss their implications with respect to bioequivalence)

205

5 SAFETY EVALUATION

5.1 Identify adverse events observed

(List any adverse events by subject number. State whether a reaction occurred following administration of the test or reference product, identify any causal relationships, and note any treatments required.

State

location of this summary in the submission.)

(Discuss the implications of the observed adverse events with respect to bioequivalence.)

206

6 EFFICACY EVALUATION

Efficacy results and tabulations of individual trial subjects data

6.1 Presentation of data

a) State location in submission of tables of mean and individual subject concentrations

b) State location in submission of (mean and individual) linear and semi-logarithmic subject drug concentration vs. time plots

6.2 Pharmacokinetic (PK) parameters

a) State how the pharmacokinetic parameters were calculated/obtained for AUC_{0-t}, AUC_{0-∞}, C_{max}, t_{max}, the elimination rate constant, and t_{1/2} (indicate location of description in protocol)

b) State whether actual sampling time points were used for estimation of the pharmacokinetic parameters

c) Complete the table below

Test Reference

e

t_{1/2} (units)

d) Ratio of AUC_{0-t} to AUC_{0-∞}

(State mean ratio for both test and reference, state location in submission where individual ratios can

be

found)

6.3 Statistical analysis

(State the method of calculation of the 90% confidence intervals for the ratio of test formulation over

the
reference formulation and indicate how treatment, period, sequence and subjects within sequence were

207

included as factors in the ANOVA. Provide the following results from the ANOVA (parametric) on the logarithmically transformed AUC0-t and CMAX and other relevant parameters. State software used for computing ANOVA.)

a) Geometric means, results from ANOVA, Degrees of Freedom (DF) and derived CV (intra-subject)

Parameter Test Reference % Ratio of 90 % DF CV (%)

geometric Confidence

means interval

AUC0-t (units)

AUC0-inf

(units)

Cmax (units)

b) Comparison of the results

(Compare the results, including mean values, inter- and intra-individual variability, of this study with published results (literature, product information of reference product (innovator), WHOPARs), and copies of the references used should be appended to this document)

6.4 Discussion of results

(State location of the discussion of the results in the submission)

208

7 ANALYTICAL VALIDATION REPORT

7.1 Analytical technique

7.1.1 Validation protocol

(State the location of the validation protocol)

7.1.2 Identify analyte(s) monitored

7.1.3 Comment on source and validity of reference standard

7.1.4 Identify internal standard

7.1.5 Comment on source and validity of internal standard

7.1.6 Identify method of extraction

7.1.7 Identify analytical technique or method of separation employed

7.1.8 Identify method of detection

7.1.9 Identify anticoagulant used (if applicable)

7.1.10 If based on a published procedure, state reference citation

7.1.11 Identify any deviations from protocol

7.2 Selectivity

(Address the methods to verify selectivity against endogenous/exogenous compounds & results)

7.3 Sensitivity

(Address the methods to verify sensitivity & results)

209

7.4 Carry-over

(Summarize the method to verify carry-over & results)

7.5 Standard curves

(State location in submission of tabulated raw data and back calculated data with descriptive statistics)

a) List number and concentration of calibration standards used

b) Describe the regression model used including any weighting

c) List the back-calculated concentrations of the calibration standards of the validation runs (highlight the values outside of the acceptance range, e.g., 15%, except 20% for LLOQ)

7.6 Quality control samples

a) Identify the concentrations of the QC samples and the storage conditions employed prior to their analysis

7.7 Precision and accuracy during validation

a) Summarize inter-day/inter-run accuracy and precision of the calibration standards during assay validation

b) Summarize inter-day/inter-run accuracy and precision of the calibration standards during assay re-validation (If applicable)

c) Summarize inter-day/inter-run and intra-day/intra-run accuracy and precision of the QC samples during assay validation

d) Summarize inter-day/inter-run and intra-day/intra-run accuracy and precision of the QC samples during assay re-validation (If applicable)

7.8 Dilution integrity

(Summarize the method to verify dilution integrity & results)

210

7.9 Matrix effect (in case of MS detection)

(Summarize methods to verify the matrix effect & results)

7.10 Stability

(For each section provide the location of the raw data, a description of the methodology employed and a summary of the data.)

a) Summarize data on long-term storage stability

b) Summarize data on freeze-thaw stability

c) Summarize data on bench top stability

d) Summarize data on auto-sampler storage stability

(e) Summarize data from any other stability studies conducted

(e.g. long-term stock solution and working solution stability, short-term stock solution and working solution stability, dry-extract stability, wet-extract stability, stability in blood before sample processing)

7.11 Re-injection reproducibility

(Summarize the method to verify re-injection reproducibility & results)

211

8 BIOANALYTICAL STUDY REPORT

(State the location of the bioanalytical report for the analysis of the study subject samples)

8.1 Analytical technique

(Confirm whether the method is the same as the validated method and whether the same equipment was employed. Identify any differences between the validated method described above in Section 7 and the method employed for subject sample analyses)

8.1.1 Analytical protocol

(State the location of the analytical protocol)

8.1.2 Identify any deviations from protocol

8.1.3 Dates of subject sample analysis

8.1.4 Longest period of subject sample storage

(Identify the time elapsed between the first day of sample collection and the last day of subject sample analysis)

8.1.5 State whether all samples for a given subject were analysed together in a single analysis run

8.2 Standard curves

(State location in submission of tabulated raw data and back calculated data with descriptive statistics)

a) List number and concentration of calibration standards used

b) State number of curves run during the study (valid and failed runs, including reasons of failure).

c) Summarize descriptive data including slope, intercept, correlation coefficients

d) List the back-calculated concentrations of the calibration standards of the study runs (highlight the values outside of the acceptance range, e.g., 15%, except 20% for LLOQ)

8.3 Quality control samples

212

a) Identify the concentrations of the QC samples, their date of preparation and the storage conditions employed prior to their analysis

b) State the number of QC samples in each analytical run per concentration

c) List the back-calculated concentrations of the QC samples of the study runs (highlight the values outside of the acceptance range, e.g., 15%)

d) Discuss whether the concentrations of the QC sample concentrations are similar to the concentrations observed in the study samples

e) State the percentage of QC samples per run with respect to the total number samples assayed in each run

8.4 Precision and accuracy

a) Summarize inter-day precision of back-calculated standards and inter-day and intra-day precision and accuracy of QC samples analysed during subject sample analysis

8.5 Repeat analysis (re-analysis, re-injection and re-integration)

a) List re-analysed samples by sample identification and include the following information for each re-analysis: initial value; reason for re-analysis; re-analysed value(s); accepted value; and reason for acceptance

b) Report the number of re-analysis as a percentage of the total number samples assayed

c) List re-injected samples by sample identification and include the following information for each re-injection: initial value; reason for re-injection; re-injected value; accepted value; and reason for acceptance

d) Report the number of re-injections as a percentage of the total number samples assayed

e) List re-integrated chromatograms by sample identification and include the following information for each re-integration: initial value; reason for re-integration; re-integrated value(s); accepted value; and reason for acceptance

213

f) Report the number of re-integrated chromatograms as a percentage of the total number of samples assayed

8.6 Incurred sample reanalysis

(State location in the submission and summarize the results of incurred sample reanalysis, including the number of subject samples included in ISR and the total number of samples analysed in the study)

8.7 Chromatograms

(State the location in the submission where the sample chromatograms can be found. The chromatograms should be obtained from a minimum of two analytical batches and include at least 20% of the subjects, up to a maximum of five. A complete set includes standards, QC samples, pre-dose and post-dose subject samples for both phases. Each chromatogram should be clearly labelled with respect to the following: date of analysis; subject ID number; study period; sampling time; analyte; standard or QC, with concentration; analyte and internal standard peaks; peak heights and/or areas)

9 QUALITY ASSURANCE

9.1 Internal quality assurance methods

(State locations in the submission where internal quality assurance methods and results are described for each of study sites (see 3.2 b-d.)

9.2 Monitoring, auditing, inspections

(Provide a list of all monitoring and auditing reports of the study, and of recent inspections of study sites by regulatory agencies. State locations in the submission of the respective reports for each study site (see 3.2 b-d.)

214

PART IV:

GUIDELINES ON FORMAT AND CONTENT OF SUMMARY OF PRODUCT CHARACTERISTICS FOR PHARMACEUTICAL PRODUCTS

215

A PRINCIPLES OF PRESENTING INFORMATION

I. The SmPC should be worded in clear and concise language.

II. Each section of the SmPC should first deal with those issues that apply to the core population for whom the medicine is indicated followed (when necessary) by specific information for any relevant special population (e.g. children or elderly).

III. Consistent medical terminology from the Medical Dictionary for Regulatory Activities (MedDRA) should be used throughout the SmPC.

IV. The SmPC provides information on a particular medicinal product; therefore, it should not include reference to other medicinal products (e.g. through statement such as "Like other medicines of the same class ...") except when it is a class warning recommended by a competent authority.

B SMPC FORMAT AND CONTENT

The SmPC will be structured and populated as outlined in 1-10 below.

1. NAME OF THE MEDICINAL PRODUCT

Both the strength and the pharmaceutical form should follow the proprietary name. However, when otherwise referring to the medicinal product throughout the SmPC text, the strength and the pharmaceutical form do not have to be mentioned in the name. The International Non-proprietary Name (INN) or the usual common name of the active substance should be used when referring to properties of the active substance(s) rather than those of the product. The use of pronouns (e.g. "it") is encouraged whenever possible.

Strength

The strength should be the relevant quantity for identification and use of the product and should be consistent with the quantity stated in the quantitative composition and in the posology. Different strengths of the same medicinal product should be stated in the same way, e.g. 250 mg, 500 mg, 750mg. The use of decimal points should be avoided where these can be easily removed (e.g. 250 microgram, not 0.25 mg). However, where a range of medicinal products of the same pharmaceutical form includes strengths of more than one unit (e.g. 250 microgram, 1 mg and 6 mg), it may be more appropriate in certain cases to state the strengths in the same unit for the purpose of comparability (e.g. 0.25 mg, 1 mg and 6 mg). For safety reasons, micrograms and millions (e.g. for units) should always be spelled out in full rather than be abbreviated.

The pharmaceutical form of a medicinal product should be described by a standard term (see Appendix 1). No reference should be made to the route of administration or container unless these elements are part of the standard term or where there is a particular safety reason for their inclusion or where there are identical products, which may be distinguished only by reference to the route of administration or to the container.

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Full details of the qualitative and quantitative composition in terms of the active substance(s) and excipients, knowledge of which are essential for proper administration of the medicinal product, should be provided in section 2 of the SmPC and as appropriate in section 4.3 or 4.4. Excipients which are required to be declared on the labelling (see Guidelines on Format and Content of Labels for Medicinal Products) should be stated here under a separate subheading qualitatively, and, quantitatively. The following standard statement should be included at the end of the section, i.e. 'for full list of excipients, see section 6.1'.

If a diluent is part of the medicinal product, information should be included in the relevant sections (usually sections 3, 6.1, 6.5 and 6.6).

Qualitative declaration

The active substance should be declared by its recommended INN accompanied by its salt or hydrate form if applicable. References to the pharmacopoeial quality should not be included.

Quantitative declaration

The quantity of the active substance should be expressed per dosage unit (for metered dose inhalation products, per delivered dose and/or per metered dose), per unit volume, or per unit of weight and should be related to the declaration of strength in section 1.

Quantity should be expressed in internationally recognised standard term which could be complemented with another term if more meaningful to healthcare professionals.

Salts and hydrates

Where the active substance is present in the form of a salt or hydrate, the quantitative composition should be expressed in terms of the mass (or biological activity in International (or other) units where appropriate) of the active moiety (base, acid or anhydrous material), e.g. '60 mg toremifene (as citrate)' or toremifene citrate equivalent to 60 mg toremifene'.

217

Where a salt is formed in situ during the preparation of the finished product (i.e. formed during the mixture of a solvent and powder), the quantity of the active moiety should be stated, with a reference to the in situ formation of the salt.

In the case of established active substances in medicinal products where the strength has traditionally been expressed in the form of a salt or hydrate, the quantitative composition may be declared in terms of the salt or hydrate, e.g. '60 mg diltiazem hydrochloride'. This may also apply when the salt is formed in situ.

Esters and pro-drugs

If the active substance is an ester or pro-drug, the quantitative composition should be stated in terms of the quantity of the ester or pro-drug. When the active moiety is an active substance of an already approved medicinal product, the quantitative composition should also be stated in terms of the quantity of this active moiety (e.g. 75 mg of fosphenytoin is equivalent to 50 mg of phenytoin).

Oral powders for solution or suspension

The quantity of active substance should be stated per unit dose if the product is a single-dose preparation or otherwise per unit dose volume after reconstitution; a reference to the molar concentration may also be appropriate in some cases.

Parenterals excluding powders for reconstitution

For single-dose parenterals, where the total contents of the container are given in a single dose ('total use'), the quantity of active substance(s) should be stated per presentation (e.g. 20 mg etc.) not including any overages or overfill. The quantity per ml and the total labelled volume should also be given.

For single-dose parenterals, where the amount to be given is calculated on the basis of the patient's weight or body surface or other variable ('partial use'), the quantity of active substance(s) should be stated per ml. The quantity per total labelled volume should also be given. Overages or overfills should not be included.

For multi-dose and large volume parenterals, the quantity of active substance(s) should be stated per ml, per 100 ml, per 1000 ml, etc. as appropriate, except for multidose vaccines containing 'n' doses of the same dose. In this case, the strength should be expressed per dose volume. Overages or overfills should not be included.

Where appropriate, e.g. for X-ray contrast media, and parenterals containing inorganic salts, the quantity of active substance(s) should also be indicated in millimoles. For X-ray contrast

media with iodine-containing active substances, the quantity of iodine per ml should be stated in addition to the quantity of the active substance.

Powders for reconstitution prior to parenteral administration

When the product is a powder to be reconstituted prior to administration, the total quantity of active substance in the container should be stated not including overages or overfills, as well as the quantity per ml when reconstituted, unless there are several means of reconstituting, or different quantities used, which result in different final concentrations.

Concentrates

The quantity should be stated as the content per ml in the concentrate and as the total content of the active substance. The content per ml when diluted as recommended should also be included unless the concentrate is to be diluted to within a range of different final concentrations.

Transdermal patches

The following quantitative details should be given: the content of active substance(s) per patch, the mean dose delivered per unit time, and the area of the releasing surface, e.g. 'Each patch contains 750 micrograms of estradiol in a patch size of 10 cm², releasing a nominal 25 micrograms of estradiol per 24 hours'.

Multidose solid or semi-solid products

Quantity of active substance should be stated, where possible, per unit dose, otherwise per gram, per 100 g or percentage, as appropriate.

Biological medicinal products

Expression of strength

The quantity of biological medicinal products should be expressed in terms of mass units, units of biological activity, or International Units as appropriate for the particular product.

The biological origin of the active substance

The origin of the active substance should be defined briefly. Thus, the nature of any cellular system(s) used for production and, if relevant, the use of recombinant DNA technology should be specified. The entry should take the form: "produced in XXX cells <by recombinant DNA technology>". The following are examples of the application of this principle:

"produced in human diploid (MRC-5) cells",

219

"produced in Escherichia coli cells by recombinant DNA technology",

"produced in chick-embryo cells",

"produced from the plasma of human donors",
"produced from human urine",

"produced from <animal> blood",

"produced from porcine pancreatic tissue",

"produced from porcine intestinal mucosa".

Special provisions for normal immunoglobulins

In the case of normal immunoglobulins, the IgG subclass distribution should be stated in terms of percent of total IgG present. The upper limit of the IgA content should follow.

Special provisions for vaccines

In the case of vaccines, the content of active substance per dose unit (e.g. per 0.5 ml) should be stated.

Adjuvants, if present, should be stated qualitatively and quantitatively.

Residues that are of special relevance (e.g. ovalbumin in egg derived vaccines) should be specified.

Additional specific guidance is available in CHMP guidelines on biotechnological medicinal products, e.g. the CHMP Guideline on the Pharmaceutical Aspects of the Product Information for Human Vaccines.

Herbal medicinal products

The quantitative declaration should be in accordance with the existing quality guidelines on herbal medicinal products.

3. PHARMACEUTICAL FORM

The pharmaceutical form should be described by a full standard term using the singular form. The term used in this section should be the same as the term used in section 1. A visual description of the appearance of the product (colour, markings, etc.) should be given, in a separate paragraph to the standard term, including information on the actual size of a solid oral formulation, e.g. In case of tablets designed with a score line, information should be given on whether or not reproducible dividing of the tablets has been shown. e.g. 'the score line is only to facilitate breaking for ease of swallowing and not to divide into equal doses', 'the tablet can be 220

divided into equal halves'. The visual description should be as presented in the finished product specifications.

Information on pH and osmolality should be provided, as appropriate. In case of products to be reconstituted before use, the appearance before reconstitution should be stated in this section. Appearance of the product after reconstitution should be stated in sections 4.2 and 6.6.

4. CLINICAL PARTICULARS

4.1 Therapeutic indications

The indication(s) should be stated clearly and concisely and should define the target disease or condition distinguishing between treatment (symptomatic, curative or modifying the evolution or progression of the disease), prevention (primary or secondary) and diagnostic indication. When appropriate it should define the target population especially when restrictions to the patient populations apply.

Study endpoints should not normally be included. The objective of a prevention indication may be mentioned in general terms only. This should also be done for the target population.

Where results from subsequent studies provide further definition or information on an authorized indication, such information, provided it does not itself constitute a new indication, may be considered for inclusion in section 5.1.

Mandatory conditions of product usage not covered more appropriately in other parts of the SmPC may also be included when relevant, e.g. concomitant dietary measures, lifestyle changes, or other therapy.

It should be stated in which age groups the product is indicated, specifying the age limits, e.g. 'X is indicated in <adults><neonates><infants><children><adolescents><aged x to y>years, months>'.>

If the product's indication depends on a particular genotype or the expression of a gene or a particular phenotype, this should be stated in the indication.

4.2 Posology and method of administration

In case of restricted medical prescription, this section should be started by specifying the conditions.

In case of specific safety need, any recommended restriction to a particular setting should also be stated (e.g. "restricted to hospital use only" or "appropriate resuscitation equipment should be available").

221 Posology

The dosage should be clearly specified for each method/route of administration and for each indication, as appropriate.

Where appropriate, a reference to official recommendations should be made (e.g. for primary vaccination and antibiotics as well as for booster dose). Dose recommendations (e.g. mg, mg/kg, mg/m²) should be specified per dose interval for each category where appropriate (specify age/weight/body surface area of subsets of the population as appropriate). Frequency of dosing should be expressed using time units (e.g. once or twice daily or every 6 hour) and, to avoid confusion, abbreviations e.g. OD or BID should not be used.

Where appropriate, the following points should be addressed:

- the maximum recommended single, daily and/or total dose,
- the need for dose titration,
- the normal duration of use and any restrictions on duration and, if relevant, the need for tapering off, or advice on discontinuation,
- advice on action to be taken if one or more dose(s) is (are) missed, or e.g. in case of vomiting (the advice should be as specific as possible, taking into consideration the recommended frequency of dosing and relevant pharmacokinetic data)
- advice on preventive measures to avoid certain adverse drug reactions (e.g. administration of antiemetic's) with cross-reference to section 4.4,
- the intake of the product in relation to drink and food intake, together with a cross-reference to section 4.5 in case of specific interaction e.g. with alcohol, grapefruit or milk,
- advice regarding repeat use, with any information on intervals to be observed between courses of treatment, as appropriate,
- Interactions requiring specific dose adjustments with cross-reference to other appropriate sections of the SmPC (e.g. 4.4, 4.5, 4.8, 5.1, 5.2), and
- it may also be relevant to recommend not to prematurely discontinue a treatment in case of specific non-serious adverse reaction(s) that are frequent but transient or manageable with dose titration.

Where relevant to the particular product, the following should appear 'The potency of this medicinal product is expressed in <proprietary name> units. These units are not

222 interchangeable with the units used to express the potency of other <active substance name> preparations'.

Special populations

Dosage adjustments or other posology related information in specific patient groups should be stated where necessary, in well-defined sub-sections ordered by importance, e.g. regarding:

- elderly population; it should be made clear whether or not any dosage adjustment is necessary in any subsets of the elderly population, with cross-reference to other sections providing information in elderly, e.g. 4.4, 4.5, 4.8 or 5.2.
- renal impairment; the dose recommendation should relate as precisely as possible to the cut-off values for biochemical markers of renal impairment in clinical studies and to the results of these studies;
- hepatic impairment, specified according to the patients included in studies, for instance 'alcohol-related cirrhosis' and the definitions used in the studies, for instance Child-Pugh score/grade of the patients;
- patients with a particular genotype; with cross-reference to other relevant sections for further detail as appropriate;
- other relevant special population (e.g. patients with other concomitant disease or overweight patients).

Advice relevant for dosage adjustment e.g. from monitoring of clinical symptoms and signs, and/or laboratory investigations, including blood concentrations of the medicinal product should be mentioned when appropriate with cross-reference to other sections where appropriate.

Paediatric population

The specific sub-section 'paediatric population' should always be included and the information given should cover all subsets of the paediatric population, using a combination of the possible situations presented below as appropriate.

If the product is indicated in the paediatric population, posology recommendations should be given for each of the relevant subsets. The age limits should reflect the benefit-risk assessment of the available documentation for each subset.

If the posology is the same in adults and children, then a statement to this effect is sufficient; the posology does not need to be repeated.

223

Dose recommendations (e.g. mg, mg/kg, mg/m²) should be specified per dose interval for the paediatric subsets where the product is indicated. Different subsets may require different dosing information. If necessary, recommendations in preterm and new borns should be presented taking into account the more appropriate age e.g. gestational age or the post-menstrual age.

Depending on the subset, the clinical data and available formulations, the dose will be expressed according to weight or body surface area, e.g. "children aged 2-4 years, 1 mg/kg bodyweight twice a day".

When appropriate, information on timing of intake of the product should consider children's daily life, e.g. school or sleep.

Where a product is indicated in children and no adequate paediatric formulation can be developed, detailed instructions on how to obtain an extemporaneous preparation shall be included in section 6.6 with a cross-reference in section 4.2.

Doses and method of administration in the various subsets may be presented in a tabulated format.

If there is no indication for the product in some or all subsets of the paediatric population, no posology recommendation can be made, but available information should be summarized using the following standard statements (one or combination of several as appropriate):

- The <safety><and><efficacy> of X in children aged x to y<months, years><or any other relevant subsets e.g. weight, pubertal age, gender><has><have> not <yet> been established.

One of the following statements should be added:

– <No data are available>.

or

– <Currently available data are described in section <4.8><5.1><5.2>but no recommendation on a posology can be made >

- X should not be used in children aged x to y<years, months><or any other relevant subsets e.g. weight, pubertal age, gender> because of <safety><efficacy> concern(s) <concern(s) to be stated with cross-reference to sections detailing data (e.g. 4.8 or 5.1) >.

- There is no relevant use of X in <the paediatric population><in children aged x to y><years, months><or any other relevant subsets e.g. weight, pubertal age, gender> in the indication(s) <specify indication(s)>.

- X is contraindicated in children aged x to y<years, months><or any other relevant subsets e.g. weight, pubertal age, gender><in the indication ...> (cross-reference to section 4.3).

224

If there are more appropriate strength(s) and/or pharmaceutical form(s) for administration in some or all subsets of the paediatric population (e.g. oral solution for infants), these can be mentioned in section 4.2 of the SmPC of the less appropriate one(s).

E.g.: Other pharmaceutical forms/strengths may be more appropriate for administration to this population.

Method of administration

Any special precautions related to the manipulation or administration of the product (e.g. cytotoxic products) by healthcare professionals (including pregnant healthcare professionals), the patient or carers should be mentioned here under a specific sub-heading (<Precaution to be taken before manipulating or administering the product>), with a cross-reference to section 6.6 (or 12).

The route of administration and concise relevant instruction for correct administration and use should be given here. Information on instructions for preparation or reconstitution should be placed in section 6.6 'Special precautions for disposal of a used medicinal product and other handling of the product' (or in section 12 if appropriate) and cross-referenced here.

When supportive data are available, information on alternative method(s) to facilitate administration or acceptability should be given as explicitly as possible (e.g. possibility of crushing tablet, cutting tablet or transdermal patch, pulverizing tablet, opening capsules, mixing with food, dissolution in drinks – specifying if a proportion of the dose can be given) particularly for administration via feeding tubes.

Any specific recommendation for use related to the pharmaceutical form should be explained, e.g.:

- "the coated tablet should not be chewed because of <bad taste>,"
- "the enteric-coated tablet should not be crushed because coating prevents <pH sensitive degradation><irritant effects> on the gut",
- "the coated tablet should not be broken because the coating is intended to ensure a prolonged release (see 5.2)".

For parenteral formulations, information on the rate or speed of injection or infusion should be provided.

For parenteral formulations - in children, especially newborns in whom quite often fluids have to be restricted - it would be useful to have information on maximal concentration that can be safely administered (e.g. "no more than X mg of Y/ml of solution").

4.3 Contraindications

Situations where the medicinal product must not be given for safety reasons, i.e. contraindications, are the subject of this section. Such circumstances could include a particular

225

clinical diagnosis, concomitant diseases, demographic factors (e.g. gender, age) or predispositions (e.g. metabolic or immunological factors, a particular genotype and prior adverse reactions to the medicine or class of medicines). The situations should be unambiguously, comprehensively and clearly outlined.

Other medicines or classes of medicine, which must not be used concomitantly or consecutively should be stated, based on either data or strong theoretical reasons. If applicable a cross-reference to section 4.5 should be made.

In general, patient populations not studied in the clinical trial programme should be mentioned in section 4.4 and not in this section unless a safety issue can be predicted (e.g. use of renally eliminated substances with narrow therapeutic margin in renal failure patients). If, however, patients have been excluded from studies due to a contraindication on grounds of safety, they should be mentioned in this section. If applicable a cross-reference to section 4.4 should be made.

Only if pregnancy or breastfeeding is contraindicated, should it be mentioned here. In section 4.6, a cross-reference should be made and further background information provided. Hypersensitivity to the active substance or to any of the excipients or residues from the manufacturing process should be included, as well as any contraindication arising from the presence of certain excipients.

For herbal medicinal products, hypersensitivity extended to other plants of the same family or to other parts of the same plant should be labelled as a contraindication, where applicable.

Lack of data alone should not lead to a contraindication. Where for safety reasons, the product should be contraindicated in a specific population, e.g. paediatric or a subset of the paediatric population, it should appear in this section with a cross-reference to the section giving detailed information on the safety issue. A contraindication in the paediatric population should be listed without a sub-heading.

4.4 Special warnings and precautions for use

The order of warnings and precautions should in principle be determined by the importance of the safety information provided.

The exact content of this section will be different for each product and the therapeutic conditions it is intended to treat. It is however suggested that the following items should be included where relevant to the specific product.

Information on a specific risk should be given in section 4.4 only when the risk leads to a precaution for use or when healthcare professionals have to be warned of this risk. Patient groups in which use of the medicinal product is contraindicated should be mentioned in section 4.3 only and not to be repeated here.

226

The following should be described:

- The conditions, in which the use of the medicinal product could be acceptable, provided

that special conditions for use are fulfilled. In particular, specific risk minimization measures requested as part of a Risk Management Plan to ensure safe and effective use should be described in this section. (For example; "Liver function should be monitored before initiation of treatment and monthly thereafter", "Patients should be advised to immediately report any symptoms of depression and/or suicidal ideation", "Women of childbearing potential should use contraception", ...)

- Special patient groups that are at increased risk or are the only groups at risk of experiencing product or product class-related adverse reactions (usually serious or common), e.g. elderly, children, patients with renal or hepatic impairment (including the degree of impairment, e.g. mild, moderate or severe), patients having an anaesthetic or patients with cardiac failure. Cross-reference to section 4.8 on the differential effects in terms of frequency and severity of the specified adverse reaction should be provided.
- Serious adverse reactions to which healthcare professionals need to be alerted, the situations in which these may occur and the action that may be required, e.g. emergency resuscitation.
- If there are particular risks associated with starting the medicinal product (e.g. first dose effects) or stopping it (e.g. rebound, withdrawal effects), these should be mentioned in this section, together with the action required for prevention.
- Any measures which can be taken to identify patients at risk and prevent the occurrence, or detect early the onset or worsening of noxious conditions. If there is a need for awareness of symptoms or signs representing early warning of a serious adverse reaction, a statement should be included.
- Any need for specific clinical or laboratory monitoring should be stated. Recommendation for monitoring should address why, when and how the monitoring should be conducted in clinical practice. If dose reduction or other posology is recommended in such circumstances or conditions, this should be included in section 4.2 and cross-referenced here.
- Any warnings necessary for excipients or residues from the manufacturing process.
- For herbal preparations containing alcohol, information about the ethanol content in the medicinal product should be included in accordance with the Guideline on excipients in the label and package leaflet of medicinal products for human use.
- Any warnings necessary with respect to transmissible agents.
- Subjects or patients with a specific genotype or phenotype might either not respond to the treatment or be at risk of a pronounced pharmacodynamics effect or adverse reaction. These may arise because of non-functioning enzyme alleles, alternative metabolic pathways (governed by specific alleles), or transporter deficiencies. Such situations should be clearly described if known.
- Any particular risk associated with an incorrect route of administration (e.g. necrosis risk with extravasation of intravenous formulation, or neurological consequences of intravenous use instead of intramuscular use), should be presented, with advice on management if possible.

In exceptional cases, especially important safety information may be included in bold type within a box.

Any adverse reactions described in this section or known to result from conditions mentioned here should also be included in section 4.8.

Specific interference with laboratory tests should be mentioned when appropriate, e.g. Coombs test and Beta-lactams. They should be clearly identified with a subheading, e.g. "Interference with serological testing".

In general, descriptions of warnings and precautions regarding pregnancy and breast-feeding, ability to drive and use machines, and other aspects of interactions should be dealt with in sections 4.6, 4.7 and 4.5, respectively. However in specific cases of major clinical importance it might be more appropriate to describe specific precautionary measures in this section, e.g. contraception measures, or when concomitant use of another medicine is not recommended, and with cross reference to section 4.5, 4.6, or 4.7.

Paediatric population

When the product is indicated in one or more subsets of the paediatric population and there are warnings and precautions for use that are specific to the paediatric population or any subset of the paediatric population, they should be identified under this subheading. Any necessary warning or precaution in relation to long-term safety (e.g. on growth, neuro-behavioural development or sexual maturation) or specific monitoring (e.g. growth) in the paediatric population should be described.

When long-term safety data are necessary but not yet available, it should be stated in this section. Warnings should be included in case of possible significant or long-lasting impact on children's daily activities, such as learning ability or physical activities, or in case of impact on appetite or sleep pattern.

If measures are requested that are specific to the paediatric population for which the product is indicated (e.g. as part of a Risk Management Plan), these measures should be described in this section.

4.5 Interaction with other medicinal products and other forms of interaction

This section should provide information on the potential for clinically relevant interactions based on the pharmacodynamics properties and in vivo pharmacokinetic studies of the medicinal product, with a particular emphasis on the interactions, which result in a recommendation regarding the use of this medicinal product. This includes in vivo interaction

results, which are important for extrapolating an effect on a marker ('probe') substance to other medicinal products having the same pharmacokinetic property as the marker.

Interactions affecting the use of this medicinal product should be given first, followed by those interactions resulting in clinically relevant changes on the use of others. Interactions referred to in other sections of the SmPC should be described here and cross-referenced from other sections.

The order of presentation should be contraindicated combinations, those where concomitant use is not recommended, followed by others.

The following information should be given for each clinically relevant interaction:

a) Recommendations: these might be

- Contraindications of concomitant use (cross-refer to section 4.3),
- Concomitant use not recommended (cross-refer to section 4.4), and
- Precautions including dose adjustment (cross-refer to sections 4.2 or 4.4, as appropriate), mentioning specific situations where these may be required.

b) Any clinical manifestations and effects on plasma levels and AUC of parent compounds or active metabolites and/or on laboratory parameters.

c) Mechanism, if known. For example, interaction due to inhibition or induction of cytochrome P450 should be presented as such in this section, with a cross-reference to 5.2 where in vitro results on inhibition or induction potential should be summarized.

Interactions not studied in vivo but predicted from in vitro studies or deducible from other situations or studies should be described if they result in a change in the use of the medicinal product, cross-referring to sections 4.2 or 4.4.

This section should mention the duration of interaction when a medicinal product with clinically important interaction (e.g., enzyme inhibitor or inducer) is discontinued. Adjustment of dosing may be required as a result. The implication for the need for a washout period when using medicines consecutively should also be mentioned.

229

Information on other relevant interactions such as with herbal medicinal products, food, alcohol, smoking, or pharmacologically active substances not used for medical purpose, should also be given. With regard to pharmacodynamics effects where there is a possibility of a clinically relevant potentiation or a harmful additive effect, this should be stated.

In vivo results demonstrating an absence of interaction should only be mentioned here if this is of major importance to the prescriber (e.g. in therapeutic area where potentially problematic interactions have been identified such as with anti-retroviral medicines).

If no interaction studies have been performed, this should be clearly stated.

Additional information on special populations

If there are patient groups in which the impact of an interaction is more severe, or the magnitude of an interaction is expected to be larger e.g., patients with decreased renal function (in case the parallel pathway is renal excretion), paediatric patients, elderly e.t.c, this information should be given here.

If interactions with other medicinal products depend on polymorphisms of metabolizing enzymes or certain genotypes, this should be stated.

Paediatric population

Information specific to a subset of the paediatric population should be given here if there is an indication for the particular age group.

The resulting exposure and clinical consequences of a pharmacokinetic interaction can differ between adults and children, or between older and younger children. Therefore;

■ any identified treatment recommendations should be given in relation to concomitant use in the paediatric subset(s) (e.g. dose adjustment, extra-monitoring of clinical effect marker/adverse reactions, therapeutic drug monitoring),

■ If the interaction studies have been performed in adults, the statement 'Interaction studies have only been performed in adults' should be included.

■ If the extent of an interaction is known to be similar in a paediatric age group to that in adults, this should be stated.

■ If this is not known, this should also be stated.

The same applies to pharmacodynamics drug interactions.

230

In cases of food interaction leading to a recommendation on co-administration with a meal or specific food, it should be specified whether this is relevant for paediatric use (especially newborns and infants) whose diet is different (100 % milk in newborns).

Overall, section 4.5 should be presented in the simplest possible way to highlight the interactions resulting in a practical recommendation regarding the use of the medicinal product. Presentation in a tabulated format may help where interactions are numerous and various, such as with anti-viral products.

4.6 Fertility, pregnancy and lactation

General principles

Efforts should be made by the Marketing Authorization Applicant or Holder to provide the reasons for the recommendations for use in pregnant or lactating women and in women of childbearing potential.

This information is important for the healthcare professionals informing the patient.

In the overall assessment, all available knowledge should be taken into account, including clinical studies and post-marketing surveillance, pharmacological activity, results from non-clinical studies, and knowledge about compounds within the same class.

Efforts should be made to update the recommendations for use during pregnancy and lactation on the basis of increasing human experience in exposed pregnancies, which eventually supersede the animal data.

In case of contraindication, this should be included in section 4.3.

The following should be mentioned:

Women of childbearing potential / Contraception in males and females

Recommendations on the use of the medicinal product in women of childbearing potential should be given when appropriate including the need for pregnancy test or contraceptive measures. Where an effective contraception is required for patients or partners of patients during treatment or for a defined period before starting or after ending treatment, the rationale should be included in this section. If contraceptive measures are recommended, there should also be a cross-reference to section 4.5 (and possibly 4.4) in case of interaction with oral contraceptives.

Pregnancy

In general, clinical and non-clinical data should be followed by recommendations.

231

With respect to non-clinical data,

■ only conclusions of the reproductive toxicity studies should be included in this section. Further details should be provided in section 5.3.

With respect to clinical data,

■ the section should include comprehensive information on relevant adverse events reported in the embryo, the foetus, neonates and pregnant women, when appropriate. The frequency of such events (for example the frequency of birth defects) should be specified when available.

■ the section should specify the extent of the human experience if no adverse events have been reported in pregnancy.

With respect to the recommendations:

■ Recommendations on the use of the medicinal product during the different periods of gestation, including the reason(s) for these recommendations, should be given.

■ Recommendations for the management of exposure during pregnancy when appropriate (including relevant specific monitoring such as foetal ultrasound, specific biological or clinical surveillance of the foetus or the neonate) should be given.

Cross-references can be included in sections 4.3, 4.4 and 4.8, as appropriate.

Breastfeeding

If available, clinical data should be mentioned (exposed breastfed infants) as the conclusions of kinetic studies (plasma concentrations in breastfed infants, transfer of the active substance and/or its metabolite(s) into human milk...). Information on adverse reactions in nursing neonates should be included if available.

Conclusions from non-clinical studies on the transfer of the active substance and/or its metabolite(s) into milk should be given only if no human data are available.

Recommendations should be given to stop or continue breastfeeding and/or to stop or continue the treatment in cases where treatment or breastfeeding discontinuation is recommended, and the reason should be provided.

Fertility

The main information on the possible effects of the medicinal product on male and female fertility should be included in section 4.6.

This section should include:

a) Clinical data if available.

232

b) Relevant conclusions from nonclinical toxicity studies, if available. Further details should be included in section 5.3.

c) Recommendations for the use of the medicinal product when pregnancy is planned but fertility might be affected by treatment.

Cross-references could be included in section 4.3, if appropriate.

If there are no fertility data at all, then this should be clearly stated.

4.7 Effects on ability to drive and use machines

On the basis of the pharmacodynamics and pharmacokinetics profile, reported adverse reactions and/or specific studies in a relevant target population addressing the performance related to driving and road safety or using machines, specify whether the medicinal product has a) no or negligible influence b) minor influence, c) moderate influence or d) major influence on these abilities. Other important factors that affect the ability to drive and use machines should be considered if known, e.g. duration of the impairing effect and the development of tolerance or adverse reactions with continued use.

For situations c and d, special warnings/precautions for use should be mentioned here (and also in section 4.4 for situation d).

4.8 Undesirable effects

This section should include all adverse reactions from clinical trials, post-authorization safety studies and spontaneous reporting for which, after thorough assessment, a causal relationship between the medicinal product and the adverse event is at least a reasonable possibility, based for example, on their comparative incidence in clinical trials, or on findings from epidemiological studies and/or on an evaluation of causality from individual case reports. Adverse events, without at least a suspected causal relationship, should not be listed in the SmPC.

The content of this section should be justified in the Clinical Overview of the marketing authorization application based upon a best-evidence assessment of all observed adverse events and all facts relevant to the assessment of causality, severity and frequency. This section should be regularly reviewed and, if necessary, updated with the aim to ensure appropriate information to health care professionals on the safety profile of the product.

It is important that the whole section is worded in concise and specific language and does not include information such as claims regarding the absence of specific adverse reactions, comparative frequency statements other than as described below, or statements of general good

233

tolerability such as “well tolerated”, “adverse reactions are normally rare”, etc. Statements on lack of proof of causal association should not be included.

In order to provide clear and readily accessible information, section 4.8 should be structured according to the following recommendations:

- a. Summary of the safety profile
- b. Tabulated summary of adverse reactions
- c. Description of selected adverse reactions
- d. <Paediatric population>
- e. <Other special population(s)>

a. Summary of the safety profile

The summary of the safety profile should provide information about the most serious and/or most frequently occurring adverse reactions.

If known, it may be helpful to indicate the timing when adverse reactions occur. For example, in order to prevent early discontinuation of a treatment, it may be important to inform about non-serious adverse reactions that are frequent in the beginning of the treatment but may disappear with its continuation. Another example would be to inform about adverse reaction associated with long-term use. Frequencies of cited adverse reactions should be stated as accurately as possible. This summary of the safety profile should be consistent with the important identified risks mentioned in the Safety Specification of the Risk Management Plan. The information should be consistent with the Table of Adverse Reactions (see section b). Cross-reference should be made to section 4.4 if relevant risk minimization measures have been proposed in that section.

An example of an acceptable statement is given below:

‘At the beginning of the treatment, epigastric pain, nausea, diarrhoea, headache or vertigo may occur; these reactions usually disappear within a few days even if treatment is continued. The most commonly reported adverse reactions during treatment are dizziness and headache, both occurring in approximately 6% of patients. Serious acute liver injury and agranulocytosis may occur rarely (less than 1 case per 1,000 patients)’

b. Tabulated list of adverse reactions

A single table (or structured listing) should list all adverse reactions with their respective frequency category. In some cases for common or very common reactions, and when it is necessary for the clarity of the information, frequency figures may be presented in the table.

Separate tables are acceptable in exceptional cases where the adverse reaction profiles markedly differ depending on the use of the product. For example, it might be the case for a product used for different indications (e.g. an oncology and a non-oncology indication) or at different posologies.

234

The table should be introduced with a short paragraph stating the source of the safety database (e.g. from clinical trials, post-authorization safety studies or spontaneous reporting).

The table should be presented according to the MedDRA system organ classification. The system organ class (SOC) should be presented in the order shown in the annex. Adverse reactions descriptions should be based on the most suitable representation within the MedDRA terminology. This will usually be at the Preferred Term (PT) Level, although there may be instances where the use of Lowest Term Level or exceptionally group terms, such as High Level Terms may be appropriate. As a general rule, any adverse reactions should be assigned to the most relevant SOC related to the target organ. For example, PT ‘Liver function test abnormal’ should be assigned to the SOC ‘Hepatobiliary disorders’ rather than to the SOC ‘Investigations’.

Within each system organ class, the adverse reactions should be ranked under headings of

frequency, most frequent reactions first. Within each frequency grouping, adverse reactions should be presented in the order of decreasing seriousness. The names used to describe each of the frequency groupings should follow standard terms established in each official language using the following convention: Very common ($\geq 1/10$); common ($\geq 1/100$ to $< 1/10$); uncommon ($\geq 1/1,000$ to $< 1/100$); rare ($\geq 1/10,000$ to $< 1/1,000$); very rare ($< 1/10,000$).

In exceptional cases, if a frequency cannot be estimated from the available data, an additional category frequency 'not known' may be used. In case the expression "Frequency not known" is used, the following text should be added in the list of terms explaining the frequency categories: "not known (cannot be estimated from the available data)". The expressions isolated/single cases/reports should not be used.

Where additional details about an adverse reaction are described in section c), the reaction concerned should be highlighted, for example with an asterisk, and, "see section c)" should be included as a footnote.

Guidance on how to estimate the frequency of an adverse reaction is provided at the end of this chapter of the guideline.

d) Description of selected adverse reactions

This section should include information characterizing specific adverse reaction which may be useful to prevent, assess or manage the occurrence of an adverse reaction in clinical practice.

This section should include information characterizing individual serious and/or frequently occurring adverse reactions, or those where there have been reports of particularly severe cases. The information should provide frequency and may describe for example reversibility, time of onset, severity, duration, mechanism of the reaction (if of clinical relevance), dose relationship, relationship with duration of exposure or risk factors. Measures to be taken to avoid specific adverse reactions or actions to be taken if specific reactions occur should be mentioned under section 4.4 and cross-referenced here.

235

Information on the occurrence of withdrawal reactions may be mentioned here with cross-reference to section 4.2 in case of need for tapering off or advice on discontinuation of the product.

Mention should be made here of any differences between different dosage forms in respect of adverse reactions.

In the case of combination products, information should be included in this sub-section pointing out which particular adverse reactions are usually attributable to which active substance of the combination, where known.

Any adverse reactions resulting directly from an interaction should be mentioned here and cross-referenced to section 4.5.

This section should also inform on adverse reactions with very low frequency or with delayed onset of symptoms which may not have been observed in relation to the product, but which are considered to be related to the same therapeutic, chemical or pharmacological class. The fact that this is a class attribution should be mentioned.

Any adverse reaction specific to excipients or residues from the manufacturing process should be included.

e) <Paediatric population>

A paediatric sub-section should always be included (unless irrelevant).

The extent and age characteristics of the safety database in children should be described (e.g. from clinical trials or pharmacovigilance data). Uncertainties due to limited experience should be stated.

If the observed safety profile is similar in children and adults this could be stated: e.g. "Frequency, type and severity of adverse reactions in children are <expected> to be the same as in adults". Similarly, it is appropriate to state whether the safety profiles in the different paediatric subsets are similar or not.

Any clinically relevant differences (i.e. in nature, frequency, seriousness or reversibility of adverse reactions) between the safety profiles in adult and paediatric populations, or in any relevant age groups, should be described and presented by age group. If there is a need for specific monitoring, this should be highlighted by cross-referencing to section 4.4. For clinically relevant differences, a separate table listing such adverse reactions by frequency can be added and presented by relevant age groups if appropriate. If some paediatric adverse reactions are considered common ($\geq 1/100$ to $< 1/10$) or very common ($\geq 1/10$), the frequencies should be provided in parentheses.

236

In case of major difference with the safety profile in adults, a summary of the safety profile in children could be presented to facilitate the presentation of the information. Available information, from any source scientifically validated, on long-term safety in children (e.g. on growth, mental development and sexual maturation) should also be summarized, whether positive or negative, with cross-reference to section 5.1 if appropriate. Any risk factors such as duration of treatment or period at risk should be specified.

If relevant, symptoms of neonatal withdrawal should be listed in a separate paragraph with cross-reference with 4.6

e. <Other special populations>

This section may include information on any clinically relevant differences (i.e. in nature, frequency, seriousness or reversibility of adverse reactions, or need for monitoring) specifically observed in other special populations such as elderly, patients with renal impairment, patients

with hepatic impairment, patients with other diseases or a specific genotype. Cross-reference to other sections such as 4.3, 4.4 or 4.5 may be added as appropriate.

Adverse reactions may also be related to genetically determined product metabolism. Subjects or patients deficient in the specific enzyme may experience a different rate or severity of adverse reactions. This should be mentioned and where relevant correlated with data from clinical trials.

Further guidance on the estimation of frequency of adverse reactions

The estimation of the frequency of an adverse reaction depends on the data source (i.e. clinical trial, post-authorization safety study or spontaneous reporting), the quality of data collection and causality evaluation. If the choice of the frequency category is based on different sources, the category representing the highest frequency should be chosen unless a more specific method has been applied and thus resulted in an estimate of clearly higher validity, e.g. a pooled analysis across suitable studies.

Sources of data should use population exposed to the doses and treatment duration as recommended in the SmPC.

Reactions that are reported under different terms but represent the same phenomenon (e.g., sedation, somnolence, drowsiness) should ordinarily be grouped together as a single adverse reaction to avoid diluting or obscuring the true effect. Similarly, reactions that represent a syndrome complex should ordinarily be grouped together under an appropriate heading to avoid obscuring the full range of respective symptoms.

Adverse reactions from clinical trials

237

Safety data from several studies should be pooled to increase the precision of adverse reaction rates as appropriate without introducing bias (e.g. major difference in population characteristics or exposure to the product).

The frequency of adverse reactions should be derived from pooled placebo-controlled studies if these data are available and the databases are sufficiently large to be informative. If these data are unavailable or not sufficiently informative, active-controlled data or possibly single-arm or add-on trials databases could be used to estimate frequencies.

Frequency should represent crude incidence rates (and not differences or relative risks calculated against placebo or other comparator).

When a common, very common or serious adverse reaction (e.g. suicide) also occurs in the placebo group with a relevant frequency, both incidence rates can be stated to put the risk into perspective (e.g. in subsection c).

Adverse reactions from safety studies

The choice of the frequency category to which any adverse reaction will be assigned is based on the point estimate of the crude incidence rate derived from a study designed in such a way that specific adverse events occurring in patients within a defined observation period would have been detected and reasonably attributed to the medicinal product. In this situation, it is possible to calculate a point estimate of the crude incidence rate using standard statistical methods. In cases where the original information is expressed as an incidence density (denominator expressed as person-time), an appropriate transformation into an incidence proportion should be performed for choosing the frequency category. Normally, incidence proportions for the most representative exposure period (e.g. 1 week, 3 months, 1 year) should be used to derive the frequency category. However, this may not be appropriate if the hazard function increases over time; in this case, the adverse reaction and its frequency pattern, when clinically relevant, should be properly described in section c).

The frequency category to be chosen for each adverse reaction should not be based on differences calculated against a comparator. However, when data are derived from a study with a non-exposed group and the rate difference attributed to the medicinal product is smaller than the baseline or background incidence rate, and if the adverse reaction is considered important, the background incidence may be provided (e.g. in section c).

Adverse reactions from spontaneous reporting

The number of spontaneous reports should not be stated because the number can quickly become outdated. Frequencies based on reporting rates from a spontaneous reporting system should not be used to assign frequency category. In case of an unexpected adverse reaction detected from spontaneous reporting, each adequately designed study where this adverse reaction could have been detected should be reviewed to choose a frequency category. If the adverse reaction has never been observed in clinical trials, then the upper limit of the 95%

238

confidence interval is not higher than $3/X$, with X representing the total sample size summed up across all relevant clinical trials and studies (e.g. those with a follow-up long enough to detect the adverse reaction).

For example, if a particular adverse reaction has not been observed among 3600 subjects exposed to the product in clinical trials and studies, then the upper limit of the 95% confidence interval for the point estimate is $1/1200$ or less and the frequency category should be "rare", based on worst value of the point estimate. The rationale for the frequency category for that particular reaction could be explained in sub-section c).

4.9 Overdose

Describe acute symptoms and signs and potential sequelae of different dose levels of the medicinal product based on all available information including accidental intake, mistakes and suicide attempts by patients.

Taking into account all relevant evidence, describe management of overdose in man, e.g. in

relation to monitoring or use of specific agonists/antagonists, antidotes or methods to increase elimination of the medicinal product such as dialysis. However, there should not be any dosage recommendation of other medicinal products (e.g. antidotes) as it could create conflict with the SmPCs of those other products. If applicable, counteractive measures based on genetic factors should be described.

Additional information on special populations

Information specifically observed in special populations such as elderly, patients with renal impairment, patients with hepatic impairment, other concomitant diseases etc.

Paediatric population

If there are specific paediatric considerations, there should be a sub-section entitled 'paediatric population'.

Special mention should be made of those medicinal products/strength of formulation for which ingestion of only one dose unit by children can cause fatal poisoning.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Sections 5.1 – 5.3 should normally mention information, which is relevant to the prescriber and to other health-care professionals, taking into account the approved therapeutic indication(s) and the potential adverse drug reactions. Statements should be brief and precise.

The sections should be updated regularly when new information becomes available, especially in relation to the paediatric population.

239

5.1 Pharmacodynamic properties

Describe:

- Pharmacotherapeutic group and ATC code:

Inclusion of the therapeutic subgroup (2nd level of WHO classification) with the 3rd level (pharmacological subgroup) and the 4th level (chemical subgroup) is recommended. If an ATC code is not yet available, this should be mentioned as 'not yet assigned'.

In case of medicinal product Authorized as similar biological medicinal product, the following statement will be included:

<<(Proprietary) Name> is a biosimilar medicinal product.

- Mechanism of action (if known)

- Pharmacodynamic effects.

- Clinical efficacy and safety

It may be appropriate to provide limited information, relevant to the prescriber, such as the main results (statistically compelling and clinically relevant) regarding pre-specified end points or clinical outcomes in the major trials, and giving the main characteristics of the patient population. Such information on clinical trials should be concise, clear, relevant and balanced, and should summarise evidence from relevant studies supporting the indication. The magnitude of effects should be described using absolute figures. (Relative risks or odd ratio should not be presented without absolute figures).

In the exceptional cases when clinically relevant information from subgroup or post-hoc analyses is presented, it should be identified as such in a balanced manner reflecting the limited robustness of both positive and negative secondary observations.

Any relevant pharmacogenetic information from clinical studies may be mentioned here. This should include any data showing a difference in benefit or risk depending on a particular genotype or phenotype.

Paediatric population

The results of all pharmacodynamic (clinically relevant) or efficacy studies conducted in children should be presented under this sub-heading.

Information should be updated when new relevant information becomes available.

Results should be presented by age or relevant subsets.

240

When there are data available, but there is no Authorized paediatric indication, data should be presented and a cross-reference should always be made to section 4.2 and, as appropriate to 4.3.

In presenting results of studies, particular attention should be given to include the relevant safety data. For exploratory studies, the results of the main endpoints should be given with the main characteristics of the population studied and the doses used. When they are available, information and results of confirmatory studies should usually supersede and replace those of exploratory studies. For confirmatory studies, the objectives, the study duration, the doses used (and the formulation used if different from the marketed one), the main characteristics of the patient population studied (including age and numbers of patient), and the main results regarding pre-specified endpoints should be provided, whether positive or negative. If data are considered inconclusive, this should be stated.

The objective and the main results or the conclusion of any specific clinical safety study should also be given.

5.2 Pharmacokinetic properties

Pharmacokinetic properties of the active substance(s) relevant for the advised dose, strength

and the pharmaceutical formulation marketed should be given in this section. If these are not available, results obtained with other administration routes, other pharmaceutical forms or doses can be given as alternative.

Basic primary pharmacokinetic parameters, for instance bioavailability, clearance and half-life, should be given as mean values with a measure of variability.

Pharmacokinetics items, which could be included in this section when relevant, are given below.

a. General introduction, information about whether the medicinal product is a pro-drug or whether there are active metabolites, chirality, solubility, information on the population in which general pharmacokinetic data were obtained, etc.

b. General characteristics of the active substance(s) after administration of the medicinal product formulation to be marketed.

Absorption: complete or incomplete absorption; absolute and/or relative bioavailability; first pass effect; T_{max}; the influence of food; in case of locally applied medicinal product the systemic bioavailability; involvement of transport proteins. If available, information on the site of absorption in the gastro-intestinal tract should be stated (as it may be important for administration by enteral feeding tubes).

241

Distribution: plasma protein binding; apparent volume of distribution per kilogram bodyweight (l/kg); tissue and/or plasma concentrations; pronounced multi-compartment behaviour; involvement of transport proteins.

Biotransformation: degree of metabolism; which metabolites; activity of metabolites and contribution to effect and toxicity; enzymes involved in metabolism; site of metabolism; results from in vitro interaction studies that indicate whether the new compound can induce/inhibit metabolic enzymes.

Elimination: elimination half-lives, total clearance; inter and/or intra-subject variability in total clearance; excretion routes of the unchanged substance and the metabolites including the relative portion of the hepatic and renal eliminated fraction, involvement of transport proteins.

Linearity/non-linearity: linearity/non-linearity of the pharmacokinetics of the active substance with respect to dose and/or time; if the pharmacokinetics are nonlinear with respect to dose and/or time, the underlying reason for the non-linearity should be presented. Additional relevant information should be included here.

c. Characteristics in specific groups of subjects or patients

■ Variations with respect to factors such as age, weight, gender, smoking status, polymorphic metabolism and concomitant pathological situations such as renal failure, hepatic disease, including degree of impairment. If the influence on pharmacokinetics is considered to be clinically relevant, it should be described here in quantitative terms (cross-reference to section 4.2 when applicable).

d. Pharmacokinetic/pharmacodynamics relationship(s)

■ Relationship between dose/concentration/pharmacokinetic parameter and effect (either true endpoint, validated surrogate endpoint or side effect).

■ The population studied should be described.

Paediatric population

Results of pharmacokinetic studies in the different paediatric age groups should be summarized, with comparison to adults if available. If appropriate, the dose producing similar product exposure as adults could be given. The pharmaceutical form(s) used for pharmacokinetic studies in children should be stated. Uncertainties due to limited experience should be stated.

5.3 Preclinical safety data

Information should be given on any findings in the non-clinical testing which could be of relevance for the prescriber, in recognizing the safety profile of the medicinal product used for the authorized indication(s), and which is not already included in other relevant sections of the SmPC.

242

If the results of the non-clinical studies do not add to the information needed by the prescriber, then the results (either positive or negative) need not be repeated in the SmPC.

The findings of the non-clinical testing should be described in brief with qualitative statements as outlined in the following example:

■ Non-clinical data reveal no special hazard for humans based on conventional studies of safety pharmacology, repeated dose toxicity, genotoxicity, carcinogenic potential and toxicity to reproduction and development.

■ Effects in non-clinical studies were observed only at exposures considered sufficiently in excess of the maximum human exposure indicating little relevance to clinical use.

■ Adverse reactions not observed in clinical studies, but seen in animals at exposure levels similar to clinical exposure levels and with possible relevance to clinical use were as follows.

Findings of non-clinical studies relevant for use in the paediatric population, including juvenile animals and peri- or post- natal studies, should be presented with a discussion of their clinical relevance, under a sub-heading if necessary.

<Environmental Risk Assessment (ERA)>

Where relevant, conclusions on the environmental risk assessment of the product should be included, with reference to section 6.6.

6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients

A list should be given of the excipients, expressed qualitatively only. All excipients, which are present in the product, should be included, even those present in small amounts, such as printing inks. Further details on the excipients to be declared may be found in the section on definitions and examples in the Guidelines on format and content of labels for medicinal products

For transdermal patches, all ingredients of the patch (including the adhesive, release liner and backing film) should be mentioned.

The active substance itself, residues of substances used during manufacture of the finished product (for example, solvents, head-space gases or antibiotics in vaccine manufacture), lubricants for prefilled syringes and constituents of capsule shells for inhalation powders not intended to be taken should not be included.

243

However, certain residues such as residues of antibiotic or other antimicrobial agents used in production that are known allergens with a potential for inducing undesirable effects should be mentioned in section 4.3 or 4.4 as appropriate.

Excipients should be referred to by their recommended INN if existing, accompanied by the salt or hydrate form if relevant or by their recognized pharmacopoeial name. If an excipient has neither an INN nor a pharmacopoeia name, it should be described by its usual common name. References to the pharmacopoeial quality should not be included. E numbers should be given along with the common name of the excipient where they exist and when necessary for proper use, e.g. when the excipient is listed in the Guideline on the excipients in the label and package leaflet of medicinal products for human use (as having recognised action or effect).

The ingredients in excipient mixtures should be listed individually. In cases where the full composition of a flavour or fragrance is not known to the applicant or is too complex, it may be declared in general terms (e.g. 'orange flavour', 'citrus perfume'). However, any of the components, which are known to have a recognised action or effect, should be included.

Ingredients that may or may not be added for the pH adjustment should be followed by the parenthesis '(for pH-adjustment)'

Proprietary names or general descriptive names such as 'printing ink' should not be used in place of the common name of an ingredient or of a mixture of ingredients but may be used in conjunction with the name(s) of the ingredient(s), so long as it is clear which ingredients are described by the name. Chemically modified excipients should be declared in such a way as to avoid confusion with the unmodified excipients, e.g. 'pregelatinised starch'.

In the case of a product containing a covert marker for the purpose of tracking, tracing and authentication, a general term such as "authentication factor" should be included in the list of excipients instead of the name of the excipient, unless the excipient is one that is known to have a recognised action or effect.

For clarity, it is recommended that each excipient be listed on a separate line. It can be useful to list excipients according to the different parts of the product, e.g. tablet core/coat, capsule contents/shells, etc. For products that are presented in more than one container or in dual-chamber containers, the excipients should be listed per container or per chamber.

Abbreviations for excipients should not be used. However, where justified for space considerations, abbreviations for excipient names may appear on the labelling, on condition that these abbreviations are designated in section 6.1.

6.2 Incompatibilities

244

Information on physical and chemical incompatibilities of the medicinal product with other products with which it is likely to be mixed or co-administered should be stated. This is particularly important for medicinal products to be reconstituted and/or diluted before parenteral administration. Significant interaction problems, e.g. sorption of products or product components to syringes, large volume parenteral containers, tubing, in-line filters, administration sets, etc. should be stated.

Statements concerning compatibility of the product with other medicinal products or devices should not be included in this section but in section 6.6. Statements concerning pharmacological and chemical/physical incompatibilities with food should be included in section 4.5. If appropriate, the standard statement, 'Not applicable', should be included.

For certain pharmaceutical forms, e.g. parenterals, either of the following standard statements should be included as appropriate:

- 'In the absence of compatibility studies, this medicinal product must not be mixed with other medicinal products.'
- 'This medicinal product must not be mixed with other medicinal products except those mentioned in section 6.6.'

6.3 Shelf life

The shelf life should be given for the medicinal product as packaged for sale and, if appropriate, after dilution or reconstitution or after first opening.

A clear statement of the shelf life should be given, in an appropriate unit of time.

An in-use shelf life may need to be stated for other medicinal products if development studies have found it to be necessary.

Additionally, if different concentrations need to be prepared, e.g. for use in children, the physicochemical stability throughout the entire concentration range should be stated; e.g. "The stability has been demonstrated between x mg/ml and y mg/ml for t hours/days at 25 °C and 2-8 °C".

In case of a paediatric indication, if no age appropriate formulation is available for children but an extemporaneous formulation could be prepared from an existing formulation, relevant physicochemical data on storage and stability should be included here with a cross-reference in sections 6.4 and 6.6."

In case of specific temporary storage conditions need to be provided to healthcare professionals or patients, e.g. for the purpose of ambulatory use (e.g. shelf-life 24 months at 2-8°C of which 3 months could be below 25°C), specific additional guidance should be provided as appropriate. Such information should always be based on stability data. In particular, the recommended temperature range and maximum duration of temporary storage should be specified. This guidance may also include the action to be taken after the product has been stored under the

245

temporary storage conditions (e.g. discard immediately). Statements such as "These data are not recommendations for storage" should not be used.

No reference should be made to the container unless there are different shelf lives for different containers. Storage conditions should not be included, except for the storage conditions after opening (see the corresponding guideline). Statements such as 'Do not use after the expiry date' should not be included.

When a device is supplied together with a medicinal product, the in-use shelf-life of the device should be given where applicable.

6.4 Special precautions for storage

Storage warnings should be stated.

For storage of sterile products that have been opened, diluted or reconstituted, a cross-reference should be made to section 6.3.

Note that if a specific storage warning is required, the warning should be consistent between the SmPC, label and PIL.

A warning to keep the product out of the reach and sight of children should not be included in the SmPC.

6.5 Nature and contents of container

Reference should be made to the immediate container using recognized pharmacopoeial standard term; the material of construction of the immediate container should be stated ('glass vials', 'PVC/Aluminium blisters', 'HDPE bottles'); and any other component of the product should be listed, e.g. needles, swabs, measuring spoons, syringes, inhaler devices, desiccant. The graduation on measuring devices should be explained. The container of any solvent provided with the medicinal product should also be described. Excessive detail, e.g., concerning the colour of the stopper, the nature of the heat-seal lacquer, should usually not be included. For parenteral preparations, when enclosure colour is used to differentiate between the presentations of a product, this should be stated here.

If appropriate, it should be indicated if the container closure is child-resistant.

Examples on the text in this section:

'<Volume> ml suspension in a pre-filled syringe (glass) with plunger stopper (chlorobutyl rubber) with or without needle in pack sizes of 5 or 10.'

246

'HDPE bottle with a child-resistant closure and a silica gel desiccant. Pack-sizes of 30, 60 or 90 film-coated tablets.'

All pack sizes should be listed. Pack sizes mentioned should include the number of units, number of doses (for e.g. multi-dose vaccines, inhalers, etc.), total weight or volume of the immediate container, as appropriate, and the number of containers present in any outer carton. If appropriate, a standard statement, 'Not all pack sizes may be marketed', should be included, in order to alert health professionals to the fact that not all listed pack sizes may be available for prescribing or dispensing.

Multiple unit packs for distribution purposes only do not constitute new pack sizes for marketing of the product and should therefore not be included in this section.

6.6 Special precautions for disposal <and other handling>

Instructions for disposal should be included here, if appropriate for the product.

Where special precautions for the handling and disposal of certain products such as cytotoxics and some biological products or waste material derived from it are advised, e.g. in the case of products containing live organisms, these should be stated in this section, as should, where relevant, the disposal of items which come into contact with the product, such as nappies, or spoons used to administer oral vaccines. If relevant, a cross-reference to conclusions on the environmental risk assessment described in section 5.3 can be included.

If applicable, e.g. for cytotoxics, the following standard statement should be included, 'Any unused product or waste material should be disposed of in accordance with local requirements.'

If there are no special use or handling instructions for the pharmacist or other healthcare professionals, the standard statement, 'No special requirements.' should be included.

Any directions necessary for the accurate preparation of certain products such as cytotoxics and some biological products and/or necessary for the protection of persons including parents or carers preparing or handling the product should be stated.

In section 4.2, instructions on handling of the product by the doctor, other health personnel, or patient should be included, as well as general information concerning the administration of the product (whether administered by the patient or the health personnel). If instructions for use/handling are needed where the medicinal product has to be prepared before use, e.g. where it must be suspended or diluted, this information has to be given here. For clarity, a cross-reference in section 4.2 to the relevant information in section 6.6 could be included, e.g. 'For instructions on dilution of the product before administration, see section 6.6.'

247

It is recommended that only information necessary for the pharmacist or other health personnel to prepare the product for administration to the patient should be included here.

Information on the preparation (e.g. the suspension of a powder for injection, or preparing a dilution) of the medicinal should be included in section 6.6, regardless of who prepares the product (e.g. pharmacist, doctor, other health personnel, patient, parents or carers). In the case of products for reconstitution, the appearance of the product after reconstitution should be stated.

Statements concerning compatibility of the product with other medicinal products or devices can be given here provided the data have been provided in the dossier.

In the exceptional cases where a product is indicated in children and where no adequate paediatric formulation can be developed (based on duly justified scientific grounds), information on extemporaneous formulation should appear under a sub-heading "Use in the paediatric population" and should cross-refer to the section 4.2. Detailed instructions for the preparation of the extemporaneous formulation from the appropriate "adult" or other "older children" dosage form and additional information on extemporaneous formulations for use in younger children shall be provided and, where appropriate, the maximum storage time during which such preparation will conform to its specifications. When necessary, the required packaging material and storage conditions should be stated here.

Any specific warnings for the handling of the product should be in section 4.4.

Information on risks due to occupational exposure should be included in this section, with reference to section 4.4 or 4.8 if there is information in that section.

7. MARKETING AUTHORIZATION HOLDER AND MANUFACTURING SITE ADDRESSES

Name and permanent address or registered place of business of the Marketing Authorization Holder and manufacturing site(s) physical address.

Telephone, fax numbers or e-mail addresses may be included (not websites or emails linking to websites).

8. MARKETING AUTHORIZATION NUMBER

Item to be completed by the Marketing Authorization Holder once the Marketing Authorization has been granted by TMDA.

9. DATE OF FIRST <REGISTRATION> / RENEWAL OF THE <REGISTRATION>

248

Item to be completed by the Marketing Authorization Holder once the Marketing Authorization has been granted or renewed.

Both the date of first authorization and, if the authorization has been renewed, the date of the (last) renewal should be stated in the format given in the following example:

Date of first authorization: 3 April 1985
Date of latest renewal: 3 April 2000

10. DATE OF REVISION OF THE TEXT

Leave blank in case of a first Marketing Authorization.

11. DOSIMETRY (IF APPLICABLE)

Full details of internal radiation dosimetry should be included in this section for radiopharmaceuticals.
For all other products, this section should be excluded.

12 INSTRUCTIONS FOR PREPARATION OF RADIOPHARMACEUTICALS (IF APPLICABLE)

For radiopharmaceuticals, additional detailed instructions for extemporaneous preparation and quality control of such preparation and, where appropriate, maximum storage time during which any intermediate preparation such as an eluate or the ready-to-use pharmaceutical will conform to its specifications.

Special instructions relating to the disposal of containers and unused contents should also be included.

249

PART V:

GUIDELINES ON FORMAT AND CONTENT OF LABELS FOR MEDICINAL PRODUCTS

250

1. GENERAL REQUIREMENTS

(a) The label text

Particulars in the label shall be easily legible, clearly comprehensible and indelible.

(b) Conformity with the Summary of Product Characteristics

The label text should be in conformity with the summary of products characteristics.

(c) Language

The labelling must be presented at least in English and/or Swahili. If more than one language is used, then all of the text must be in each language and the overall readability should not be adversely affected. The content of all language versions must be identical. It is recommended to group different text elements for each language, where appropriate.

(d) Products with different strengths

Container labels may look similar across multiple strengths of the same product or across multiple products within a company's product line.

Product labels for medicinal products with multiple pharmaceutical strengths, within a manufacturer's product line, should be designed such that the products are identifiable and can be significantly differentiated from one another. Colour differentiation on product labels should be an effective tool that can differentiate products within a manufacturer's product line.

When applying differentiating colour, the applicant should ensure that the text highlighted by the differentiating colour has adequate colour contrast against the background colour on the container label.

(e) Label layout and artwork

Images, pictograms and other graphics may be used to aid comprehension of the information on the labels of non-prescription medicines only and not on the container labels of prescription medicines.

Images, pictograms and other graphics should exclude any element of a promotional nature and should only be used to aid navigation, clarify or highlight certain aspects of the text and should not replace the actual text.

The overall layout should not be misleading or have any inappropriate connotations in a way that no doubt about the meaning of a particular pictogram will be perceived.

251

2. PARTICULARS TO BE INCLUDED ON THE LABEL

(a) Outer packaging or, where there is no outer packaging, on the immediate packaging

The label should include at least the following:

- i. Proprietary Name where applicable
- ii. International Non-Proprietary name(s) of the Active Pharmaceutical Ingredient(s)
- iii. Amount of each Active Pharmaceutical Ingredient present in a dosage unit
- iv. List of excipients known to be a safety concern for some patients, e.g. lactose, gluten, metabisulfites, parabens, ethanol, or tartrazine. For parenterals and topical preparations, all excipients should be listed.
- v. Pharmaceutical form and contents of the container, e.g. number of dosage units, weight or volume.
- vi. Method and route(s) of administration and the statement "Read the patient information leaflet before use."
- vii. Special warning that the medicinal product must be stored out of the reach and sight of children ("Keep out of the reach and sight of children").
- viii. Other special warnings and handling precautions, if necessary (e.g. in case of specific toxicity of the agents)
- ix. The word "sterile" if the product is sterile
- x. Batch number assigned by the manufacturer
- xi. The manufacturing date
- xii. The expiry date
- xiii. Special storage conditions, if applicable
- xiv. Special precautions for disposal of unused medicinal products or waste material derived from such medicinal products, if appropriate
- xv. The name and address of the Marketing Authorization Holder
- xvi. Physical address of the site responsible for release of the finished product
- xvii. Advice on general classification for distribution, e.g., Controlled Medicines, Prescription Only Medicines, Pharmacy Only Medicines, Over-the-Counter and General Sales List
- xviii. Instruction on use
- xix. The proprietary name, strength and expiry date in braille (Marburg Medium)
- xx. A unique identifier (example a product specific barcode, unique code or registration number issued by NMRA).

(b) Guidance for small containers

For containers of less than or equal to 10 ml capacity that are marketed in an outer pack such as

a carton, and the outer pack bears all the required information, the immediate container should contain at least these minimum information (added):-

252

- i. Brand Name of the FPP, INN name, strength, pharmaceutical form, active substance(s) and route(s) of administration
- ii. Method of administration
- iii. Batch number assigned by the manufacturer
- iv. Expiry date
- v. Manufacturing date if space is enough
- vi. Contents by weight, by volume or by unit
- vii. The name and address of the manufacturing site— or a logo that unambiguously identifies the company.
- viii. Directions for use, and any warnings or precautions that may be necessary

(c) Guidance for Blisters and strips

Blisters and strips should include, as a minimum, the following information (printed directly):-

- i. Name, strength and pharmaceutical form of the FPP.
- ii. Name and physical address of the manufacturing site (the site responsible for release of the finished product)
- iii. The batch number assigned by the manufacturer
- iv. The expiry date [Note that for co-blistered products, the expiry date is that of the product which expires first.]
- v. The manufacturing date, if space is enough
- vi. The batch number assigned by the manufacturer
- vii. Directions for use, and any warnings or precautions that may be necessary.

(d) Additional labelling information required by some Partner States

Partner State NMRAs may require the use of certain forms of labelling making it possible to indicate:-

- i. Price of the medicinal product;
- ii. The reimbursement conditions of social security organisations;
- iii. Identification and authenticity;
- iv. A statement that the product is a property of government

The information specific to a Partner State NMRA should be accommodated on the label in a box, to appear on one side of the pack. Each box should only be presented in the official language or languages of the Partner State concerned and should state the name of that Partner State.

3. CONTROL OF THE CONFORMITY OF THE LABELLING

The labelling of the medicinal product forms part of the authorization and it must, therefore, be approved by the NMRA when the authorization is granted.

253

4. CHANGES TO THE LABELLING

Any changes to the labelling, which are not connected with the Summary of Product Characteristics, shall be notified to the NMRA where the authorization is granted. Therefore, if a Marketing Authorization Holder wishes either to introduce any label text additional to that in the decision or to change any aspect of the labelling he must first notify this change to the relevant mentioned NMRA, who shall inform the Marketing Authorization Holder whether the proposed change is accepted or not.

254

PART VI:

GUIDELINES ON FORMAT AND CONTENT OF PACKAGE INSERTS FOR PHARMACEUTICAL PRODUCTS

255

1. GENERAL REQUIREMENTS

1.1 The Package insert

Particulars in the package insert shall be easily legible, clearly comprehensible and indelible.

a) Type size and font

The following should be considered while selecting type size and font:

- i. The font should be easy to read; stylized fonts which are difficult to read should not be used;
- ii. The font should be such that similar letters/numbers such as "l", "I" and "1" can be easily distinguished from each other;
- iii. A minimum type size of 9 points, as measured in font 'Times New Roman', not narrowed, with a space between lines of at least 3 mm, should be used;
- iv. Widespread use of capitals is discouraged; however, capitals may be used for emphasis.

b) Paper

The quality of insert paper should be taken into consideration in order to ensure proper readability of the insert. The following should be considered:

- i. The paper weight should be such that the paper is sufficiently thick to reduce transparency which makes reading difficult, particularly where the text size is small.
- ii. Uncoated paper is preferred as glossy paper reflects light thus making information difficult to read.
- iii. When the leaflet is folded the creases should not interfere with the readability of the information or lead to tearing of the insert.

1.2 Conformity with the Summary of Product Characteristics

The package insert should be in conformity with the summary of products characteristics.

1.3 Language

The labelling must be presented at least in English. An active style of writing should be used instead of passive.

2. PARTICULARS TO BE INCLUDED ON THE PACKAGE INSERT

256

2.1 CONTENT AND FORMAT OF THE PRESCRIBING INFORMATION

For prescription only medicines, the package insert should include prescribing information. The content and format for the prescribing information should follow that of Summary of Product Characteristics (SmPC). Please refer to the Guidelines on Format and Content of Summary of Product Characteristics for Pharmaceutical Products.

2.2 CONTENT AND FORMAT OF THE PATIENT INFORMATION LEAFLET

The patient information leaflet shall include the particulars outlined in the template in the following section.

The applicant should complete the template and delete the parts which are not applicable.

2.2.1 TEMPLATE FOR PATIENT INFORMATION LEAFLET

{{(Proprietary) name strength pharmaceutical form}}

{Active substance(s)}

Read all of this leaflet carefully before you start <taking><using> this medicine.

■ Keep this leaflet. You may need to read it again.

■ If you have any further questions, ask your <doctor, health care provider><or><pharmacist>.

■ This medicine has been prescribed for you. Do not pass it on to others. It may harm them, even if their symptoms are the same as yours.

■ If any of the side effects gets serious, or if you notice any side effects not listed in this leaflet, please tell your <doctor, health care provider><or><pharmacist>.>

In this leaflet:

- a) What {product name} is and what it is used for
- b) Before you <take><use> {product name}
- c) How to <take><use> {product name}
- d) Possible side effects

257

- e) How to store {product name}
- f) Further information

[Delete sections that are not applicable]

a) WHAT {PRODUCT NAME} IS AND WHAT IT IS USED FOR

b) BEFORE YOU <TAKE><USE> {PRODUCT NAME}

Do not <take><use> {product name}

- <if you are allergic (hypersensitive) to {active substance(s)} or any of the other ingredients of {product name}>.

- <if ...>

Take special care with {product name}

- <if you ...>

- <when ...>

- <Before treatment with {product name},...>

<Taking><Using> other medicines

<Please tell your <doctor, health care provider><or><pharmacist> if you are taking or have recently taken any other medicines, including medicines obtained without a prescription.>

<Taking><Using> {product name} with food and drink

Pregnancy and breast-feeding

<Ask your <doctor, health care provider><or><pharmacist> for advice before taking any medicine.>

Driving and using machines

<Do not drive <because...>.>

<Do not use any tools or machines.>

258

Important information about some of the ingredients of {product name}

c) HOW TO <TAKE><USE> {PRODUCT NAME}

<Always <take><use> {product name} exactly as your doctor or health care provider has told you. You should check with your <doctor, health care provider><or><pharmacist> if you are not sure.><The usual dose is...>

<Use in children>

If you <take><use> more {product name} than you should

If you forget to <take><use> {product name}

<Do not take a double dose to make up for a forgotten <tablet><dose><...>.>

If you stop <taking><using> {product name}

<If you have any further questions on the use of this product, ask your <doctor, health care provider><or><pharmacist>.>

d) POSSIBLE SIDE EFFECTS

Like all medicines, {product name} can cause side effects, although not everybody gets them.

If any of the side effects gets serious, or if you notice any side effects not listed in this leaflet, please tell your <doctor, health care provider><or><pharmacist>.

e) HOW TO STORE {PRODUCT NAME}

Keep out of the reach and sight of children.

<Do not store above °C>, <Store in the original <container><carton>>

Do not use {product name} after the expiry date which is stated on the <label><carton><bottle><...><after {abbreviation used for expiry date}>.><The expiry date refers to the last day of that month.>

<Do not use {product name} if you notice {description of the visible signs of deterioration}>.

259

<Medicines should not be disposed of via wastewater or household waste. Ask your pharmacist how to dispose of medicines no longer required. These measures will help to protect the environment.>

f) FURTHER INFORMATION

What {product name} contains

- The active substance(s) is (are)...
- The other ingredient(s) is (are)...

What {product name} looks like and contents of the pack

Name and full physical address of Marketing Authorization Holder and Manufacturing site:-

PART VII:

GUIDELINES ON COMMON GLOSSARY OF TERMS USED IN MEDICINES REGISTRATION

261

ABBREVIATIONS AND ACRONYMS

BMGF - Bill and Melinda Gates Foundation

EAC - East African Community

EAC-MRH - East African Community Medicines Regulatory

EMA - European Medicines Agency

GMP - Good Manufacturing Practice

ICH - The International Council for Harmonisation of Technical Requirements
for Pharmaceuticals for Human Use

MA - Marketing Authorization

MAH - Marketing Authorization Holder

MER - Medicines Evaluation and Registration

NEPAD - New Partnership for African Development

NMRA - National Medicines Regulatory Authority

Requirements for Registration of Pharmaceuticals for Human Use

TWG - Technical Working Group

US FDA - United States Food and Drug Administration

WHO - World Health Organization

SRA - Stringent Regulatory Authority

262

1. INTRODUCTION

Glossary of terms in medicines registration have been developed to minimize misunderstanding of words used in medicines registration as this process is at the nexus of many key stakeholders. There is also an increasing proliferation and duplication of terms and definitions, as the medicines registration field itself is still evolving and adapting itself to new and changing contexts.

The glossary provides information on the range of terms and definitions encountered in medicines registration. It does not present new or different definitions of terms, but draws together definitions from many existing sources. Changes to definitions have been minimal, and only made to unify the style of the Glossary, e.g. some spelling has been standardised, and the plural form of terms has been replaced by the singular form.

2. SELECTION OF TERMS

The terms were selected from existing glossaries appended to guidelines on application for registration of medicines from respective EAC Partner States. Also, the terms were selected from international guidelines such as USFDA, WHO, EMA, Health Canada and other international publications.

Furthermore, definitions were selected using the criteria of widespread acceptance, wide spread use and consultation from EAC National Medicines Regulatory Authorities.

3. SCOPE

This glossary of terms primarily addresses terms that are used in various EAC harmonized guidelines on registration of human medicinal products. The terms are defined in context of EAC Human Medicines Registration Harmonization Project as they are confined to the respective regulations and guidelines that are intended to be used in EAC Region.

263

4. GLOSSARY

In the context of EAC-Human Medicines Registration Harmonization the following words/phrases are defined as follows:

Active pharmaceutical An active ingredient is any component that provides ingredient (API) pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease, or to affect the structure or any function of the body of man or animals.

(USFDA Glossary of terms, it can be found in line at
Drugs@FDA Glossary of Terms).

Acceptance criteria The product specifications and acceptance/rejection criteria, such as acceptable quality level and unacceptable quality level, with an associated sampling plan, that are necessary for making a decision to accept or reject a lot or batch (or any other convenient subgroups of manufactured units).

(WHO guide to good manufacturing practice (GMP) requirements, at <http://www.who.int/vaccines-documents/DocsPDF/www9651.pdf>).

Active Pharmaceutical See Drug Master File (DMF)
Ingredient Master File-
(APIMF)

Active Substance See Active pharmaceutical ingredient (API)

Adverse reaction (Adverse An adverse drug reaction is a response to a medicinal Drug Reaction, ADR) product which is noxious and unintended and which occurs at doses normally used in man for the prophylaxis, diagnosis or therapy of disease or for the restoration, correction or modification of physiological function.

At:<http://www.who.unc.org/DynPage.aspx?id=13111&mn=1513>]

Applicant See Marketing Authorization Holder

Batch (or lot) A defined quantity of material produced in a process or

264

series of processes so that it is expected to be homogeneous within specified limits.

(European Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Batch number (or lot A distinctive combination of numbers and/or letters which number) specifically identifies a batch or lot and from which the production history can be determined.

(European Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Bio-equivalence The absence of a significant difference in the rate and extent to which the active ingredient or active moiety in pharmaceutical equivalents or pharmaceutical alternatives becomes available at the site of action when administered at the same molar dose under similar conditions in an appropriately designed study.

(Glossary (terms and abbreviations)/EMA).

Bulk product Any product that has completed all processing stages up to, but not including, final packaging.

(WHO guide to good manufacturing practice (GMP) requirements, at <http://www.who.int/vaccines-documents/DocsPDF/www9651.pdf>).

Calibration A set of operations which establish, under specified conditions, the relationship between values indicated by a measuring instrument or measuring system, or values represented by a material measure, and the corresponding known values of a reference standard.

(European Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Certificate of Pharmaceutical WHO-type certificate as defined in the WHO Certification Product (CPP) Scheme on the quality of pharmaceutical products moving in international commerce.

(WHO Model Quality Assurance System for Procurement Agencies; it can be found at <http://www.myaccessrh.org/documents/10157/37547/ModelQualityAssurance.pdf>).

Clinical trial (clinical study) A clinical trial is any systematic study on pharmaceutical

265

products in human subjects, whether in patients or other volunteers, in order to discover or verify the effects of, and/or identify any adverse reaction to, investigational products, and/or to study the absorption, distribution, metabolism and excretion of the products with the object of ascertaining their efficacy and safety.

(WHO Medicines Regulatory Package. A Collection of Tools for Medicines Regulatory Authorities - Regulatory Support Series No. 014 at: <http://infocollections.org/medregpack/interface/files/glossary.pdf>)

Comparator An investigational or marketed product (i.e., active control), or placebo, used as a reference in a clinical trial.

(<http://www.gcpelpdesk.com/index.php/glossary/10-c>)

Comparator product A pharmaceutical product with which the multisource product is intended to be interchangeable in clinical practice

(https://www.who.int/medicines/areas/quality_safety/quality_assurance/guidanceontheselectionofcomparatorpharmproducts-etc_qas14-596_18072014.pdf)

Composition Composition in relation to a medicinal product means the ingredients of which it consists, proportions, degree of strength, quality and purity in which those ingredients are contained.

Kenya and Guidelines on submission for Documentation for Registration of Human medicinal Product-TMDA).

Conflict of interest A conflict of interest is a situation in which a public official's decisions are influenced by the official's personal interests.

[At: <http://wordnet.princeton.edu/>]

Contamination The unintended, non-process related, introduction of impurities of a chemical or microbiological nature, or of foreign matter, into or onto a material during production,

sampling, packaging or repackaging, storage or transport.
(European Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

266

Continuous production A process in which a material is continuously produced in a step or series of steps. In a continuous process the batches of raw materials and the process parameters can be statistically, but not absolutely, correlated to the material produced in a given window of time.

(European Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Controlled Medicines Narcotic medicines and psychotropic substances regulated by provisions of national medicines laws.

(WHO Medicines Regulatory Package. A Collection of Tools for Medicines Regulatory Authorities - Regulatory Support Series No. 014 at: <http://infocollections.org/medregpack/interface/files/glossary.pdf>)

Cross contamination Contamination of a material or product with another material or product, thus cross contamination is a particular form of contamination.

(European Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Data exclusivity Data exclusivity is the protection of an originator pharmaceutical company's data preventing other parties from using these data for a commercial purpose.

(OECD – Pharmaceutical Pricing Policies in a Global Market, at: http://www.oecd.org/document/36/0,3343,en_2649_33929_41000996_1_1_1_37407,00.html).

Design Space The multidimensional combination and interaction of input variables (e.g., material attributes) and process parameters that have been demonstrated to provide assurance of quality.

(ICHQ8- Glossary at http://www.ema.europa.eu/docs/en_GB/document_library/Scientific_guideline/2009/09/WC500002872.pdf)

Direct to consumer Direct-to-consumer advertising (DTC advertising) usually advertising refers to the marketing of medicines aimed directly toward the public, rather than healthcare professionals. Forms of DTC advertising include TV, print, and radio.

267

(OECD – Pharmaceutical Pricing Policies in a Global Market, at: http://www.oecd.org/document/36/0,3343,en_2649_33929_41000996_1_1_1_37407,00.html).

Distribution category Distribution category indicates how a drug product is sold or dispensed. For example Prescription Only Medicines (POM), Over the Counter (OTC) refer to national guideline).(WHO glossary of terms)

Dosage form See pharmaceutical form

Drug Master File (DMF) Is a master file that provides a full set of data on an active pharmaceutical ingredient (API). In other circumstances the term may also comprise data on an excipient.

(Guidelines to Submission of Applications for Registration of Drug, Pharmacy and Poisons Board-Kenya).

Drug Product A finished dosage form, for example, a tablet, capsule or solution that contains an active pharmaceutical ingredient, generally, but not necessarily, in association with inactive ingredients. Reference: Manufacturing, Processing, or Holding Active Pharmaceutical Ingredients FDA Guidance (<https://www.registrarcorp.com/fdadugs/definitions/>)

Drug Substance See Active pharmaceutical ingredient (API)

Marketing authorization issued to a product that is Duplicate license identical in terms of qualitative and quantitative composition, manufacturing process and sites as well as quality controls to an already registered medicinal product. The only difference would be the brand name and product labels.

Efficacy The ability of a drug to produce the intended effect as determined by scientific methods, for example in pre-clinical research or clinical research studies.

(WHO Glossary of terms used in Pharmacovigilance, at <http://who-umc.org/Graphics/24729.pdf>).

Essential medicines Essential medicines satisfy the priority health care needs of the population. They are selected with due regard to public

health relevance, evidence on efficacy and safety, and comparative cost-effectiveness.

(At: http://www.who.int/topics/essential_medicines/en/)

Ethics Committee (EC)/ Ethics Committees (EC) ensure that biomedical research Institutional Review Board follows international guidelines, including the Declaration (IRB) of Helsinki, the WHO and ICH Guidelines for Good Clinical Practice. The purpose of an EC in reviewing biomedical research is to contribute to safeguarding the dignity, rights, safety, and well-being of all actual or potential research participants. (Operational Guidelines for Ethics Committees That Review Biomedical Research Geneva 2000, can be found online at: <http://apps.who.int/tdr/publications/training-guideline-publications/operational-guidelines-ethics-biomedical-research/pdf/ethics.pdf>)

Excipient Is any constituent of a pharmaceutical form that is not an active pharmaceutical ingredient

(Guideline on excipients in the dossier for application for marketing authorization of a medicinal product, it can be found on line at

http://www.ema.europa.eu/docs/en_GB/document_library/Scientific_guideline/2009/09/WC500003380.pdf).

Extension application A new application that is a modification/addition to an already registered medicinal product. The modification/addition shall be such that it does not fulfil criteria for minor or major variations but is similar enough to the original (already registered) product in terms of quality, safety and efficacy. A new marketing authorization will be issued for extension applications.

Finished Pharmaceutical Product (FPP) A finished dosage form of a pharmaceutical product which has undergone all stages of manufacture, including packaging in its final container and labelling (WHO Glossary)

Formulary A formulary is a manual containing clinically oriented summaries of pharmacological information about selected medicines.

(How to develop a national formulary based on the WHO model 269

formulary, a practical guide Geneva 2004, can be found online at: <http://apps.who.int/medicinedocs/en/d/Js6171e/2.3.html>)

General Sales Medicines Medicines which may be sold either by way of retail or (GSM) wholesale in an open shop such as supermarkets.

Generic product Is a medicinal product which has the same qualitative and quantitative composition in active substances and the same pharmaceutical form as the reference medicinal product, and whose bioequivalence with the reference medicinal product has been demonstrated by appropriate bioavailability studies.

(PHIS Glossary 2009, can be found on line at:

<http://phis.goeg.at/index.aspx?alias=phisglossary>)

Good Clinical Practice A standard for the design, conduct, performance, monitoring, auditing, recording, analyses, and reporting of clinical trials that provides assurance that the data and reported results are credible and accurate, and that the rights, integrity, and confidentiality of trial subjects are protected.

(PHIS Glossary 2009, can be found on line at:

<http://phis.goeg.at/index.aspx?alias=phisglossary>)

Good Manufacturing Practice (GMP) Part of quality assurance which ensures that products are consistently produced and controlled to the quality standards appropriate to their intended use and as required by the marketing authorization.

(WHO A model quality assurance system for procurement agencies Geneva 2007, can be found online at:

<http://apps.who.int/medicinedocs/documents/s14866e/s14866e.pdf>)

Impurity Any component present in the active pharmaceutical ingredient other than the substance defined as the active pharmaceutical ingredient

(European Federation of Pharmaceutical Industries and Association; GMP for API manufacturer,

At <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Innovator medicinal product Generally the medicinal product that was first authorized for marketing (normally as a patented product) on the basis of documentation of efficacy, safety and quality. (WHO glossary of terms)

In-process control Checks performed during production in order to monitor and, if necessary, to adjust the process, including repeating a process step, to ensure that the product conforms to its specification.

(European Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Intermediate Partly processed material which must undergo further production steps before it becomes an Active Ingredient. (European Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

International Conference on The International Conference on Harmonization of harmonisation of Technical Technical Requirements for Registration of Requirements for Pharmaceuticals for Human Use (ICH) is a project that Registration of brings together the regulatory authorities of Europe, Japan Pharmaceuticals for Human and the United States and experts from the pharmaceutical Use (ICH) industry in the three regions to discuss scientific and technical aspects of product registration. [At: <http://www.ich.org/cache/compo/276-254-1.html>]

Reference product Pharmaceutical product with which the new product is intended to be interchangeable in clinical practice. The reference product will normally be the innovator product for which efficacy, safety and quality have been established. Where the innovator product is not available, the product which is the market leader may be used as a reference product, provided that it has been authorized for marketing and its efficacy, safety and quality have been established and documented.

(<http://apps.who.int/medicinedocs/en/d/Js5516e/19.2.htm#Js5516e.19.2>)

International Non- INN is a unique name that is globally recognized and is proprietary Name (INN) public property. [WHO Guidance on INN at: <http://www.who.int/medicines/services/inn/innguidance/en/index.html>]

Label Is a descriptive matter, written, printed, stenciled, marked, 271 embossed or impressed on or attached to a packaging of any medicinal product. (Adapted from USFDA Glossary of terms, can be found in line at Drugs@FDA Glossary of Terms).

Law Laws define the roles, rights and obligations of all parties involved in the subject matter in general terms. (WHO Medicines Regulatory Package. A Collection of Tools for Medicines Regulatory Authorities - Regulatory Support Series No. 014 at: <http://infocollections.org/medregpack/interface/files/glossary.pdf>)

Legal category See Distribution category

Legislation Legislation corresponds to the first stage of the legislative process, in which laws are passed by the legislative body of government with regard to a subject matter such as the control of pharmaceuticals. (WHO A model quality assurance system for procurement agencies Geneva 2007, can be found online at: <http://apps.who.int/medicinedocs/documents/s14866e/s14866e.pdf>)

License Holder A license holder is an individual or a corporate entity possessing a marketing authorization for a medicinal product. (WHO Medicines Regulatory Package. A Collection of Tools for Medicines Regulatory Authorities - Regulatory Support Series No. 014 at: <http://infocollections.org/medregpack/interface/files/glossary.pdf>) (Also see Market authorization Holder).

Licensing system National legal provisions on who should manufacture, import or supply medicinal products, what qualifications people in the supplying agency should have, and who should dispense and sell pharmaceutical products. (WHO glossary of terms)

Local Technical A person or company with sufficient pharmaceutical Representative expertise that is incorporated within the specific country and who will be responsible for facilitating communication with the Applicant and when the product is registered shall assume all legal responsibilities.

272

Manufacture Manufacturing includes all operations of receipt of (manufacturing) materials, production, packaging, repackaging, labelling, relabeling, quality control, release, storage and distribution

of active pharmaceutical ingredients and/or medicinal product.

[PHIS Glossary 2009, can be found on line at:

<http://phis.goeg.at/index.aspx?alias=phisglossary>]

Manufacturer A manufacturer is a natural or legal person with responsibility for manufacturing of a medicinal product or active pharmaceutical ingredient.

(PHIS Glossary 2009, can be found on line at:

<http://phis.goeg.at/index.aspx?alias=phisglossary>)

Market Authorization Holder Is a person who holds authorization to place a medicinal product in the EAC Partner States and is responsible for that product.

Marketing Authorization Means approval to market a medicinal product in an EAC (MA) Partner States.

(Glossary of terms and abbreviations/EMA, it can be found at

http://www.ema.europa.eu/docs/en_GB/document_library/Other/2010/12/WC500099907.pdf).

Medical device Means an article which is intended to be used for human beings or animals for the purpose of diagnosis, prevention, monitoring, treatment or alleviation of disease, diagnosis, monitoring, treatment, alleviation of or compensation for an injury or handicap, investigation, replacement or modification of the anatomy or of a physiological process, or control of conception and does not achieve its purpose by pharmacological, immunological or metabolic means.

(Upholding standards and public trust in pharmacy, at

<http://www.pharmacyregulation.org/sites/default/files/Glossary%20of%20terms%20used%20in%20GPhC%20standards%20Feb%202012.pdf>)

Medicinal Product Any substance or combination of substances which may be administered to human beings or animals with a view to making a medical diagnosis or to restoring, prevention, correcting or modifying physiological functions in human beings or animals.

Medicinal Substance See Active pharmaceutical ingredient (API)

273

Medicines Regulatory Authority A national body that has the legal mandate to set objectives and administer the full spectrum of medicines regulatory activities.

(WHO Medicines Regulatory Package. A Collection of Tools for Medicines Regulatory Authorities - Regulatory Support Series No. 014 at:

<http://infocollections.org/medregpack/interface/files/glossary.pdf>).

National essential medicines The list of essential medicines that has been defined, list adopted, and published at country level.

(WHO A model quality assurance system for procurement agencies Geneva 2007, can be found online at:

<http://apps.who.int/medicinedocs/documents/s14866e/s14866e.pdf>)

Originator medicinal product An originator brand is generally the product that was first product/originator brand authorized worldwide for marketing (normally as a patented product) on the basis of the documentation of its efficacy, safety and quality, according to requirements at the time of authorization.

(HAI/WHO Measuring medicine prices, availability, affordability and price components (2nd Edition) and at:

<http://www.haiweb.org/medicineprices/manual/documents.html>)

Over-The-Counter medicines Are medicines which are safe and effective for use by the general public without a doctor's prescription.

(WHO Medicines Regulatory Package. A Collection of Tools for Medicines Regulatory Authorities Regulatory Support Series No. 014 at:

<http://infocollections.org/medregpack/interface/files/glossary.pdf>)

Packaging materials Any material used to protect an Active Pharmaceutical Ingredient or finished pharmaceutical product during storage and transport but excluding labels.(European Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Patient Information Leaflet Packages insert which contains information for patient's (PIL) understanding of how to safely use a medicinal product.

274

(USFDA Glossary of terms, can be found in line at [Drugs@FDA](http://www.fda.gov/oc/ohrt/Drugs@FDA) Glossary of Terms).

Pharmaceutical alternatives Medicinal products are considered pharmaceutical alternatives if they contain the same therapeutic moiety, but are different salt, esters, or complexes of that moiety, or are different dosage forms or strengths.

(USFDA Orange book, it can be found on line at

http://www.fda.gov/ohrms/dockets/ac/05/briefing/2005-4137B1_07_Nomenclature.pdf)

Pharmaceutical equivalents Medicinal products are considered to be pharmaceutical equivalents if they contain the same active ingredient(s) same dosage form and route of administration and they are identical in strength or concentration. (USFDA Glossary of terms, can be found in line at [Drugs@FDA Glossary of Terms](#))

Pharmaceutical form The pharmaceutical form is the pharmaceutical-technological form in which an active substance is made available. Pharmaceutical may be administered in solid form (e.g. tablets, powers), in semi-liquid form (e.g. ointments, pastes), in liquid form (e.g. drops, injectables, infusions) or in gaseous form (inhalation). (WHO glossary of terms).

Pharmaceutical Product A pharmaceutical product is any substance for human or veterinary use that is intended to modify or explore physiological systems or pathological states for the benefit of the recipient.

[WHO A model quality assurance system for procurement agencies Geneva 2007, can be found online at:

<http://apps.who.int/medicinedocs/documents/s14866e/s14866e.pdf>]

Pharmacy Pharmacies are premises which in accordance to the local legal provisions and definitions may operate as a facility in the provision of pharmacy services in the community or health facility setting.

(In WHO Operational package for assessing, monitoring and evaluating country pharmaceutical situations at:

http://www.who.int/medicines/publications/WHO_TCM_2007.2/en/)

Post-marketing surveillance Post-marketing surveillance is testing medicine samples to assess the quality of medicines that have already been

275

licensed for public use.

(In WHO Operational package for assessing, monitoring and evaluating country pharmaceutical situations at:

http://www.who.int/medicines/publications/WHO_TCM_2007.2/en/)

Post-marketing surveillance Studies performed after the pharmaceutical product has study been marketed.

(In WHO Operational package for assessing, monitoring and evaluating country pharmaceutical situations at:

http://www.who.int/medicines/publications/WHO_TCM_2007.2/en/)

Pre-marketing The stage before a drug is available for prescription or sale to the public.(WHO Glossary of terms used in

Pharmacovigilance,

At <http://who-umc.org/Graphics/24729.pdf>

Prescription-Only Medicines Prescription-only medicines are medicines supplied only in licensed pharmacies on the presentation of signed prescriptions issued by a licensed and registered medical practitioner, licensed and/or registered dentist (for dental treatment only), and/or licensed and/or registered veterinarian (for animal treatment only), and the supply and dispensing of these medicines must be carried out by a pharmacist or under the supervision of a pharmacist. (WHO glossary of terms)

Procedures Description of the operations to be carried out, the precautions to be taken, and measures to be applied directly or indirectly related to the manufacture of an Active Ingredient and Finished Pharmaceutical product.

(European Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at

<http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Process aids Materials used as aids in the manufacture of an Active Ingredient and Finished Pharmaceutical Product which themselves do not participate in a chemical or biological reaction.

(Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

276

Product Information Product information refers to the summary of product characteristics (SmPC), labelling and patient information leaflet.

(Glossary of terms and abbreviations/EMA it can be found at

http://www.ema.europa.eu/docs/en_GB/document_library/Other/2010/12/WC500099907.pdf).

Promotion Promotion refers to all informational and persuasive activities by manufacturers and distributors, the effect of

which is to induce the prescription, supply, purchase and/or use of medicinal drugs.
[C:\Documents and Settings\CVialle\Desktop\Country profile - Instructions and glossary 14 Sept 2010\WHO. A model quality assurance system for procurement agencies.pdf Criteria for Medicinal Drug Promotion can be found online at:
<http://apps.who.int/medicinedocs/documents/whozip08e/whozip08e.pdf>]

Proprietary name Name given for marketing purposes to any ready-prepared medicine placed on the market.
(PHIS Glossary 2009, it can be found at http://phis.goeg.at/downloads/glossary/PHIS%20Glossary_UpdatedApril2011.pdf).

Quality Information The QIS is a condensed version of Summary (QIS) the Quality Overall Summary – Product Dossier (QOS-PD) and represents the final, agreed upon key information from the PD review (inter alia identification of the manufacturer(s), API/FPP specifications, stability conclusions and relevant commitments)

Qualification The action of proving that any equipment is properly installed, works correctly, and consistently produces the expected results. Qualification is part of, but not limited to, the validation process. (Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Quality assurance It is the sum total of the organized arrangements made with the object of ensuring that Active Ingredients and Finished Pharmaceutical products are of the quality required for their intended use.
(Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Quality attribute Any product characteristic which may reflect quality, or may affect safety or efficacy of the product during its expected shelf life.
(Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Quality Control Quality control is the part of Good Manufacturing Practices (GMP) concerned with sampling, specifications, and testing and with the organization, documentation, and release procedures which ensure that the necessary and relevant tests are actually carried out and that materials are not released for use or products released for sale or supply, until their quality has been judged to be satisfactory.
(WHO Medicines Regulatory Package. A Collection of Tools for Medicines Regulatory Authorities - Regulatory Support Series No. 014 at: <http://infocollections.org/medregpack/interface/files/glossary.pdf>).

Quarantine The status of materials isolated physically or by other effective means whilst awaiting a decision on their subsequent use.
(Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Rational use of medicines Rational use of medicines requires that patients receive medications appropriate to their clinical needs, in doses that meet their own individual requirements, for an adequate period of time, and at the lowest cost to them and their community.
(Promoting rational use of medicines: Core components Geneva 2002, can be found online at: <http://apps.who.int/medicinedocs/pdf/h3011e/h3011e.pdf>)

Raw materials Any material of defined quality used in the manufacture of an Active Ingredient, but excluding packaging materials or labels.
(European Federation of Pharmaceutical Industries and Associations; April 1996, Good manufacturing practices for Active ingredient manufacturers).

Recovery Any treatment of materials by a process intended to make them suitable for further use.
(Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Registration See Marketing Authorization

Regulations The second stage of the legislative process (the first stage being legislation). Regulations are specifically designed to

provide the legal machinery to achieve the administrative and technical goals of legislation.

(WHO A model quality assurance system for procurement agencies Geneva 2007, can be found online at:

<http://apps.who.int/medicinedocs/documents/s14866e/s14866e.pdf>
f)

Regulatory Inspection A regulatory inspection is an officially conducted examination (i.e. review of quality assurance processes, personnel involved, any delegation of authority and audit) by relevant authorities at sites where pharmaceutical activities take place (i.e. manufacturing, wholesale, testing, distribution, clinical trials) to verify adherence to Good Practices.

(WHO Medicines Regulatory Package. A Collection of Tools for Medicines Regulatory Authorities - Regulatory Support Series No. 014 at:

<http://infocollections.org/medregpack/interface/files/glossary.pdf>)

Reprocessing The treatment of a batch or sub-batch of materials of unacceptable quality by repeating the same process steps from a defined stage of production so that its quality may be made acceptable.

(Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Reworking The treatment of a batch or sub-batch of materials of unacceptable quality by using a process other than that used to produce the original material so that its quality may be made acceptable.

279

(Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Route of administration Is a way of administering a medicinal product to a site in a patient.

(USFDA Glossary of terms, can be found on line at Drugs@FDA Glossary of Terms).

Sample A sample is a portion of a material collected according to a defined sampling procedure.

WHO Medicines Regulatory Package. A Collection of Tools for Medicines Regulatory Authorities - Regulatory Support Series No. 014 at:

<http://infocollections.org/medregpack/interface/files/glossary.pdf>

Sampling Operations designed to obtain a representative portion of a pharmaceutical product, based on an appropriate statistical procedure, for a defined purpose, e.g. acceptance of consignments, batch release.

(WHO Medicines Regulatory Package. A Collection of Tools for Medicines Regulatory Authorities - Regulatory Support Series No. 014 at:

<http://infocollections.org/medregpack/interface/files/glossary.pdf>)

Side effect Any unintended effect of a pharmaceutical product occurring at normal dosage which is related to the pharmacological properties of the drug.

(WHO Glossary of terms used in Pharmacovigilance, at <http://who-umc.org/Graphics/24729.pdf>)

Specifications A document describing in detail the requirements such as physical, chemical, biological and microbiological test requirements with which the products or materials used or obtained during manufacture have to conform.

(A WHO guide to good manufacturing practice (GMP) requirements; it can be found at

<http://www.who.int/vaccinesdocuments/DocsPDF/www9651.pdf>
).

Specifications Test Procedures and Acceptance Criteria for active pharmaceutical ingredients and medicinal products.

(ICHQ8- Glossary at

http://www.ema.europa.eu/docs/en_GB/document_library/Scientific_guideline/2009/09/WC500002872.pdf)

280

Standard operating An authorized written procedure giving instructions for procedure performing operations not necessarily specific to a given product or material but of a more general nature.

(WHO guide to good manufacturing practice (GMP)

requirements, at <http://www.who.int/vaccines-documents/DocsPDF/www9651.pdf>).

Stringent Regulatory A regulatory authority that is:

Authority a) A member of ICH prior to 23rd October 2015, namely the USFDA, the European Commission and the Ministry of Health, Labour and Welfare of Japan also represented by the Pharmaceuticals and Medical

Devices Agency, or

b) An ICH observer prior to 23rd October 2015, namely the European Free Trade Association, as represented by Swissmedic and Health Canada, or

c) A regulatory authority associated with an ICH member through a legally-binding, mutual recognition agreement prior to 23rd October 2015, namely Australia, Iceland, Liechtenstein and Norway.

Summary of Product Characteristics (SmPC) Authority. The SmPC serves as the basis for production of information for health personnel as well as for consumer information on labels and leaflets of medicinal products and for control of advertising.

(WHO Medicines Regulatory Package. A Collection of Tools for Medicines Regulatory Authorities - Regulatory Support Series

No. 014 at:

<http://infocollections.org/medregpack/interface/files/glossary.pdf>)

Tentative Approval If a generic drug product is ready for approval before the expiration of any patents or exclusivities accorded to the reference listed drug product, FDA issues a tentative approval letter to the applicant. The tentative approval letter details the circumstances associated with the tentative approval. FDA delays final approval of the generic drug product until all patent or exclusivity issues have been resolved. A tentative approval does not allow the applicant to market the generic drug product.

(USFDA Glossary of terms, it can be found on line at Drugs@FDA Glossary of Terms).

Theoretical yield The quantity that would be produced at any appropriate phase of manufacture, processing, or packaging of a

particular drug product, based upon the quantity of components to be used, in the absence of any loss or an error in actual production.

(WHO guide to good manufacturing practice (GMP) requirements, at <http://www.who.int/vaccines-documents/DocsPDF/www9651.pdf>).

Therapeutic Equivalence Medicinal products are considered to be therapeutically (TE) equivalent only if they are pharmaceutical equivalents or pharmaceutical alternatives and their effect are essentially the same. This can be and have been scientifically demonstrated to be bioequivalent.

(Adapted from WHO glossary of terms)

Unique identifier Is a unique code that is added to the medicinal product label (primary and/or secondary pack) in order to specifically identify and capture particulars of the product for market surveillance purposes. It may be in form of a code, barcode or security number that is unique for a specific product. The product registration number issued by the NMRA may be considered as a unique identifier.

Validation Action of proving and documenting that any procedure, process, equipment, activity or system will, with a high degree of assurance, lead to the expected results.

(Federation of Pharmaceutical Industries and Association; GMP for API manufacturer, at <http://apic.cefic.org/pub/1gmp-api9604.pdf>).

Variation Variation is a change to a Marketing Authorization that is considered to fundamentally alter the terms of the MA for a medicinal product.

(Glossary of terms and abbreviations/EMA it can be found at http://www.ema.europa.eu/docs/en_GB/document_library/Other/2010/12/WC500099907.pdf).

Wholesale All activities consisting of procuring, holding, supplying or exporting bulk medicinal products, apart from supplying medicinal products to the public.

(PHIS Glossary 2009, can be found on line at: <http://phis.goeg.at/index.aspx?alias=phisglossary>).

282

PART VIII:

GUIDELINES ON LIST OF STANDARD TERMS FOR PHARMACEUTICAL DOSAGE FORMS AND ROUTES OF ADMINISTRATION

283

ABBREVIATIONS AND ACRONYMS

NMRA - National Medicine Regulatory Authority

EAC - East Africa Community

CTD - Common Technical Document

284

1. INTRODUCTION AND GUIDANCE FOR USE

1.1 Scope

This list of standard terms for pharmaceutical dosage forms and routes of administration will assist in knowing all dosage forms used and routes used, accurate dose, protected dosage forms e.g. coated tablets, sealed ampoules, masked taste and odour, placement of drugs within body tissues, sustained release medication, controlled release medication, optimal drug action, insertion of drugs into body cavities (rectal, vaginal) and Use of desired vehicle for insoluble drugs. It has the double purpose to bring information to user (patient/prescriber) and distinguishing medicinal products having the same trade/generic name. Because of labelling purposes it is imperative that any Standard Term and combination of Standard Terms is constructed with a view to the patient

However, information on the container and the route of administration need not always be included in the Standard Term but may appear elsewhere in the labelling, package leaflet and SmPC.

1.2 Guidance for use

The EAC List of Standard Terms covers dosage forms and routes of administration for the use in the marketing authorization application, Summary of Product Characteristics (SmPC), Patient Information leaflet and labelling of medicinal product for human use.

1.2.1 Definitions

For the purposes of the Standard Terms, the following definitions apply.

1.2.1.1 Pharmaceutical form

The pharmaceutical form may be:

- a) a dosage form;
- b) a combination of dosage forms; or
- c) a combination of dosage form(s) and route(s)/method(s) of administration and/or container/administration device.

In the assessment of marketing authorization applications, pharmaceutical forms that differ only with respect to the containers/administration devices may not always be considered as different pharmaceutical forms.

1.2.1.2 Dosage form:

The dosage form is the physical manifestation of a medicinal product that contains the active ingredient(s) and/or excipient(s) that are intended to be delivered to the patient; it

285

may refer to the form of presentation or the form of administration, which in some cases are identical.

a) Form of presentation:

The form of presentation is the dosage form of a medicinal product as manufactured and, where applicable, before reconstitution; where reconstitution is required before administration to the patient, the term includes the eventual form of administration.

Examples: Powder for solution for injection;
Tablet

b) Form of administration

The form of administration is the dosage form of a medicinal product as administered to the patient, after any necessary reconstitution has been carried out.

Examples: Solution for injection;
Tablet

1.2.1.3 Combined term

A combined term is a combination of existing Standard Terms or elements thereof that is constructed in order to properly characterize a medicinal product; a combined term may be a combination of dosage forms, or a combination of dosage form(s) and route(s)/method(s) of administration and/or container/administration device.

Examples: Powder and solution for solution for injection;
Eye drops, solution in single-dose container.

1.2.2 Pharmaceutical forms

The list of Standard Terms does not distinguish between medicinal products as presented by the manufacturer (form of presentation) and medicinal products as administered to the patient (form of administration). However, for a term representing a form of presentation such as 'Powder for solution for injection', the words 'for solution for injection' indicate that a reconstitution is required, and that the resulting form of administration is 'solution for injection'.

The label of the medicinal product may be too small to permit the inclusion of the Standard Term(s). In addition to the Standard Terms given in the Dosage forms section, a number of patient-friendly terms (generally shortened versions of existing terms), which may be used for labelling only, in case of space limitation, are also proposed. Where a term contains two or more dosage form elements, these elements are linked by 'and'; e.g. 'Powder and solvent for solution for injection'

If the same pharmaceutical form may be used in alternative ways, these ways are separated by '/', e.g. 'Gargle/mouthwash', 'Chewable/dispersible tablet'.

286

In the case of a powder that is dissolved in a small amount of solvent before it is diluted in a larger volume to be infused and this dilution is mandatory for safety reasons, the

term 'concentrate' should appear in the pharmaceutical form (e.g. 'Powder for concentrate for solution for infusion'). If the powder that is dissolved in a small amount of solvent can either be administered as such or be further diluted before administration (i.e. no safety issue), there is no need to use the term 'concentrate' (e.g. 'Powder for solution for infusion').

The term 'modified-release' is not sufficiently precise for describing a particular product. A more specific term such as 'prolonged-release' or 'gastro-resistant' should be used, wherever applicable.

1.2.3 Routes of administration

The route of administration indicates the part of the body on which, through which or into which the medicinal product is to be introduced. The short terms proposed may be used for labelling only.

Where several routes of administration are intended for a medicinal product, the focus should be placed on the primary use for the creation of a standard term or a combination of standard terms, for example 'Oral use' is sufficient as the primary use for a request of 'Oral/gastric/gastroenteral use'.

1.2.4 Procedure for the addition or modification of terms in the list of standard terms

1. Scope

1.1 The scope of these guidelines is covers prescription and non-prescription medicines.

Similar principles and guidance provided in this document should apply to the registration of prescription and non-prescription products. Nevertheless, the risk–benefit considerations (and consequently data requirements) may be different.

FDCs are getting highly popular in the pharmaceutical markets of developing countries and have been particularly flourishing in the last few years. Unfortunately, scientific literature has provided evidence that many FDCs being introduced in certain countries are irrational. Regulatory authorities should take due care in implementing this guidance and can also take guidance of the World Health Organization's (WHO) Model List of Essential Medicines, which provides examples of some rational FDCs.

1.2 The principles in these guidelines would also apply to chemical combinations and complexes that comprise more than one active.

1.3 The scientific principles applicable to FDC products will also be applied in the assessment of co-packaged medicines.

2. General considerations

2.1 These guidelines are intended to be used in conjunction with the EAC guidelines on submission of documentation for registration of human medicinal products.

2.2 Appendices 2, 3 and 4 provide guidance on subjects that are not exclusive to FDCs, but

are nevertheless important in this context, and for which suitable guidance is not otherwise readily available.

2.3 It is important that access to useful, new FDCs should not be delayed by unnecessary constraints. These guidelines are not intended to define the only means of demonstrating the advantages and disadvantages of a new FDC. In some cases an alternative approach may be appropriate, for example when:

2.3.1 Scientific developments allow alternative means of achieving the same goals.

2.3.2 A circumstance unique to the product in question can be demonstrated.

2.3.3 An original but acceptable approach is devised.

2.3.4 Sufficient alternative studies have been conducted which, although not exactly what the guidelines seek, nevertheless satisfy the criteria of quality, safety and efficacy.

307

When these guidelines (or others referred to herein) describe evidence that is required, applicants may either: provide the requested evidence, or provide an alternative form of evidence that addresses the same issues. In this case, the application should include an explanation and justification of the approach taken.

2.4 It is not always necessary to generate new (original) data. Evidence may be obtained from the scientific literature, subject to its being of adequate quality (see Appendix 2 entitled Principles for determining whether data from the scientific literature are acceptable).

An application for a marketing authorization may comprise:

2.4.1 Entirely original data.

2.4.2 Entirely data from the literature.

2.4.3 Both original data and data from the literature (a "generic" submission).

For FDC-FPPs, it is likely that generic submissions will be the most common type.

The scientific literature rarely contains enough adequately validated information on quality to allow the full quality data set to be based solely on data from the literature. In particular, the complete formulation and method of manufacture are rarely specified. Consequently the quality data set is almost always either totally original or generic.

2.5 When these guidelines request that an applicant explain and/or justify non-conformity with requirements, a suitable argument should be included in the section that discusses the advantages and disadvantages of the combination (see below), together with cross-references to data elsewhere in the submission.

2.6 When an applicant is unsure of registration requirements or wishes to deviate from these guidelines, prior consultation with the relevant regulatory authority may be advantageous. However, applicants should not request advice until they have read all relevant guidelines and WHO's Marketing authorization of pharmaceutical products with special reference to multisource (generic) products: a manual for a drug regulatory authority (1999) or updates thereof. Not all of the guidelines in Tables 1–5 are necessarily relevant to a particular enquiry; the particulars of each case should be considered.

2.7 Risk–benefit assessments for FDCs should take into consideration any differences in anticipated patient populations. Consequently, decisions on the same data set may vary between different national drug regulatory authorities.

3. Definitions

The definitions given below apply solely to the terms as used in these guidelines. They may have different meanings in other contexts.

308

Active pharmaceutical ingredient (API)

Any substance or mixture of substances intended to be used in the manufacture of a pharmaceutical dosage form. When so used the API becomes the active moiety as defined below, often termed simply the active. The API may be a salt, hydrate or other form of the active moiety, or may be the active moiety itself. Active moieties are intended to furnish pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease or to affect the structure and function of the body.

Active moiety

The term used for the therapeutically active entity in the final formulation of therapeutic goods, irrespective of the form of the API. The active is alternative terminology with the same meaning. For example, if the API is propranolol hydrochloride, the active moiety (the active) is propranolol.

Applicant

The person or company who submits an application for marketing authorization of a new pharmaceutical product, an update to an existing marketing authorization or a variation to an existing market authorization.

Certificate of pharmaceutical product

A WHO-type certificate of the form described in Guidelines for implementation of the WHO Certification Scheme on the quality of pharmaceutical products moving in international commerce. Geneva, World Health Organization, 1998.

Comparator

The finished pharmaceutical product with which an FDC-FPP is to be compared. The

comparison may be by means of bioequivalence studies or clinical studies of safety and/or effectiveness. A single study may use more than one comparator, for example several single entity FPPs. A comparator may be a placebo.

Co-packaged product

A product consisting of two or more separate pharmaceutical products in their final dosage forms that are packaged together for distribution to patients in the co-packaging.

Drug

Any substance or product for human or veterinary use that is intended to modify or explore physiological states for the benefit of the recipient.

309

Finished pharmaceutical product (FPP)

A product that has undergone all stages of production, including packaging in its final container and labelling. An FPP may contain one or more actives.

Fixed-dose combination (FDC)

A combination of two or more actives in a fixed ratio of doses. This term is used generically to mean a particular combination of actives irrespective of the formulation or brand. It may be administered as single entity products given concurrently or as a finished pharmaceutical product.

Fixed-dose combination finished pharmaceutical product (FDC-FPP)

A finished pharmaceutical product that contains two or more actives.

Generic products

The term generic product has somewhat different meanings in different jurisdictions. Use of this term has therefore been avoided as far as possible, and the term multisource pharmaceutical product is used instead (see the definition below). Multisource products may be marketed either under the approved non-proprietary name or under a brand (proprietary) name. They may be marketed in dosage forms and/or strengths different to those of the innovator products.

Where the term generic product is used, it means a pharmaceutical product, usually intended to be interchangeable with the innovator product, which is usually manufactured without a licence from the innovator company and marketed after expiry of the patent or other exclusivity rights. The term should not be confused with generic names for APIs.

Microbiology

A branch of science that refers to microbes of all of types, including bacteria, viruses, rickettsia, protozoa, fungi and prions. Derived words (such as microbiological) have a similar meaning.

Multisource (generic) pharmaceutical product

Multisource pharmaceutical products are pharmaceutically equivalent products that may or may not be therapeutically equivalent. Multisource pharmaceutical products that are therapeutically equivalent are interchangeable.

310

New chemical (or biological) entities

Actives that have not previously been authorized for marketing as a drug for use in humans in the country in question.

Pharmaceutical equivalents

Products are pharmaceutical equivalents if they contain the same amount of the same actives in the same dosage form, if they meet comparable standards, and if they are intended to be administered by the same route. Pharmaceutical equivalence does not necessarily imply therapeutic equivalence, as differences in the excipients and/or manufacturing process and some other variables can lead to differences in product performance.

Pivotal clinical trials

Those clinical studies that provide the significant evidence that is the basis for the decision as to the risk–benefit assessment for a particular FDC.

Product information

The information provided by the supplier of an FPP that allows prescribers and consumers to ensure the safe and effective use of drugs. If it is written especially for prescribers, it may be termed prescribing information.

Reference product

A pharmaceutical product with which the new product is intended to be interchangeable in clinical practice. The reference product will normally be the innovator product for which efficacy, safety and quality have been established. Where the innovator product is not available, the product that is the market leader may be used as a reference product, provided that it has been authorized for marketing and its

efficacy, safety and quality have been established and documented.

Summary of product characteristics (SPC)

A term used in the European Union. Product information or data sheets in the European Union should be based on the approved SPC.

Well-established drugs

Actives that:-

— have been marketed for at least 5 years in countries that undertake active post marketing monitoring;

311

— have been widely used in a sufficiently large number of subjects to permit the assumption that safety and efficacy are well known; and

— Have the same route of administration and strength and the same or similar indications as in those countries.

4. Scenarios

An application to register an FDC-FPP may fall into any one of the following four scenarios. These guidelines are intended to address the different requirements for each scenario.

4.1 Scenario 1.

The new FDC-FPP contains the same actives in the same doses as an existing FDC-FPP; that is it is a "generic" of the existing FDC-FPP; they are "multisource" products. The quality, safety and efficacy of the existing product have been established.

4.2 Scenario 2.

The new FDC-FPP contains the same actives in the same doses as an established regime of single entity products, and the dosage regimen is the same. Alternatively the established regime may involve combinations of single entities and FDCs, for example, a single entity FPP combined with an FDC-FPP that contains two actives. In all cases, the established regime has a well-characterized safety and efficacy profile, and all of the FPPs used in obtaining clinical evidence have been shown to be of good quality.

4.3 Scenario 3

- The new FDC-FPP combines actives that are of established safety and efficacy but have not previously been used in combination for this indication.
- The new FDC-FPP comprises a combination for which safety and efficacy have been established, but that will be used in a different dosage regimen.

4.4 Scenario 4.

The new FDC-FPP contains one or more new chemical entities.

5. Balancing the advantages and disadvantages of a new fixed-dose combination

5.1 In determining whether it is rational to combine actives into a single product, there are medical, quality and bioavailability considerations.

5.1.1 Quality issues may be addressed by much the same criteria that apply to single-component products and it is difficult to imagine a case in which essentially the same standards would not apply.

312

5.1.2 Medical considerations are more complex and sometimes contradictory, for example, when increased efficacy is accompanied by increased toxicity. The decision as to whether to give marketing approval for a new FDC-FPP in scenarios 3 and 4 is often based on a consideration of the balance of advantages and disadvantages from the medical perspective.

5.1.3 Interpretation of the results of bioavailability and bioequivalence tests involves both quality and medical considerations. For example it is not acceptable that bioavailability is reduced or variable, when compared with that of single entity products, because of poor formulation, but an interaction between two actives that leads to an increased bioavailability may be one of the advantages that is taken into account when balancing advantages and disadvantages.

Balancing the advantages and disadvantages of a new FDC-FPP should form a major component of submissions pursuant to this guideline.

5.2 Submissions for marketing approval of a new FDC in scenarios 2, 3 and 4 should include a section in which the advantages of the new combination are weighed against the disadvantages. All the possible advantages and disadvantages of the combination should be listed and discussed. The discussion should be based on the available data and on scientific and medical principles. In less well-developed nations, and particularly where there are difficulties with transport and the logistics of distribution, other matters may need to be taken into account, such as:

5.2.1 The cost of the combination as compared with the cost of individual components.

5.2.2 Evidence as to whether the new FDC will improve the reliability of supply as a result of simplified distribution procedures. Improved patient adherence may result from more reliable (continuing) availability of the FDC-FPP than of all of the components as loose combinations of single entity products.

However, issues of cost and procurement alone are not sufficient reason to approve an FDC if it has not been justified by appropriate data and on scientific and medical principles.

5.3 From a scientific or medical perspective, FDCs are more likely to be useful when several of the following factors apply:

5.3.1 There is a medical rationale for combining the actives.

5.3.2 There is an identifiable patient group for which this combination of actives and doses is suitable therapy. The larger the patient group in question, the more significant is this factor. It is not appropriate to combine actives that separately treat conditions that do not commonly coexist.

313

5.3.3 The combination has a greater efficacy than any of the component actives given alone at the same dose.

5.3.4 The incidence of adverse reactions in response to treatment with the combination is lower than in that response to any of the component actives given alone, for example as a result of a lower dose of one component or a protective effect of one component, and particularly when the adverse reactions are serious.

5.3.5 For antimicrobials, the combination results in a reduced incidence of resistance.

5.3.6 One drug acts as a booster for another (for example in the case of some antiviral drugs).

5.3.7 The component actives have compatible pharmacokinetics and/or pharmacodynamics. See comments under Pharmacokinetics and pharmacodynamics below (section 6.6.2).

5.3.8 Therapy is simplified, particularly when the existing therapy is complex or onerous (e.g. because of a "high tablet load").

5.3.9 One of the ingredients is intended to minimize abuse of the other ingredient (e.g. the combination of diphenoxylate with atropine, or buprenorphine with naloxone).

5.3.10 The active pharmaceutical ingredients are chemically and physico-chemically compatible or special formulation techniques have been used that adequately address any incompatibility.

5.3.11 Other potential advantages of FDCs over single entity products given concurrently in the same dose may include:

5.3.11.1 Convenience for prescribers and patients.

5.3.11.2 Better patient adherence.

5.3.11.3 Simplified logistics of procurement and distribution.

5.3.11.4 Lower cost.

These factors are important, but there may not necessarily be evidence to support them; they may be more significant when there is specific evidence available to support a particular case.

5.4 From a scientific or medical perspective, FDCs are less likely to be useful when one or more of the following factors apply:

5.4.1 The component actives are normally separately titrated to meet the patient's needs. Consequently:

314

5.4.1.1 Either the doses of the components, and/or the ratio of doses, typically differ from patient to patient, and/or

5.4.1.2 Patients are likely to be taking different doses at different stages of treatment (for example initial treatment compared with long-term treatment).

These two factors are particularly significant when one or more of the actives has a narrow therapeutic index and/or a steep dose–response curve in the therapeutic range.

5.4.2 There is a higher incidence or greater severity of adverse reactions to the combination than with any of the ingredients given alone, or there are adverse reactions not seen in response to treatment with any of the individual ingredients.

5.4.3 There are unfavourable pharmacokinetic interactions between the ingredients, for example when one drug alters the metabolism, absorption or excretion of another. However, see comments under Pharmacokinetics and pharmacodynamics below (section 6.6.2) concerning circumstances in which such interaction is intended.

5.4.4 Dose adjustment is necessary in special populations, such as in people with renal or hepatic impairment.

5.4.5 The product (tablets or capsules), is so large that patients find it difficult to swallow.

6. Data requirements for marketing authorization of fixed-dose combination finished pharmaceutical products

6.1 General

6.1.1 The framework for issuing a marketing authorization for an FDC-FPP is the same as that for single entity FPPs and is stipulated in the EAC guidelines on submission of documentation for registration of human pharmaceutical products.

6.1.2 Data requirements for marketing authorization of FDC-FPPs depend broadly on the scenario into which the application falls (see sections 4.1–4.4 above). Table 1 summarizes these differences.

However, each application should be considered on its own merits using scientific judgement and logical argument.

6.1.3 All applications to register an FDC-FPP should include a draft “product information” or “summary of product characteristics” for indicated diseases, and any package information leaflet or patient information. See the more detailed discussion below (section 7).

315
Summary of requirements for the various scenarios

This table is a list of the most likely set of requirements for marketing authorization of an FDC-FPP in each scenario. However each application should be considered on its own merits in relation to data requirements, using scientific judgement and logical argument. Some of the data may be provided in the form of literature studies.

Requirement Scenario 1 Scenario 2 Scenario 3 Scenario 4

Plan for active post- Not usually Not usually ✓ ✓
marketing
surveillance

6.1.6 A full quality data set is required in all scenarios (see 6.3 below).

6.1.7 In general, preclinical or clinical safety and efficacy data are not required in scenario 1. If the risk–benefit assessment has been found to be acceptable for an FDC, then new brands may be approved on the basis of bioequivalence with the brand(s) used in pivotal clinical trials.

The applicant may, however, be asked to establish that a risk–benefit assessment has been conducted and found acceptable if, for example the drug regulatory authority to which the application is submitted is not convinced that this is the case or does not have access to the data.

6.1.8 If the FDC directly substitutes for an established regimen of single entity products, in relation to both actives and doses and for the same indication(s), a bioequivalence study may provide adequate evidence of safety and efficacy. This is scenario 2. The established regimen should have well-characterized safety and efficacy.

6.2 Good manufacturing practice
Evidence of GMP compliance for all the API and FPP sites should be provided in Module 1 of the PD.

6.3 Quality

6.3.1 In relation to quality, very similar principles apply to FDC-FPPs as apply to single entity products. However there are additional complexities arising from the need to consider two or more actives instead of one. These complexities are principally, but not exclusively, related to assay, stability, physicochemical properties (for example dissolution rate) and bioavailability/ bioequivalence. Consequently the following considerations (and others) may be pertinent.

6.3.2 Pharmaceutical development studies are especially important for FDC-FPPs because they are technically more demanding than single-component products. Issues that are specific to the development of FDC-FPPs include:

6.3.2.1 Chemical and physicochemical compatibility of the APIs in an FDC with one another

as well as with possible excipients.

317

6.3.2.2 The degradability of each API under stress conditions in the presence of the others.

6.3.2.3 Uniformity of content of each active prior to compression (tablets) or filling (for instance capsules, sachets and suspension dosage forms). This study determines whether mixing during manufacture is adequate.

6.3.2.4 Analytical procedures. These should be validated for each active in the presence of the others during development of analytical methods for quality control of the finished product, stability testing and dissolution testing.

Validation should be conducted for each active in the presence of the others and in the presence of related synthesis (process) impurities and potential degradation products. In the case of high-performance liquid chromatography (HPLC) (a common analytical technique), possible interference by degradation products in the assay of the active can usually be controlled by peak purity testing.

6.3.2.5 The dissolution rate of each active in pilot formulations. Multipoint limits should normally be established for routine quality control of each active. For some FDCFPs, different dissolution media may be acceptable for the different actives.

6.3.2.6 Different assay procedures may be necessary for the different actives in the finished product, and for different purposes (e.g. dissolution testing may be needed rather than stability testing).

6.3.3 For solid dosage forms a test and limit for content uniformity should be applied to any active that is present at a weight of ≤ 25 mg or when the API comprises 25% or less of a dosage unit.

Typically, when any one API is present at less than 25 mg or less than 25% of the weight of a dosage unit, all of the actives are subjected to content uniformity testing.

If a solid dosage form is not subject to content uniformity testing, for example because all of the actives are present at a weight of greater than 25 mg and greater than 25% of the weight of a dosage unit, there should be a test and limit for mass variation.

6.3.4 Acceptance criteria for impurities in FDC-FPPs should be expressed with reference to the parent API (and not with reference to the total content of APIs). If an impurity results from reaction between two APIs, its acceptance limits should be expressed in terms of the API that represents the worst case. If available, a reference standard should be used to quantify the degradation product in percentage mass/mass with respect to the parent API. Alternatively, and if justified, other quantitative techniques that are described in Impurities in new drug products (revised) ICH-Q3B(R) (2003), may be applied.

318

Note: there should be an approximate mass balance. Together with the remaining active, degradants expressed with reference to the parent compound should sum to approximately 100% of initial strength.

6.3.5 The specifications and defining characteristics of the product should be based on the most vulnerable active. For example expiry dates should be based on the stability of the least stable active.

6.3.6 In setting specifications, relevant pharmacopoeial monographs, WHO guidelines, ICH guidelines and EAC guidelines should be taken into account.

6.3.7 Specifications in addition to those in pharmacopoeias may be necessary for APIs in some cases, for example for particle size, residual solvents and synthesis-related impurities that are not covered by relevant monographs.

6.4 Bioavailability and bioequivalence

6.4.1 Data on bioequivalence provide a bridge between two pharmaceutical equivalents (see Glossary) when safety and efficacy data are available for one of the FPPs, but not for the other. By demonstrating that the two products lead to the same profile for plasma concentration over time, available safety and efficacy data for one of the products can be extrapolated to the other. The two products being compared may be different brands, or different batches of the same brand, for example when manufactured by different methods, at different sites or according to different formulations.

6.4.2 Data on bioequivalence may also be important when the same FPP is administered under different circumstances, for example before or after food, in different patient populations (such as children versus adults), or by different routes of administration (such as subcutaneous versus intramuscular injection).

6.4.3 In the context of these guidelines, an additional application of bioequivalence studies is in scenario 2 in which safety and efficacy data on single entity products given concurrently may be extrapolated to an FDC-FPP, provided that all of the conditions described elsewhere in these guidelines are met.

6.4.4 Evidence as to bioequivalence is required for scenarios 1 and 2, and sometimes for scenarios 3 and 4, for example when there are major differences between the formulation and/or method of manufacture of the product to be registered and that used in pivotal clinical trials.

6.4.5 If a study of bioequivalence finds that the two treatments are bioequivalent, it may be assumed that any pharmacokinetic interactions between the actives were the same, even if one treatment comprised an FDC-FPP and the other comprised separate products.

319

6.4.6 Data on absolute bioavailability are usually required in scenario 4, i.e. comparison of the

area under the curve for plasma concentration over time after an intravenous injection with that after administration of the dosage form to be marketed, for example a tablet given orally.

6.4.7 A decision as to whether it is necessary to conduct a study of the effect of food on the bioavailability of an FDC-FPP should be based on what is known of the effect of food on the individual actives, and any relevant recommendations in the product information for the single entity products.

The effect of food should normally be studied in scenario 4.

6.4.8 Recommendations as to the conduct and analysis of bioequivalence studies are provided in the EAC guidelines on submission of documentation for registration of human medicinal products.

6.5 Preclinical pharmacology and safety

6.5.1 Preclinical data are not normally required in scenarios 1 and 2. Data may, however, be required in some circumstances, for example if an unusual excipient is included in the formulation or if the impurity profile differs significantly from that of reference products.

6.5.2 Preclinical data will be required in scenario 4 as for any new chemical entity. The standard of evidence should be the same as for any new chemical entity.

6.5.3 In scenario 3, preclinical studies may not be required if all the actives have been extensively used in humans in the same combination for a long period and the safety of the combination has been well demonstrated. Bridging studies may be appropriate in some cases, for example for a new ratio of doses.

6.5.4 If the safety of the combination in humans has not already been demonstrated (i.e. in scenarios 3 and 4), preclinical studies should be conducted on the actives administered in combination in order to investigate possible additive or synergistic toxicological effects.

The preclinical data that are required in scenarios 3 and 4 will vary according to the data that are already available. For example, by definition in scenario 3, the safety and efficacy of each active will have already been established, but that of the combination will not. In scenario 4, the safety and efficacy of one or more of the actives may already have been established, but not those of all the actives or of the combination.

320

6.5.5 When preclinical data are required, the studies should aim to determine both the pharmacological and the adverse effects that may be expected from the combination of actives during clinical use.

6.5.6 As a general rule, preclinical studies on the combination should be performed with the actives in same the ratio as in the FDC-FPP in question. If this is not the case, the applicant should explain and justify the proportions used. A comparison of the systemic exposures in animals and humans will be relevant.

6.5.7 In the absence of relevant WHO guidelines, the ICH preclinical guidelines in Table 4 may be used as source of guidance.

6.5.8 Preclinical studies should comply with a suitable code of good laboratory practice (GLP); see, for example Handbook: Good laboratory practice: Quality practices for regulated non-clinical research and development. World Health Organization (2001)

6.5.9 Microbiological preclinical studies

In general this section is applicable to scenarios 3 and 4, but not to scenarios 1 and 2. There may be some exceptions, for example microbiological data may be appropriate in scenarios 1 and 2 if a different pathogen or resistance pattern is encountered.

6.5.9.1 In scenarios 3 and 4, when a new combination is proposed for an antimicrobial indication, microbiological studies may be needed to determine the advantage of the FDC over the individual active moieties against relevant pathogen(s), and especially when clinical trials of monotherapy are inappropriate or unethical.

6.5.9.2 Data from microbiological preclinical studies of FDCs are particularly useful when clinical trials of monotherapy are inappropriate or unethical.

6.5.9.3 Data from the following types of study should normally be available for the combination:

6.5.9.3.1 Characterization of microbiological activity in vitro and in vivo against laboratory strains and clinical isolates of the targeted pathogen(s), including those strains in the relevant geographical regions.

6.5.9.3.2 Characterization of microbiological activity in appropriate animal models of infection with the targeted pathogen(s).

6.5.9.3.3 If possible, characterization of the mechanism by which the actives exhibit additive or synergistic microbiological activity against the targeted pathogen(s).

6.5.9.3.4 The potential for antagonistic effects between the actives.

6.5.9.3.5 The potential for development of resistance by target pathogens.

321

6.6 Clinical efficacy and safety

This section is in general applicable to scenarios 3 and 4 but not to scenarios 1 and 2. Bridging studies may sometimes be appropriate in scenario 3, for example for a new

ratio of doses or a longer duration of treatment.

6.6.1 General principles

6.6.1.1 The risk–benefit assessment for a new combination may be based on data generated using either the components given as single entity products concurrently or the FDC as a single FPP.

6.6.1.2 Any theoretical advantages of a particular combination should be confirmed by means of efficacy studies. The risk–benefit assessment should not be based on theoretical considerations only, or on extrapolation from other data.

6.6.1.3 If the actives in an FDC are intended to relieve different symptoms of a disease state, it is a prerequisite that these symptoms commonly occur simultaneously at a clinically relevant intensity and for a period of time such that simultaneous treatment is appropriate. Occurrence of the individual symptoms in isolation should not be indications for the FDC.

6.6.1.4 Clinical studies should be designed to determine whether the combination has an advantage over the component actives given alone in a substantial patient population. The data should demonstrate that each active contributes to the therapeutic effect of the combination.

It may not be essential to show that all of the components have efficacy when administered as single entities; for example clavulanic acid has little or no antimicrobial activity when given alone, but it enhances the efficacy of beta-lactam antibiotics.

6.6.1.5 In situations where comparative clinical trials are not feasible, for example when monotherapy is inappropriate or is unethical, an aggregate of clinical and preclinical data may be substituted. Such data may include:

6.6.1.5.1 Historical clinical data, preferably at an exposure comparable to that for the proposed FDC.

6.6.1.5.2 Bridging pharmacokinetic data.

6.6.1.5.3 Preclinical pharmacology and/or toxicology data.

6.6.1.5.4 In vitro data (e.g. microbiological studies).

322

6.6.1.6 If the FDC is available in more than one strength or ratio of doses, there should be a risk–benefit assessment for each combination.

6.6.1.7 The choice of comparators for the purposes of safety and efficacy studies should be justified. They should normally represent the recognized treatment for the indication in question. As far as possible, comparators should be licensed products with well-established safety and efficacy profiles and of established quality. Unapproved or novel combinations should be avoided as comparators as they may introduce new efficacy or toxicity characteristics and thus complicate assessment of the combination under test.

6.6.1.8 If the combination is intended for long-term use, data on safety in patients will normally be required for 6 months or longer.

6.6.1.9 If one or more of the component actives has an established use and dosage regimen in indications unrelated to the indications of the FDC, existing experience as to its safety may nevertheless be taken into account, bearing in mind the relative doses for the two sets of indications.

6.6.1.10 End-points in clinical trials should be such as to characterize the advantages and disadvantages of the combination.

For example, for a combination designed to reduce the development of drug resistance, end-points might include the frequency of new drug resistance as well as the overall clinical outcome.

6.6.1.11 Parallel group comparisons are one means of demonstrating a therapeutic effect. A parallel placebo group should be included if feasible and if consistent with the indications under treatment. Multi factorial designs are another means by which it may be possible to demonstrate that a combination is superior to the individual actives.

6.6.1.12 In some cases, studies have to be specifically designed to confirm the minimal effective dose and the usual effective dose of the combination. Multiple dose–effect studies may be necessary.

6.6.1.13 The design and analysis of studies of efficacy and safety should consider (among other things) whether the combination is indicated as first- or second-line therapy.

6.6.1.14 In general, all of the actives in a combination should have a similar duration of action. If this is not the case, the applicant should explain and justify the combination.

323

6.6.1.15 In general, the actives in a combination should have similar pharmacokinetics. If this is not the case, the applicant should explain and justify the combination.

6.6.1.16 If there is an increase in the number or severity of adverse reactions to the FDC as compared with those in response to the individual actives given alone, evidence and argument should be presented showing that the advantages of the

combination outweigh the disadvantages. These should be included in the section of the submission entitled "Balancing the advantages and disadvantages of a new FDC".

6.6.1.17 Data generated in clinical safety and efficacy studies should comply with the WHO Guidelines for good clinical practice (GCP) for trials on pharmaceutical products (1995).

6.6.2 Pharmacokinetics and pharmacodynamics

This section is generally applicable to scenarios 3 and 4, but not to scenarios 1 and 2. In scenarios 1 and 2, the information described below will usually already be available.

6.6.2.1 In general, it is desirable that there be no pharmacokinetic or pharmacodynamic interactions between the components of a combination. However, there are circumstances in which such an interaction is intentional and may even contribute to the therapeutic outcome.

For example:-

6.6.2.1.1 Ritonavir boosts the activity of protease inhibitors.

6.6.2.1.2 Carbidopa and benserazide both reduce decarboxylation of levodopa in the gut wall, and consequently reduce the dose of levodopa that should be administered.

6.6.2.1.3 Clavulanic acid reduces bacterial hydrolysis of beta lactam antibiotics and consequently both increases the concentration and prolongs the duration of effectiveness.

6.6.2.2 Tests should be conducted to elucidate any pharmacokinetic or pharmacodynamic interaction between the actives in a combination. Some interactions may be predictable from pharmacokinetic and enzyme profiles, but should be confirmed by experiment. Any interaction should be quantified so that its effect on safety and efficacy is either predictable or (preferably) has been tested in a clinical study.

This includes competing metabolic effects and effects on gastrointestinal efflux mechanisms or on renal excretion or re-absorption. Interactions may be additive, synergistic or antagonistic.

324

6.6.2.3 If there is an unintended pharmacokinetic interaction between the actives, it should be demonstrated that the therapeutic advantages of the combination outweigh any disadvantages resulting from the interaction. Relevant argument and cross-references to data should be included in the section that discusses the balance between the advantages and disadvantages of the combination.

6.6.3 Additional guidelines for scenario 3

6.6.3.1 The risk–benefit assessment for a new combination may be based (at least in part) on a demonstration of the clinical non-inferiority of the combination to another product licensed for the same indication. See Appendix 4, entitled Superiority, equivalence and non-inferiority clinical trials, for more information.

6.6.3.2 Pharmacodynamic studies for new combinations should normally be conducted at several dose ratios of the actives unless the applicant can provide justification for not doing so.

6.6.4 Additional guidelines for scenario 4

6.6.4.1 When an FDC-FPP contains an active that is a new chemical entity, data requirements are the same as for any new chemical entity. In some circumstances, some of the preclinical and clinical data on safety and/or efficacy may have been generated from studies on the combination rather than on single entities, for example when one active confers a protective effect in relation to adverse reactions or when the actives act synergistically.

6.6.4.2 Dose-finding monotherapy studies should normally be conducted for the new chemical entity before commencing studies of combination therapy, unless the new chemical entity is not intended to have activity when used alone (such as clavulanic acid). Alternative approaches may be acceptable if they can be justified.

6.6.4.3 The pharmacokinetics and enzyme profile of any new chemical entity should be fully characterized, including prediction of possible interactions and pharmacokinetics in children if the new chemical entity could be used in that population (see also section 7.6.6 on Paediatric dosage forms).

6.6.5 Superiority, equivalence and non-inferiority trials and fixed-dose combinations

Appendix 4 defines superiority, equivalence and non-inferiority trials and makes some general points concerning different types of study.

More information can be found in the Committee for Medicinal Products for Human Use (CHMP) guidelines in Table 3.

325

6.6.5.1 In the context of FDCs, equivalence trials are largely confined to bioequivalence studies.

6.6.5.2 An FDC-FPP should be shown, directly or indirectly, to be superior to the component actives given as single entity treatments.

Only a superiority trial can give the necessary statistical confidence. Submissions should discuss both the statistical significance and clinical relevance of the

results. Any alternative form of evidence that purports to address the same issues, for example one that concerns a dose–response surface, must be explained and justified with appropriate statistical confidence.

6.6.5.3 In clinical trials that are intended to test for superiority and/or non-inferiority, the choice of comparator should be carefully considered and will depend in part on the medical and ethical circumstances. The comparator may be:

6.6.5.3.1 The treatment whose risk–benefit profile is best supported by evidence or is at least well established.

6.6.5.3.2 One or more of the actives in the FDC given as a single treatment.

6.6.5.3.3 A placebo.

6.6.5.4 Depending on the claim, superiority or non-inferiority should be demonstrated for each specified clinical outcome. For example if the claim is less bone marrow depression, but similar efficacy, a non-inferiority outcome should be demonstrated for efficacy and a superiority outcome for safety.

6.6.6 Paediatric dosage forms

6.6.6.1 Different FDC-FPPs may be needed in paediatric populations from those needed in adults because of differences in pharmacokinetic and pharmacodynamic profiles of the actives, and for reasons of palatability. The doses of each active may need to be lower or higher, and the appropriate dose ratio may be different.

326

Scenarios 1 and 2

6.6.6.2 In scenarios 1 and 2, when the combination of actives and doses has already been shown to be safe and effective in the paediatric population, a bioequivalence study in adults may be extrapolated to the paediatric population provided that the pharmacokinetics of all actives are well-established in both populations and it is known that there are no differences that could affect the outcome of the bioequivalence study. Extrapolation of bioequivalence data between age groups should be justified in these terms.

Scenarios 3 and 4

6.6.6.3 If the FDC is indicated in a paediatric population, but the combination of actives and doses has not been shown to be safe and effective in this population, suitable doses of the actives given in combination should be established. In some cases, it may be necessary to do this in more than one age group (see table 2 below).

Table 2: Paediatric populations

Paediatric populations

Neonate Birth to under 1 month

Infants 1 month to under 2 years

Children 2 years to under 12 years

Adolescents 12 years to under 16 years

From the age of 16 years, individuals are considered to be adults in the context of these guidelines.

6.6.6.4 The pharmacokinetic profile of each active should be established in the age groups for which the FDC is indicated.

6.6.6.5 If it is possible to define target plasma concentrations in both adults and the paediatric population for an FDC that has established safety and efficacy in adults, then it may be possible to define suitable doses in the paediatric population on the basis of pharmacokinetics. The task is easier for actives that have the same target concentrations in adults and the paediatric population, such as antimicrobials that have established minimum inhibitory concentrations (MICs) and established safety at these concentrations.

6.6.6.6 When defining target plasma concentrations in the paediatric population, possible differences in the concentration–effect relationship should be taken into account.

327

6.6.6.7 If safe and effective use of the FDC has not been established in any age group, and extrapolation between groups is not possible based on pharmacokinetic data, then new clinical, and possibly also preclinical, safety and efficacy data should be obtained.

7. Product information (or summary of product characteristics) for fixed-dose combination finished pharmaceutical products

7.1 This section of the guideline applies to all scenarios.

7.2 The product information should be an integrated evaluation of the FDC, and not a summation of the product information for each of the actives.

7.3 The rationale for use of the product should be presented in terms of the combination rather than in terms of the individual actives.

7.4 Only those indications for which each active in the FDC makes a useful contribution should be included in the product information. Each indication should be a well-recognized disease state, modification of a physiological state, dysfunctional state, syndrome or pathological entity.

7.5 For each indication there should be a statement as to whether the FDC is recommended for first- or second-line therapy.

7.6 Any pharmacokinetic and pharmacodynamic interactions between the actives should be described in qualitative and, as far as possible, in quantitative terms.

7.7 All clinically relevant interactions between the FDC and other drugs should be described, together with the resulting contraindications and precautions. Any deviations from expected interactions known for the single components should be highlighted.

7.8 When safety experience with the FDC is limited in comparison with that for the individual components, safety experience from clinical trials and post marketing experience should be presented for both the FDC and the individual components, and should be identified as such.

7.9 If the safety profile for the combination is different to that for the individual actives, this should be highlighted. For example a combination of a fibrate and a statin might carry a risk of more frequent or more severe rhabdomyolysis than for either individual active.

8. Post marketing studies and variations

8.1 Post market monitoring of safety is an important part of the role of both drug regulatory authorities and manufacturers. It is especially important when there are unresolved

328 concerns regarding safety, and when a new product is intended for wide community use, as for example a new antimicrobial FDC-FPP for use in the treatment of tuberculosis, malaria or HIV/AIDS. See WHO's importance of pharmacovigilance: safety monitoring of medicinal products (2002). Manufacturers should have (and use) written operating procedures for continuous assessment of the safety and utilization of their products following marketing authorization; SOPs can be examined during a GMP inspection.

For antimicrobials, monitoring of patterns of resistance is an important component of pharmacovigilance. Note also that pharmacovigilance outcomes can differ with diet, ethnicity, comorbidity and other factors.

8.2 For scenarios 1 and 2, passive surveillance (spontaneous reporting) would usually be acceptable. For scenarios 3 and 4, additional active (prospective) surveillance should be considered, especially when there is an outstanding safety concern. For more information, see the draft ICH guideline Pharmacovigilance planning (Table 5), or later updates thereof.

To ensure that drug regulatory authorities are aware of proposed changes to product information, it is recommended that marketing approval letters contain this statement: "The product information may not be altered without prior approval, except for safety updates that further restrict use of the product. Any such safety-related changes should be notified to [name of regulatory authority] within five days of making the change."

8.3 Variations to pharmaceutical aspects of registered FDC-FPPs are subject to the EAC guidelines on variations to registered products.

To ensure that drug regulatory authorities are aware of proposed variations, it is recommended that marketing approval letters contain this statement: "No changes may be made to the product without prior approval, except for changes of the type listed in [name of regulatory authority]'s policy on 'Changes to pharmaceutical aspects which may be made without prior approval'. Conditions in that policy apply."

9. Guidelines for co-packaged fixed-dose combinations

A co-packaged product consists of two or more separate pharmaceutical products in their final dosage form that are packaged together for distribution to patients in the co-packaging.

1. Co-packaged products may fall into any of scenarios 1 to 4. The data requirements for each scenario are the same as those listed in Table 6 of this Annex.

329

2. A full quality data set is required for all components of co-packaged pharmaceutical products, except for any component that already has marketing authorization in which case more limited requirements apply (see below).

3. If one or more of the pharmaceutical products already has marketing authorization, then the additional quality information to support co-packaging of those pharmaceutical products will typically be limited to data on stability of the products in the co-packaging.

However the manufacturer of each component pharmaceutical product should provide an assurance that the product as used in co-packaging will be identical in formulation and method of manufacture to the one that already has marketing authorization. This is especially important when the manufacturer of a component is not the manufacturer of the co-packaged product.

4. Submissions concerning co-packaged pharmaceutical products should take into account the Guidelines on packaging for pharmaceutical products. In: WHO Expert Committee on Specifications for Pharmaceutical Preparations. Thirty-sixth report. Geneva, World Health Organization, 2002 (WHO Technical Report Series, No. 902), Annex 9.

1. INTRODUCTION

All pharmaceutical products in Tanzania are regulated by the Tanzania Medicines and Medical Devices Authority (TMDA). As a preliminary step, TMDA issues marketing authorization of all pharmaceutical products prior to their use in the country. The objective of pharmaceutical product marketing authorization is to ensure that pharmaceutical products marketed in Tanzania are safe, efficacious and of good quality and are manufactured in facilities that complies with the requirements prescribed in the TMDA Good Manufacturing Practice guidelines. All local manufacturers, wholesalers, distributors and importers of pharmaceutical products must be licensed before they can conduct their businesses.

The guideline covers the steps that are followed from the submission of a dossier to the final outcome, the timeframe and procedure for competent authorities to amend, where necessary the conditions of marketing authorization of a particular product.

2. SCOPE

The guideline is applicable for all types of application submitted to TMDA that include new application, renewal of application and application for variation of a registered pharmaceutical product.

3. TYPES OF APPLICATIONS

3.1 For purposes of submission, applications are classified into new application, application for variation of a registered pharmaceutical product and renewal application.

3.2 A new application is an application for registration of a pharmaceutical product that is intended to be placed on the market for the first time. A new application may only be made by the applicant and he shall be the person who signs the application form.

3.3 A new application for registration shall include submission of relevant documentation as provided in the main guidelines for registration of pharmaceutical products in use.

4. GENERAL REQUIREMENTS AND APPLICATION PROCEDURES FOR PHARMACEUTICAL PRODUCT REGISTRATION

4.1 All applications and supporting documents shall be in English. All submitted documents which are in any language other than English must be accompanied by a certified or notarized English translation.

4.2 The responsibility of applying for product marketing authorization rests with the company responsible for the introduction of the product into the Tanzanian market i.e. the Marketing Authorization Holder (MAH).

333

4.3 Applications must be duly completed and supported by all of the required documents i.e. Module I to Module V in accordance with the guidelines on submission of documentation for marketing authorization. The submitted application will be screened for completeness within 30 working days. Dossiers which are incomplete will not be accepted for evaluation.

4.4 A dossier is a file that contains detailed scientific information on the chemistry, formulation, manufacturing, quality control and non-clinical and clinical studies that

demonstrates quality, safety and efficacy of active pharmaceutical ingredient(s) and the corresponding finished pharmaceutical product.

Different sections of the dossier shall be distinctly marked and page numbered in the style: page x of y and have a table of contents indicating the sections and page numbers. Where information is required in the application forms its location shall be cross referenced in dossier. Information for each section shall be printed on both sides of an A-4 paper which will be arranged sequentially on a 1.00 mm or more diameter stainless spring and clamped with a stainless steel binder of not less than 1.0 mm thick in an A4 expandable spring file. The file shall be of cardboard or paper material of not less than 600gsm.

4.5 The covering letter shall be submitted in hard copy and the entire dossier on a CD-ROM or the entire application be electronically submitted to TMDA through the online system.

2

4.6 Data shall be presented on A4 and 80g/m paper with readily readable letters of at least 12 font sizes. Every page shall be numbered sequentially. Extension sheets, tables, diagrams and other supporting documents shall as far as possible be of the same size, well annotated, numbered and appropriately cross-referenced.

4.7 Application must be accompanied by two samples of the finished product as packaged for sale. The Authority may request for additional samples when need arises.

4.8 The registration fee as prescribed in the fees and charges regulations must be paid at the point of submission of the application.

5. PROCESSING OF APPLICATIONS (MANAGEMENT OF APPLICATIONS)

5.1 Upon acceptance of an application, an acknowledgement for the receipt of the application will be issued within and a reference number will be generated. The reference number shown in this acknowledgement should be used in all subsequent correspondences relating to the application.

334

5.2 The Authority shall complete screening of the dossier for completeness within 30 working days from receiving such application.

5.3 In the event that the dossier is incomplete, the applicant will be notified of the deficiencies and requested to resubmit the application.

5.4 In case of a positive outcome during screening, the application shall be placed in the evaluation queue.

5.5 Review of application for marketing authorization of a product will follow the appropriate evaluation queue. Priority review may be granted where the product is intended for treatment of a serious or life-threatening disease. Evaluation of priority product shall be carried out within 120 working days from receiving the application.

5.6 Evaluation of the application shall be carried out within 240 working days from receiving the application.

5.7 Abridged evaluation may be carried out to pharmaceutical products that are registered in any of the agreed benchmark regulatory agencies.

5.8 During product evaluation, the Authority may request for further information and additional supporting documents from the applicant. This shall be considered as the first round of evaluation.

5.9 Applicant should make available such information or documentation requested after the first round of evaluation within 180 calendar days from the date of receipt of the request.

5.10 Applicant should make available any information or documentation requested after subsequent rounds of evaluation within 120 calendar days from the date of receipt of the request.

5.11 If no response is received from applicant after the timelines described in 5.9 and 5.10 above, the clock stops and the application will be cancelled if no formal request for extension of deadline has been made. A new application will have to be submitted if the MAH wishes to pursue marketing authorization of the product.

5.12 Evaluation of the additional information shall be carried out within 3 months from receiving such information. This shall be considered as the second round of evaluation and subsequent submission of additional information shall be considered as third round of evaluation and so forth.

5.13 Evaluation of one application shall not exceed five rounds of evaluation with the exception of administrative queries.

335

5.14 The MAH will be informed of the decision in writing as to whether the application has been approved or rejected.

5.15 A registration number will be given when a product is registered. The registration number is specific for the product registered as specified in the registration documents. A certificate of registration shall be issued for the registered product.

5.16 For a product to be issued MA, it must be manufactured in a GMP compliant facility and studies conducted following GCP.

6. MAINTENANCE OF MARKETING AUTHORIZATION

6.1 The conditions for marketing authorization of pharmaceutical products are as follows:-

6.1.1 The product registered with the marketing authorization number as stated in the marketing authorization certificate shall have the name, composition, characteristics, specifications and origin as specified in the marketing authorization documents.

6.1.2 The holder of the marketing authorization certificate must supply such documents, items, samples, particulars or information as the Authority may require in relation to the registered product.

6.1.3 Changes in name, composition, characteristics, origin, specifications, manufacturer, packing, indications, labelling, package insert, product literature or any other particulars of the registered product shall not be made without prior notification and/ or approval from the Authority.

6.1.4 The labels for the registered product must comply with all of the labelling requirements as specified by the guidelines for labelling.

6.1.5 The registered product must only be indicated for use as approved by the Authority.

6.1.6 The holder of the marketing authorization certificate must inform the Authority of any adverse reactions or complaints on quality, safety and efficacy of the registered product immediately after he/she becomes aware of such adverse reactions or complaints.

6.1.7 The holder of the registration certificate must notify in writing to the Authority of any decision to withdraw the marketing authorization of the product and shall state the reasons for the decision.

6.2 MAH shall be required to pay retention fees as specified by the fees and charges regulations.

336

6.3 The registration of a product shall be valid for 5 years or such period as specified in the registration certificate (unless sooner suspended or cancelled by the Authority).

6.4 The renewal of product registration should be done not later than three months prior to expiry. Applications for renewal of registration shall be made by submitting documents as outlines in guidelines on submission of documentation for renewal of registration.

7. CANCELLATION OR SUSPENSION OF MARKETING AUTHORIZATION

7.1 The Authority may cancel or suspend the marketing authorization of any product if there are deficiencies in safety, quality or efficacy of the product or failure to comply with the marketing authorization requirements or due to changes in national policies.

7.2 Such products may not be imported and marketed in the country. The holder of the registration certificate shall immediately surrender to the Authority the marketing authorization certificate upon cancellation or suspension of marketing authorization of the product.

8. APPEALS AGAINST AUTHORITY'S DECISIONS ON PHARMACEUTICAL PRODUCT MARKETING AUTHORIZATION

8.1 For products that have been suspended and cancelled marketing authorization by the Authority, MAH may make a written appeal to the Director General of TMDA to review its decision.

8.2 All notice of appeals must be made within thirty (30) calendar days from the date of the notification.

8.3 MAH shall make appeal by giving grounds for review for each reason given for the rejection of his product. The grounds for the request shall be based on the information that was submitted in the product dossier. Any additional or new information that was not earlier submitted will not be accepted. The Authority may review or uphold its earlier decision.

9. VARIATIONS IN PARTICULARS OF REGISTERED PRODUCTS

All variations to a registered product shall be made according to requirements stipulated in the variation guidelines.

9.1 EXTENSION APPLICATIONS

9.1.1 An extension application is an application that is a modification of an already registered medicinal products. The modification shall be such that it does not fulfil criteria for

337

minor or major variations but is similar enough to the original product in terms of quality, safety and efficacy.

9.1.2 A marketing authorization holder may apply for extension of marketing authorization of an already registered product as an extension application. Such an application should be submitted as a new application however an abridged evaluation will be carried out.

9.1.3 Extension applications shall be applicable in the following situations:-

a) Changes or addition of a pharmaceutical form from multi-dose to single-dose of the finished product or vice versa.

b) Change or addition of strength of the finished product.

c) Change or addition of a route of administration of the finished product for products of the same pharmaceutical form.

d) Inclusion of medical devices that result in change of strength, pharmaceutical form or route of administration of the finished product.

9.1.4 An extension application shall be accompanied by the following:-

a) A duly filled in applicant form with the extension application box clearly marked (ticked).

b) The applicable registration fees for applications for registration of new applications.

c) A full dossier submitted in accordance to the requirements stipulated in the guidelines for submission of documentation for registration of human medicinal products.

d) A cover letter declaring the following:

- i. The name and registration number of the relevant product from which the extension is applied.
- ii. The marketing authorization holder for both products shall remain the same.

e) An overview of the nature of the extension being made.

f) Supporting data related to the proposed extension.

9.1.5 The final decision on whether an application meets the criteria for extension applications will lie with the Authority. In case of any doubt the MAH may contact the the Director General TMDA before filling for an extension application.

338

9.2 Duplicate Licensing

9.2.1 The Authority shall authorize the same applicant to submit more than one application for a finished product when there are objective verifiable reasons on public health grounds regarding the availability of finished products to health-care professionals and/or patients, or for co-marketing reasons and/or for Export purposes.

9.2.2 Additionally, the holder of a marketing authorization can grant the use of product information to another marketing authorization holder, whereby the original marketing authorization holder acts as a contract manufacturer.

9.2.3 The assessment on whether the conditions of a duplicate application are met shall be done on a case-by-case basis, having regard to the facts of each application. The overall objectives being preservation of public health.

9.2.4 To assess whether an application refers to a particular finished product that has already been granted a marketing authorization, and consequently, whose application for a marketing authorization qualifies for a duplicate license, the composition in active substance(s) and the pharmaceutical form shall be considered. Thus, any finished product with the same qualitative and quantitative composition in active pharmaceutical ingredient (i.e. the same strength) and the same pharmaceutical form are to be considered as the same relevant product.

9.2.5 A duplicate product shall be identical in all marketing authorization requirements with the exception of brand name and any other specific requirements on labelling. Additionally, any variation made to the original marketing authorization should be applied for the duplicate license.

9.2.6 Conditions for a Duplicate Marketing Authorization are outlined hereafter:-

a) That the duplicate application shall be submitted by the same applicant that submitted and/or holds the marketing authorization/application that is being duplicated (hereafter "original marketing authorization/application").

b) That the original marketing authorization is valid. This step does not apply in case of duplicate applications that are submitted in parallel with the original marketing authorization application (i.e. in cases where the application for the original marketing authorization is still pending).

c) In cases where the duplicate marketing authorization is submitted on the basis of an informed consent application, there should be a letter of consent from the marketing authorization holder that owns the dossier that is referred to.

d) The original marketing authorizations to which the duplicate application relates has to be valid at the time of the submission of the duplicate application.

339

9.2.7 The applicant for a duplicate license may fall under the following categories:-

a) Applicant is the same entity that applied for the original marketing authorization.

b) Applicant belongs to the same group of companies as the applicant of the original marketing authorization.

c) Applicant is an independent entity that has agreed to placing on the market the product with the applicant of the original marketing authorization (evidence of license agreement or other agreement that can be identified are required).

d) Applicant is an independent entity whereby there are license agreements with the marketing authorization holder of the product in respect of which the duplicate is asked but not for the placing on the market of that product.

e) Applicant is an independent entity that has got an agreement to purchase and/or use data from the company that has applied for a marketing authorization for the product for the first time but there is not an agreement regarding the placing on the market of the product.

9.2.8 All documents in accordance to the guidelines on submission of documentation for new applications should be submitted however an abridged evaluation shall be applied. In addition, the following shall be submitted when making a duplicate license application:-

a) A dully filled in application form (Annex II) with the duplicate license box clearly marked (ticked).

b) A cover letter detailing the following:-

- i. The name of the marketing authorization holder relevant for the duplicate application.
- ii. The name of the product relevant for the duplicate application.
- iii. The proposed brand name for the duplicate license.
- iv. The proposed marketing authorization holder for the duplicate license.

c) The applicable registration fees for applications for registration of new applications.

d) For co-marketing reasons, the evidence co-marketing (contract or letter of agreement between the companies).

e) For duplicates asked on grounds of the existence of patents protecting certain therapeutic indications or pharmaceutical forms, the applicant shall provide a commitment undertaking to extend the therapeutic indication(s)/ pharmaceutical form(s) of the duplicate marketing authorization as soon as the patent restrictions no

340
longer exist. Alternatively, the applicant may also commit to withdraw the marketing authorization with restricted indications/pharmaceutical forms after the relevant patents are no longer in force. The SmPC shall be harmonized. The commitment letter shall be submitted alongside the Marketing authorization Application Dossier.

f) Letter of consent in the case of an "informed consent application".

341

PART XI:

GUIDELINES ON NAMING OF MEDICINAL PRODUCTS

342

1. Introduction

Prescription and medication error may occur partly due to medicinal products having sound-alike or look-alike brand names, unclear labeling or poorly designed label artwork. Hence this guideline was developed in order to provide Applicants with clear guidance on how to choose brand names for their medicinal products.

Tanzania Medicines and Medical Devices Authority may request changes to a brand name if based on evaluation, it is deemed to potentially: -

- a) cause confusion with the name of an existing medicine;
- b) mislead as to the composition of the product or the use;
- c) or otherwise unsafe.

Approval of the name does not imply that the marketing authorization holder is absolved of any responsibility in the incidence that actual or potential adverse reactions occur due to the brand name.

State legislations in particular trade laws, should be taken into consideration while proposing a specific brand name.

2. Scope

This guideline is applicable to all prescription and non-prescription medicinal products as well as medicinal products of biological origin.

The principles outlined in this guideline are also applicable for applications for variation of names of registered medicinal products.

3. Acknowledgments

This guideline was developed based on the European Medicines Agency's Guideline on the acceptability of names for human medicinal products processed through the centralized procedure.

4. Criteria applied when reviewing proposed brand names

The criteria listed below should be seen as general principles. The Authority may develop additional guidance on specific topics based on experience and may apply additional requirements not listed in this document during review of proposed brand names.

The criteria for acceptability of proposed brand names shall be based on public health concerns and in particular with regard to safety.

Applicants should ensure that the proposed name complies with the criteria outlined in this guideline before submitting an application for marketing authorization. Requirements and

343

considerations taken during review are outlined hereafter:-

4.1 Safety concerns and other public health concerns in brand names

4.1.1 The brand name of a medicinal product should not be liable to cause confusion in print, handwriting or speech with the brand name of another medicinal product.

When assessing the potential for such confusion, the following aspects are considered:

- The indication(s);
- The patient population(s);
- The pharmaceutical form(s);
- The route(s) of administration;
- The strength(s);
- The setting for prescription, dispensing and use;
- The legal status/classification for supply:
- Medicinal product subject to medical prescription;
- Medicinal product not subject to medical prescription;
- Medicinal product subject to special medical prescription;
- Medicinal product subject to restricted medical prescription;
- Medicinal product subject to special and restricted medical prescription;
- Orphan (designation) status;
- (Potential) New pharmaceutical forms, routes of administration and/or strengths for the medicinal product concerned, as appropriate.
- The degree of similarity versus the potential for harm to the patient in case of mix-up.

It should be noted that the Authority will consider potential for confusion of proposed brand names with the brand names of authorized, suspended and revoked/withdrawn medicinal.

344

When considering potential for confusion with the name of a withdrawn/revoked marketing authorization, in principle, a period of 5 years should have elapsed after the official invalidity of the marketing authorization according to national legislation (e.g. publication in the national gazette notice, etc.). This period could be reduced (e.g. the product was not marketed in Tanzania for a period preceding this 5 year period) if it can reasonably be justified by the Applicant. The period may be extended (e.g. that the withdrawal of the marketing authorization was linked to serious safety concerns and this has an impact on the potential risk to public health associated with the name) at the discretion of the Authority. The Authority may also consider potential safety concerns and other public health concerns associated to the re-use of identical brand names.

4.1.2 The brand name of a medicinal product should not convey misleading therapeutic and/or pharmaceutical connotations.

This also includes brand names that are similar or allude to the name of pharmaceutical companies if they are thought to be misleading and cause confusion at the level of product information.

4.1.3 The brand name of a medicinal product should not be misleading with respect to the composition of the product.

4.1.4 Consideration should be given to the phonetics and the potential difficulties a proposed brand name may create in terms of pronunciation in the official or native languages of Tanzania.

Consideration should also be given to the fact that very short brand names composed of, for instance, a string of letters, may be inappropriate to identify medicinal products in certain settings.

4.1.5 The use of qualifiers/abbreviations by letters as part of the brand name should in principle be acceptable on conditions.

Qualifiers consisting of a single letter or number(s) (Arabic and Roman) are discouraged, because they may be confused with the strength and/or posology of the medicinal product. However, the use of numbers may in certain cases be acceptable, e.g. vaccines (see section 4.3.1). The applicant may provide a justification for their inclusion.

The potential added benefit versus its potential risk to public health in case of medication error shall be taken into consideration when considering the acceptability of a qualifier/abbreviation. The following shall be considered:-

a) Whether the qualifier/abbreviation provides further information on characteristics of the medicinal product (e.g. duration of action, devices, route of administration, composition, patient population) without being misleading or

345

provides for a differentiation, which may help healthcare professionals and/or patients to prescribe/select the appropriate medicinal product.

b) The applicability and use of the qualifier across all official and native languages.

Qualifiers or abbreviations should not require translation to provide further information in the users.

c) The potential risk resulting from more complex names, adversely affecting memorability, pronunciation and/or prescription of the medicinal product.

4.1.6 The brand name should not convey a promotional message with respect to the therapeutic and/or pharmaceutical characteristics and/or the composition of the medicinal product.

4.1.7 The brand name should not be offensive or have an inappropriate connotation in any of the official or native languages.

4.1.8 For a medicinal product containing a prodrug, a different brand name from the brand name of the medicinal product containing the related active substance is required.

4.1.9 The brand name should not comprise wholly of initial letters (acronyms) or code numbers nor include punctuation marks.

4.1.10 The importance of other elements such as labelling and pack design should be taken into consideration as contributing factors for the safe use of a medicinal product. These aspects should be discussed at the time of the review of mock-ups.

The following are examples where labelling and pack design may play a role in the final decision of acceptability of brand names:-

- a) The actual display of a brand name in the printed material may increase the level of similarity between two brand names or may convey a misleading connotation.
- b) The labelling and pack design may support the meaning of a qualifier which otherwise would have been rejected.

4.2 Use of international non-proprietary names in proposed brand names

When proposing a brand name, Applicants are advised to take into consideration WHO resolution (WHA46.19), where appropriate, i.e. "It would therefore be appreciated if brand names were not derived from international non-proprietary names (INNs) and if INN stems were not used in brand names".

Two types of INN concerns could be considered i.e. a potential similarity with its own or different INN or the inclusion of an INN stem into the proposed brand name(s).

The Applicant is strongly advised to review INN similarity and/or INN stem inclusion before requesting that the proposed brand name(s) be considered for a medicinal product.

The Authority will review the above cases on the basis of WHO World Health Assembly 346 resolution (WHA46.19) on protection of INNs/INN stems to prevent any potential risk of confusion between brand names and common names.

4.3 Product specific concerns in proposed brand names

4.3.1 For vaccines composed of several serotypes, when adding a new serotype the original brand name may be kept, it is recommended that the name is then followed by the number of serotypes present. The description of serotypes present is then listed in the qualitative and quantitative composition. An example of the format of the proposed brand name follows:

Brand name + X [number of serotypes]

The same applies when different types of antigens are added. This is of particular importance in situations where both vaccines are simultaneously available on the market in order to allow differentiation of the products.

4.3.2 For radiopharmaceutical medicinal products, the inclusion of target organs in the brand name should be avoided in order to prevent misleading connotations should an extension of the indication include new target organs.

In principle, numbers should not be used in the name to avoid confusion with the strength. In cases where the numbers appear in the radionuclide, these should be displayed in superscript, i.e. mass numberElement + [brand name]

Numbers included as part of commonly known abbreviations will be assessed on a case by case basis.

4.3.3 When reviewing the acceptability of brand names for orphan medicinal products, the same approach as for non-orphan medicinal products shall be applied. It is of particular importance in these cases to provide detailed information on the specific setting in which the product is dispensed and used as well as on the target population.

4.3.4 For non-prescription medicinal products, the use of qualifiers/abbreviations within the brand name should aid selection/identification/differentiation of the product by the patient and should minimize the risk of inappropriate use.

In view of the above considerations, the specific criteria as described under sections 4.1.5, 4.1.8 and 4.3.7 may not apply here.

In order to help self-selection and compliance by patients/consumers, it is acceptable that brand names have a positive connotation and/or be informative; labelling and pack design could be considered as contributing factors to this end. Carton and container labels are particularly critical for non-prescription medicinal products (general sale and over the counter).

347

In case of a switch from "prescription" to "non-prescription" status of an already authorized medicinal product it is up to the Applicant to choose whether to vary/extend the existing marketing authorization and consequently retain the same

brand name or to submit a separate marketing-authorization application under a different brand name (see section 5). In exceptional cases, depending on the therapeutic context, the acceptability of the maintenance of the existing brand name may be further considered by the Authority during the evaluation process.

4.3.5 For generic/hybrid/similar biological medicinal products the same criteria apply as for any other medicinal products in respect to the brand name.

Special consideration should be given to the proposed brand name of a hybrid medicinal product to allow for differentiation when the latter differs in pharmaceutical form, strength, expression of active substance and/or indication from the reference medicinal product or other generics in the market.

4.3.6 Where the Applicant wishes to use instead of the brand name the common name or scientific name, together with a trademark or the name of the marketing-authorization holder/applicant, they should take into account the following rules:-

- a) If an INN recommended by the World Health Organization exists for the active moiety it should be used within the name of the medicinal product exactly as published without omissions or abbreviations. All the linguistic versions of the INN, including translations officially recognized at the national level, shall be considered to be the same name. If one does not exist, the usual common name should be used.
- b) If a Modified INN (INNM) recommended by the World Health Organization exists for the active moiety, it should be used within the name of the medicinal product exactly as published without omissions or abbreviations.
- c) Where the active moiety is an unpublished INNM the name of the medicinal product should be that as agreed by users of INNs (pharmacopoeia, regulatory bodies, stakeholders), in accordance with the WHO INNM working document 05.167/3.
- d) The 'name of the MAH' within the name of the medicinal product should correspond to all or part of the official name of the MAH as presented in the proof of establishment of the applicant/MAH.
- e) For consistency reasons, ease in prescription by healthcare professionals and database entries, punctuation marks in between the INN and the name of the Company/trademark are not acceptable (with the exception of fixed combinations, where multiple INNs should be clearly separated by slash '/').
- f) The proposed brand name should either be an brand name or the common name accompanied by a trademark or the name of the MAH.

4.3.7 The brand name of a fixed combination medicinal product should be sufficiently different from those of the individual active substances and/or those of other fixed combinations containing the same active substance(s).

The whole brand name of individual active substance(s) should not be inserted into the proposed brand name for the fixed dose combination.

4.3.8 As multiple applications can have an independent life (e.g. may develop a different indication at a later stage), the proposed brand names of such applications should not lead to confusion.

5. Regulatory aspects related to the acceptability of proposed brand names

Brand names for variation/extension/duplicate applications should be the same as those of the existing medicinal product. The addition of a qualifier to an already approved brand name constitutes a different brand name, which would require submission as new marketing authorization application.

In case the applicant wants to submit a separate marketing-authorization application for, e.g., a new indication, a different brand name shall be used.

The Authority may request the MAH to change the brand name of an already approved medicinal product if the approved brand name is deemed inappropriate.

5.1 Change of the brand name

The brand name can also be changed at a post-authorizations stage through an application for variation if the MAH wishes to change the name. Post-authorizations procedural requirements are outlined in the Guidelines on Variations on Registered Medicinal Products.

5.2 Report of prescription errors/medication errors due to the brand names of medicinal products:

The marketing authorization holder is responsible for reporting any adverse drug reactions resulting from:-

- a) Prescription errors/medication errors due to the brand name of the medicinal product (example mix up with another medicinal product resulting into an ADR).
- b) Misuse and/or abuse of a medicinal product caused by misleading therapeutic connotations of the brand name.

The ADRs should be reported in accordance to the procedures and guidance stipulated in the Guidelines on Safety and Vigilance of Medical Products and Health technologies.

EAC/TF-MED/MER/FD/ MA /N1R0

1. INTRODUCTION

All pharmaceutical products in the EAC region are regulated by individual Partner States' NMRA. As a preliminary step, the NMRA issues marketing authorization of all pharmaceutical products for human use prior to their use in the region. The objective of pharmaceutical product marketing authorization is to ensure that pharmaceutical products marketed in the region are safe, efficacious and of good quality and are manufactured in facilities that complies with the requirements prescribed in the EAC Good Manufacturing Practice guidelines. All local manufacturers, wholesalers, distributors and importers of pharmaceutical products must be licensed before they can conduct their businesses.

The guideline covers the steps that are followed from the submission of a dossier to the final outcome, the timeframe and procedure for competent authorities to amend, where necessary the conditions of marketing authorization of a particular product.

2. SCOPE

The guideline is applicable for all types of application submitted to the EAC Partner States National Medicines Regulatory Authorities (NMRAs) that include new application, renewal of application and application for variation of a registered pharmaceutical product.

3. TYPES OF APPLICATIONS

3.1 For purposes of submission to the NMRA, applications are classified into new application, application for variation of a registered pharmaceutical product and renewal application.

3.2 A new application is an application for registration of a pharmaceutical product that is intended to be placed on the market for the first time. A new application may only be made by the applicant and he shall be the person who signs the application form.

3.3 A new application for registration shall include submission of relevant documentation as provided in the main guidelines for registration of pharmaceutical products in use.

3

EAC/TF-MED/MER/FD/ MA /N1R0

4. GENERAL REQUIREMENTS AND APPLICATION PROCEDURES FOR PHARMACEUTICAL PRODUCT REGISTRATION

4.1 All applications and supporting documents shall be in English. All submitted documents which are in any language other than English must be accompanied by a certified or notarized English translation.

4.2 The responsibility of applying for product marketing authorization rests with the company responsible for the introduction of the product into the EAC market, i.e.: the Marketing Authorization Holder (MAH).

4.3 Applications must be duly completed and supported by all of the required documents i.e. Module I to Module V in accordance with the EAC Common Technical Document (CTD) for registration of pharmaceutical products. The submitted application will be screened for completeness within 30 working days. Dossiers which are incomplete will not be accepted for evaluation.

4.4 A dossier is a file that contains detailed scientific information on the chemistry, formulation, manufacturing, quality control and non-clinical and clinical studies that demonstrates quality, safety and efficacy of active pharmaceutical ingredient(s) and the corresponding finished pharmaceutical product.

Different sections of the dossier shall be distinctly marked and page numbered in the style: page x of y and have a table of contents indicating the sections and page numbers. Where information is required in the application forms its location shall be cross referenced in dossier. Information for each section shall be printed on both sides of an A-4 paper which will be arranged sequentially on a 1.00 mm or more diameter stainless spring and clamped with a stainless steel binder of not less than 1.0 mm thick in an A4 expandable spring file. The file shall be of cardboard or paper material of not less than 600gsm.

4.5 The covering letter shall be submitted in hard copy and the entire dossier on a CD-ROM or the entire application be electronically submitted to the NMRA.

2

4.6 Data shall be presented on A4 and 80g/m paper with readily readable letters of at least 12 font sizes. Every page shall be numbered sequentially. Extension sheets, tables, diagrams and other supporting documents shall as far as possible be of the same size, well annotated, numbered and appropriately cross-referenced.

4.7 Application must be accompanied by two samples of the finished product as packaged for sale. The NMRAs may request for additional samples when need arises.

4.8 The processing fee as prescribed in the respective NMRA's fees and charges schedule must be paid to the NMRA at the point of submission of the application.

4

EAC/TF-MED/MER/FD/ MA /N1R0

5. PROCESSING OF APPLICATIONS (MANAGEMENT OF APPLICATIONS)

5.1 Upon acceptance of an application, an acknowledgement for the receipt of the application will be issued within and a reference number will be generated. The reference number shown in this acknowledgement should be used in all subsequent correspondences relating to the application.

5.2 The NMRA shall complete screening of the dossier for completeness within 30 working days from receiving such application.

5.3 In the event that the dossier is incomplete, it will be rejected. The applicant will be notified of the rejection.

5.4 In case of a positive outcome during screening, the NMRA shall notify the MAH in writing that the screening has been successfully completed and place the dossier in the evaluation queue.

5.5 Review of application for marketing authorization of a product will follow the appropriate evaluation queue. Priority review may be granted where the product is intended for treatment of a serious or life-threatening disease. Evaluation of priority product shall be carried out within 6 months from receiving the application.

5.6 Evaluation of the application shall be carried out within 12 months from receiving the application.

5.7 Abridged evaluation will be carried out to pharmaceutical products that are registered in any of the agreed benchmark regulatory agencies.

5.8 During product evaluation, the NMRA may request for further information and additional supporting documents from the applicant. This shall be considered as the first round of evaluation.

5.9 Applicant should make available such information or documentation requested after the first round of evaluation within 180 calendar days from the date of receipt of the request.

5.10 Applicant should make available any information or documentation requested after subsequent rounds of evaluation within 120 calendar days from the date of receipt of the request.

5.11 If no response is received from applicant after the timelines described in 5.9 and 5.10 above, the clock stops and the application will be cancelled if no formal request for extension of deadline has been made to the NMRA. A new application

will have to be submitted if the MAH wishes to pursue marketing authorization of the product.

5
EAC/TF-MED/MER/FD/ MA /N1R0

5.12 Evaluation of the additional information shall be carried out within 3 months from receiving such information. This shall be considered as the second round of evaluation and subsequent submission of additional information shall be considered as third round of evaluation and so forth.

5.13 Evaluation of one application shall not exceed four rounds of evaluation with the exception of administrative queries.

5.14 The MAH will be informed of the decision of the NMRA in writing as to whether the application has been approved or rejected.

5.15 A registration number will be given when a product is registered. The registration number is specific for the product registered as specified in the registration documents. A certificate of registration shall be issued for the registered product.

5.16 For a product to be issued MA, it must be manufactured in a GMP compliant facility and studies conducted following GCP.

6. MAINTENANCE OF MARKETING AUTHORIZATION

6.1 The conditions for marketing authorization of pharmaceutical products are as follows:-

6.1.1 The product registered with the marketing authorization number as stated in the marketing authorization certificate shall have the name, composition, characteristics, specifications and origin as specified in the marketing authorization documents.

6.1.2 The holder of the marketing authorization certificate must supply such documents, items, samples, particulars or information as the NMRA may require in relation to the registered product.

6.1.3 Changes in name, composition, characteristics, origin, specifications, manufacturer, packing, indications, labelling, package insert, product literature or any other particulars of the registered product shall not be made without prior approval from the NMRA.

6.1.4 The labels for the registered product must comply with all of the labelling requirements as specified by the guidelines for labelling.

6.1.5 The registered product must only be indicated for use as approved by the NMRA.

6.1.6 The holder of the marketing authorization certificate must inform the NMRA of any adverse reactions or complaints on quality, safety and efficacy of the registered product immediately after he/she becomes aware of such adverse reactions or complaints.

6
EAC/TF-MED/MER/FD/ MA /N1R0

6.1.7 The holder of the registration certificate must notify in writing to the NMRA of any decision to withdraw the marketing authorization of the product and shall state the reasons for the decision.

6.2 MAH shall be required to pay retention fees as specified by the respective NMRA.

6.3 The registration of a product shall be valid for 5 years or such period as specified in the registration certificate (unless sooner suspended or cancelled by the NMRA).

6.4 The renewal of product registration should be done not later than three months prior to expiry. Applications for renewal of registration shall be made by submitting the following:

- a) Duly filled in application form for registration.
- b) Batch Manufacturing Record (BMR) of a real batch manufactured within at most six months before the submission of the application.
- c) Details of all changes during validity of the registration.
- d) Two samples of the finished product as packaged for sale.
- e) A site master file that describes the manufacturing facilities.
- f) Non-refundable evaluation fee for registration of pharmaceutical product and GMP and GCP inspection fees for facilities not inspected and approved by the NMRA within a period specified by NMRA.

7. CANCELLATION OR SUSPENSION OF MARKETING AUTHORIZATION

7.1 The NMRA may cancel or suspend the marketing authorization of any product if there are deficiencies in safety, quality or efficacy of the product or failure to comply with the marketing authorization requirements or due to changes in national policies.

7.2 Such products may not be imported and marketed in the country. The holder of the registration certificate shall immediately surrender to the NMRA the marketing authorization certificate upon cancellation or suspension of marketing authorization of the product.

7.3 NMRA shall notify all Partner States on the decision taken by the respective NMRA.

8. APPEALS AGAINST NMRA'S DECISIONS ON PHARMACEUTICAL PRODUCT MARKETING AUTHORIZATION

8.1 For products that have been suspended and cancelled marketing authorization by the NMRA, MAH may make a written appeal to the NMRA to review its decision.

8.2 All notice of appeals must be made within thirty (30) calendar days from the date of the NMRA's notification.

8.3 MAH shall make appeal by giving grounds for review for each reason given for the rejection of his product. The grounds for the request shall be based on the information that was submitted in the product dossier. Any additional or new information that was not earlier submitted will not be accepted. The NMRA may review or uphold its earlier decision.

9. VARIATIONS IN PARTICULARS OF REGISTERED PRODUCTS

All variations to a registered product shall be made according to requirements stipulated in the EAC Application Guidelines for Variation of Registered Pharmaceutical Products.

9.1 EXTENSION APPLICATIONS

9.1.1 An extension application is an application that is a modification of an already registered medicinal products. The modification shall be such that it does not fulfil criteria for minor or major variations but is similar enough to the original product in terms of quality, safety and efficacy.

9.1.2 A marketing authorization holder may apply for extension of marketing authorization of an already registered product as an extension application. Such an application should be submitted as a new application however an abridged evaluation will be carried out.

9.1.3 Extension applications shall be applicable in the following situations:-

a) Changes or addition of a pharmaceutical form from multi-dose to single-dose of the finished product or vice versa.

b) Change or addition of strength of the finished product.

c) Change or addition of a route of administration of the finished product for products of the same pharmaceutical form.

d) Inclusion of medical devices that result in change of strength, pharmaceutical form or route of administration of the finished product.

9.1.4 An extension application shall be accompanied by the following:-

a) A duly filled in applicant form with the extension application box clearly marked (ticked).

b) The applicable registration fees for applications for registration of new applications.

c) A full dossier submitted in accordance to the requirements stipulated in the guidelines for submission of documentation for registration of human medicinal products.

d) A cover letter declaring the following:

- i. The name and registration number of the relevant product from which the extension is applied.
- ii. The marketing authorization holder for both products shall remain the same.

e) An overview of the nature of the extension being made.

f) Supporting data related to the proposed extension.

9.1.5 The NMRA final decision on whether an application meets the criteria for extension applications will lie with the NMRA. In case of any doubt the MAH may contact the NMRAs before filling for an extension application.

9.2 Duplicate Licensing

9.2.1 The NMRA shall authorize the same applicant to submit more than one application for a finished product when there are objective verifiable reasons on public health grounds regarding the availability of finished products to health-care professionals and/or patients, or for co-marketing reasons and/or for Export purposes.

9.2.2 Additionally, the holder of a marketing authorization can grant the use of product information to another marketing authorization holder, whereby the original marketing authorization holder acts as a contract manufacturer.

9.2.3 The assessment on whether the conditions of a duplicate application are met shall be done on a case-by-case basis, having regard to the facts of each application. The overall objectives being preservation of public health.

9.2.4 To assess whether an application refers to a particular finished product that has

already been granted a marketing authorization, and consequently, whose application for a marketing authorization qualifies for a duplicate license, the composition in active substance(s) and the pharmaceutical form shall be considered. Thus, any finished product with the same qualitative and quantitative

9
EAC/TF-MED/MER/FD/ MA /N1R0

composition in active pharmaceutical ingredient (i.e. the same strength) and the same pharmaceutical form are to be considered as the same relevant product.

9.2.5 A duplicate product shall be identical in all marketing authorization requirements with the exception of brand name and any other specific requirements on labelling. Additionally, any variation made to the original marketing authorization should be applied for the duplicate license.

9.2.6 Conditions for a Duplicate Marketing Authorization are outlined hereafter:-

a) That the duplicate application shall be submitted by the same applicant that submitted and/or holds the marketing authorization/application that is being duplicated (hereafter "original marketing authorization/application").

b) That the original marketing authorization is valid. This step does not apply in case of duplicate applications that are submitted in parallel with the original marketing authorization application (i.e. in cases where the application for the original marketing authorization is still pending).

c) In cases where the duplicate marketing authorization is submitted on the basis of an informed consent application, there should be a letter of consent from the marketing authorization holder that owns the dossier that is referred to.

d) The original marketing authorizations to which the duplicate application relates has to be valid at the time of the submission of the duplicate application.

9.2.7 The applicant for a duplicate license may fall under the following categories:-

a) Applicant is the same entity that applied for the original marketing authorization.

b) Applicant belongs to the same group of companies as the applicant of the original marketing authorization.

c) Applicant is an independent entity that has agreed to placing on the market the product with the applicant of the original marketing authorization (evidence of license agreement or other agreement that can be identified are required).

d) Applicant is an independent entity whereby there are license agreements with the marketing authorization holder of the product in respect of which the duplicate is asked but not for the placing on the market of that product.

e) Applicant is an independent entity that has got an agreement to purchase and/or use data from the company that has applied for a marketing authorization for the product for the first time but there is not an agreement regarding the placing on the market of the product.

10
EAC/TF-MED/MER/FD/ MA /N1R0

9.2.8 All documents in accordance to the guidelines on submission of documentation for new applications should be submitted however an abridged evaluation shall be applied. In addition, the following shall be submitted when making a duplicate license application:

a) A duly filled in application form (Annex II) with the duplicate license box clearly marked (ticked).

b) A cover letter detailing the following:

- i. The name of the marketing authorization holder relevant for the duplicate application.
- ii. The name of the product relevant for the duplicate application.
- iii. The proposed brand name for the duplicate license.
- iv. The proposed marketing authorization holder for the duplicate license.

c) The applicable registration fees for applications for registration of new applications.

d) For co-marketing reasons, the evidence co-marketing (contract or letter of agreement between the companies).

e) For duplicates asked on grounds of the existence of patents protecting certain therapeutic indications or pharmaceutical forms, the applicant shall provide a commitment undertaking to extend the therapeutic indication(s)/ pharmaceutical form(s) of the duplicate marketing authorization as soon as the patent restrictions no longer exist. Alternatively, the applicant may also commit to withdraw the marketing authorization with restricted indications/pharmaceutical forms after the relevant patents are no longer in force. The SmPC shall be harmonized. The commitment letter shall be submitted alongside the Marketing authorization Application Dossier.

f) Letter of consent in the case of an "informed consent application".

Maintenance of Marketing Authorization in the MENA Region

Danksagung

An dieser Stelle möchte ich mich bei meiner Familie für die jahrelange Unterstützung in allen Lebenslagen bedanken. Insbesondere meiner Mutter Safia und meinem Vater Hassan habe ich meine berufliche und persönliche Entwicklung zu verdanken, da ich ohne sie heute nicht dort stehen würde, wo ich nun stehe.

Auch bei meinen Geschwistern, meinem Mann und dem Rest meiner Familie möchte ich mich bedanken, dass sie sowohl in guten als auch in schwierigen Lebenslagen für mich da waren und mich bei meinen Vorhaben immer unterstützt haben.

Außerdem gilt mein Dank all meinen Bekannten, die ich in dieser Zeit kennengelernt habe. Das Team des DGRA sowie allen Dozenten verdanke ich eine schöne Studienzeit und viele lehrreiche Vorlesungen.

Maintenance of Marketing Authorization in the MENA Region

Executive summary

The aim of this master thesis is to identify and define the regulatory requirements for maintenance procedures of marketing authorization for medicinal products in the countries of the Middle East and North Africa.

The importance of marketing authorizations of medicinal products is not only limited in the approval of new marketing authorization. It is more important to maintain existing marketing authorizations in these countries to ensure the prevention, diagnosis and treatment of diseases and for patient rehabilitation.

In the last 10 years the MENA region has become one of the most emerging markets in the world. This is due to the growth of the population, the increasing affluence and the increase of life expectancy. Inside the region, the tendency of the increased numbers of MAH and manufactures increased since several is still ongoing and the authorities are developing and modifying new regulations and laws in order to justify this development.

Even the developing process of adequate regulations for medicinal products is still ongoing, in most of the MENA countries there are a lot of challenges. Many of the regulations are only available in Arabic. For the Maghreb States the submission dossier has to be provided in French. Additionally the political situation in some MENA country is not stable and the processes are not transparent enough. These barriers complicate the authorization and maintenance for medicinal products in the MENA region. Finally the population has to face up with the consequence of these barriers.

This master thesis will provide an overview about the maintenance procedures for marketing authorizations in the MENA region and to compare them with the European procedure. This comparison conveys how far the development of the pharmaceutical sector in the MENA region is in opposite to Europe and how the trend will develop in the next years.

1

Maintenance of Marketing Authorizations in the MENA Region

1. Introduction in Regulatory Affairs Department in MENA

The MENA region is one of the "emerging" markets in the pharmaceutical sector in the world. The importance of this region for many multinational pharmaceutical companies is very high. This section will provide some basic information to gain a better understanding of how the pharmaceutical market is organized and to maintain a marketing authorization in the MENA region.

1.1. Definition of MENA and geographical location

The term "MENA" is defined as "Middle East and North Africa" and includes in general 22 countries from Morocco at the eastern border until Iran in the north of the region. (1)

Due to the fact, that a firm definition does not exist, there are several opinions that Turkey belongs to the MENA region. In this case we will follow the definition of the World Bank and exclude Turkey in this analysis.

According to the World Bank and UNICEF the following countries belong to the MENA region: Algeria, Bahrain, Egypt, Iran, Iraq, Israel, Jordan, Kuwait, Libya, Morocco, Oman, Qatar, Saudi Arabia, Syria, Tunisia, United Arab Emirates (UAE), West bank and Yemen. (2)

Figure 1: Overview of countries of the MENA region

Source: https://www.researchgate.net/figure/s-a-map-showing-list-of-MENA-countries-1_fig1_318837933

Maintenance of Marketing Authorizations in the MENA Region

Inside the MENA region we have to divide three subgroups:

Middle East:

- GCC countries: Saudi-Arabia, UAE, Bahrain, Oman, Qatar, Kuwait, Yemen
- Levant countries: Iran, Iraq, Syria, Lebanon, West Bank, Jordan, Israel, Egypt, Libya: These countries are not part of any union. (3)

North-Africa:

- Maghreb-States: The countries Morocco, Algeria and Tunisia belong to the Maghreb countries.

The political situation in the MENA region is middling. Since the beginning of the Arab revolutions in 2011, the political situation in some countries is quite instable. In Syria, Yemen and Libya the current situation is not transparent and there are still civil wars in these countries. The medical supply is quite inadequate and the procedures to authorize import or maintain medicinal products into the affected markets are not up-to-date and not in use. Due to this fact these three countries will not be taken into account for the aim of this master thesis.

Maintenance of Marketing Authorizations in the MENA Region

1.2. Pharmaceutical & Healthcare sector in the MENA region

The pharmaceutical and healthcare sector in the MENA region grows up since the 1970's. The need of medicinal products and healthcare was growing up due to the growth of the population of 532 Million people. The increased life expectancy of the population and the decreased death mortality are one of the most important reasons. Additionally, the change of the life cycle during the last years leads to many widespread diseases, such as Diabetes, cancer or cardio-vascular diseases. (4)

The region belongs to one of the Emerging markets in the world after China. The amount of the MENA region in the world belongs to \$32 Billion dollar, which makes only a percentage of 2 percent. (5) The pharmaceutical sector is estimated to grow from 9 to 11 percent until 2020. (6)

Figure 2: Increase of Diabetes as widespread disease in the world

Source: https://www.huffingtonpost.com/riva-greenberg/diabetes-stats_b_4273505.html

The increased demand of medicinal products is shown in the figure. The amount of people with diabetes will be increased in the MENA region about 96.2 percent until 2035.

Inside the MENA region nearly all competent authorities and Institutions are in the process to develop easier procedures for granting authorization of medicinal products to counteract against this need. This challenge leads to the growth of the pharmaceutical sector in the region. Since 1970 more than 140 local pharmaceutical companies are located in countries of the MENA region.

Maintenance of Marketing Authorizations in the MENA Region

Figure 3: Development of MENA Health Expenditure in comparison with other markets

Source: http://www.gphaonline.org/media/cms/Osama_Nabulsi.pdf

Most of the domestic pharmaceutical companies are generic drug manufacturer. This is due to the fact that the development of new innovative drug substances is not well advanced in the MENA region. A large part of the countries are dependent on import of medicinal products from USA, Europe and China. Especially for the manufacturing, the import of active drug substances and ingredients are essential. This heavy dependence aggravated the development of the pharmaceutical sector in the MENA region.

Another point is the strong individuality and the status of development inside the MENA region. The Gulf States are well-advanced in the development of appropriate procedures and regulations, but the Maghreb States are backward in this case. In the Maghreb States a strong dependence on laws, regulations and procedures during and after the authorization of medicinal products to the French Authority ANPP. This can be judged from the fact that the price for medicinal products in Algeria, Morocco and Tunisia are similar to the actual prices of medicinal products in France.

In the last decade, local authorities and institutions are in the progress of developing appropriate procedures for authorization and maintenance of MA of medicinal products in regard to ICH-Guidelines. This development leads also to an increase of the amount of privatization of pharmaceutical companies.

Maintenance of Marketing Authorizations in the MENA Region

Figure 4: Number of pharmaceutical companies in the countries of the MENA region (private and non-private companies)

The figure shows, that the pharmaceutical market size in almost all countries is mainly generated by state-own enterprises, except for Iraq, where private pharmaceuticals companies makes more than 50 percent of the market size. It is

expected that the amount of private companies will increase in the next years. This development shows that with the privatization of companies in the countries leads to more independence on imports of medicinal products in the region.

All these points show that the development of the pharmaceutical industry in the MENA region is in progress, but many important milestones still need to be reached. In contrast to the industrial nation as the United States, Europe or Japan the development and manufacturing of new innovative drug substances and biologicals are not well developed in the countries of the MENA region. Additionally the manufacturing and authorization of medicinal products is difficult in many countries, due to the long approval timelines of the authorities. The missing resources inside the authorities complicate the access of pharmaceutical products to the local markets. In nearly all countries the Ministries of Health contain appropriate departments for authorization of medicinal products instead of European countries, where "own" competent authorities are responsible for marketing authorization and post-approval activities of medicinal products.

6

Maintenance of Marketing Authorizations in the MENA Region

1.3. Overview of Competent Authorities in the MENA region

To understand the procedure of the maintenance of marketing authorizations in the MENA region it is important to get an overview about the National Competent Authorities in each country.

1.3.1. Competent Authorities in the Gulf States

Kingdom of Saudi Arabia (KSA)

Since 2003 the Saudi Food and Drug Authority (SFDA) is the competent authority for registrations, maintenance, quality, pharmacovigilance and import of medicinal products. (7) It is an independent authority from the Ministry of Health.

United Arab Emirate (UAE)

Seven Emirates belongs to the United Arab Emirate. Abu Dhabi (the capital), Dubai, Sharjah, Ajman, Umm Al-Qaiwain, Ras Al-Khaimah and Fujairah.

In UAE there are two competent authorities who are responsible for all regulatory issues of medicinal products.

The Health Authority of Abu Dhabi (HAAD) is responsible for medicinal products in the capital emirate Abu Dhabi and for Dubai it is the Dubai Health Authority (DHA). For the other emirates, the Ministry of Health and Prevention is responsible for all drug related issues. For the management and regulation of health services the Health Authority of Abu Dhabi and the Dubai Health Authority merged together. (8)

Bahrain

For all pharmaceutical issues as licensing, healthcare professional's regulation, Healthcare facilities regulation and complaints the National Health Regulatory Authority of Bahrain (NHRA) takes the responsible. (9) The NHRA is an independent institution to the Ministry of Health.

7

Maintenance of Marketing Authorizations in the MENA Region

Oman

The Directorate of Pharmaceutical Affairs & Drug Control as part of the Ministry of Health is responsible for registration, import, maintenance and quality of medicinal products authorized in Oman. (10)

Qatar

In Qatar, the department of Pharmacy & Drug Control as part of the Ministry of Public Health takes the responsibility for all drug related issues such as registration, quality control, inspection and drug release. (11)

Kuwait

The Kuwait Drug and Food Control Administration (KDFA) is part of the Ministry of Health. This department is the competent body for all drug related issues as quality control, authorization and assessment of marketing authorizations for medicinal products. (12)

8

Maintenance of Marketing Authorizations in the MENA Region

1.3.2. Competent Authorities in the Levant countries

Egypt

The Egyptian Drug Authority (EDA) is a competent authority body within the MoH, which is responsible for issues regarding authorization and control of medicinal products. (13)

- The Central Administration of Pharmaceutical Affairs (CAPA) is an entity within the EDA, which takes the responsibility for the assessment and licensing for medicinal products. (14)
- The National Organization for Drug Control & Research (NODCAR) is responsible for all Quality related issues of nationally authorized products in Egypt. (15)
- For Biologicals the National Organization for Research and Control of

Biologics (NORCB) is the main department of authorization, import & quality related issues for Biologicals. (16)

Iraq

In Iraq there is a special situation. The Iraqi Directorate of Technical Affairs (DTA) as part of the MoH is responsible for all drug related issue as registration, inspection and quality control for medicinal products in the Iraqi market. (17)

Since 1992 the MoH in the Kurdish autonomous area establish the Kurdistan Medical Control Agency (KMCA). This competent body is responsible for the registration, quality control, distribution and quality control of medicinal products in Kurdistan. (18)

Iran

The Food and Drug Department of the Ministry of Health and Medical Education (MOHME) is responsible for all issues related to the authorization, maintenance and marketing of medicinal products in Iran. (19); (20)

Israel

For the authorization, control and marketing of medicinal products (human, herbal and veterinary products) the MoH in Israel is responsible. The Registration Department is responsible for the licensing processes while the Institute for

9

Maintenance of Marketing Authorizations in the MENA Region

Standardization and Control of Pharmaceuticals is responsible for the quality control of authorized medicinal products in Israel. (21); (22)

Jordan

The Jordan Food and Drug Administration (JFDA) belong to the MoH and take the responsibility for licensing processes for medicinal products and food products.

Inside the JFDA the Registration Division is the main directorate for the authorization for medicinal products in Jordan. (23)

Lebanon

The Ministry of Public Health (MoPH) is responsible for all drug related issues.

The "Service of Pharmacy" as part of the MoPH has the following activities:

- Issuing certificates related to pharmacies and pharmacists' practice
- Drug pricing
- Drug industry management and control
- Narcotic drugs' imports, distribution, and statistics
- Medicinal imports/exports
- Drug registration and control
- Registration of non-medicinal health-related items
- Pharmacies' and drugstores' inspection
- Controlling fraud in the pharmaceutical industry (24)

West Bank

The General Directorate of Pharmacy as part of the Ministry of Health take the responsibility of all licensing, quality control and price issues for medicinal products authorized and marketed in Palestine. Inside the Directorate there are separate departments for each section

- Registration Department
- Drug Quality Department
- Pharmaceutical Policy Department
- Dangerous Drug Department (narcotics and psychotropic drugs)
- Drug Information Department

10

Maintenance of Marketing Authorizations in the MENA Region

- Import and Export Department (25)

For the authorization of medicinal products, medical devices, food products and cosmetic products the Drug Registration Department of the General Directorate of Pharmacy is the main contact point. (26)

11

Maintenance of Marketing Authorizations in the MENA Region

1.3.3. Competent Authorities in the Maghreb States Morocco

In Morocco, the Ministry of Health is the main body for healthcare for public health. The department "Direction des Médicaments et de la Pharmacie"(DMP) is responsible for all drug related issue, as authorizations, maintenance, monitoring and distribution of pharmaceutical products. (27)

Algeria

The "Pharmacy and Medicine Directorate" (DPM) is an independent body of the Ministry of Health and Population, which is responsible for all regulatory topics for medicinal products. (28) Since 2017, the National Agency of Pharmaceutical Product

(ANPP) replaced the DPM and took the responsibility as independent and non-government agency for all drug related issues as drug registration, maintenance and distribution. (29) (30) (31)

Tunisia

The Ministry of Public Health is the main body related to regulatory issues for medicinal products. Since 1981 the Directorate of Pharmacy and Medicine (DPM) is a part of the Ministry of Public Health is responsible for the management of drug related issues in Tunisia. (32)

12

Maintenance of Marketing Authorizations in the MENA Region

1.3.4. Gulf Central Committee for Drug Registration

The Gulf Central Committee for Drug Registration is a committee founded by six of the Gulf States in 1999. The members of the committee are

- Saudi Arabia
- Qatar
- Oman
- Bahrain
- Kuwait
- United Arab Emirates
- Yemen

The committee is responsible for the assessment and authorization of medicinal products, which should be authorized via the "Central Drug registration". Marketing authorizations from the GCC-DR will get a marketing license for all members of the GCC. (33)

13

Maintenance of Marketing Authorizations in the MENA Region

2. Marketing Authorization in the MENA Region

In the last years, the MENA region became more important for international pharmaceutical companies. This is due to the fact that 32 Billion Dollar was made in pharma sales and the trend is still growing (34).

Inside the MENA region, besides the diversity of culture, language, and tradition, there are significant differences in the processes for obtaining marketing authorizations in the countries. Therefore, it is difficult to describe the processes for the whole region. In this part we will take the opportunity to summarize the most important parts of marketing authorizations in the MENA region.

A main reason for the complexity and diversity of the processes for marketing authorization of medicinal products are due to the development of the health- and pharmaceutical sector in the respective countries. In the last years significant progresses were done in the MENA region, mainly in the GCC-States and in some Levant States as Egypt and Israel. The numbers of local manufacturers increased in this region over the recent years. (34). This indicates that the region tries to get independent from medicinal products imported from other parts of the world. The pharmaceutical and health sector grows in these countries also due to the increased population and medical needs in this region.

Even there are positive trends for the whole region, inside the MENA region there are significant differences in the regulatory "know-how" and experience. While many GCC countries and several Levant States as indicate much progresses in the healthcare and pharmaceutical development and regulatory of medicinal products, the Maghreb States are not on the same level. There is a historical background behind the significant differences inside the MENA region. Until 1956 the Maghreb States were under French colonial power and this had a major impact on all administrative bodies, including the Ministries of Health and the Committee for all drug related issues. Especially the Algerian and Tunisian Authorities often refer to the decision of the French NCA ANSM (Agence nationale de sécurité du médicament et des produits de santé).

14

Maintenance of Marketing Authorizations in the MENA Region

Despite the numerous progresses in the recent/ past few years, there are still many aspects inside the pharmaceutical sector, which are not yet regulated adequate enough. The NCA of the MENA region have limited experience in the fields of biologicals and gene-therapy. Their experience with such kind of medicinal products cannot be compared with the European or American NCA's. There are only a few special laws and regulations for these kinds of medicinal products and this indicates that this field is still in progress. (35)

The timeline to get a marketing authorization depends on certain countries. A general statement is not possible. While the authorization procedures in the GCC States, Maghreb States and some Levant countries take 2 – 4 years, the same procedure can take up to 5 years in Iraq and Iran, even it is the same dossier for a medicinal product, which were submitted to other MENA countries. In comparison to this, a marketing authorization for a Centralized procedure in Europe takes 300 days, including the decision of the European Commission.

In the most countries of the MENA region, a local agent is required for the communication and the submission to the Health Authorities. For a MAH outside the respective country, it is not allowed to submit any application to the authorities, except for medicinal products, which were authorized centrally by the Drug Registration of the GCC (GCC-DR). Due to this fact, many multi-national companies have several establishments in these countries to facilitate the communication to the

authorities and to fulfill the local requirements. The local agent is the main contact point between the local authority and the MAH. This obligatory is a problem for small and medium enterprises, because due to financial aspects and the short range not every company can establish local agents in these countries. The result is that medicinal products of these companies cannot be marketed in the MENA region or only a small portfolio is available.

Another important role beside the local contact point in the certain country is the format of the dossier. Nearly all countries require the dossier as CTD format (agreed in line with the ICH-M8 Guideline), but till now it is not possible to submit the dossier electronically in all countries of the MENA. Especially in some Levant states and in the Maghreb states, an electronically submission of an eCTD is currently not possible. (36)

15

Maintenance of Marketing Authorizations in the MENA Region

Many authorities still require the dossier in hard and soft copies as CDs/DVDs. The reason for this is that many countries are not yet ready for eCTD submissions because the technical conditions are still missing. On the contrary, Saudi Arabia and Bahrain require eCTD submissions via electronically portals since 2015. (37) In Egypt and Lebanon, the CTD is still not implemented. The documents have to be provided electronically as simple pdf dossier via Email and paper-based. (38)

Figure 5: Definition of CTD dossier according to ICH

Source: http://www.ich.org/fileadmin/Public_Web_Site/ICH_Products/CTD/CTD_triangle.pdf

For the Maghreb States, the documents in the CTD should be provided in French. This leads to a serious problem for the applicant, because for the two biggest markets - the US and Europe and most of the countries in the world, the language requirements of submission dossiers are in English. Therefore, it is quite complicated if the whole submission package needs to be translated into French. This additional workload leads to a high workload and a massive loss of time for the applicant.

Another special feature for marketing authorizations is that all authorities required a legalized CPP from the country of origin (COO). This requirement is valid for all MAH outside the respective country. The country of origin is defined as the country where the batch release takes place. (39)

It is also required, that the medicinal product has a valid license in the COO. In many countries it is not possible to maintain a marketing authorization (MA) without a valid license in the country of origin. If the MA is expired in the COO, the MAH requires a justification in the application form.

16

Maintenance of Marketing Authorizations in the MENA Region

All these points have to be taken into account for pre- and post-marketing authorization activities especially for renewal procedures.

The assessment processes at the authorities' sites are not transparent and clear to the applicant. The timelines are not well communicated and this leads to the consequence that the applicant has to consider a delay for market access of the medicinal product due to the absence of information about the timelines and the assessment process. Due to the missing information about timelines, the applicant must always be prepared for further requests from the authorities at any time of the renewal procedure.

Another point of discussion for receiving a marketing authorization in the MENA region is the fact, that there are no mutual recognition procedures inside the region. The authorities do not accept any approvals from other authorities of the region for guarantying a MA in the respective country. In opposite to the countries of the European Union, where a MA can be guaranteed via the Centralized, De-centralized or Mutual Recognition procedures, only national procedure for MA is available. The only exception is the central authorization procedure in the Gulf States. Since 1999 it becomes possible to get a marketing license for a medicinal product with one central procedure for all Gulf States and Yemen. Therefore, the Applicant has to submit a dossier for marketing authorization to the Gulf Central Committee for Drug Registration (GCC-DR) and after the assessment and the positive approval, the medicinal product can be marketed in all Gulf countries.

17

Maintenance of Marketing Authorizations in the MENA Region

3. Maintenance of Approved Medicinal Products – Middle East and North Africa

This part contains information about relevant procedures to maintain a marketing authorization of a medicinal product in the MENA Region. The main focus is the description of "renewal procedures" in this region. The first part of this section will be an overview about the renewal processes in the MENA region as whole region and in each individual country. In the second part of this section, there will be a discussion about other procedures to maintain a marketing authorization in different countries. The last part of this section will expand the issue of availability of harmonization processes of renewal or other "maintenance" procedures in the MENA region.

3.1. Renewal as procedure to maintain marketing authorizations in the MENA Region

For all countries in the Middle East and North Africa the Marketing Authorization holder is obligated to submit a renewal application to maintain the marketing authorization in the relevant countries.

As mentioned in the previous part, the MAH should have a local agent within a

country, if the MAH is stated outside the affected country. This local agent is responsible for the renewal application and he is stated as main contact point for the authorities.

Due to the fact that the development of regulations affecting the marketing authorization of biological are still in development, the requirements for renewal applications do not differ between chemical entities and biological. Only in Israel and Egypt, the national competent authorities require other documents for the renewal applications for chemical entities and for biologicals. (40); (41)

In general, all marketing authorizations have to be renewed every 5 years from the beginning of the initial registration. Except in Iran the timelines for renewal of marketing authorization is 4 years. (42) In Israel there is the exemption that if the product is not changed in the manufacturing processes; the renewal has to be done 10 years after the initial registration.

18

Maintenance of Marketing Authorizations in the MENA Region

The renewal application has to be submitted within the last year of the marketing authorization. Most of the countries require that the applicant has to submit the dossier within 3 upon 9 months before the marketing authorization expires. In Jordan, it is usually that the renewal will be submitted at latest 6 months after expiry of the marketing authorization. (43) (44)

In many MENA countries it is required to submit the dossier of the initial marketing authorization to the competent authorities for renewal application. It is unusual to submit a shortened dossier containing only Module 1 and Module 2 for the initial renewal application. For further renewals, some authorities as the DMP in Morocco only require a cover letter containing a declaration that the license should be continued in the relevant country. (45)

In some countries, there are minor differences between the required documents from local manufactured where the MAH is stated in the country and for imported products, where the MAH is stated outside the country. In cases that the medicinal products where imported from foreign countries, the authorities always require a CPP of the country where the batch release takes place. For renewal applications, the applicant has to submit a list of all approved variations, which were submitted and approved during the time of the marketing authorization. This requirement is valid for all MENA countries.

In many MENA countries, a valid license of the current manufacturing site is a condition for submission of renewal applications. Especially in the Gulf and Levant states, the authorities require a "manufacturing site renewal" before the renewal of the marketing authorization. Without a valid manufacturing license, a renewal application for a MA is not possible.

Another important requirement for a renewal application in the MENA region is a valid marketing authorization in the country, where the MAH is stated (except the MAH is stated in one country of the MENA region). Some countries refer during the renewal assessment to the marketing authorization and the opinion of FDA, EMA or from other authorities. For the Maghreb States as Algeria, the opinion of the French authority ANPP will be take into consider for the assessment. (46)

19

Maintenance of Marketing Authorizations in the MENA Region

Nearly all countries require a submission of a renewal application dossier as CTD sequence. In the Gulf countries, a submission of an eCTD becomes mandatory. (36), (39) (47)

In other countries, a submission of hard and soft copies of the dossier to the NCA's is required. Only in Egypt and in Lebanon a submission of the renewal as CTD format is not possible. It is required to submit the dossier via Email or as hard copy to the different departments of the authorities, which are involved in the assessment of the renewal application. (48); (49); (50)

The timeline for renewal applications in the MENA countries are different. The assessment timelines can take from 15 days up to 24 months. In Tunisia the assessment of a renewal takes only 15 days, but in Egypt a renewal application can take up to 24 months. (51) In general, a renewal application takes 6 months. For a part of the countries, a procedure timeline is not applicable.

Another important point to consider is the fact, that in most cases the assessment procedure after submission of the renewal application is not well communicated to the applicant. Due to this fact, the applicant has to consider that the authorities may send questions or a request for more documents to any time of procedures. Additionally the approval of the renewal application cannot be foreseen and this should be involved in the planning of the submission

The countries of the MENA region are very individual and every authority refers to their own standards. In the next section, the renewal application for each country will be discussed.

20

Maintenance of Marketing Authorizations in the MENA Region

3.2. Renewal procedure in the countries of the MENA region

In this section, the renewal procedure in each country will be discussed. At the beginning, the procedure of renewal in the GCC States, the Levant States and the Maghreb States will be specified.

3.2.1. Renewal application in the Gulf States

3.2.1.1. Kingdom of Saudi Arabia

Legal Basis

In the "Law of Pharmaceutical Establishments and Preparations" from 2004 and the "Executive Rules of the Institutions and Pharmaceutical Products Law" the mandatory for renewal of a MA in KSA is stated. The renewal application has to be submitted within 6 months before the marketing authorization expires. (37) (47)

Required documents

The Applicant has to submit the renewal dossier in CTD format. The application form for renewals is the same as for the initial marketing application. (37) (47)

For the renewal application it is mandatory to submit the Module 1 and Module 3 within the CTD format to the SFDA. It is mandatory to submit the renewal dossier electronically via "Saudi Drug Registration System (SDR System)". Additionally, it is required to submit the dossier via paper.

The following documents are required for the submission (52)

Module 1

- Cover Letter
- Application form [Annex I - Application Form for Renewal application in KSA]
- Table of content
- Product Information
- Certificate of suitability for TSE, and the
- price list

21

Maintenance of Marketing Authorizations in the MENA Region

For MAHs, which were not stated in Saudi Arabia it is required to include a Certificate of Pharmaceutical Product (CPP). (52)

- The CPP from COO

Module 3

- specification of the drug substance (3.2.S.4)
- specification of the finished product (3.2.P.5.1)
- stability data of the finished drug product (3.2.P.8).

Assessment procedure and timelines

The renewal process can be divided into two main phases.

Figure 6: Schematic figure showing the renewal process of a marketing authorization

Source - Saudi Food & Drug Administration Regulatory Framework for Drug Approvals (version 5.0)

The validation phase (Phase II) takes 10 days for authority to ensure that all requirements for the renewal application were fulfilled by the applicant.

The next phase is divided into three main sub-processes:

- The related product manager will start the assessment by distributing the renewal application to three departments (Quality, Efficacy, and Safety). All

22

Maintenance of Marketing Authorizations in the MENA Region

three departments have to finish the assessment within 50 days and forward their assessment reports back to the project manager. (47)

- Within 30 days the price department has to check the rules for pricing of the affected medicinal product. (47)
- Lastly, the inspection department of the Authority checks if the manufacturing line is valid to the last inspection. If there are any changes, which were not included in the last valid inspection report, the manufacturing site has to be inspected again. This phase can take up to 50 days.

After this processes the assessment report of the renewal application will be forwarded to the "Renewal committee". Within 10 days the committee can decide about the renewal application for approval, rejection or ask for further information from the applicant.

After the positive approval of the renewal application, the marketing authorization is valid for 5 years. (47)

3.2.1.2. United Arab Emirates

Legal Basis

For medicinal products authorized in the Arab Emirates, the Circular 28 and 29 from 2007 describes the mandatory and requirements for renewal applications of medicinal products. (53)

A marketing authorization for a medicinal product in UAE is valid for 5 years. To maintain a marketing authorization for medicinal products in the UAE it is required from the Ministry of Health to submit a renewal application within 3 months before the marketing authorization expires. (53)

Required documents

The Ministry of Health differs between originator and generic medicinal products. Additionally it is required to use different application forms for the renewal of "commercial medicinal products", herbal medicinal products, and products for general sales. (54)

23

Maintenance of Marketing Authorizations in the MENA Region

The MAH or the local partner (if the MAH is stated outside the UAE) is obligated to submit a renewal application. It is required to submit the following documents: (54)

- Cover Letter
- Application form
 - o [Annex II - Application Form for Renewal of a conventional medicinal products UAE];
 - o [Annex III - Renewal Application Form for General sale - UAE];
 - o [Annex IV - Application form for Renewal for Herbal Medicinal Product - UAE]
- declaration for the intention of the renewal of a marketing authorization. This declaration is important; otherwise the Authority will withdraw the marketing license for the affected medicinal product without () notification. (54) for MAH located outside of UAE
- legalized CPP from COO
- approved SmPC, PIL and approved artworks

The applicant has to submit an appointment for the submission of the renewal and have to pay the fees before submitting.

Assessment procedure and timelines

After submission of the required documents, the Registration Department will send a confirmation about the receipt of the renewal dossier to the Applicant. The renewal procedure will take 3 months after submission of the dossier. (54)

3.2.1.3. Bahrain

Legal Basis

The Pharmacy Law 18 from 1997 clearly states, that a medicinal products authorized in Bahrain needs a valid license for manufacturing and sales purposes. In Bahrain, a renewal application should be submitted every five years. (39)

Required documents

The NHRA has published a Renewal Guideline which includes all relevant information for the applicant.

24

Maintenance of Marketing Authorizations in the MENA Region

For the renewal application, it is required that the manufacturing site registration is still valid at the time of the renewal. Any variation should be approved before the renewal application, while a common submission of a renewal and a variation application for the same medicinal product is not allowed. (39)

The renewal application should be submitted via eCTD. The dossier should include the following documents: (39)

- Cover letter
- application form for renewals in Bahrain (see Annex V - Renewal Application Form – Bahrain)
- checklist from the NHRA for renewal applications [Annex VI - Renewal

Checklist – Bahrain]

- approved SmPC, PIL and artworks
- CPP of the country where the batch release of the medicinal product takes place.
- A valid GMP certificate of the manufacturing site
- Certificate of Suitability for TSE
- Certificate of analysis for the active substance and the finished drug product and
- Manufacturing registration certificate in Bahrain.

Assessment procedure and timelines

The application should be submitted three months before the marketing authorization expires. Before the submission, the Applicant has to request an appointment of submitting the renewal application.

For the renewal application, it is mandatory to perform a laboratory analyze of the medicinal products upon assessment. Therefore, the NHRA requires samples of the product and several certificates of the product composition, method of analysis, product specification and safety data of the material used in the medicinal product. (39)

There is no timeline for the renewal assessment for medicinal products in Bahrain.

25

Maintenance of Marketing Authorizations in the MENA Region

3.2.1.4. Oman

Legal Basis

A special feature for marketing authorizations in Oman is that the process of "renewal" is called "re-registration" at the Ministry of Health (MoH) and the Directorate General of Pharmaceutical Affairs & Drug Control (DGPA&DC).

As in all Gulf countries, the renewal of a marketing authorization has to be done every 5 years. The renewal application should be submitted within 6 months before the expiry date of the marketing authorization of the affected medicinal products. (55)

Required documents

Before submission of the "re-registration" the applicant has to submit a "submit request" to the MoH before submitting the renewal application.

The applicant has to submit the renewal application via eCTD. The following documents have to be provided (55)

- Cover Letter
- Application form (see Annex VII - Application Form for Marketing and Renewal Application - Oman]
- Samples of the medicinal product
- Pharmacovigilance system
- Risk Management Plan
- CPP
- Certificate of analysis for drug substance & finished product
- Alcohol content declaration
- Pork content declaration
- diluents & color agents in the product formula
- Price list

Assessment procedure and timelines

The DGPA & DC does not publish any information about the timelines and the procedures for re-registration of marketing authorizations in Oman.

26

Maintenance of Marketing Authorizations in the MENA Region

3.2.1.5. Qatar

In the "Law No. 1 of 1986 on the Registration of Pharmaceutical Companies and their Products" it is not stated, that a renewal application for medicinal products authorized in Qatar is required. (56).

Moreover the MoH in Qatar does not publish any information about information about renewal procedures for national marketing authorizations. It can therefore be concluded that a renewal application for a MA of a medicinal product is not required in Qatar and a MA receive an unlimited validity after approval.

Only if the product was approved via the centralized GCC procedure, a renewal according the GCC is required. The renewal application of the centralized procedure in the GCC region will be discussed in a later section.

3.2.1.6. Kuwait

Legal basis

In the ministerial decree 302/80, it is stated, that a medicinal product has to be renewed. The decree is not available for the public. The MoH publish a guidance document for the submission of registration and renewal applications based on the ministerial decree. (57)

A renewal application has to be submitted within 3 months before the MA expires.

Required documents

The following documents are required for the renewal application: (57)

- checklist for renewal application [Annex VIII - Renewal Checklist – Kuwait]
- legalized CPP
- currently approved SmPC
- long term and accelerated stability studies from production batches
- Samples of the finished medicinal product

Assessment procedure and timelines

Information about the assessment procedure and the timelines are not available.

27

Maintenance of Marketing Authorizations in the MENA Region

3.2.2. Renewal application in the Levant States

In this section, the renewal process of marketing authorization of medicinal products in Levant states will be discussed.

3.2.2.1. Egypt

Legal Basis

The renewal of medicinal products in Egypt is regulated in two main ministry decrees. For medicinal products, the decree 425/2015 includes all requirements for registration in Egypt. (48) For Biologicals, the renewal process is described in the

Ministry decree 297/2009. (58)

For medicinal products according to Ministry Decree 425/2015 the renewal process should be done every 10 years. (48) For Biologicals, a renewal of the marketing authorization is required every 5 years. (58)

There is no exact timeline, when the Marketing Authorization Holder has to submit the renewal application to the authority. In the Ministry Decree, it is only stated that the submission should be done in the last year of the expiry date of the marketing authorization. (48), (58)

Required documents

For local and imported medicinal products, the renewal should be performed within 2 years after the previous registration certificate. (48), (58)

In Egypt, the submission dossier cannot be submitted as eCTD sequence. The applicant has to submit the dossier as simple PDF documents.

The renewal application should be submitted to the following email addresses:

- For human drugs: hf296@eda.mohealth.gov.eg
- For Biologicals: Biological_App@Eda.mohealth.gov.eg (59)

It is mandatory to send a request before submission to the EDA. For medicinal products, it is required to submit the following documents: (48), (58)

- request form the latest certificate of registration, and the latest price certificate.

28

Maintenance of Marketing Authorizations in the MENA Region

- for biologicals, the applicant should provide beside the certificate of analysis and the latest price certificate, a list of all variations, the last batch release certificate and the renewal fee receipt.

After reply of the authority on the request for the renewal, the applicant has to submit a "preliminary re-registration file" via Email. This dossier should contain: (48); (58); (59)

- Application form [Annex IX - Renewal Application Form – Egypt]
- Registration certificate
- legalized CPP
- Letter of Authorization between MAH and local partner
- registration fees receipt

Procedure and Timeline

The EDA will inform the applicant via "Renewal Status Letter" that the marketing authorization is under renewal registration.

At the same time, the applicant has to submit the "preliminary re-registration file" to the following department for approval:

- Scientific committee: If no scientific reference is available
- Egyptian Pharmacovigilance Center
- Technical committee communication section:
- Naming & labels committee: if the trade name was changed or for the approval of changes of the labeling for post-stability and pharmacology committee
- Variation committee
- Pricing committee
- Stability committee
- Pharmacology committee
- Bioequivalence committee:

Assessment procedure and timelines

The timeline for the renewal approval can be from 12 up-to 24 months. (48); (58); (59)

29

Maintenance of Marketing Authorizations in the MENA Region

3.2.2.2. Iraq

In Iraq there is a special situation, that two authorities are responsible for all drug related issues. The Iraqi Directorate of Technical Affairs (DTA) as part of the MoH is responsible for all medicinal products authorized and marketed in Iraq.

For the Kurdish autonomous region, the KMCA in Erbil is responsible for the assessment of renewal applications.

Legal Basis

The legal basis for the renewal of marketing authorizations in Iraq is two important guidelines, which describes the renewal process in Iraq.

A marketing authorization in Iraq has to be renewed every five years for imported products and every 10 years for medicinal products manufactured locally. (60)

Required documents

The renewal application must be submitted three months before the expiry date of

the marketing authorization. The product can be still placed on the market after submission of the renewal application. (61)

The documents have to be sending out to the Directorate of Technical Affairs (DTA) as hard and soft copies. For the submission, an application form is not required. Instead of this, the manufacturer has to insert the following document: (60)

- Declaration that the composition of the finished product has not been changed.
- checklist for renewal application [Annex X - Renewal Checklist – Iraq]
- CPP from COO or CPP from one reference country and a letter from the Iraqi National Laboratory - This letter should confirm that the finished product has pass all required testing for the last five batches. In this case, it is allowed to import the medicinal product upon one year until the requirements are fulfilled. (60)

The other requirements for renewal application are the same as for an initial marketing authorization. (60)

Assessment procedure and timelines

30

Maintenance of Marketing Authorizations in the MENA Region

The DTA will start the assessment of the renewal application after receipt of all required documents. A detailed description of the procedure is not available. For the timeline of renewal, there is no timeline available.

3.2.2.3. Kurdistan

The KMCA in Erbil is responsible for the assessment of renewal applications in the Kurdish autonomous area in Iraq it is required to submit two samples of the medicinal product.

Legal Basis

The authority published a guidance document, which includes all relevant information for renewal applications of medicinal products authorized in Kurdistan. (62)

According to the Guideline, a marketing authorization has to be renewed every 5 years. (62)

Required documents

Additionally the following documents are required: (62)

- Original CPP from the country of origin of the manufacturer legalized by the chamber of commerce and the Iraqi embassy in the country of origin.
- Product composition certificate signed and stamped by the manufacturer;
- Finished product specifications signed and stamped by the manufacturer;
- Specifications of active and inactive ingredients signed and stamped by the manufacturer;
- Letter from the manufacturer company declaring that there are no changes made on the formula, manufacturing method and the specifications of active and inactive ingredient and finished product;
- Proof of payment of the registration fees.

3.2.2.4. Iran

Legal basis

The renewal process for medicinal products authorized in Iran is stated in the law No. D/1243 dated 9th April 2009 by the Ministry of Health & Medical Education (63) and

31

Maintenance of Marketing Authorizations in the MENA Region

the "GUIDELINES ON REGISTRATION OF PHARMACEUTICAL PRODUCTS FOR IMPORTS" provide the legal basis for renewal applications for medicinal products authorized in Iran. (42)

A marketing authorization of a medicinal product in Iran is valid for 4 years. (42)

The renewal application has to be submitted within six months before the marketing authorization expires. (63); (42)

Required documents

For the renewal dossier it is required to include the following documents: (42)

- Letter of authorization (in copy)
- Valid Representation Registration Certificate issued by the Iranian Ministry of Commerce
- Certificate of a pharmaceutical Product (CPP)
- A photocopy of the Responsible Pharmacist's license
- The bank receipt for license renewing fee
- A photocopy of the existing Marketing Authorization License
- An approval issued by the Product License Holder (PLH) or its Marketing Authorization Holder (MAH) on non-variation in the formulation, manufacturing methods and manufacturing site, and etc. of the medicine in question
- A sample of the packaging (including the box, label, strip, cartridge or vial, carton labeling or shrink-wrap)
- A specimen of the product
- The latest approval of the Division of Quality Control Laboratory of Deputy for

Food and Drug on the imported consignment of the medicine in question

Assessment procedure and timelines

The Iranian MOHME does not publish any information about the assessment procedure and the timelines for approval.

32

Maintenance of Marketing Authorizations in the MENA Region

3.2.2.5. Israel

Legal basis

The basis for the requirement of renewal processes of medicinal product in Israel is stated in the "Pharmacist Regulations for Medicinal products" from 1986. (64)

Additionally, the Guideline EX 005/02 from 2016 includes all processes for renewal applications in Israel. (65)

Required documents

Medicinal products, which were authorized and marketed in Israel has to be renewed every 5 years for the first time. In the Guideline it is stated:

"The director is authorized to renew the validity of a registration of a medicinal product in the Drug Registry for additional period, each of which is not longer than ten years, after the expiration of the registration in the Registry." (65)

The renewal follows two steps

1. At first, the MAH has to request a renewal of the "quality certificate" to the Institute of Standardization and Control of Pharmaceuticals in Jerusalem.

The Institute of Standardization checks the quantitative and qualitative composition of the medicinal product against the approved specification. After a positive outcome, the Institute certify, that the medicinal product meets the required standards. (65)

Submission

The renewal dossier for the quality certificate should be submitted as CTD dossier according to the ICH-M5 Guideline (65). The following parts of the dossier are required:

Module 1:

- Checklist for submission of renewal application (for chemical entities and biological.
- o [Annex XI – Application Form for renewal of chemical entities - Israel]
- o [Annex XII - Renewal Checklist for Biologicals – Israel]
- Cover Letter

33

Maintenance of Marketing Authorizations in the MENA Region

- Proof of Payment
- Valid GMP certificate
- QP approval for the active ingredient
- TSE statement
- CEP
- Certificate of Analysis for the drug substance and the finished product
- Valid MSDS for the active substance and excipients
- Currently approved SmPC & PIL
- Summary of validation status and information about the medicinal product for chemical entities

Module 3:

For the first renewal, it is required to submit all documents from this part of the CTD. For the next renewal applications the Institute required a reduced Module 3 which should include the following documents: (65)

- specifications for drug substance and finished medicinal product
 - stability data from the last 5 years
 - significant Type II Variations - If significant variations (variations of type II that require the replacement of entire chapters in the registration file) occurred since the last renewal and the version of the file at the Institute does not correspond to the file in the hands of the MAH as a result of that, a complete updated file should be filed at the time of renewal.
 - For any submission of a complete file a signed statement by the Appointed Pharmacist stating that the submitted file does not contain any non-reported changes or changes not approved by the Ministry of Health should be attached.
- The file evaluator is authorized to request the submission of the complete file at his/her own discretion, even if it is not the first renewal.

Assessment procedure and timelines

Information about the assessment process and the timeline for the approval of a renewal application are not published.

3.2.2.6. Jordan

Legal Basis

In Jordan, the renewal application is regulated in the Jordan Law No. 12 of 2013, the Criteria for Drug Registration from 2015 and Circular No. 2/9/1/12448 of 2015. (43) (44)

A renewal application should be submitted every 5 years. (66) The applicant should submit the dossier within 3 months after expiry of the marketing authorization. Every year, the JFDA informs the local representatives with a list of all renewed products about the upcoming renewals.

Required documents

For the first renewal of a medicinal product, the JFDA requires the following documents, which have to be submitted in a CTD structure.

The following documents has to be included in the renewal application (43)

Module 1:

- Cover Letter from local representative, the Marketing Authorization holder or manufacturer
- Cover Letter from of the technical manager of the company or the responsible pharmacist.
- Application form - [Annex XIII - Renewal Checklist – Application form for Marketing and Renewal Application - Jordan]
- Comparison table between registration file for initial registration and re-registration dossier
- List of all ingredients (human or animal origins) including all relevant certificates
- Confirmation letter from manufacturer that the manufacturing processes does not change
- Approval letters from JFDA about all post approval changes
- Technical agreement
- Product Information and approved artworks

- Summary of Product Characteristics (legalized from the NCA) of the country of origin
- Price certificate

Module 3:

- Drug composition
- Shelf life specification of the drug substance
- Certificate of Analysis of the finished product
- Stability Studies

Module 5:

- Periodic Safety Update Reports (PSUR)

If it is not the first renewal, the applicant has only to submit a legalized CPP of the COO and a price certificate.

Assessment procedure and timelines

There are no specific timelines for the renewal. According to the information of the authority it can take around two years for the assessment of the renewal.

3.2.2.7. Lebanon

Legal basis

The Decision 528/2017 and 293/2017 provides the basis for the requirement for the renewal (re-registration) of marketing authorization of medicinal products in Lebanon. (49); (50)

Since 2017 it is required for MAH to submit a renewal application for all registered medicinal products to the MoPH (Ministry of Public Health). The Technical Committee of the MoPH is responsible for all issues related to registrations of medicinal products.

The Marketing authorization will be cancelled, if the MAH does not submit a re-registration dossier for all registered medicinal products to the MoPH. Additionally the applicant has to provide a renewal plan with information about the importance of the affected medicinal products for Lebanon, the date of the registration and the countries, where the manufacturing takes place.

For renewal applications where the submission dossier is not completed until the 31th December 2017, the marketing authorization will be on hold. This has the consequence that it's forbidden to bring these medicinal products to the market. They will be listed as "non-marketed drugs" (49); (50)

In a Memorandum from 2016, the Ministry stated that the new re-registration process is still ongoing. Therefore it is not possible to give a timeline and procedure about the renewal process.

37

Maintenance of Marketing Authorizations in the MENA Region

3.2.2.8. West Bank

Legal Basis

According to the Guidance document "GUIDANCE ON PHARMACEUTICAL PRODUCTS REGISTRATION IN PALESTINE" from 2007, a marketing authorization for a medicinal product has to be renewed every 5 years. (67)

The renewal application has to be submitted at least 4 months before the MA expires to the Drug Control and Registration" Department of the MoH. It is possible to submit the application later, but if the submission will be performed more than 2 months after expiration date of the MA, the MA will be suspended.

Required documents

The application shall include the following: (67)

- Application form for the renewal – [Annex XIV – Application Form for Renewal

- Palestine]

- Proof of Payment
- Approved method of analysis for the finished medicinal product
- Specification of the finished product
- Current master formula for the product
- Current stability study (Shelf life study)
- Sufficient samples for analysis accompanied by a reference standard material from the active constituent(s). Palestinian National Authority General Directorate of Pharmacy Ministry of Health Drug Control and Registration Dept DC 002-0 37 December 2007
- Samples from the latest secondary packaging materials and from the aluminum foil primary packaging material.

Assessment procedures and timelines

The Department of Drug Control and Registration reserves the right to ask for any additional documents with regard to the registered drug file.

A timeline for the procedure and an overview about the assessment report are not available.

38

Maintenance of Marketing Authorizations in the MENA Region

3.2.3. Renewal application in the Maghreb States

3.2.3.1. Morocco

Legal basis

In Morocco, the following laws mention the obligatory and requirement for the renewal of marketing authorizations of medicinal product

- Law No. 17-04: Code of Medicine and Pharmacy; (68)
- Circular No. 48 DMP/00: Procedure for the Marketing Authorization Application of Pharmaceutical Products; (45)

A marketing authorization of a medicinal product has to be renewed every 5 years. The local contact of the MAH has to submit a renewal dossier 180 days before the marketing authorization expires. For medicinal products imported from outside the marketing authorization has to be valid in the COO as well. (45)

Required documents

Concerning the submission of the renewal application, the DMP differs between the first renewal application and the following renewal applications. For the first review, the applicant has to submit a full CTD dossier of a medicinal product except of Module 4 (Non-clinical) and Module 5 (Clinical).

It is required to submit two application forms (45)

- "DMP" application form – [Annex XV – DMP Application Form for Renewal -

Morocco]

- "LNCM" application form – [Annex XVI – LNCM Application Form for

Renewal - Morocco]

For the following renewal applications, it is only required to submit a cover letter, which states that the marketing authorization will be renewed. (45)

Assessment procedure and timelines

The assessment of the renewal application will be submitted to the DMP. The review of the quality part of the dossier will be done by the LNCM and the administrative review by the DMP. Within 6 months, the marketing application will be renewed.

3.2.3.2. Algeria

Legal Basis

The legal basis for the renewal of marketing authorization is the Decree No. 92-284 of 1992. (46)

In Algeria a marketing authorization of a medicinal product has to be renewed every 5 years. The submission of the renewal has to be done at earliest in 6 months and at latest in 3 month by the local agent of the MAH before the marketing authorization expires to the ANPP. (46)

Required documents

The ANPP differs between two types of scenario: (46)

1. In case that the dossier of the initial registration does not changed or if all variations were submitted on-time (which means that the dossier is at the time of renewal up-to-date), the applicant has to submit the following documents
 - Statement of the MAH, that the content of the technical information of the medicinal product has not been changed since the first registration
 - Proof of payment of the registration fees (also from variations which were submitted in the last five years)
 - legalized CPP from the country of the MAH
2. In case, that the current dossier of the medicinal product does not correspond to the initial registration dossier or if variations were not submitted previous the following dossier requirements has to be fulfilled
 - Renewal letter (2 copies) and statement from MAH (3 copies) that the changes of the medicinal product were approved.
 - Submission receipts of variations
 - Checklist list of local application form
 - Form A (legalized) –
 - o Annex XVIII – Annex A Application Form for Renewal - Algeria
 - o Annex XVII – Application Form for Renewal - Algeria
 - o Annex XIX – Annex II Application Form for Renewal - Algeria
 - CPP and/or marketing authorization Approval letters with annexes issued by the country, where the MAH is stated

- Manufacturing license for all sites involved in drug product manufacturing.
- GMP certificates for all sites participating in the drug product manufacturing.
- Free On Board (FOB) price attestation
- Therapeutic information form
- 1 finished product sample along with the corresponding original certificate of analysis;
- Copies of certificate of analysis for the active ingredient and excipients;
- Updated soft copy of the Common Technical Document (CTD) Module 3 (no hard copy is needed; only a CD/DVD) in addition to the updated labelling and summary of product characteristics;
- Proof of payment of the registration fees;
- Authenticated certificate of suitability (CoS) or Drug Master File (DMF) with letter of access;
- Statement mentioning all the parties involved in the product manufacturing;
- Copy of the Active Pharmaceutical Ingredient (API) GMP certificate;
- Variation forms signed and stamped by the MAH.

Legalization of required documents has to be done by the Chamber of Commerce, by the Ministry of Foreign Affairs and by the Algerian embassy in the country of origin of the MAH)

Assessment procedure and timelines

The renewal will be assessed within three to six months by the ANPP. (46)

3.2.3.3. Tunisia

Legal basis

In the Tunisian Law No. 85-91 from 1985 the requirement for MAH to renew the marketing authorization of medicinal products marketed in Tunisia is included. (69)

Additionally the Order from the MoH from 1996 describes the obligation and requirements for a renewal application in Tunisia. (70)

A marketing authorization in Tunis is valid for 5 years. A renewal application has to be submitted by the local contact point of the MAH 6 month before expiry date (51).

Required documents

The Tunisian law divides the requirement of the renewal application into two subgroups.

For medicinal products manufactured in Tunisia the following documents has to be

included in the renewal application: (51).

- Cover letter
- Application sheet in French signed by the applicant responsible pharmacist
- A Certificate from the responsible pharmacist of the company attesting that there is no change in the medicinal product files that had been submitted for the initial registration
- GMP certificate of manufacturing sites for the finished product
- Updated SmPC (Word and PDF versions)
- Proof of payment for the renewal fee
- Two samples of the medicinal products (Tunisian market sale model) accompanied by their certificate of analysis.

For medicinal products imported into Tunisia, the above mentioned documents have to be submitted too. Additionally it is required to submit: (51)

- Copy of the updated Marketing authorization in the country of origin (COO)
- CPP from COO

42

Maintenance of Marketing Authorizations in the MENA Region

- Approved SmPC in the country of origin (COO)
- Two sale model samples (Country of origin market) and the corresponding certificates of analysis
- Certificate of wholesale price excluding issued by competent authorities in the country of origin.

Procedure and timelines

The timeline for the renewal assessment is due within 15 days. (51)

43

Maintenance of Marketing Authorizations in the MENA Region

3.2. Other procedure to maintain a marketing authorization of a medicinal product in the MENA region

In all countries of the MENA region, a marketing authorization of a medicinal product will be suspended, if the benefit-risk relation is negative and if there are high risks for the public health.

A MA for a medicinal product can be withdrawn, if the qualitative and quantitative composition of the finished drug product does not fit with the specification submitted within the application for marketing authorization or if the documents provided in the initial registration are not in line with the manufacturing and pharmaceutical profile of the medicinal product. In some countries, it is required that at least 2 of 3 batches have to be compliant with the approved drug specification; otherwise the MA will be withdrawn by the NCA.

For imported medicinal products, it is required that the MA in the COO is still valid. Otherwise this could be an entitled reason to withdrawn the marketing authorization in the affected country.

Additionally a large number of MENA countries implement regulations, which defined that if the medicinal product is not placed on the market over a certain period, the marketing authorization will be cancelled.

This procedure is well known in the European countries as "Sunset Clause". The EMA defines the term as follows:

"The so-called "sunset clause" is a provision leading to the cessation of the validity of the marketing authorization..." (71)

The EMA differs between two possible scenarios to withdrawn a marketing authorization according to Sunset Clause: (71)

- if the medicinal product was not placed in the market within three years after the initial marketing authorization.
- if the medicinal products is not marketed for three years

Many countries of the MENA region implement similar rules, but in the opposite to the Member States of the European Union, the marketing authorization will be cancelled, if the medicinal product is not marketed within a defined period of time after getting

44

Maintenance of Marketing Authorizations in the MENA Region

the approval for MA. Only in a few countries of the Levant states and in Morocco, there are also other defined requirements to obtain a MA in these countries.

For medicinal products registered centrally in the GCC States, a marketing authorization can be withdrawn if the medicinal product is not placed on the market within two years after approval. It is required that the medicinal product is marketed at least in two countries of the GCC otherwise the marketing license will be suspended. (72)

The following tables provide an overview about existing rules regarding sunset clause in each country.

3.2.1. Gulf States

Table 1: Overview about Sunset Clause in the Gulf States

Country Sunset available Timelines Other requirements

[Yes/No]

KSA No N/A N/A

UAE Yes 12 months - Medicinal product
has to be marketed
within 12 months
after registration

Bahrain No N/A N/A

Oman No N/A N/A

Qatar Yes 3 months - Sunset clause for
GCC

- Pharmaceutical
company does not
marketed registered
products for 3
months (the
registration of the
pharmaceutical
company will be
withdrawn) (40)

Kuwait Yes 2 years - Medicinal product is

45

Maintenance of Marketing Authorizations in the MENA Region

not imported within 2
years after
registration

3.2.2. Levant States

Table 2: Overview about Sunset Clause in the Levant States

[Yes/No]

Morocco Yes -12 months - medicinal product
- 6 months has to be marketed
within 1 year of
obtaining a license
- continuous supply
of goods over 6
months and
maintenance of
safety stock required
(75)

Algeria Yes 12 months - medicinal product
has to be placed on
marketed within 1
year after registration
(46)

Tunisia No N/A N/A

47

Maintenance of Marketing Authorizations in the MENA Region

3.3. Harmonization of renewal procedure in MENA region

Inside the MENA region, there are three subgroups, but only the Gulf States has developed a central renewal procedure for marketing authorizations.

Legal Basis

In Article 29A of the "Executive Board of the Health Ministers' Council For GCC", a marketing authorization for a centrally registered medicinal product in the GCC region is valid for 5 years. . (76)

In case that the medicinal product was centrally approved by the GCC-Drug Registration Committee (GCC-DR), the renewal application has to be submitted within 3 months before the marketing authorization expires. (76)

Required documents

For products, which were authorized centrally via GCC-DR, it is not obligatory, that a local contact has to submit the application to the authority. The marketing license will be cancelled, if the applicant fails to submit a renewal application within 6-months after the expiry of the MA.

The following documents should be submitted to the committee of the GCC-DR, which is responsible for renewal of medicinal products: (76)

- Application form
- CPP or certificate of free sale legalized by the NCA of the COO
- List of manufacturers including the countries, who handle the medicinal product
- List of countries, where the product is
 - o authorized
 - o not authorized and the reasons
- Currently Approved EN version of the SmPC or PIL from COO (approved by the NCA of the COO)
- List of all approved variations and re-registration applications
- Declaration form MAH, that there is no change of the medicinal products. In case of any changes of the medicinal products (quality, safety or efficacy)

48

Maintenance of Marketing Authorizations in the MENA Region

related), the applicant has to submit the changes together with the re-registration dossier

- Update of Stability data and stability study for two batches
- Certificate of Suitability
- Drug Master File from Manufacturer (in case, if CEP is not available)
- Methods of analysis for finished product according to the last approved Pharmacopeia
- Certificate of Analysis for finished medicinal products
- result of follow-up studies the product-marketing
- Commercial Samples
- Sample or Artwork for External Package

For biologicals or herbal medicinal products, the Committee required the following documentation additionally:

- Microbial Contamination Test for oral solutions (if one of the excipients are animal or plant origin)

Assessment procedure and timelines

The timelines for the approval of a renewal application and the assessment procedure were not communicated by the GCC-DR.

49

Maintenance of Marketing Authorizations in the MENA Region

4. Differences and Similarities to European Procedures

The previous part describes the renewal procedures and maintenance procedures of MA in the MENA countries.

For pharmaceutical companies located in Europe, it's more interesting to know the similarities and differences to known European Procedures.

4.1 Renewal procedure for medicinal products authorized via CP, DCP and MRP in the European Union

To get a better overview about the differences and similarities of maintenance procedures of MAA between the countries of the European Union and the MENA region, it is important to get an overview about renewal procedures for medicinal products authorized in the Member States of the European Union. In Europe there are three possible procedures to receive a MA for a medicinal product in the member states of the EU.

4.1.1 Centralized procedure

The centralized procedure allows medicinal products to receive MAA in all Member States of the EU. For drug substances against cancer, metabolic diseases, infectious diseases, and biologicals, it is required to submit an application for MA via the centralized procedure.

Legal framework

In the European regulation EC 726/2004 it is stated, that a MA for medicinal products authorized via CP is valid for 5 years. The EMA Guideline "Guideline on the processing of renewals in the centralised procedure" describes the renewal process for CP products. (77)

The applicant has to submit a renewal application to the EMA within 9 months, before the MAA expires. It is required, that the Applicant appoints a submission date to the EMA. This step is important, because the EMA has to agree the proposed submission date with the Rapporteur and Co-Rapporteurs. (77)

50

Maintenance of Marketing Authorizations in the MENA Region

Required documents

The Applicant has to submit Module 1 and Module 2 of the dossier. Module 2 contains the Quality Addendum, Non-clinical and Clinical Addendum. The Risk-Management Plan has to be included in the dossier too. (77)

All required documents are listed in Annex XX – Required documents for renewal of CP products

It is possible to include changes in the renewal application. This has to be stated in the application form. If new clinical studies are available, it is obligatory to submit the data within the renewal application. (77)

Assessment procedure and timelines

The CHMP and the PRAC are involved in the assessment of a renewal application for a medicinal product. If the Rapporteur and Co-Rapporteur agree, that the benefit risk evaluation is positive, the CHMP recommend a positive opinion. This means that the MAA will get either an unlimited validity or validity for five years.

If the CHMP comes to the output, that the benefit risk evaluation is not positive and that the medicinal product has a potential risk for the public health, the Committee will adopt an "unfavorable" opinion. The MAA will suspend and be withdrawn from the European Market. (77)

The EMA will prepare an update of the European Public Assessment Report (EPAR), reflecting the renewal assessment and CHMP opinion. After the Commission Decision on the renewal, the updated EPAR shall be published.

The renewal process takes 120 days. (77)

51

Maintenance of Marketing Authorizations in the MENA Region

4.1.2 Decentralized procedure/Mutual recognition procedure

The DCP and MRP procedures are two other options to authorize a medicinal product in countries of the European Union. In opposite of the centralized procedure, the MAH can select in which countries

Legal Basis

In Article 24 of the European Directive 2001/83/EC, it is stated that a MAA for a medicinal product is valid for five years. If the the MAA is renewed for once, the validity will be unlimited. The "Guideline on the Processing of the Renewals in the Mutual Recognition and Decentralized Procedure" describes the renewal process for medicinal products, which were authorized via DCP or MRP. There is no difference between the renewal application of medicinal products authorized via DCP or MRP. (78)

The Applicant has to submit the renewal application within six months before the MAA expires. (78) It is important that the Applicant agrees a "common" renewal date with all Member States, which were involved in the process. (78)

Required documents

As for the renewal application for MAA authorized via Centralized Procedure, the Applicant has to submit the whole documentation of Module 1 and Module 2 (see Annex XXI – Required documents for renewal of DCP or MRP products).

The dossier should be submitted in eCTD. (78)

If Applicant wants to implement new amendments in the Product Information, it has to be discussed and agreed with the RMS before submission.

Assessment procedure and timelines

The aim of the renewal application is to assess the benefit-risk evaluation of a medicinal product based on new information and on PSURs.

During the renewal procedure, variations should not be included in the renewal procedures. However it is permitted to include administrative changes of the Product Information together in this procedure. The changes need to be listed in the application form (see Annex). It is recommended to discuss proposed amendments

52

Maintenance of Marketing Authorizations in the MENA Region

of the SmPC together with the responsible RMS before submission of the renewal application.

The timeline for a renewal for medicinal products authorized via DCP or MRP is around 90 days. During this time, a clock-stop period is possible. The Applicant may send further documentation to the RMS & CMS upon request within 30 days after the start of the clock-stop period.

It is possible to submit a "shortened" renewal application. This will follow a 30 days procedure. In this case, a clock-stop is not possible and the RMS will lead the assessment of the renewal.

After the first renewal, the MA will have an unlimited validity. In some exceptions, it is possible that the RMS required a renewal after 5 years.

4.1.4. Other maintenance procedures in the European Union

To maintain a MA for a medicinal product in the EU, it is required to obtain the sunset clause for medicinal products authorized under regulation 2001/83/EC.

For centrally authorized medicinal products it is stated in Article 14 of the regulation 726/2004 and in Article 24 of the regulation 2001/83/EC, [which is also valid for medicinal products authorized via DCP or MRP], it is stated that a MA will be valid, if one presentation of the medicinal product is placed on the market. If a medicinal product is not marketed within 3 years in any Member State of the EU (including the EEA States as Norway, Island and Lichtenstein) the MA will be withdrawn from the pharmaceutical market. (79)

53

Maintenance of Marketing Authorizations in the MENA Region

4.2. Differences and Similarities between the procedures in the MENA Region and the European Union

In the previous parts of this master thesis, several procedures to maintain a MAA in the MENA region and the European Union were discussed. The differences and similarities will be shown in detail.

Validity

All MA in European countries and in the MENA countries have a validity of 5 years, except Iran, where a MA for medicinal products is valid for 4 years. (42)

The main difference is if the first renewal application for a MAA authorized via CP, DCP or MRP is positive, the MAA has an unlimited validity. But this comes with an exception, except for medicinal products, which were authorized under "conditional approval or exceptional circumstances". For these products, they have to be renewed again.

All NCA's of the MENA countries require a renewal application for every five years. That also applies, even the qualitative and quantitative composition of the medicinal products does not change or the benefit-risk evaluation remains the same as in the initial application.

Date of Renewal

To maintain a MAA via a renewal application, applicant has to submit the dossier within 9 months for medicinal products authorized via CP, and 6 months for medicinal products authorized via DCP or MRP. In the MENA region, the timelines for renewal are quite different.

A majority of the MENA countries have a renewal timeline of 6 months before expiration of the MA. In several countries the renewal application should be submitted within 3 months.

Required documents

The Applicant has to submit the Module 1 and Module 2 of the CTD to the Authorities for renewal application of European MAA.

54

Maintenance of Marketing Authorizations in the MENA Region

In most cases, the NCA of nearly all countries of the MENA region requires documents from Module 1 and Module 3. The overall summaries of the quality, non-clinical and clinical part are not part of the assessment of the benefit-risk evaluation. The European CA does not require documents for Module 3, only on request.

This is a main difference between MENA and Europe, because the assessment of a renewal application based on information provided in Module 2. For NCA of the MENA region, the assessors are focused on data based on the CMC part of a dossier, because most of variations affect the quality of a medicinal product. The assessment of the benefit-risk evaluation based on the summaries provided in Module 2 is not sufficient for the NCA of the MENA region.

For the GCC and Levant States another possible reason could be that the data in Module 3 should improve, that the current manufacturing processes, the analysis and the specifications are up-to-date and not been changed without a corresponding notification to the authority. This fact could be seen as "additional" control from the NCA to avoid medicinal products with content which were not approved by the authorities.

This "additional control" could also be a possible reason, why the applicant has to provide a list of all submitted variations including the approvals of the NCA. It can be seen as further measures against corruption, because the MAH's and manufacturers cannot implement changes in the quality and quantity of a medicinal product without

approval of the Authorities. This also indicates that the confidence of the Authorities to the manufacturers and MAH's is not stabilized enough and it can be disassembled.

For imported products or medicinal products, where the MAH is stated outside the affected country, the applicant has to indicate that a MAA is still valid in the COO. This can usually be done by submitting a CPP either from the origin country of the MAH (if outside the affected country) or of the country where the manufacturing takes place. In some countries it is also required to submit a list of all valid MAA in the world of the relevant medicinal product. For European renewal procedures, a CPP is not required for submission. Most of the medicinal products authorized in the MENA region are mostly imported from European countries and the USA. On the one side the initial applications for new drug substances will be done in these countries. Most of the MAH are located there, the development of potential new drug substances takes

55

Maintenance of Marketing Authorizations in the MENA Region

place there and both markets rank among the most important markets for pharmaceuticals in the world.

On the other side the development of innovative medicinal products in the MENA region is not on the same level as in USA, Europe or Japan. The missing innovations and regulations for potential new drugs are still under development and it will take decades to reach the same level regarding development and marketing of medicinal products as the EU, USA and Japan.

The format of the submission dossier is another point, which should be considered. This point indicates only exceedingly few differences. Most of the MENA countries require a CTD according to ICH-M4 as in the European countries. Only in Lebanon and Egypt, a submission of the dossier as CTD format is still not possible. The dossier language is English, except in the Maghreb States. In these countries, the applicant has to provide the documents in French.

Assessment procedure

The assessment of renewal applications for European MAA is quite simple. The benefit-risk evaluation will be assessed based on the overall summaries. For NCA from MENA, the assessors evaluate the benefit-risk evaluation based on the data mainly provided from Module 3.

The difference in the approach of an assessment of a renewal application could be, that most of the NCA in the MENA region are relative "young" in opposite to the European NCA and not so much experienced with renewal application. In several countries, such as Lebanon, the obligatory for MAH to renew the MAA of their products was introduced in 2017 and also the renewal procedure for medicinal products authorized via centralized procedure of the GCC-DR is not as long as in Europe.

Another important point to consider is, the NCA of the MENA countries included other activities (eg. inspection of the local manufacturing) in the assessment of the renewal process. For European procedures, an inspection during a renewal procedure is not required. This additional inspection is time consuming and cause longer periods for the assessment of renewal applications.

56

Maintenance of Marketing Authorizations in the MENA Region

In opposite to the renewal procedures for marketing authorizations granted via CP, DCP or MRP, the applicant cannot submit variations within the renewal applications. The authorities recommend that all important variations, which may have an impact on the safety, efficacy and quality of a medicinal product, should be submitted and approved prior to the renewal application. This is also a reason, why the applicant has to submit all variations, which were submitted and approved prior to the renewal application- due to the fact that the Authorities try to avoid additional workload during the renewal process. Another plausible reason could be, that the NCA does not have enough resources for the assessment of variations and renewal application on the same time.

Timelines

For renewal application for CP, DCP or MRP products the timeline is 120 days. This consists of 90 days of assessment for the authorities and 30 days as "clock-stop".

Sunset clause

To maintain a MA for a medicinal product via Sunset clause exist for all European procedures and for the MENA countries. The requirements are nearly the same, except in Lebanon. The special situation there is that if the sales numbers for a medicinal product are not high enough, the product will be withdrawn from the market.

57

Maintenance of Marketing Authorizations in the MENA Region

Fact Sheet

Table 4: Differences and Similarities between EU and MENA

Renewal MA – EU	Renewal MA – MENA
Validity 5 years for initial MAA, Every 5 years unlimited validity after renewal* (Iran 4 years)	
Renewal Date 9 months for CP products	3 – 6 months

6 months for DCP/MRP products
 Important requirement N/A Valid MAA in COO
 Required documents Module 1 Module 1
 Module 2 Module 3
 Module 4
 Module 5
 • Documents will be provided in English language (except Maghreb States**)
 Assessment of benefit-risk evaluation
 Submission EU- e-CTD CTD (hard copy and soft copy), (no paper submission) additional paper submission optional
 Timelines 120 days (90 days assessment 15 days – 24 months + 30 days clock-stop) - CP
 90 days (DCP/MRP)
 Inclusion of other applications within renewal? • variation can be included within renewal application (for CP) application
 Mock-ups required No Yes (not for all MENA countries)
 Shortened renewal Yes (for DCP/MRP) No applicable? (except Morocco)
 Sunset clause available Yes Yes except
 * except for medicinal products authorized under “conditional approval” or “Exceptional circumstances”

** documentation should be provided in French

58 Maintenance of Marketing Authorizations in the MENA Region

5. Summary, Discussion and Outlook

The detailed reflection of procedures in the MENA region to maintain a marketing authorization for a medicinal product shows, that the regulatory affairs for medicinal products is in an ongoing process. During the time, many authorities in the MENA try to improve the procedures and regulations for pharmaceuticals. Especially due to the increased need of medicinal products and the development of the pharmaceutical sectors of local and private manufacturers, the authorities and institutions develop and improve existing laws and regulation to facilitate the post-authorization procedures in the MENA region.

On the other side this master-thesis also shows, that many NCA in the MENA region are still not enough regulated. Many issues need to be improved in future as the transparency and timelines for renewal procedures in the relevant countries.

The renewal applications for medicinal products authorized in the MENA region are (dependent from the country) very demanding. All NCA's in the region requires further renewal applications of a medicinal products, even the quality and the composition of the medicinal product does not changed.

These further renewal applications are not necessary, due to the fact, that neither the composition nor the quality of a medicinal product changed. Additionally the assessment of a renewal application is not transparent; in some countries as in Tunisia, the renewal application takes only 15 days, in Egypt the assessment can take up to 2 years.

There are some similarities between the European procedures and the procedures in the MENA region. Nearly all MENA countries, except Egypt and Lebanon, require a CTD dossier, in the Gulf States a submission even as eCTD is mandatory.

The main difference between European procedures and MENA procedures for renewal applications is the required documents.

Whereas the European HA's require the submission of Module 2, which contains the overall summaries for the quality, non-clinical and clinical part of a dossier, none of the HA's in the MENA region requires documentation from Module 2. In some countries, it is obligatory to include documents from Module 4 and Module 5 into the renewal application.

59 Maintenance of Marketing Authorizations in the MENA Region

The most of the authorities in the MENA require the submission of documents from Module 3. These documents will not be provided to the European HA's at time of renewal.

Regarding sunset clause, there requirements for medicinal products authorized in Europe or in the MENA region are nearly the same. In this case it is interesting to see, that a medicinal product can be withdrawn from the Lebanese pharmaceutical market, if the sales numbers are not high enough, even the medicinal product is placed on the market.

The maintenance procedures in the MENA are very individual and none of the countries accept the approval of a renewal from another MENA country, especially for the Levant and Maghreb States. For these subgroups, there are no “recognition” procedures for renewal applications. In this case the Gulf States are further developed, because it is possible to maintain one MA for a medicinal product, centralized via GCC-DR. The renewal for a MA is valid for all member of the GCC.

The objective of this thesis shows, how demanding the MENA region is. Especially for small and medium enterprises it is very difficult to authorize and maintain a MA for a medicinal product, due to the fact that besides the high request of documents, a local agent is required for all countries of the MENA region. Only in case of a centrally MA via GCC-DR, a local agent is not necessary.

In the author's point of view, the pharmaceutical sector of the MENA countries and the maintenance procedures for MA of medicinal products are in development and it can be expected with great confidence, that the regulatory procedures will be much better as today.

Information of other manufacturing and testing site

Currently, the firm has only one site for manufacturing and testing.

Manufacturing site: No. 83, South Dongfeng Road, High and New Technology Industrial Development Zone, Yuxi, China

Short description of site

Walvax Biotechnology Co., Ltd. (hereinafter referred to as Walvax) is a modern biological pharmaceutical enterprise engaged in R & D, production and sales of vaccine products for human use and biological products. Walvax is a leading enterprise in strategic emerging industries in Yunnan province. Based on independent innovation, Walvax aims to provide safe and effective, high quality and advanced biopharmaceuticals products to domestic and foreign markets. Walvax was founded in 2001, with a registered capital of 1.537 billion Yuan, a total asset of 6.938 billion Yuan, a net capital of 5.013 billion Yuan. In November 2010, Walvax Biotechnology Co., Ltd. (stock name: Walvax Biotech, and stock code: 300142) was listed on Shenzhen Stock Exchange. Walvax is the first enterprise listed in China Growth Enterprise Market in Yunnan Province, with a market capitalization of 31.902 billion Yuan. There are 26 national, provincial and municipal innovation platforms such as

4

Yuxi Walvax Biotechnology Co., Ltd national recognized Enterprise Technology Centre, R&D and production international scientific and technological cooperation base. There are about 1200 staffs in Walvax Biotech including more than

100 staffs that have a doctorate or master's degree, 15 high-end returned scientists, 3 staffs in Walvax are in the Chinese 1,000 Talents Plan issued by the central organization department in China. Walvax has one of the leading R&D and industrialization teams for vaccine and therapeutic monotherapy in China.

1.2 Authorized Pharmaceutical manufacturing activities of the site.

a) The production scope of the company is prophylactic vaccines.

See in Appendix 1- Manufacturing license-Yuxi Walvax-CN&EN

b) The products manufactured by Yuxi Walvax are as follows:

Table 1 The products manufactured by Yuxi Walvax

Product name	Approval date
Haemophilus Influenzae Type b Conjugate Vaccine	April 2nd, 2007
Group A and C Meningococcal Polysaccharide Conjugate Vaccine	January 4th, 2009
Group ACYW135 Meningococcal Polysaccharide Vaccine	March 23th, 2012
Group A and C Meningococcal Polysaccharide Vaccine	March 23th, 2012
Diphtheria, Tetanus and Acellular Pertussis Combined Vaccine, adsorbed	July 27th, 2015
23-valent pneumococcal polysaccharide vaccine	March 22th, 2017
13-valent pneumococcal polysaccharide conjugate vaccine	Dec 30th, 2019

c) GMP Certificates
See in Appendix 2-GMP certificates

1.3 Any other manufacturing activities

None. Only preventive biological products manufacturing activity is carried out and there is no other manufacturing activities carried out on the site.

2.Quality Management System of Manufacturer

2.1 The Quality Management System of Manufacturer

According to requirements of the ICH Q10 and other relevant regulations and as well as the company's strategic development needs, Yuxi Walvax has established a Quality Manual, defining quality policies and quality objectives in the production quality management. In order to achieve the

5
Yuxi Walvax Biotechnology Co., Ltd

quality policies and quality objectives, a quality management system based on risk management has been set up, covering all the elements of GMP management, including organization and personnel, facilities, equipment, materials and products, production management, quality control, file management, qualification and validation, product distribution and recall etc., ensuring that products meet quality standards approved by the registration. Quality management system elements are shown in the following figure:

Figure 0 Quality Management System Elements - Structure Chart

Yuxi Walvax has established six departments: Quality Operation Department, Quality Assurance Department, Quality Supervision Department, Quality Control Laboratory, Laboratory Animal Centre and Risk Validation Management, directly led by manager of Quality Management Department, responsible for all quality management work. The Quality Operation Department continuously improves quality management system through six methods: deviation management, change management, product quality review, self-inspection and product OOS/OOT management. The Quality Assurance Department is responsible for law & regulation research, document management, training management, material control and product release, to guarantee operations conform to requirements. The Quality Supervision Department is responsible for the whole monitoring of product quality activities. The Quality Control Laboratory and the Laboratory Animal Centre are responsible for quality testing of materials, semi-finished products and finished products and daily environment monitoring, to evaluate whether product quality conforms to quality standards or not. The Risk Validation Management Department is responsible for organizing comprehensive confirmation and validation management work, to guarantee that the manufacturing processes and operations meet the requirements demanded by regulations and manufacturing techniques. See the organization chart of Quality Management Department in the following chart.

Quality Supervision Department

Figure 2 Organization chart of Quality Management System

Yuxi Walvax operates Quality Management System based on risk management system. Maintenance and improvement of quality management system is based on risk management system. Walvax considers organizations as core, quality plan as basis, documents operation and management as support, quality information as tie of operation of quality management. All operation procedures form quality record. At the same time, Plan-Do-Check-Action (PDCA) circulation is adopted, applying three systems, deviation system, change system, rectification and prevention system for process management control, thus guaranteeing effective operation of quality management system.

General information and brief introduction of the production department

The production system establishes 10 departments such as Production Management Department, Bacterial Vaccine Room I, and Bacterial Vaccine Room II, and is in charge of assistant general manager.

According to the production plan and production management department organizing regulating and controlling of production schedule, the production orders are issued. In the production order, the product batch number, validity period, manufacture date and so on are stipulated. The production order is the basis for the production organization activities in each workshop. The production order includes strain preparation order, polysaccharide production order, conjugate bulk production order, filling order, labeling order and packaging order, and the issuance of the orders is through the whole process of the product manufacturing.

Each production department organizes production activities according to the production order.

7

Yuxi Walvax Biotechnology Co., Ltd

2.2 Release Procedures of Finished Products

Manufacturer's release procedures

Yuxi Walvax established Standard Operation procedure for Sampling (Code: WSYX-QS-SOP-00-09-0003) and Standard Management Procedure for Review and Release of Finished Product (Code: WSYX-QA-SMP-00-09-0008) to standardize sampling and audit release of finished product. After the finished products are produced, the quality supervisor samples the finished products and transfers them to the Quality Control Laboratory (QC) for inspection. The Quality Assurance Department shall review the information on the batch production record (instruction information, batch record review status, production environment confirmation, material balance) and batch testing record (batch record review status, status of inspection (sampling) application, inspection record, test result) and issue a Certificate of Analysis. For products that meet the specification, apply for batch release, according to the batch release conclusion, the authorized quality personnel decide release or not.

Yuxi Walvax has established the "Standard Management Procedure for Reserve Samples" (code: WSYX-QA-SMP-00-09-0002) to stipulate that the reserve samples volume of the finished products is 2 times the total inspection volume.

Role of authorized person/qualified person

There is only one authorized person and role of authorized person/qualified person in quarantine and release of finished products and in assessment of compliance with the Marketing Authorization is below:

■To make sure such every released batch production and control test as is in compliance with regulations, registration requirements and quality standard.

- Responsible for approval of release of every batch of raw materials and final products
- Responsible for dealing with un-qualified products and approval of deviation processing
- Responsible for approval of AEFI reports and product recalls
- Responsible for handling consumer complaints

Product release procedures of NRA

Yuxi Walvax's products have passed the inspection and been packaged. The batch release application is submitted by the batch release administrator into the management system for the batch issuance of biological products. Subsequently, the NRA authorizes the staff at the provincial drug administration to sample each batch of products and store the sealed samples in the refrigerator (the storage temperature is 2-8 °C). Afterwards, the samples are sent to the National Institutes for Food and Drug Control for testing. If the product meets the requirements, the National Institutes for Food and Drug Control will issue a release certificate for the batch and mail it to the company.

8

Yuxi Walvax Biotechnology Co., Ltd

2.3 Management of Suppliers and contractors

Management of Suppliers

Yuxi Walvax has established Supplier Management Procedures (Code WSYX-QA-SMP-00-09-0001), SOP for Supplier Audit (Code: WSYX-QA-SOP-00-09-0001) to guide and regulate supplier management. The Quality Assurance Department has special posts and staff responsible for supplier control. Based on the scheme of risk management, supplier management adopts grading management of Grade I, II and III according to the degree of influence of supplied materials on product quality. In process of management, methods of documents auditing, on-site auditing management, quality assurance agreement, quality commitment letter, quality evaluation, service quality evaluation, questionnaires, dynamic management (including complaint management, change management) are adopted to evaluate quality of suppliers, in order to guarantee the normalization and validity of supplier management, provide basis for materials quality, and provide security for product quality.

Management of contractors

Not applicable. All of the manufacturing procedures and analysis are carried out by Yuxi Walvax.

2.4 Quality Risk Management

Policies of quality risk management of the firm

Through control systemic processes of risk assessment, risk control, risk communication and risk review and evaluation etc., Keep risk management throughout the life cycle of product production. Mainly taking preventive measures, Yuxi Walvax recognizes potential risk factors in each production process. Practices risk control measures into the implemented document system, to reduce risk of product quality, to improve quality management level, ensure the safety and vital interests of users as the ultimate purpose.

Scope and emphasis of quality risk management activities, and the process of risk recognition, risk evaluation, risk control, risk communication and risk review under quality risk management system

Yuxi Walvax considers product quality as the core, connecting public project equipment and facility system, manufacturing technique control, process quality control and product distribution in series to manage risks, emphasizing risk communication of risk management in each part and improving risk management effect. Walvax has established Risk Management Control Procedures (Code: WSYX-P-09-0012), taking the concept of whole-staff risk, commanding methods, self-service risk control, and cooperation & communication as the target. At the same time, Walvax guides risk management through annual Main Plan of Risk Management.

9

Yuxi Walvax Biotechnology Co., Ltd

Yuxi Walvax has established risk management committee, quality head as its director. The members of the committee include manufacturing head, managers and key cadres of each department. Each department has established a quality risk management group; each department head is the group leader. Group members are person for each position and core technical employees. The quality management system, based on risk management, follows out the concept of whole-staff risk management, implementing risk management into daily manufacturing activities. Walvax identifies risk sources by risk recognition and evaluation on each process of manufacturing activity and management activity, finally the control document is formed, the risk evaluation report corresponds to risk level. At the same time, Walvax regularly carries out two risk reviews every year, to make sure the control effects of risk source, to continuously improve quality management system based on risk management, and to decrease risks lying in vaccine manufacturing and circulation control, thus guaranteeing the quality of vaccines.

2.5 Review of Product Quality

Yuxi Walvax has designed Management Regulation for Product Quality Review (Code: WSYX-QO-SMP-00-09-0001) according to ICH Q7a, EU GMP Part I - Basic Requirements for Medicinal Products and Annex 6 Good manufacturing practices for sterile pharmaceutical products, aiming for guiding, regulating and controlling annual product quality review.

The Quality Operation Department of Yuxi Walvax appoints special persons to compile templates of product quality review protocol and report, clearly regulating responsibilities, review range and contents. Templates of product quality review protocol and report will come into implementation after joint hearing and obtaining approval by Quality Management Department, production management, workshops involved in production and other departments. Yuxi Walvax collects data of equipment and facilities such as air purification system, water system and compressed air system, material supplier, intermediate control of manufacturing process and stability examination, adopts line trend chart and tables to make statistic analysis, thus forming annual product quality review report, proposing manufacturing and quality improvement measures to guide continuous improvement of manufacturing and quality management system for the next year.

3. Personnel
3.1 Organization chart

In order to comply with Good Production Practice (2010), Yuxi Walvax has 27 departments to meet drug production demands. The organization chart is covering production, quality, storage, product

11
Yuxi Walvax Biotechnology Co., Ltd
distribution, and etc. Yuxi Walvax has an independent quality management department to perform the duty of quality assurance and control. Job descriptions of each department and position have been made to ensure proper implementation of staff in each department.

Figure 5 Organizational Chart of Yuxi Walvax

3.2 Outline of arrangements for basic and in-service training and how records are maintained
Yuxi Walvax has established Training Management Control Procedure (Code: WSYX-P-02-0002) and Work License Standard Management Procedure (Code: WSYX-HR-SMP-00-02-0002), which are used for guiding and regulating training for persons relevant with production and quality, thus to enhance employees' consciousness, experiences and abilities, guarantee drug production and decrease risks. The Human Resources Department and Quality Assurance Department are jointly responsible for training management, selecting proper training content adapting job responsibilities, operating according to training objects, and forming training plan reviewed by each department head and jointly approved by person in charge of production management and person in charge of quality management. Each department shall organize training by lecturing, actual operation, group discussion and other ways, and evaluate actual training results by written examination, Q&A and other methods. All records involved in training shall be archived and stored in the archive room.
Training management of new employees

12
Yuxi Walvax Biotechnology Co., Ltd
New employees shall attend pre-job training. The training includes three parts. The first part is basic GMP knowledge, company introduction and other basic information. The second part is training of public management knowledge of intended department. The third part is training of professional knowledge and operation skills. New employees shall attend the three parts training above and pass the examination during probationary period. The HR Department will issue work license for new employees, indicating the new employees obtain qualification of independent working ability. See detailed training contents in the following table.

Employee continuing training management

Continuing training management for employees is designed by HR Department, Quality Assurance Department and responsible persons of each department according to national regulation requirements, position requirements, self-inspection and external audit evaluation etc., including basic training and targeted training. Basic training is general GMP requirements, rules and regulations, basic company information and safety knowledge, which shall be learned by employees, applicable for all staff. The HR Department and Quality Assurance Department shall organize the training once a year together. The continuing trainers are those who are familiar with GMP, rules and regulations, and company profile. Targeted training is designed for qualification training of special professional operations, professional knowledge and special work, applicable for relevant operation personnel. Each relevant department shall organize targeted training once a year at least. The trainer shall be a professional employee or person from qualified training agencies. See detailed basic knowledge training and targeted training contents in the following tables.

Except for annual training plan, there are other trainings derived from deviations, changes, regulation revision, self-inspection, etc. At the end of each year, evaluate whether it shall be included in basic training or targeted training in the following year through training summary.
 Training implementation and evaluation management of training examination

During implementation of training, training consultants carry out training by selecting correspondent training textbooks and adopting classroom learning, actual operation, special training of special organizations, etc. according to training contents. To ensure better training results, the training consultants will adopt written examination, on-site Q&A or on-site operation to confirm training results. The department responsible for training shall arrange failed employees to attend training and examination again.

Management of training archives

16

Yuxi Walvax Biotechnology Co., Ltd

The training archives include training plan, training textbooks, learning record of training, examination materials, training review plan and report. Each department transfers training archives to HR Department every year. The HR Department reviews the archives and then transfers all the archives to achieve room.

3.3 Health requirements for personnel engaged in production

Yuxi Walvax has established Standard Management Procedure for Staff Health (Code: WSYX-HR-SMP-00-02-0003), used for guiding staff health management. The HR Department is responsible for

establishment and maintenance of staff health archives. New employees shall take health check before entry, and employees take health check once a year. Personnel engaged in production and process supervision should be vaccinated corresponding vaccine. Personnel directly contacting with product manufacturing and related with process monitoring shall not have skin disease and infectious disease, and corrected visual acuity of persons responsible for physical appearance inspection shall be above 5.0, thus guaranteeing the staff meet health requirements and decreasing contamination risk caused by personnel.

3.4 Personnel hygiene requirements, including clothing.

Yuxi Walvax has established Standard Management Procedure for Staff Hygiene (Code: WSYX-QS-SMP-00-02-0001) for guiding personnel hygiene. All the staffs should take the hygiene knowledge training. They are allowed to operate after pass examination of the training. As required, operators are not allowed to wear make-ups or jewellerys. Operators must follow gowning procedures to change clothes, wash and disinfect hands. Operators are not allowed to use bare hands to touch raw materials, excipients, final bulk, intermediate, packing materials and surface of the equipment, which directly contact with products. Smoking, eating, storing food, drinks, cigarettes, personal medicines are prohibited in production area and storage area. Visitors entering production area must be approved by production or quality responsible person and accompanied by specified person. Visitors must follow gowning procedures in accordance with SMP before entering the cleanliness area. Operators who work in clean area must operate appropriately. Putting hands down, akimbo, putting hands under the arms or holding hands high over the shoulder are not allowed. Operators must put hands in front of chest, and avoid to squat. Operators must keep a distance between each other to avoid contact with each other (even with sterile gloves). Operators must check whether gowns are proper when operating in high-risk areas. Hand disinfection must be carried out before touching any material or surface. Disinfect hands every 10-20mins when just in contact with air.

4. Premises and Equipments

4.1 Premises

Yuxi Walvax is the industrialization base of Walvax Biotech Co., Ltd., and is one of the focused supporting enterprises of Yuxi Government. The plant has been built since 2003 and covers an area of 85000 m². The phase I construction was completed in 2005 with the construction area as 1170 m², which is leased to the group companies for producing new variety vaccines and monoclonal antibody drug. The phase II construction was completed in 2010 with the construction area as 21720 m². Phase III was completed in 2012, the area of which is 63610 m².

The workshops are distant from urban arterial road. Surrounding environment has no pollutant source to affect product quality. Air and water quality are in good condition. Environment in the plant is clean and tidy, meeting the drug production hygiene criteria. The plant has two entries to effectively prevent possible cross contamination: west entry for personnel and north entry for logistics. The internal layout is reasonable. Personnel channel and logistic channel are separated. Production areas and administrative areas are independent to protect the vaccine production from possible pollution. The roads are cement concrete pavement to avoid fugitive dust. The roads are smooth and clear, good for safety and fire protection.

18

Yuxi Walvax Biotechnology Co., Ltd

Quality Control Laboratory is responsible for physical and chemical testing, material testing, preparation and management of standard test samples, and microbial, biochemical testing. The labs for microbial limit test and sterile test are separated in different rooms, and equipped with independent HVAC systems to prevent the pollution and cross contamination.

Production workshops are strictly managed and controlled according to production process approved by National Medical Products Administration (NMPA). All the production and quality operations meet the WHO cGMP requirements.

Joints of process pipelines, colored steel plates and high-efficiency supply air filters and the juncture of lamps and lanterns and so on entering the clean management areas are sealed with silicone glass glue. Buffer rooms and air blocks are set between the clean production areas and the control areas, ensuring closed clean production environment, not polluted by the outside clean air.

Warehouses and storage areas

Virulent material are checked upon receiving and stored in double-locked virulent safe storage. The storage is audited by Production Management Department and inspected by Quality Assurance department, with clear classification and numbering.

There are two keys for the double-locked storage with two warehouse administrators. Each administrator keeps one key. The code of safety box is kept by appointed staff from Transportation Department. The key of safety box is kept by appointed staff from Production Management Department. Rest eating and smoking in virulent storage room are prohibited.

The warehouse administrators check chemical-unstable virulent material once every month and stable nature material once a quarter. If find out any problem, the administrator must have proper measures, and report to QA manager immediately.

In case of break or spill virulent material, the administrator must report to QA immediately. Personnel in the storage shall put on gas masks clothing and gloves, and then clean and ventilate under the supervision of QA. Any materials with virulent splash shall be cleaned carefully. All the materials that cannot clean or wash shall be destroyed.

Description of specific storage conditions

The cold storage area of Walvax is about 5000 m², totally meeting the storage requirement of Walvax's products (bulks and final products). The Validation Management Department of Walvax carried out validation according to the approved master validation plan. The validation result shows all the design, installation and performance of cold storage meet the storage temperature for products. Not only verified mercurial thermometers are established in cold storage for monitoring, but also online monitoring platform are established for monitoring real-time temperature. The monitoring platform

19 Yuxi Walvax Biotechnology Co., Ltd

has alarm system. If the temperature exceeds the scheduled range, the responsible person in Walvax and the person in charge of cold storage will be informed by satellite network system, thus making timely emergency measures to guarantee the storage temperature safety of the products.

Layouts and flow charts of the production areas, as well as layouts of warehouses and storage areas for the storage and handling of highly toxic, hazardous and sensitising materials indicated are attached in Appendix 4.

4.1.1 HVAC system.

The 9 sets of HVAC system in Meningococcal Vaccine Workshop meet the national requirements for production plant. The schematic diagrams are as follows:

The air shall be filtrated out of dust by fresh air filter, and then mixed with returned air from clean rooms. The mixed air shall be filtered by G4 primary-efficiency air filter, and then be cooled/dehumidification by 7℃ cooling water in surface cooling section. After heating and stabilizing temperature by 0.3MPa of low-pressure saturate steam, filter the air by F6 medium efficiency filter. The filtered air shall enter wind inlet duct after humidification in humidification section. De-noised by muffler in air inlet duct, the air is sent into the room through HEPA filter (H14). Air in some rooms (such as air lock room and dressing room) shall exhaust through air outlet, exhaust duct and air filter (F5). The returned air shall return through hair return duct, mix with fresh air and then enter primary-efficiency air filter for circulation. JK-MGa HVAC system in non-sterile area is full fresh air system. The exhausted air is filtered by H13 high efficiency filter. The operation process is shown in Figure :

1. Fresh air 7. Medium efficiency filtration section

Figure 6 Schematic diagrams of HVAC System (Meningococcal Vaccine Workshop)

The HVAC system in Fill & Finish Workshop meets the national requirements for production plant. The schematic diagrams are as follows:

The air shall be filtrated out of dust by fresh air filter and then be mixed with returned air from clean room in air returning section. The mixed air shall be filtered by primary-efficiency air filter, cooled/dehumidified by 0°C or 7°C cooling water at the surface cooling section, then be supplied to 0.3MPa low pressure saturated steam heating section for heating. Humidify the air with necessary industrial steam at the humidification section, supply the humidified air to medium-efficiency air filter for filtration and then enter the main air inlet duct. Before entering each room through the branch ducts, filter the air by high efficiency filter. For areas of grade A/B, Fan Filter Units (FFU) is added before entering the room after filtration by high efficiency filter. The schematic diagrams are shown in Figure :

Figure 7 Schematic diagram of HVAC System (Fill & Finish Workshop)

The HVAC system in International Vaccine Formulation Centre meets the national requirements for production plant. The schematic diagrams are as follows:

The air shall be filtrated out of dust by fresh air filter (G4) above the air returning section and then be mixed with returned air from clean room in air returning section. The mixed air shall be filtered by medium-efficiency air filter, cooled/dehumidified by 0°C or 7°C cooling water at the surface cooling section, then transfer to be heated with 60/50 hot water at heating section, and then humidify the

21

Yuxi Walvax Biotechnology Co., Ltd

air with necessary clean steam at the humidification section, supply the air to medium-efficiency air filter (F8) for filtration and then enter the main air inlet duct. Before entering each room through the branch ducts, filter the air by high efficiency filter (H14). Then enter into each clean room, the pressure sensor feedbacks the pressure in each room to Air volume regulating valve to adjust the pressure in room, a part of the air is out of the room through the outlet machine after filtered with medium-efficiency air filter (F6). The schematic diagrams are shown in Figure :

Figure 8 Schematic diagram of HVAC System (International Vaccine Formulation Centre)

The 4 sets of HVAC system in Quality Control Laboratory meet the national requirements for production plant. The HVAC system is composed of air inlet ducts, air outlet ducts, and air handling units. The air-handling units include filters of each grade, fans, temperature/humidity adjustment devices, etc.

KX4-2 and JK4-2 systems are full fresh air systems for non-sterile area of Quality Control Laboratory. The working principles are as follows: the air shall be filtrated by G3 primary efficiency filter. The filtered mixed air shall be cooled and dehumidified by 7°C chilled water at the surface cooling section, then be supplied to 0.3MPa low pressure saturated steam heating section for heating. The heated air shall be filtered in F6 medium-efficiency air filter, humidified in humidification section and then be supplied into air inlet duct. De-noised by muffler in air inlet duct, the air is supplied into the end of duct-HEPA filter (H13) and then the air enters the room. Air in rooms shall be filtered through air outlet, air outlet duct, and air outlet filter (F15) and then exhausted out of the room.

22

Yuxi Walvax Biotechnology Co., Ltd

JK4-1 and KX4-1 systems are for sterile area of Quality Control Laboratory, among which KX4-1 is full fresh air system with the same working principles as HVAC systems in non-sterile area. The working principles of KX4-1 are as follows: the air shall be filtrated by G3 primary efficiency filter. The filtered mixed air shall be cooled and dehumidified by 7°C chilled water at the surface cooling section, then be supplied to 0.3 MPa low pressure saturated steam heating section for heating. The heated air shall be filtered in F6 medium-efficiency air filter, humidified in humidification section and then be supplied into air inlet duct. De-noised by muffler in air inlet duct, the air is supplied into the very end of duct-HEPA filter (H13) and then the air enters the room. Before entering KX4-1 HVAC system, the air shall be filtered by FFU high efficiency filter (H14). Air in some rooms (Buffer Room and Sterilizing Air Valve) shall be filtered through air outlet, air outlet duct, and air outlets filter (F5) and then exhausted out of the rooms. Air in other rooms shall be mixed with fresh air in air returning duct and then enter primary efficiency filter for circulation.

The schematic diagrams of JK4-1 and KX4-1 systems are shown in Figure and Figure :

1. Fresh air section 7. Medium efficiency filtration section
2. Primary filtration section 8. High efficiency filtration section

Figure 10 Schematic diagram of JK4-1 HVAC System (QC Lab)

Distributed Control System (DCS) is used in all the air conditioning control systems. This system meets requirements of three different conditions of production: normal operation, disinfection and stop. It is capable of automatically controlling the air return system and temperature, humidity and pressure of some rooms. Rooms with air exhaust equipment are also set up with monitoring and

automatic adjustment of pressure. Fresh air ducts and air outlet ducts are equipped with electric control valves, which have chain control with the fan. When the system shut down unexpectedly, the fresh air and air outlet electric valve will be shut down automatically to prevent outdoor airflow back into the clean room.

Design Standard of HVAC system

HVAC systems of Meningococcal Vaccine Workshop, Fill & Finish Workshop and Quality Control Laboratory were designed and constructed according to requirements of Good Manufacturing Practice (2010), Design Specifications of Heating Ventilation and Air Conditioning GB 50019-2003, Design Specifications of Clean Room GB 50073-2001, Design Specifications of Pharmaceutical Industry Clean Room GB 50457-2008 and the production process of products. Room cleanliness is classified as grade A, B, C, D and E. Grade E is controlled non- classified (CNC). Pressure cascade between clean areas and black areas, or between different grades are not less than 10 Pa.

C + A design is used in Meningococcal Vaccine Workshop and areas of high contamination risk in Quality Control Laboratory, such as sampling, strain operation, centrifugation, ultrafiltration and conjugation. B + A design is used in areas of high contamination risk in International Vaccine Formulation Centre involved in process such as formulation, filling and capping. Preparation of final bulk and filling process are carried out in an independent air conditioning partition, while capping

24
Yuxi Walvax Biotechnology Co., Ltd
process is in another air conditioning partition, to avoid cross-contamination. Air supply in Grade B areas is unidirectional laminar airflow supplied from ceiling and returned from sidewalls, Fan Filter Units (FFU) are designed for final bulk preparation rooms in grade A clean zone, the air is processed with HEPA filter again to ensure grade A environment. Equipment in capping room and sub-packing room are with its own isolation system in Grade A clean zone, effectively control contamination and to guarantee cleanliness grade. Online Particle Monitoring System is established for critical Grade A areas (such as filling area). The design specifications [according to China GMP (2010), Appendix 1 “Sterile Drugs”) are as follows:

Table 7 Maximum Permitted Number of Particles Concentrate in Clean Area
Maximum Permitted Number of Particles /m3

Environmental monitoring procedure

According to the technical standard of ISO14644-1:2015, the company has established the Standard Operation Procedure of Dynamic Environmental Monitoring in Clean Area (Code: WSYX-QS-SOP-00-09-0001) and Standard Management Procedure of Routine Environmental Monitoring in Clean Area (Code: WSYX-QS-SMP-00-09-0002) to monitor and manage the clean environment. Routine

25
Yuxi Walvax Biotechnology Co., Ltd
environmental monitoring includes monthly environmental monitoring and in-operational monitoring of production process.

4.1.2 Water system
 Operational Principle

The purified water preparation system produces purified water by urban drinking water with the
 process of "pre-treatment+ reverse osmosis + Electrode ionization (EDI)". Detailed production
 process is: city water is sequentially treated by multi-medium filter, softener, activated carbon filter
 and precision filter, then processed by reverse osmosis membrane and EDI device to generate purified
 water. Water for injection preparation system uses purified water as raw materials and factory steam
 as source of the first evaporation heat tower. Six-effect distiller generates WFI. Detailed production
 process is: raw water (purified water) is pumped into the pipes of distiller and heat exchange with
 industrial steam in the shell of distiller. After distillation, the raw water is separated by separator
 and
 pure steam is obtained. The pure steam produced in the first evaporation tower is used to heat the
 second evaporation tower, and the rest can be done in the same manner. The pure steam produced in
 the last evaporation tower enters the condenser for cooling down to generate water for injection.
 Water system is designed with a programmable logic controller (PLC) + touch screen automatic
 control with display and limit alert for liquid grade, electric conductivity, temperature, automatic
 pressure monitoring. At the same time, parameters of key process (conductivity of producing water,
 temperature of producing water) are continuously monitored and recorded to ensure the quality of

27
 Yuxi Walvax Biotechnology Co., Ltd

process water.

Designing Standards

It is designed according to WHO GMP, EU GMP, Chinese GMP, United States pharmacopoeia, European pharmacopoeia and Chinese pharmacopoeia. It is set with the purified water preparation system, water for injection preparation system and pure steam preparation system. The production capacity of purified water is 20 t/hr, 10 t/hr for water for injection, and 4 t/hr for pure steam. Production capacity of purified water; water for injection and pure steam is 20t/hr, 10t/hr and 4t/hr, respectively. Distribution systems of purified water and water for injection strictly divide the purified water and water for injection in sterile area and non-sterile area in bulk workshop and Fill & Finish Workshop by different storage tanks to avoid risk of cross-contamination. Online conductivity analysis meter and Total Organic Carbon (TOC) analysis meter are set up at the water returning section for real-time monitoring of water quality.

The hardware of the system is equipped according to engineering design and construction guidance of ASME BPE of American Society of Mechanical Engineers to avoid the blindness of pipe tube and angle. At the same time, the pipe has a certain slope (not less than 5‰) to facilitate the cleaning, drainage, and sterilization of the system. The storage tank and clean pipeline adopts 316L stainless steel material. The valve adopts diaphragm valve from Gemu of German. The water for injection system uses the no hidden corners T valve type of Gemu. The circulation pump is drainable centrifugal pump of Sweden Alfa Laval in sanitary grade. The heat exchanger is adopted the shell and table heat exchanger of German Neumo in sanitary grade. The respirator with electric heating jacket has a separate pure steam pipeline to sterilization in place (SIP).

As for the software of the system, automatic control systems of storage and distribution systems meet the requirements of computer validation system guidance GAMP5 (Good Automation Manufactory Practice 5), recommended by ISPE (International Society for Pharmaceutical Engineering). The control system is programmable control system (PLC), established with user groups of different limit level, thus guaranteeing the stability, controllability and verifiability of automatic control system and data integrity.

Yuxi Walvax adopts the method of risk assessment to assess the whole water system, from the User Requirement Specification (URS), Design Qualification (DQ), Factory Acceptance Test (FAT), Installation Qualification (IQ), Site Acceptance Test (SAT), Operational Qualification (OQ) and Performance Qualification, throughout the whole system process. The distribution system was designed, manufactured, installed and debugged by the Morimatsu group of Japan, Shanghai Morimatsu Process Equipment Engineering Co., LTD. The water for injection system adopts above 70°C heat preservation cycle, and installed online TOC analyser (GE, USA) in the water outlet, in

28

Yuxi Walvax Biotechnology Co., Ltd

order to real-time monitor the quality condition of water.

Water system operation and verification

According to the validation main plan of our company, the Risk & Validation Management Department is responsible for organizing the validation of the water system, and the validation period is one year. According to the validation results, the Standard Management Procedure for Process Water Monitoring (Code: WSYX-QS-SMP-00-03-0002) has been formulated to stipulate the process water management plan. The Quality Supervision Department is responsible for sampling from the supply and outlet of the water system every 14 days, and should complete the sampling and monitoring of all used points in three months. The results of the validation and the daily monitoring data show that the company's purified water and water for injection system is stable and can continue to produce process water in line with quality standard of Chinese Pharmacopoeia, Pharmacopoeia of United States and European Pharmacopoeia.

Clean procedures and arrangements for water systems

According to the validated period of disinfection / sterilization, the purified water system and water for injection system will be disinfected / sterilized periodically. In meningococcal vaccine workshop and International Vaccine Formulation Centre, disinfection of purified water system is at 80°C for 120 minutes, and sterilization of water for injection system is overheated water at 121°C for 30 minutes. In Phase II Fill & Finish Workshop, the purified water system and the water for injection system both adopt hot water at 121°C for 30 minutes for sterilization. In order to ensure the complete set of water systems meets the requirements, cleaning validations of purified water system and water for injection system are carried out every five years.

4.1.3 Other System

Yuxi Walvax has established Standard Operation Procedures of Receiving, Storage and Distribution of Hazardous Chemicals (code: WSYX-ST-SMP-00-03-0004). Hazardous Chemicals are stored in specific hazardous chemicals warehouse, shall be isolated, separated and stored separately according to the storage method, storage quantity and safe distance specified in relevant technical standards. Hazardous chemicals warehouse conforms to the relevant technical standards for safety, fire protection requirements, set up with obvious signs, and be managed by special personnel; All hazardous chemicals in and out of the warehouse are registered and checked regularly. It is carried out the two-man rule for highly toxic chemicals, two men in charge of receiving and dispatching, two men in charge of keeping accounts, two men in charge of two locks, two men in charge of transportation, and two men in charge of using. The company has established Processing Procedures of the management of unqualified product (Code: WSYX-QA-SMP-00-09-0011) and Processing

29

Yuxi Walvax Biotechnology Co., Ltd

Procedures of destroying of unqualified product (Code: WSYX-ST-SOP-00-05-0012), to standardize the disposal of waste Hazardous Chemicals.

The company has established Processing Procedures of the Bacteria Carrier Items and Thallus in the Meningococcal Vaccine Workshop I (code ■ WSYX-BV1-SOP-00-08-0011), in order to conduct sterilization of the equipment after using in non-sterile area, and the sterilization condition is moist heat sterilization (122.1±1°C, 30 min), to reduce the contamination risk from non-sterile items in the production operation area.

4.1.4 Description of planned preventive maintenance program for premises and the recording system.

The company has established Procedures of Equipment Preventive Maintenance (code: WSYX-PM-SMP-00-04-0012), to guide the management of equipment preventive maintenance. According to the demands of equipment preventive maintenance, at the end of every year, each of the equipment

management department shall draft the equipment preventive maintenance plan for the coming year, (1) it must be carried out a review on the equipment operation and maintenance situation of the previous year and analyse the reason of the maintenance have not completed as planned; (2) According to the level assessment before the purchase of equipment, the critical evaluation of components during equipment verification, statistically analyse the breakdown, maintenance and maintenance of the equipment in each department last year, review and analyse whether the frequency and measures of key maintenance components last year are reasonable, and whether the preventive maintenance frequency and measures last year are reasonable or not. According to the equipment preventive maintenance plan, during daily production, the equipment using department / management department shall establish "Equipment Maintenance Table", record the anomalies, failures, and maintenance of each device during its use. The information should be including equipment code, type, manufacturer, place site, failure date, description of failure, Maintenance and maintenance measures and etc. We review the table at the end of every year as reference for the equipment preventive maintenance plan for the next year.

4.2 Equipment
4.2.1 Production and Quality Control laboratory equipment

Equipment and facilities for the vaccines and diluents are all purchased from the famous equipment manufacturers both domestic and abroad. Equipment lists are as follows:

4.2.2 Cleaning and Sanitation

Yuxi Walvax has established Standard Management Procedure for Cleaning and Disinfection (No. WSYX-RVM-SMP-0009-0001). It is specified the cleaning and disinfection methods for production workshop, process equipment, clean areas and inspection equipment in quality control laboratory. The company has established SOP of Clean Air Conditioning System Maintenance (Phase III)(Code: WSYX-EO-SOP-00-03-0025), SOP of Use and Maintenance of OZS Ozone Generators (Phase III) (Code: WSYX-EO-SOP-00-04-0010), SOP of Use and Maintenance of Purified Water/Water for Injection Distribution System (Phase III) (Code: WSYX-EO-SOP-00-03-0028), which specify the cleaning and disinfection methods for Air Conditioning and Water System. The company has developed SOP of Cleaning, disinfection and maintenance of BIOQUELLZ-2 Hydrogen Peroxide Generator (Code: WSYX-FP-SOP-00-04-0043), which specifies the sterilization 40
Yuxi Walvax Biotechnology Co., Ltd

method and frequency of vaporized hydrogen peroxide in critical operating room of Fill & Finish Workshop.

4.2.3 Description of planned preventive maintenance programs for equipment and the recording system

Preventive Maintenance System

The company has established Procedures of Equipment Preventive Maintenance (code: WSYX-PM-SMP-00-04-0012), to guide the management of equipment preventive maintenance. According to the demands of equipment preventive maintenance, at the end of every year, each of the equipment management department shall draft the equipment preventive maintenance plan for the coming year, (1) it must be carried out a review on the equipment operation and maintenance situation of the previous year and analyse the reason of the maintenance have not completed as planned; (2) According to the level assessment before the purchase of equipment, the critical evaluation of components during equipment verification, statistically analyse the breakdown, maintenance and maintenance of the equipment in each department last year, review and analyse whether the frequency and measures of key maintenance components last year are reasonable, and whether the preventive maintenance frequency and measures last year are reasonable or not. According to the equipment

preventive maintenance plan, during daily production, the equipment using department / management department shall establish "Equipment Maintenance Table", record the anomalies, failures, and maintenance of each device during its use. The information should be including equipment code, type, manufacturer, place site, failure date, description of failure, Maintenance and maintenance measures and etc. We review the table at the end of every year as reference for the equipment preventive maintenance plan for the next year.

Maintenance of daily production operation

Equipment preventive maintenance is divided into primary level maintenance and secondary level maintenance. Primary maintenance is a routine maintenance conducted during the daily use of equipment, and secondary maintenance is a professional maintenance by the Engineers.

Primary equipment preventive maintenance is carried out during the routine operation. The equipment using departments organize and implement the equipment maintenance according to the annual preventive maintenance plan.

As for the secondary preventive maintenance of equipment, the equipment using departments should apply for maintenance to Engineering Security Department 1 week before the maintenance according to the production plan and maintenance plan, According to the maintenance content and maintenance

41

Yuxi Walvax Biotechnology Co., Ltd

requirements, the Engineering Security Department shall determine the maintenance personnel and feedback them to the Production Management Department, which shall coordinate the relevant public systems and sign opinions according to the maintenance contents and maintenance requirements, and then feedback to the device using department. The device using department organize and cooperate with the professional engineering staff to complete the maintenance. In the process of secondary level equipment maintenance, if there are multiple projects, which need to be carried out at the same time, equipment should be maintained according to equipment maintenance class and critical equipment parts assessment, in the order of class A→B→C.

After the equipment maintenance, fill the Equipment Preventive Maintenance Records, and fill the Equipment Maintenance Log Book by the using department at the same time, as reference for equipment preventive maintenance plan for the next year.

4.2.4 Qualification and calibration including the recording system arrangements for computerized systems validation

According to the Chinese GMP and WHO GMP requirements, as per the risk assessment, the company has formulated the Validation Master Plan (document code: WSYX – RVM – TS0006 - 0051), clarifying all the validation key elements like responsibilities, plant, facilities, equipment, analytical instruments, manufacturing process and so on to ensure the consistency and rationality of the validation method. Computer system validation strategy, as shown in the following table:

Validation Strategy for Computerized System

Items Content

Design qualification (DQ) for Computerized System should meet the Design

requirements of GMP and production process. Qualification should at least

Qualification contain URS and design documents.

The installation qualification should contain the following items: criteria

Installation operation files, general drawing of the control system, the manuals for Qualification hardware and software, the configuration lists of hardware and software, input/output (I/O) lists and continuity check, test of environment and utilities.

Operation qualification should contain the following items: system security

Operation test, interface test, alarm and interlock function test, functional test and

Qualification disaster recovery test.

Performance qualification (PQ) is to confirm the validity and stability during

Performance the system running. It should be tested under the normal working

Qualification environment. Test items are determined by the overall expected operation effect (for example, testing all the characteristics of product quality).

5. Documentation

Arrangements for the preparation, revision and distribution of documentation

42

Yuxi Walvax Biotechnology Co., Ltd

The Company has enacted the Document Management Control Procedures (document code: WSYX-P-07-0008) to regulate the document drafting, revision, approval, distribution, control and archiving, so as to ensure that the documents are under control in different life cycles and to guarantee that the document management is consistent with the corresponding regulations and procedure requirements.

Document preparation/deletion:

Preparation of documents (policies, guidance documents, regulations and records) includes drafting of new documents and revision of existing documents. In the case of document addition, alteration or deletion, the preparation/deletion personnel shall fill in the Approval Form for Quality Document ■Addition ■Alteration ■Deletion, stating the reason and basis for document addition, alteration or deletion and other necessary information descriptions.

Upon completion of document preparation, the preparation personnel shall attach the draft printing on both sides in black and white to the Approval Form for Quality Document to the related personnel for review and approval.

Record preparation and approval process:

Each activity related to the GMP management shall have records to ensure that the product production, quality control, quality assurance and other activities are traceable. When record is designed, sufficient blank shall be left for filling out data and information.

Document review:

Document review includes format review and content review: a. format review shall be carried out by Quality Assurance Department, which shall check the corresponding contents (e.g. document number, version number, font, font size and space between lines, etc.) according to the document standard format specified in the SOP for Document Preparation, and sign the review basis and comments in the column "Review Comments about Drug Administration Regulations from Quality Assurance Department" in the Approval Form for Quality Document; b. content review shall be completed according to the approval process specified in "document preparation", where the document contents shall be concise and complete, accurate and rigorous in wording, clear, comprehensible and logical in expression for the regulatory, technological and management purposes, so as to ensure the document operability and regulatory compliance; the different managers shall review from different points of view according to the review sequence, and fill out the review basis and comments in the corresponding columns of the Approval Form for Quality Document. If any document to be reviewed involves any legal requirement (Labor Law or Civil Law), the column for joint review comments shall include the legal counsel's opinions. If any document to be jointly reviewed or reviewed must be kept confidential, the SOP for Confidentiality of Technological

43
Yuxi Walvax Biotechnology Co., Ltd
Documents shall be followed.

Document approval:

Document approval shall be completed by the approver specified in "document preparation". Documents must be approved before use, and the approved documents can be used for training. The blank column for approval in the Approval Form for Quality Document shall be crossed out by the document submitter but signed and dated.

Document distribution:

Distribution of policies, guidance documents or regulations

Documents shall be released among which job description shall be jointly released by Quality Assurance Department and Human Resources Department, while the remaining documents shall be released by Quality Assurance Department. Document system documents shall be confidential, the original of which shall be affixed with the cross-page seal of "Quality Assurance Department" before color printing and distribution. Each page of documents distributed to each department shall be affixed with the "control seal" for reference and use, in the middle for documents or on the top left corner for records, and "special seal for quality document distribution" shall be affixed to the top right corner of the home page of documents. Documents shall be released after preparation of distribution number. Before document distribution, the distribution range and number of documents shall be specified by Quality Assurance Department according to the document's coverage range. Quality Assurance Department shall prepare the distribution number with unified printing and distribution, and the recipients shall sign on the Quality Document Distribution Record Form.

Distribution of documents under other circumstances:

After document distribution, if dissenting on the distribution range or the number of documents distributed, the user department shall complete the Quality Document Distribution Range Application Approval Form, which shall be printed and distributed uniformly by Quality Assurance Department after approval from leaders with specific duties (Director of Production Management or Director of Quality Management). Quality Assurance Department shall determine the distribution range according to the document's coverage range or the approved Quality Document Distribution Range Application Approval Form, and distribute the documents after preparation of document number. The recipients shall sign on the Quality Document Distribution Record.

Document training:

Upon receipt of the documents, each department head shall organize the related personnel to learn, and complete the Training & Learning Record. Document learning shall be completed before the

44
Yuxi Walvax Biotechnology Co., Ltd
documents become effective, and document training shall follow the Training Management Control Procedures.

Document effectiveness:

Documents shall become effective within no more than 30 working days after official release, so as to ensure that each use site can obtain the applicable documents in current edition, and that the implementers can have sufficient time to learn and understand the documents before document implementations. The documents shall be implemented as of the effective date.

6.2 Process Validation

6.2.1 Description of general policy for process validation

According to the requirements of China GMP, WHO GMP and risk evaluation, Yuxi Walvax has established Validation Master Plan (Code: WSYX-RVM-TS-0006-0051), which clarifies the validation responsibility and all the key elements of validation for the factory buildings, facilities, equipment, test instruments and production process, to guarantee consistency and rationality of validation method.

The company organizes the validation and production in strict accordance with the regulations issued by China Food and Drug Administration, and has a specialized Risk Validation Management department, which is under Quality Management Department, fully responsible for organizing the validation tasks of the company to ensure the continuously stable product quality. The Risk Validation Management Department provides the engineering equipment validation management and the process validation management according to the validation category. Process validation management mainly involves the process validation of the products manufactured by the company.

Process validation includes prospective validation, synchronous validation and retrospective validation by type, and the standards and contents for different types of process validation have been identified in the overall validation plan. To ensure that the products are always within the acceptable range and in the controllable state, and to effectively control the deviations during the production, the company shall use the method of risk assessment according to the product intended use and the registration standard to evaluate the effects of the process parameters during the entire life cycle of manufacturing of the products, so as to determine the process validation protocol and to organize the implementation in strict accordance with the validation protocol. Upon formation of the validation results, the company shall carry out the risk assessment and analysis of the validation results to judge whether the product process parameters and the product quality are in acceptable and controllable state, forming the validation report before implementation.

46
Yuxi Walvax Biotechnology Co., Ltd

Figure 11 Flow Chart of Carrying out Process Validation

6.2.2 Arrangements for reprocessing or reworking.

1)According to national approved drug standard, rejected intermediates and products which cannot be reprocessed, such as conjugate bulk and finish products should be clearly marked and stored separately in restricted areas. They should be destroyed under the supervision of local drug administration. Whatever action taken should be approved and recorded by authorized personnel.
2)According to national approved drug standard, the rejected intermediates, such as polysaccharide bulk could be reprocessed. It is only permitted after a series of evaluation and approving by workshop manager, QA manager, manufacture director and quality director. If the specifications are met and if it is done in accordance with a defined and authorized procedure, the intermediates could be reprocessed. Record should be kept of the reprocessing.

6.3 Material management and warehousing

6.3.1 Arrangements for the handling of starting materials, packaging materials, bulk and finished products, including sampling, quarantine, release and storage.

To guarantee intended use of products, the company has established a comprehensive and scientific material management and storage system and has established the Material Management Control Procedures (Document No.:WSYX-P-05-0005) to guide and control the material management and storage. All the purchased materials are from the qualified suppliers approved by the Director of Quality Management. Primary seeds are purchased from China Bacterial Culture Collection Center of National Institutes for Food and Drug Control, with clear record, history and source. The company has established Testing SOPs for each material to test whether the material quality indicators meet the

47
Yuxi Walvax Biotechnology Co., Ltd
production quality requirements. The company uses the means of risk assessment to conduct evaluation and hierarchical management of the materials.
The purchased materials shall be managed by zone, identification and quality state, and those with special storage requirements (e.g. products with special temperature & humidity requirements, highly toxic products and easily manufactured narcotic drugs) shall be stored in special storage zones. Quality Management Department shall take samples for testing by batch, review the materials whether acceptable, and issue the certificate of approval if approved, permitting the materials to be put into production.

Figure 12 Flow Chart of Material Management System

6.3.2 Arrangements for the handling of rejected materials and products.

In strict accordance with the GMP (revised edition in 2010), the company has enacted the Rejected Product Management Procedures (Document No.: WSYX-QA-SMP-0009-0031) to standardize the handling of rejected products, so as to prevent the rejected products from being used in production. After the material, intermediate product and finished product are rejected as nonconforming product

48

Yuxi Walvax Biotechnology Co., Ltd

by the deviation / OOS investigation, the quality assurance department shall issue a certification of unqualification according to the minimum packing /container quantity. The warehouse management personnel shall transfer them to the unqualified warehouse and store them in isolation, and hang the red "unqualified" status identification and storage card.

Figure 13 Rejected Product Management Procedures

7. Quality Control:

7.1 Description of the quality control system and of the activities of the Quality Control Department.

QC Laboratory is a department subordinate to Quality Management Department, responsible for providing objective and scientific testing data for the review and release of raw and auxiliary materials, packaging materials, intermediate products, semi-finished products and finished products involved in the quality management system.

QC Laboratory, with the total building area of about 3905m², has such functions as product physiochemical testing, material testing, standard test sample preparation and management as well as microbiological and biochemical testing. According to the GMP requirements, laboratories for microbial limit test and sterility test shall be separated and provided with independent air-conditioning purification system to prevent contamination and cross contamination. QC Laboratory is divided into Microbiological and Biochemical Laboratory, Product Physiochemical Laboratory, Material Physiochemical Laboratory, Environmental Monitoring Room, Validation Workshop, Standard Test Sample Management Room and Quality Standard Research Room based on the testing functional requirements.

The personnel at all levels of the quality control laboratory shall be trained for national relevant laws and regulations and professional knowledge according to the regulations, and shall be certified to work after passing examinations. Job description shall be formulated for personnel at all levels according to the position business requirements, and the number of personnel is appropriate to the

49

Yuxi Walvax Biotechnology Co., Ltd

volume of positions business, so as to ensure accurate and effective completion of the work within the prescribed time.

Quality control laboratory has formulated the Quality Control Laboratory Management Procedures (document coding: WSYX - QC - SMP - 0009 – 0021), for the guidance and control of the management of the entire experimental system.

Figure 14 Quality control laboratory inspection work flow

The quality control laboratory shall promptly start the investigation process and take corresponding corrective and preventive measures in case of OOS and OOT of the test results.

7.2 Procedures for the release of the finished products.

Product release procedures of Manufacturer

Yuxi Walvax established Standard Operation procedure for Sampling (Code: WSYX-QS-SOP-00-09-0003) and Standard Management Procedure for Review and Release of Finished Product (Code: WSYX-QA-SMP-00-09-0008) to standardize sampling and audit release of finished product. After the finished products are produced, the quality supervisor samples the finished products and transfers them to the Quality Control Laboratory (QC) for inspection. The Quality Assurance Department shall review the information on the batch production record (instruction information, batch record review status, production environment confirmation, material balance) and batch testing record (batch record review status, status of inspection (sampling) application, inspection record, test result) and issue a

50

Yuxi Walvax Biotechnology Co., Ltd

Certificate of Analysis. For products that meet the specification, apply for batch release, according to the batch release conclusion, the authorized quality personnel decide release or not.

Yuxi Walvax has established the " Standard Management Procedure for Reserve Samples" (code: WSYX-QA-SMP-00-09-0002) to stipulate that the reserve samples volume of the finished products is 2 times the total inspection volume.

Product release procedures of NRA

Yuxi Walvax's products have passed the inspection and been packaged. The batch release application is submitted by the batch release administrator into the management system for the batch issuance of biological products. Subsequently, the NRA authorizes the staff at the provincial drug administration to sample each batch of products and store the sealed samples in the refrigerator (the storage temperature is 2-8 °C). Afterwards, the samples are sent to the National Institutes for Food and Drug Control for testing. If the product meets the requirements, the National Institutes for Food and Drug Control will issue a release certificate for the batch and mail it to the company.

Figure 15 FPP release flow chart

8. Distribution, complaints, and product recall

8.1 Arrangements and recording system for distribution.

After obtaining the "Batch Release Certificate of Biological Products", Yuxi Walvax will fill in the "Inspection Record for the Release of Finished Product" in accordance with the "Procedures for the Inspection and Release of Finished Products" (document code: WSYX-QA-SMP-00-09-0008). After the "Release Order of Finished Products" is approved and signed by the authorized quality manager, the products can be sold on the market.

51

Yuxi Walvax Biotechnology Co., Ltd

After Yuxi Walvax receives the purchase order, the distribution center of finished products is responsible for the delivery of the finished products, which are managed according to the "Procedure for the Receiving, Storage and Distributing of Finished Products" (document code: WSYX-DC-SOP-00-05-0003). The product is placed in the cold storage tank made of a non-fluorinated polyurethane special material, which has good thermal insulation performance. The automatic temperature recorder or 3M temperature label is placed with the goods to ensure the traceability of the temperature during cold chain shipment. The mode of transport is by refrigerated trucks, and if necessary, the products kept in the cold storage tanks are then transferred by air.

Yuxi Walvax has established a shipping record for the delivery of finished products, so that the shipment status of each batch of products, including product name, dosage form, specification, batch number, quantity, receiving unit, receiving address, contact information, delivery date, transportation mode, sales invoice number, can be traced.

8.2 Arrangements for the handling of complaints and product recalls.

Yuxi Walvax has set up special posts and personnel to handle product complaints, to review and analyze the complaints as well as their investigation and handling, and to implement and evaluate relevant corrective and preventive measures. In order to standardize the procedures for handling product complaints and adverse reactions, Yuxi Walvax established the "Management Regulations for Quality Complaint" (code: WSYX-QA-SMP-00-09-0038).

A recalling group has been founded with specific responsibilities in Yuxi Walvax, in which the General Manager is group leader and all department heads are group members. Established the "Management and Control Procedure for Product Recall and Distribution" (code: WSYX-P-11-0013) to clarify that product recalls are initiated immediately after product quality incidents or after serious adverse events have been identified to be related to product quality. Relevant recall procedures shall be carried out according to recalling procedure of Class 1, 2 and 3 specified in Management and Control Procedure for Product Recall and Distribution.

After Yuxi Walvax recalls the product, it will be sealed and stored in isolation. During the recall, relevant records shall be filled, including client-informing record, client feedback record, recalled product receiving record, quantity balance relation of products to be recalled and real recalled products, etc. The recalled products should be isolated with obvious identity. Finally, the destruction process is carried out under the supervision of the drug administration.

52

Yuxi Walvax Biotechnology Co., Ltd

Figure 16 Recall control procedures

9. Self inspection

9.1 Short description of the self-inspection system

Yuxi Walvax has established Self-inspection Management Control Procedures (Code: WSYX-P-12-0014), to guide and regulate the carrying out of self-inspection. The Quality Operation Department appoints professional persons with correspondent knowledge and skills to carry out at least twice self-inspections every year, and is responsible for annual self-inspection plan and self-inspection scheme. Through inspecting persons, plant facilities, equipment, materials and products, confirmation and validation, document management, production management, quality control and quality assurance, products distribution and recalls, etc., the Quality Operation Department puts forward necessary rectifying and preventive measures, and finally self-inspection report and record are formed, jointly approved by manufacture head and quality head.

53

Yuxi Walvax Biotechnology Co., Ltd

Yuxi Walvax divides self-inspection into company-level inspection and special inspection.

Yuxi Walvax Biotechnology Co., Ltd.

Summary of product characteristics

Confidential 1 / 24

Yuxi Walvax Biotechnology Co., Ltd.

1. Name of the medicinal product

Generic Name: 13-valent Pneumococcal Polysaccharide Conjugate Vaccine

2. Qualitative and quantitative composition

1 dose (0.5 ml) contains:

Pneumococcal polysaccharide serotype 1 2.6 µg

Pneumococcal polysaccharide serotype 3 2.5 µg

Pneumococcal polysaccharide serotype 4 3.0 µg

Pneumococcal polysaccharide serotype 5 2.5 µg

Pneumococcal polysaccharide serotype 6A 2.5 µg

Pneumococcal polysaccharide serotype 6B 6.0 µg

Pneumococcal polysaccharide serotype 7F 2.85 µg

Pneumococcal polysaccharide serotype 9V 2.5 µg

Pneumococcal polysaccharide serotype 14 2.75 µg

Pneumococcal polysaccharide serotype 18C 3.25 µg

Pneumococcal polysaccharide serotype 19A 2.6 µg

Pneumococcal polysaccharide serotype 19F 2.75 µg

Pneumococcal polysaccharide serotype 23F 3.0 µg

Conjugated to Tetanus Toxoid carrier protein, adsorbed on aluminium phosphate.

Excipients with known effect

For the full list of excipients, see section 6.1.

3. Pharmaceutical form

Suspension for injection.

The vaccine is a homogeneous white suspension.

Confidential 2 / 24

Yuxi Walvax Biotechnology Co., Ltd.

4. Clinical particulars

4.1 Therapeutic indications

The vaccine elicits immune response in recipients following immunization, and is indicated for the prevention of invasive disease caused by 13 serotypes (1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F) of *Streptococcus pneumoniae*.

See sections 4.4 and 5.1 for information on protection against specific pneumococcal serotypes.

The use of PCV13-TT should be determined on the basis of official recommendations taking into consideration the risk of invasive disease and pneumonia in different age groups, underlying comorbidities as well as the variability of serotype epidemiology in different geographical areas.

4.2 Posology and method of administration

The immunisation schedules for PCV13-TT should be based on official recommendations.

Posology

Infants and children aged 6 weeks through 5 years of age (before 6th birthday).

The vaccine should be shaken well immediately prior to use, and be given intramuscularly. The preferred sites for injection are the anterolateral aspect of the thigh in infants and the deltoid muscle of the upper arm in toddlers and children. Each dose (0.5 mL) is to be injected. The vaccine should not be injected in and/or near the areas where there may be a nerve trunk and/or blood vessel.

Vaccination Schedule for Infants and Toddlers: 4-dose series in total.

The primary infant series consists of three doses, with the first dose recommended to be given at 2 months of age (minimum age: 6 weeks) with an interval of 2 months between doses; the booster dose (4th dose) is given between 12 and 15 months of age.

Alternatively, the primary infant series consists of three doses, with the first dose recommended to be given at 3 months of age with an interval of 1 months between doses; the booster dose (4th dose) is given between 12 and 15 months of age.

To sum up, the product is to be administered as a four-dose series at 2, 4, 6, and 12-15 months of age or 3, 4, 5, and 12-15 months of age, respectively, as described in Table 1 and Table 2.

Table 1 Vaccination Schedule for Infants 2 months of age

Dose Dose 1*† Dose 2† Dose 3† Dose 4‡

Age at Dose 2 months 4 months 6 months 12-15 months

*Dose 1 may be given as early as 6 weeks of age.

†The recommended dosing interval is 8 weeks.

‡The fourth dose should be administered at approximately 12–15 months of age, and at least 2 months after the

third dose.

Table 2 Vaccination Schedule for Infants 3 months of age

Dose Dose 1† Dose 2† Dose 3† Dose 4‡

Age at Dose 3 months 4 months 5 months 12-15 months

†The recommended dosing interval is 4 weeks.

‡The fourth dose should be administered at approximately 12–15 months of age, and at least 2 months after the

third dose.

Confidential 3 / 24

Yuxi Walvax Biotechnology Co., Ltd.

Infants 7 through 11 months of age: The primary series consists of 2 doses with an interval of at least 2 months between doses; the booster dose (3rd dose) is given at 12+ months of age, with an interval of at least 2 months apart from the 2nd dose.

Toddlers 12 through 23 months of age: 2 doses in total, with an interval of at least 2 months between doses.

Children 2 through 5 years of age: a single dose.

For children 7 months through 5 years of age who have not received the product, the catch-up schedule in Table 3 applies:

Table 3 Vaccination Schedule for Infants and Toddlers 7 months through 5 years of age

Age at First Dose Total Number of 0.5 mL Doses

7-11 months of age 3*

12-23 months of age 2†

24 months through 5 years of age (prior to the 6th birthday) 1

*The first 2 doses at least 4 weeks apart; third dose after the one-year birthday, separated from the second dose

by at least 2 months.

†Two doses at least 2 months apart.

4.3 Contraindications

Hypersensitivity to any component of the product, including active antigens, excipients, or tetanus toxoid, etc.

4.4 Special warnings and precautions for use

1. Do not vaccinate via intravenous route or by gluteal intramuscular injection, ensure the syringe needle is not puncturing blood vessel during inoculation.
2. Check if the package, container, label, appearance and expiration date of the vaccine are in compliance with corresponding requirements before administration. Do not use the vaccine in case that there is any crack in the container, loosened stopper, detached label, foreign particle(s) or discoloring inside the container, etc. Do not use the vaccine after the expiration date.
3. Use immediately after unsealing. A single human dose shall be used up each time according to prescribing information.
4. The vaccination should be postponed in case of fever, acute disease, and acute attack of chronic disease.
5. Appropriate monitoring and medical care and rescue measures should be readily available in case of occurrence of rare hypersensitivity reactions during vaccination. If allergic reactions occur after vaccination, please go to the vaccination site or hospital in time.
6. Cautions should be taken for vaccination in recipients with thrombocytopenia, any coagulopathy or those who are receiving anticoagulant treatment.
7. Preterm infants should be monitored for the potential risk of apnea during primary series. For preterm infants under hospitalization (gestational age ≤ 30 weeks at birth) vaccinated with PCV13-TT according to the recommended immunization schedule, at least 48 hours of monitoring should be considered. Given the benefit of vaccination in preterm infants, discontinued or deferred vaccination of the product is not recommended.

Confidential 4 / 24

Yuxi Walvax Biotechnology Co., Ltd.

8. Given there is still no available safety and immunogenicity data for PCV3-TT in immuno-compromised individuals (e.g., malignancy or nephrotic syndrome), vaccination in this special group should be considered on an individual basis.
9. The use of PCV13-TT does not replace the use of 23-valent pneumococcal polysaccharide vaccines in children ≥ 24 months of age with conditions such as sickle cell disease, asplenia, HIV infection, chronic illness, or those who are immuno-compromised.
10. Under no circumstances shall the tetanus toxoid contained in the vaccine replace the routine immunization of tetanus vaccine or tetanus containing vaccine.
11. This product cannot guarantee all recipients can be protected from any diseases caused by *Streptococcus pneumoniae*.

■PREGNANCY AND LACTATION■

4.5 Interaction with other medicinal products and other forms of interaction

There is no concomitant immunization data available either inside or outside of China for the product. During the phase III clinical trial of the product, the interval between vaccination of the product and any other diphtheria, tetanus and acellular pertussis (DTaP) containing vaccine was ≥ 10 days. No adverse impact of DTaP-containing vaccine was observed on the immunogenicity of PCV13-TT under the indicated immunization interval.

4.6 Fertility, pregnancy and lactation

Pregnancy

There is no data for using the product in pregnant women.

Breast-feeding

It is unknown whether this product is excreted in human milk.

Animal studies do not indicate direct or indirect harmful effects with respect to reproductive toxicity (see section 5.3).

4.7 Effects on ability to drive and use machines

PCV13-TT has no or negligible influence on the ability to drive and use machines. However, some of the effects mentioned under section 4.8 "Undesirable effects" may temporarily affect the ability to drive or use machines.

4.8 Adverse Reactions

4.8.1. Clinical trials of the vaccine

Two clinical trials (phase I and III) of the vaccine (PCV13-TT) were conducted within China, including 120 and 2760 subjects, respectively; among all subjects, 1754 have been vaccinated with at least one dose of PCV13-TT. The systematic safety observation period of PCV13-TT started from the first vaccination to 30 days after each subsequent dose, and the long-term safety observation for the majority of subjects was performed through 180 days after the last dose (after full immunization).

4.8.1.1. Summary description

The incidence of adverse reactions reported in clinical trials, according to the guidance on classifications of adverse events recommended by The Council for International Organizations of

Confidential 5 / 24

Yuxi Walvax Biotechnology Co., Ltd.

Medical Sciences (CIOMS), are classified as: very common ($\geq 10\%$), common ($\geq 1\%$ to $<10\%$), uncommon ($\geq 0.1\%$ to $<1\%$), rare ($\geq 0.01\%$ to $<0.1\%$), very rare ($<0.01\%$), the safety data post primary immunizations collected from phase I and III clinical trials of all populations included are summarized as follows:

① Systemic adverse reactions

②Incidence and severity of unsolicited adverse reactions

The incidence of unsolicited adverse reactions for PCV13-TT was 0.06%-0.73%, and most episodes were grade 1 in severity. The documented symptoms include: nasal obstruction, rhinorrhea, nasopharyngitis, upper respiratory tract infection, oral ulcer, abdominal pain, abdominal distension, decreased appetite, hyperhidrosis, increased tearing and eye discharge and

red eyelids.

4.8.2. Safety monitoring of similar products inside and outside China

Despite the adverse reactions reported in clinical trials of PCV13-TT, the additional adverse reactions captured from a similar vaccine, the marketed 13-valent Pneumococcal Conjugate Vaccine (Prevenar 13®) which has also been investigated in clinical trials within China, were reported among 1182 infants aged 6 through 11 weeks vaccinated with at least one dose of Prevenar 13®, as irritability and decreased sleep; besides, in another 15 clinical trials conducted outside China enrolling 5075 toddlers and children 6 weeks through 5 years of age, additional adverse reactions were identified after the vaccination of Prevenar 13®, including insomnia, convulsion (including febrile convulsion), anaphylactic reaction (including facial edema, dyspnea and bronchial spasm) and hypotonia events.

In addition, the reported additional adverse reactions since the marketing of Prevenar 13® include dermatitis/urticaria in injection site, lymphadenopathy limited to vaccination site, hypersensitivity/hypersensitivity-like reactions (including shock), angioedema, erythema multiforme and Kawasaki syndrome, all are with indeterminate incidence rates due to the spontaneous reporting nature.

4.9 Overdose

Overdose with PCV13-TT is unlikely due to its presentation as a vial or a pre-filled syringe. There is no overdose data available for the product in recipients.

Confidential 10 / 24

Yuxi Walvax Biotechnology Co., Ltd.

5. Pharmacological properties

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: vaccines, pneumococcal vaccines; ATC code: J07AL02

Prevenar 13 contains the 7 pneumococcal capsular polysaccharides that are in Prevenar 7 (4, 6B, 9V, 14, 18C, 19F, 23F) plus 6 additional polysaccharides (1, 3, 5, 6A, 7F, 19A) all conjugated to Tetanus Toxoid carrier protein.

Burden of disease

Infants and children aged 6 weeks to 5 years

Based on serotype surveillance in Europe performed before the introduction of Prevenar, Prevenar 13 is estimated to cover 73-100 % (depending on the country) of serotypes causing invasive pneumococcal disease (IPD) in children less than 5 years of age. In this age group, serotypes 1, 3, 5, 6A, 7F, and 19A account for 15.6 % to 59.7 % of invasive disease, depending on the country, the time period studied, and the use of Prevenar.

Acute otitis media (AOM) is a common childhood disease with different aetiologies. Bacteria can be responsible for 60-70 % of clinical episodes of AOM. *S. pneumoniae* is one of the most common causes of bacterial AOM worldwide.

PCV13-TT is estimated to cover over 90% of serotypes causing antimicrobial-resistant IPD.

Children and adolescents aged 6 to 17 years

In children and adolescents aged 6 to 17 years, the incidence of pneumococcal disease is low, however, there is an increased risk of morbidity and mortality in those with underlying comorbidities.

Adults ≥18 years and the elderly

Pneumonia is the most common clinical presentation of pneumococcal disease in adults.

The reported incidence of community-acquired pneumonia (CAP) and IPD in Europe varies by country, increases with age from 50 years and is highest in individuals aged ≥ 65 years. *S. pneumoniae* is the most frequent cause of CAP, and is estimated to be responsible for approximately 30% of all CAP cases requiring hospitalisation in adults in developed countries. Bacteraemic pneumonia (approximately 80% of IPD in adults), bacteraemia without a focus, and meningitis are the most common manifestations of IPD in adults. Based on surveillance data following the introduction of Prevenar but before the introduction of PCV13-TT in childhood vaccination programmes, the pneumococcal serotypes in PCV13-TT may be responsible for at least 50 – 76% (depending on country) of IPD in adults.

The risk for CAP and IPD in adults also increases with chronic underlying medical conditions, specifically, anatomical or functional asplenia, diabetes mellitus, asthma, chronic cardiovascular, pulmonary, kidney or liver disease, and it is highest in those who are immune-suppressed such as those with malignant haematological diseases or HIV infection.

PCV13-TT immunogenicity clinical studies in infants, children and adolescents

The protective efficacy of PCV13-TT against IPD has not been studied. As recommended by the World Health Organization (WHO) the assessment of potential efficacy against IPD in infants and young children has been based on a comparison of immune responses to the seven common serotypes shared between PCV13-TT and Prevenar, for which protective efficacy has been proven

Confidential 11 / 24

Yuxi Walvax Biotechnology Co., Ltd.

(for Prevenar (7-valent) efficacy in infants and children, see below). Immune responses to the additional 6 serotypes were also measured.

Immune responses following a three-dose primary infant series

In China, the pivotal phase III clinical trial of PCV13-TT was a randomized, blinded, positive control of imported similar vaccine (Prevnar), and non-inferiority study designed to evaluate the immunogenicity and safety of PCV13-TT and Prevnar in 2760 subjects 2 through 71 months of age (at least 6 weeks of age). A total of 1040 infants aged 3 months were randomized in a 1:1 ratio as study group and control group, with PCV13-TT or Prevnar given at 3, 4, 5 and 12-15 months of age, respectively; for 520 infants aged 2 months (at least 6 weeks of age), PCV13-TT were vaccinated at 2, 4, 6 and 12-15 months of age; the other three age groups of 7 through 11 months (vaccinated at 0, 2 months and 12-15 months of age, with an interval of at least 2 months between the third and second dose), 12 through 23 months (vaccinated at 0, 2 months), and 24 through 71 months (vaccinated at 0 month), each was with 400 subjects randomized in a 1:1 ratio to receive PCV13-TT or Prevnar, respectively. Enzyme-linked immunosorbent assay (ELISA) was utilized to detect the IgG antibody concentration in all serum samples collected from each group; additionally, 100 subjects in PCV13-TT and Prevnar groups in each age stratification, totaling 900, were included as a subgroup for opsonophagocytic activity (OPA) antibody assay, which provides the measurement of the ability of serum antibodies to eliminate pneumococci by promoting complement-mediated phagocytosis.

The main target population of the trial was infants 2 and 3 months of age (at least 6 weeks of age). For immunogenicity, the PCV13-TT (3 months) group was compared with Prevnar (3 months) group in the first place, followed by comparison between PCV13-TT (2 months) group versus Prevnar (3 months) group and then versus PCV13-TT (3 months) group in a sequential

manner. The immunogenicity measures included the proportion of subjects with vaccine type-specific pneumococcal IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ (positive rate) and IgG geometric mean concentration (GMC) one month post primary immunization(s) and one month post booster dose, as well as the proportion of subjects with vaccine type-specific pneumococcal OPA antibody titer $\geq 1:8$ (positive rate) and OPA geometric mean titer (GMT) one month post primary immunization(s) and one month post booster dose.

The noninferiority comparison was performed for the immune responses of 7 common serotypes between PCV13-TT and Pevnar groups. Once the lower limits of 2-sided 95% CI for IgG antibody positive rate of 6 additional serotypes in study group achieved $\geq 70\%$, superiority test was then performed to compare the immune responses to 6 additional serotypes and corresponding serotypes in control group; meanwhile, the 6 additional serotypes in study group were compared with the serotype with the lowest response among all the 7 common serotypes in control group to determine the non-inferiority. The non-inferiority was demonstrated as the lower limit of the 2-sided 97.5% CI for the difference in percentage of responders at $0.35 \mu\text{g/mL}$ between groups (study group - control group) $> -10\%$, or the lower limit of the 2-sided 97.5% CI for IgG geometric mean concentration (GMC) ratio (study group/control group) > 0.5 ; the superiority was demonstrated as the lower limit of 2-sided 95% CI for the difference in percentage of responders at $0.35 \mu\text{g/mL}$ between groups > 0 , and the lower limit of the 2-sided 95% CI for the IgG GMC ratio > 1 . The results demonstrate that:

In subjects aged 3 months, after primary immunizations (3 doses), the IgG antibody were compared between PCV13-TT group and Pevnar group, and 6 out of 7 common serotypes met the non-inferiority criterion with the exception of 6B; the 6 additional serotypes reached superiority threshold; besides, the 6 additional serotypes in PCV13-TT group were non-inferior to the serotype with the lowest response among all the 7 common serotypes in Pevnar group.

Confidential 12 / 24
Yuxi Walvax Biotechnology Co., Ltd.

In subjects aged 3 months, after full immunizations (4 doses), the IgG antibody were compared between PCV13-TT group and Pevnar group, and all 7 common serotypes met the non-inferiority criterion; the 6 additional serotypes reached superiority threshold; besides, the 6 additional serotypes in PCV13-TT group were non-inferior to the serotype with the lowest response among all the 7 common serotypes in Pevnar group.

In subjects aged 2 months (at least 6 weeks of age), after primary immunizations (3 doses), the IgG antibody were first compared between PCV13-TT (2 months) group and Pevnar (3 months) group, and all 7 common serotypes met the non-inferiority criterion; the 6 additional serotypes reached superiority threshold; besides, the 6 additional serotypes in PCV13-TT (2 months) group were non-inferior to the serotype with the lowest IgG response among all 7 common serotypes in Pevnar (3 months) group. The IgG antibody were then compared between PCV13-TT (2 months) group and PCV13-TT (3 months) group, and 12 out of the 13 serotypes met the non-inferiority criterion with the exception of serotype 5.

In subjects aged 2 months (at least 6 weeks of age), after full immunizations (4 doses), the IgG antibody were first compared between PCV13-TT (2 months) group with Pevnar (3 months) group, and all 7 common serotypes met the non-inferiority criterion; the 6 additional serotypes reached superiority threshold; besides, the 6 additional serotypes in PCV13-TT (2 months) group were non-inferior to the serotype with the lowest IgG response among all 7 common serotypes in Pevnar (3 months) group. The IgG antibody were then compared between PCV13-TT (2 months) group and PCV13-TT (3 months) group, and all the 13 serotypes met the non-inferiority criterion. The testing results of OPA antibody demonstrated that, all serotypes were capable of inducing functional OPA antibody reaction in all age groups included in the study.

The immunogenicity data from subjects 2 months (at least 6 weeks of age) through 71 months of age are shown in Table 6–Table 11

5.2 Pharmacokinetic properties
Not applicable.

5.3 Preclinical safety data
The evaluation results showed that, the dosage of the vaccine is within a safety margin; minor irritation at injection site is observed after use in animals, while may resolve after discontinuation of treatment; in addition, there are no apparent abnormalities regarding the general conditions, body temperature, body weight, food consumption, blood biochemistry, hematology, urine, bone marrow, ophthalmology, electrocardiogram, organ weight, pathological findings of tissues and other measures, no obviously increased or inhibited immune function is noted; specific antibody to vaccine components can be detected; risk of anaphylaxis is present due to the use of carrier protein; agglutination effect is observed in rabbit red blood cells, while no hemolytic reaction is seen.
The pharmacological and toxicological tests studies of the vaccine products demonstrate excellent safety and immunogenicity, and thus can be safely administered clinically. The results of animal tests were shown in Table 12 to Table 15

Water for injection Qs to 0.5 mL Excipient

6.2 Incompatibilities

In the absence of compatibility studies, this medicinal product must not be mixed with other

medicinal products.

Confidential 23 / 24

Yuxi Walvax Biotechnology Co., Ltd.

6.3 Shelf life

The shelf life of the vaccine is 24 months. Please use before the expiration date printed on the label on vial or small box.

6.4 Special precautions for storage

Store and transport at 2-8°C away from light.

Do not freeze. If the product is frozen, it cannot be used again.

Keep it out of the reach of children.

6.5 Nature and contents of container

0.5 ml suspension for injection in pre-filled syringe, 1 syringe /box.

1 ml vials, 1 vial/box.

6.6 Special precautions for disposal and other handling

During storage, a white deposit and clear supernatant can be observed. This does not constitute a sign of deterioration.

The vaccine should be shaken well to obtain a homogeneous white suspension prior to expelling air from the syringe, and should be inspected visually for any particulate matter and/or variation of physical aspect prior to administration. Do not use if the content appears otherwise.

No special requirements for disposal.

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

2006.03-2008.10: Yuxi Walvax Biotechnology Co. Ltd., supervisor of Hib conjugate vaccine stain amplification process

2008.10--2014.02: Yuxi Walvax Biotechnology Co. Ltd., workshop director of Hib conjugate vaccine, led a team work on production of Hib conjugate vaccine

2015.03-Now: Yuxi Walvax Biotechnology Co. Ltd., QA manager

2016.04-Now: Yuxi Walvax Biotechnology Co. Ltd., QM deputy manager
2.2.1.5 Head of Quality Operation Department – Shen Feng

Table 2-5 Curricula Vitae for Head of Quality Operation Department

Name Shen Feng Gender Male Birth Date 1983.3

Education Bachelor Degree Major Bioscience Technical Title Assistant Engineer

Quality Management Manager Working
Position 11 years
Quality Operation Manager Seniority

1 Education Background

2003.09-2007.07: Heilongjiang Jiamusi University, major in bioscience

2 Working Experience

2009.11-2012.06: Yuxi Walvax Biotechnology Co. Ltd., QA department

2012.06-2014.04: Yuxi Walvax Biotechnology Co. Ltd., site supervisor of QA department, conducted on establishment of quality supervision system and GMP certificate of products

2014.04-2015.04: Yuxi Walvax Biotechnology Co. Ltd., quality operation supervisor of quality management (QM) department, worked on perfect and improvement deviation and change progress

2015.04-2016.01: Yuxi Walvax Biotechnology Co. Ltd., quality operations deputy manager, work on establishment of quality operation system

2016.03-Now: Yuxi Walvax Biotechnology Co. Ltd., QM deputy manager and quality operations manager, worked on improvement of quality operation system and Halal Assurance System (HAS)

2.2.1.6 Head of Quality Supervision Department - Li Ding

Table 2-6 Curricula Vitae for Head of Quality Supervision Department

Name Li Ding Gender Male Birth Date 1986.12

Education Bachelor Degree Major Biotechnology Technical Title Engineer

Working

Position Deputy Manager of Quality Supervision 8 years

Seniority

1 Education Background

2005.09-2009.07: Yunnan Nationalities University, Biotechnology

2 Working Experience

2012.04-2014.03: Yuxi Walvax Biotechnology Co. Ltd., QA department, participated in GMP certificate and unannounced inspection of sub-packaging centre phrase II

2014.04-2016.04: Yuxi Walvax Biotechnology Co. Ltd., on-site supervisor of QA department, participated in GMP certificate and unannounced inspection of products. Meanwhile, published an article, Use of VVM label on Meningococcal Group A,C Bivalent Polysaccharide Conjugate Vaccine, in Chinese Journal of Biologicals

2016.05-Now: Yuxi Walvax Biotechnology Co. Ltd., Quality supervision deputy manager, lead the team to annual supervision and monitoring task (production process supervision, routine inspections, environmental dynamism monitoring and so on) to ensure the completion of KPI.

2.2.1.7 Head of Quality Control – Li Pengyang

Table 2-7 Curricula Vitae for Head of Quality Control

Name Li Pengyang Gender Male Birth Date 1989.01

Bachelor's pharmaceutical

Education Major Technical Title Engineer

Degree engineering

Working

Position Deputy Manager of QC Lab 10 years

Seniority

1 Education Background

2007.09-2011.06: Sichuan University, majored in pharmaceutical engineering

2 Working Experience

2011.10-2013.05, worked in Quality Supervision dept. was responsible for the quality supervision of meningococcal vaccine workshop and quality control laboratory. participated in the GMP certification of group A and C meningococcal polysaccharide vaccine and ACYW135 meningococcal polysaccharide vaccine.

2013.05-2014.04, supervisor of the Microbiology and Biochemistry Laboratory of the Quality Control Laboratory, is responsible for organizing the aseptic test, microbial limit test and production strain test for all samples of Yuxi Walvax. Familiar with the requirements of sterility test and microbial limit test in Chinese Pharmacopoeia.

2014.04-2015.04, the OOS/OOT supervisor of the Quality Operations Department. formulated the OOS and OOT survey management documents, and was responsible for organizing the tracking and investigation of the OOS and OOT results generated during the operation. Master failure mode risk management tools, responsible for the drafting and training of company risk management master plan.

2015.04-now, the deputy manager of the quality control laboratory, in charge of the quality control laboratory inspection management and quality management, and organizes the product inspection and stability sample inspection. At the same time, as the project manager of the Laboratory Information Management System (LIMS), responsible for system function design, auditing, validation and so on.

2.2.1.8 Head of Laboratory Animal Centre - Yan Yongqing

Table 2-8 Curricula Vitae for Head of Laboratory Animal Centre

Name Yan Yongqing Gender Male Birth Date 1986.02

Bachelor's Chemical Engineering

Education Major Technical Title Engineer

Degree and Technology

Working

Position Director of Laboratory Animal Centre 10 years

Seniority

1 Education Background

2004.09-2008.07: Nanjing Forestry University, Chemical Engineering and Technology (fine chemical engineering)

2 Working Experience

2010.05-2012.04: Employee of Quality Assurance Department of Yuxi Walvax Biotechnology Co., Ltd, responsible for supervision management of manufacturing sites, to guarantee the drug product, laying pavement for passing GMP examination;

2012.04-2015.03: Director of Quality Control Laboratory of Yuxi Walvax Biotechnology Co., Ltd, responsible for organizing and completing compilation and review of related documents of Laboratory Animal Centre, cooperatively completing application of usage approval of Laboratory Animal Centre, and improving examination methods for potency and toxicity of Diphtheria, Tetanus and Acellular Pertussis Combined Vaccine, Adsorbed;

2015.03-Now: Laboratory Animal Centre Manager of Yuxi Walvax Biotechnology Co., Ltd, established management model and team of Laboratory Animal Centre, possessed good practical ability, experimental R&D ability, and abilities of management, organization, coordination, and solving problems.

2.2.1.9 Head of Risk Validation Management Department – Xin Guangcheng

Revision Date: 17th July, 2020

Package Insert for 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Please read the package insert carefully and follow physician's guidance to use

■PRODUCT NAME■

Generic Name: 13-valent Pneumococcal Polysaccharide Conjugate Vaccine

■PRODUCT DESCRIPTION■

The vaccine is formulated by compounding the glycoconjugates of the capsular polysaccharide antigen of *Streptococcus pneumoniae* serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F, individually conjugated to tetanus toxoid carrier protein. The individual polysaccharides are extracted from the cultures of *Streptococcus pneumoniae*, and purified through centrifugation, precipitation, ultrafiltration and column chromatography. The polysaccharides are chemically activated and derivatized, and then conjugated to tetanus toxoid carrier protein to form the glycoconjugate, with aluminum phosphate as adjuvant. The vaccine should be shaken well to obtain a homogeneous milky white suspension. During storage, a white deposit and clear supernatant might be observed due to adjuvant precipitation.

Active components: capsular polysaccharides of *Streptococcus pneumoniae* serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F conjugated to tetanus toxoid carrier protein.

Excipients: sodium chloride, sodium dihydrogen phosphate, disodium hydrogen phosphate, aluminum phosphate.

■ELIGIBLES■

The vaccine is indicated for use in infants and children 6 weeks through 5 years of age (before 6th birthday).

■INDICATION■

The vaccine elicits immune response in recipients following immunization, and is indicated for the prevention of invasive disease caused by 13 serotypes (1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F) of *Streptococcus pneumoniae*.

The vaccine does not protect against diseases caused by *Streptococcus pneumoniae* serotypes that are not contained in the vaccine.

■NAME AND STRENGTH OF ACTIVE INGREDIENT(S)■

The vaccine is supplied as 0.5 mL/vial or in a single-dose prefilled syringe with 0.5 mL suspension for intramuscular injection. Each dose (0.5 mL) of the vaccine is formulated to contain polysaccharides of:

Streptococcus pneumoniae serotype 1 2.6 µg *Streptococcus pneumoniae* serotype 14 2.75 µg
Streptococcus pneumoniae serotype 3 2.5 µg *Streptococcus pneumoniae* serotype 18C 3.25 µg
Streptococcus pneumoniae serotype 4 3.0 µg *Streptococcus pneumoniae* serotype 19A 2.6 µg
Streptococcus pneumoniae serotype 5 2.5 µg *Streptococcus pneumoniae* serotype 19F 2.75 µg
Streptococcus pneumoniae serotype 6A 2.5 µg *Streptococcus pneumoniae* serotype 23F 3.0 µg
Streptococcus pneumoniae serotype 7F 2.85 µg *Streptococcus pneumoniae* serotype 6B 6.0 µg
Streptococcus pneumoniae serotype 9V 2.5 µg

1 / 16

■DOSAGE AND ADMINISTRATION■

Since this product is a suspension containing an adjuvant, shake vigorously immediately prior to use to obtain a homogenous, white suspension in the vaccine container. This product is for intramuscular injection only. The preferred sites for injection are the anterolateral aspect of the thigh in infants and the deltoid muscle of the upper arm in toddlers and children. Each dose (0.5 mL) is to be injected. The vaccine should not be injected in and/or near the areas where there may be a nerve trunk and/or blood vessel.

Vaccination Schedule for Infants and Toddlers

The product is to be administered as a four-dose series at 2, 4, 6, and 12-15 months of age or 3, 4, 5, and 12-15 months of age, respectively, as described in Table 1 and Table 2.

Table 1 Vaccination Schedule for Infants 2 months of age

Dose Dose 1*† Dose 2† Dose 3† Dose 4‡

Age at Dose 2 months 4 months 6 months 12-15 months

*Dose 1 may be given as early as 6 weeks of age.

†The recommended dosing interval is 8 weeks.

‡The fourth dose should be administered at approximately 12–15 months of age, and at least 2 months after the

third dose.

Table 2 Vaccination Schedule for Infants 3 months of age

Dose Dose 1† Dose 2† Dose 3† Dose 4‡

Age at Dose 3 months 4 months 5 months 12-15 months

†The recommended dosing interval is 4 weeks.

‡The fourth dose should be administered at approximately 12–15 months of age, and at least 2 months after the

third dose.

For children 7 months through 5 years of age who have not received the product, the catch-up schedule in Table 3 applies:

Table 3 Vaccination Schedule for Infants and Toddlers 7 months through 5 years of age

Age at First Dose Total Number of 0.5 mL Doses

7-11 months of age 3*

12-23 months of age 2†

24 months through 5 years of age (prior to the 6th birthday) 1

*The first 2 doses at least 4 weeks apart; third dose after the one-year birthday, separated from the second dose

by at least 2 months.

†Two doses at least 2 months apart.

Children 2 through 5 years of age: a single dose.

■ADVERSE REACTIONS■

1. Clinical trials for PCV13-TT

Two clinical trials (phase I and III) of the vaccine (PCV13-TT) were conducted in China, including 120 and 2760 subjects, respectively; among all subjects (2880), 1754 have been vaccinated with

at least one dose of PCV13-TT. The safety observations were conducted in a systematic fashion for all subjects, starting from the first dose of vaccination, the safety observation will last for 30 days post each dose. For a majority of subjects excluding the dropout, the long-term safety observation period will start from the first vaccination till 180 days post the last dose of vaccination (after complete series).

(1) Summary

2 / 16

The incidence rate of adverse reactions reported in clinical trials, according to the guidance on classifications of adverse events recommended by The Council for International Organizations of Medical Sciences (CIOMS), are classified as: very common ($\geq 10\%$), common ($\geq 1\%$ to $<10\%$), uncommon ($\geq 0.1\%$ to $<1\%$), rare ($\geq 0.01\%$ to $<0.1\%$) and very rare ($<0.01\%$). The safety data for the primary series of PCV-13 collected from both phase I and phase III clinical trials of all subjects are summarized as following:

① Systemic adverse reactions

Very common: fever, diarrhea

Common: crying, cough, nausea/vomiting, fatigue/somnolence, allergic reaction

Uncommon: myalgia

② Local adverse reactions

Very common: redness

Common: swelling, pain, induration

Uncommon: itching

Rare: rash (vaccination site)

③ Serious adverse reactions

There was one case of serious adverse event (SAE) reported during the primary series in the 3-months age group. This SAE was reported to be fever and considered to be possibly related to PCV13-TT. Other serious adverse events were judged to be irrelevant to PCV13-TT.

(2) Adverse reactions in phase III clinical trial

① The incidence and severity of solicited adverse reactions

The incidence and severity of solicited adverse reactions post primary and booster immunization in the phase III clinical trial of PCV13-TT comparing to the comparator vaccine (7-valent Prevnar, referred to as Prevnar) are summarized in Table 4 and Table 5.

3 / 16

* N=number of subjects reporting "yes" for at least 1 day, or "no" for all 30 days.

a.

Minimum age: 6 weeks.

b. The minimum and maximum incidence rates for systemic adverse reactions after primary and booster immunizations.

Grade 1, 37.1-37.5 ■; grade 2, 37.6-39.0 ■; grade 3, >39.0 ■.

c. Grade 1, slight reduction in normal activities for ■48 h, not affecting daily activities; grade 2, 20%-50% reduction in normal activities for >48 h, affecting daily activities mildly; grade 3, >50% reduction in normal activities, affecting daily activities severely and is unable to work.

d. Grade 1, once or twice/24 h, with basically normal intake and will not affect activities; grade 2, 2-5 times/24 h, with significantly reduced intake or restricted activities; grade 3, > 6 times/24 h, with no significant intake, and in need of intravenous infusion.

e.

Grade 1, mild or transient with 2-3 times of loose stools/day, or mild diarrhea lasting ■1 week; grade 2, moderate or persistent diarrhea, 4-5 times/day, or diarrhea lasting >1 week; >6 times of watery stool/day, or bloody diarrhea, orthostatic hypotension, electrolyte imbalance, in need of intravenous infusion of > 2 L.

f.

Grade 1, not affecting daily activities; grade 2, tender muscles in non-vaccination sites, affecting daily activities mildly; grade 3, severe tender muscles, affecting daily activities severely.

g. Grade 1, transient, no treatment required; grade 2, persistent and controllable cough; grade 3, uncontrollable paroxysmal cough; grade 4, emergency care required.

h. Grade 1, slight increase in frequency than usual; grade 2, doubled frequency than usual; grade 3, doubled frequency than usual, and lasts > 3 days.

i. Grade 1, itching with no rash; grade 2, local urticaria; grade 3, extensive urticaria, angioedema.

j.

All systemic reactions, including body temperature ≥37.1 °C, fatigue/somnolence, nausea/vomiting, diarrhea, myalgia, cough, abnormal crying and allergic reactions.

6 / 16

②Incidence and severity of unsolicited adverse reactions

The incidence of unsolicited adverse reactions for PCV13-TT was 0.06%-0.73% with most episodes were grade 1 in severity. The documented symptoms include: nasal obstruction, rhinorrhea, nasopharyngitis, upper respiratory tract infection, oral ulcer, abdominal pain, abdominal distension, decreased appetite, hyperhidrosis, increased tearing and eye discharge and red eyelids.

■CONTRAINDICATIONS■

Hypersensitivity to any component of the product, including active antigens, excipients, or tetanus toxoid, etc.

■PRECAUTIONS■

1. Do not vaccinate via intravenous route or by gluteal intramuscular injection, ensure the syringe needle is not puncturing blood vessel during inoculation.
2. Check if the package, container, label, appearance and expiration date of the vaccine are in compliance with corresponding requirements before administration. Do not use the vaccine in case that there is any crack in the container, loosened stopper, detached label, foreign particle(s) or discoloring inside the container, etc. Do not use the vaccine after the expiration date.
3. Use immediately after unsealing. A single human dose shall be used up each time according to prescribing information.
4. The vaccination should be postponed in case of fever, acute disease, and acute attack of chronic disease.
5. Appropriate monitoring and medical care and rescue measures should be readily available in case of occurrence of rare hypersensitivity reactions during vaccination. If allergic reactions occur after vaccination, please go to the vaccination site or hospital in time.
6. Cautions should be taken for vaccination in recipients with thrombocytopenia, any coagulopathy or those who are receiving anticoagulant treatment.
7. Preterm infants should be monitored for the potential risk of apnea during primary series. For preterm infants under hospitalization (gestational age ≤ 30 weeks at birth) vaccinated with PCV13-TT according to the recommended immunization schedule, at least 48 hours of monitoring should be considered. Given the benefit of vaccination in preterm infants, discontinued or deferred vaccination of the product is not recommended.
8. Given there is still no available safety and immunogenicity data for PCV13-TT in immuno-compromised individuals (e.g., malignancy or nephrotic syndrome), vaccination in this special group should be considered on an individual basis.
9. The use of PCV13-TT does not replace the use of 23-valent pneumococcal polysaccharide vaccines in children ≥ 24 months of age with conditions such as sickle cell disease, asplenia, HIV infection, chronic illness, or those who are immuno-compromised.
10. Under no circumstances shall the tetanus toxoid contained in the vaccine replace the routine immunization of tetanus vaccine or tetanus containing vaccine.
11. This product cannot guarantee all recipients can be protected from any diseases caused by *Streptococcus pneumoniae*.

■PREGNANCY AND LACTATION■

Pregnancy

7 / 16

There is no data for using the product in pregnant women.

Breast-feeding

It is unknown whether this product is excreted in human milk.

■INTERACTIONS WITH OTHER MEDICAMENTS■

There is no concomitant immunization data available either inside or outside of China for the product. During the phase III clinical trial of the product, the interval between vaccination of the product and any other diphtheria, tetanus and acellular pertussis (DTaP) containing vaccine was ≥ 10 days. No adverse impact of DTaP-containing vaccine was observed on the immunogenicity of PCV13-TT under the indicated immunization interval.

■OVERDOSE AND TREATMENT■

Overdose with PCV13-TT is unlikely due to its presentation as a vial or a pre-filled syringe. There is no overdose data available for the product in recipients.

■PHARMACODYNAMIC/PHARMACOKINETICS■

Not applicable.

■CLINICAL TRIALS■

In China, the pivotal phase III clinical trial of PCV13-TT was a randomized and blinded non-inferiority study comparing to Prevnar. This study evaluated the immunogenicity and safety of PCV13-TT and Prevnar in 2760 subjects 2 through 71 months of age (at least 6 weeks of age). A total of 1040 infants aged 3 months were randomized in a 1:1 ratio as study group and control group, with PCV13-TT or Prevnar given at 3, 4, 5 and 12-15 months of age, respectively; for 520 infants aged 2 months (at least 6 weeks of age), PCV13-TT were vaccinated at 2, 4, 6 and 12-15 months of age. 1200 Children of 7 through 71 months of age, including children 7 months through 11 months of age, 12 months through 23 months of age and 24 months through 5 years of age (prior to the 6th birthday) who were naïve to pneumococcal conjugate vaccine, were split into three age groups with each containing 400 subjects randomized in a 1:1 ratio given 3, 2 or 1 dose of PCV13-TT or Prevnar, respectively, according to the age-appropriate schedules in Table 1 and Table 2. Enzyme-linked immunosorbent assay (ELISA) was utilized to detect the IgG antibody concentration in all serum samples collected from each group; additionally, a subsets of sera randomly obtained from 100 subjects in each age group for PCV13-TT and Prevnar, totaling 900, were tested by opsonophagocytic assay (OPA) to measure the ability of serotype-specific functional antibodies to eliminate corresponding pneumococci by promoting complement-mediated phagocytosis.

The main target population of the pivotal trial were infants of 2 and 3 months of age (at least 6 weeks of age). For immunogenicity, the PCV13-TT (3 months) group was compared with Prevnar (3 months) group in the first place, followed by the comparison between PCV13-TT (2 months) group versus Prevnar (3 months) group and then the comparison between PCV13-TT (2 months) versus PCV13-TT (3 months) group. The immunogenicity endpoints include the percentage of subjects with IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ (positive rate) and the geometric mean concentration (GMC) of serotype-specific IgG antibody one month post the final dose of primary series and booster dose, as well as the percentage of subjects with vaccine serotype-specific OPA titer $\geq 1:8$ (positive rate) and OPA geometric mean titer (GMT) one month post the final dose of primary series and booster dose.

The non-inferiority comparison was performed for the immune responses of 7 common serotypes between PCV13-TT and Prevnar. For the 6 additional serotypes, if the lower limits of 95% CI for IgG antibody positive rate in study group achieved $\geq 70\%$, superiority assessment was then

8 / 16

performed to compare the immune responses to 6 additional serotypes and corresponding serotypes in control group; meanwhile, the 6 additional serotypes in study group were compared with the serotype with the lowest response among all the 7 common serotypes in control group to determine the non-inferiority. The non-inferiority can be established either through demonstrating the lower limit of 97.5% CI for the difference of positive rate between groups (study group - control group) $> -10\%$, or the lower limit of 97.5% CI for IgG geometric mean concentration (GMC) ratio (study group/control group) > 0.5 ; Whereas the superiority can only be demonstrated when both lower limit of 95% CI for the difference of positive rates between groups (study group - control group) > 0 , and the lower limit of 95% CI for the IgG GMC ratio (study group/control group) > 1 .

The results are shown as below:

In subjects aged 3 months, after primary series (3 doses), the IgG antibody were compared between PCV13-TT group and Prevnar group. 6 out of 7 common serotypes met the non-inferiority criteria with the exception of 6B; the 6 additional serotypes reached superiority threshold; besides, the 6

additional serotypes in PCV13-TT group were non-inferior to the serotype with the lowest response among all the 7 common serotypes in Pevnar group.

In subjects aged 3 months, after complete series (4 doses), the IgG antibody were compared between PCV13-TT group and Pevnar group. All 7 common serotypes met the non-inferiority criteria; the 6 additional serotypes reached superiority threshold; besides, the 6 additional serotypes in PCV13-TT group were non-inferior to the serotype with the lowest response among all the 7 common serotypes in Pevnar group.

In subjects aged 2 months (at least 6 weeks of age), after primary series (3 doses), the IgG antibody were firstly compared between PCV13-TT (2 months) group and Pevnar (3 months) group, showing that all 7 common serotypes met the non-inferiority criteria and the 6 additional serotypes reached superiority threshold; besides, the 6 additional serotypes in PCV13-TT (2 months) group were non-inferior to the serotype with the lowest IgG response among all 7 common serotypes in Pevnar (3 months) group. The IgG antibody were then compared between PCV13-TT (2 months) group and PCV13-TT (3 months) group. 12 out of the 13 serotypes met the non-inferiority criterion with the exception of serotype 5.

In subjects aged 2 months (at least 6 weeks of age), after complete series (4 doses), the IgG antibody were firstly compared between PCV13-TT (2 months) group and Pevnar (3 months) group. All 7 common serotypes met the non-inferiority criteria and the 6 additional serotypes reached superiority threshold; besides, the 6 additional serotypes in PCV13-TT (2 months) group were non-inferior to the serotype with the lowest IgG response among all 7 common serotypes in Pevnar (3 months) group. The IgG antibody were then compared between PCV13-TT (2 months) group and PCV13-TT (3 months) group. All the 13 serotypes met the non-inferiority criteria.

The testing results of OPA antibody demonstrated that, all 13 serotypes of PCV13-TT were capable of inducing anti-pneumococcal OPA antibody in all age groups in the study group.

The immunogenicity data from subjects 2 months (at least 6 weeks of age) through 71 months of age are shown in Table 6 to Table 11.

■STORAGE CONDITION■

Transport and store refrigerated at 2°C to 8°C, protected from light.

DO NOT FREEZE. If the vaccine has been frozen. Please discard and keep the product in places out of children's reach.

■DOSAGE FORMS AND PACKAGING AVAILABLE■

1 mL vial, 0.5 mL/one single human dose/vial, 20 vials per package;
prefilled syringe, 0.5mL/one single human dose/prefilled syringe, 1 dose per package.

■SHELF LIFE■

The shelf life of the vaccine is 24 months. Please use before the expiration date printed on the label or small box.

1 Objective

To standardize the management of products distribution, to ensure that all the products meet the requirements of the quality standard for temperature during storage and transport, eliminate defects during distribution; to establish the recall management system and improve company's recall system in order to timely and effectively recall products, to avoid or minimize drug quality incidents.

2 Definitions/Abbreviations

2.1 Finished products: products have completed all the production procedure and with final packaging.

2.2 Distribution: refers to a series of operations in the procedure that enterprise delivers products to agents or users, including allocate cargo and transport etc.

2.3 The first class logistics company (the mainline logistics distribution enterprise): the company that delivers the finished products directly from our company, as well as the national mainline logistics distribution enterprise which has been registered in our company and meet the requirement of distribution.

2.4 The secondary logistics company (the storage and distribution enterprise): the company connected with the first class logistics company, storage and distribution enterprise outside Yunnan Province, which has been registered in our company and meet the requirement of distribution.

2.5 Recall: in accordance with the prescribed procedures, pharmaceutical production enterprises take back the drugs which have been sold in the listed market but exist potential safety risk, That is to say, due to products violate regulations and/or registration information; the products existing defects; the product is reported that has serious adverse reactions etc., it should be taken back from the market, clinical trial, a batch or more.

2.6 Potential safety risk: it means, due to research or development or other reasons, the drug

may lead to an unreasonable harm for human health and life safety.

2.7 Voluntarily recall: depending on severity of case, pharmaceutical production enterprises

start unsafe products recall on the premise that there's no official mandate, use the method of collection of information analysis, investigation and assessment.

2.8 Mandatory recall: the Drug Supervision and Administration Department considers that in some kind of product exists potential safety risk by investigation and assessment, and the enterprise should recall the medicine, but didn't, and order the enterprise to recall the medicine.

2.9 World Health Organization: WHO.

2.10 World Health Organization Pre-qualification: WHOPQ.

2.11 United Nations International Children's Emergency Fund: UNICEF.

3 Scope of Application

This procedure applies to management of entire procedure of finished products distribution and entire recall procedure for unqualified products or products unsuitable for clinic trial from market.

4 Responsibilities

4.1 Products Distribution Center

- Responsible for implementing the delivery of products;
- Responsible for acceptance and storage of recall products.

4.2 Marketing Center

- Responsible for connecting logistics company and monitoring products' temperature during transport;
- Responsible for supplying batch sales record in which is involved the recall;
- Responsible for delivering recall notice to domestic customers and storage & distribution enterprise outside Yunnan Province;
- Responsible for communicating with domestic customers and storage & distribution enterprise during the process of recall, as well as follow-up and feedback.

4.3 International Cooperation Department

- Responsible for connecting Logistics Company with Market Center;
- Responsible for supplying recall products' foreign sales record with experimental or clinical sample;
- Responsible for delivering recall notice to the supervision organization of exporting country, customers or agents, if recall products is involved WHO PQ products, this department should report recall information to WHO and related procurement agencies such as: UNICEF etc.;
- Responsible for communicating with foreign customers or agents during the process of recall, as well as follow-up and feedback.

4.4 Quality Assurance Department

- Responsible for implementing and continuing the improvement of this procedure;
- Responsible for making recall notice and delivering to International Cooperation Department, Marketing Center;
- Responsible for making recall implementation plan and reporting to supervision institution according to regulations;
- Responsible for making recall information and reporting to national supervision institution, if involved WHO PQ products, the recall information should be submitted to International Cooperation Department in order to report to WHO and related procurement agencies;
- Responsible for following-up recall schedule and reporting to supervision institution as

requested;

——Responsible for evaluating recall situation and forming the final report of recall, submit it to national supervision institution, if involved WHOPQ products the final recall report should submit to WHO to make an announcement.

4.5 Quality Operation Department

——Responsible for organizing investigation for products defects;

——Responsible for compiling Products Potential Security Risks Investigation and Assessment Report for company in order to take actions involve recall.

4.6 Quality Supervision Department

——Responsible for supervising implementation of products delivery;

——Responsible for implementing investigation for products defects;

——Responsible for following-up recall schedule and reporting it to Quality Assurance Department;

——Responsible for supervising recall products storage management.

4.7 Quality Management Department

——Responsible for helping to organize, coordinate and take part in products recall.

4.8 Quality Control Laboratory

—— Quality Control Lab responsible for testing recall products.

4.9 Finance Department

——Finance Department responsible for recalling products and financial processing of compensation.

4.10 Production Management Department

——Responsible for making an alternative supply approaches;

——Responsible for supplying the using situation of raw material, excipients, packing material in recall products.

4.11 Quality Authorized Person

——The Quality Authorized Person responsible for organizing related work for recall.

4.12 (Vice) General Manager

——(Vice) general manager responsible for guiding and supervising products recall,

examination and approval for important decisions, communicating with media, public, and internal staff.

4.13 Other relevant departments responsible for supplying necessary information and helping recall task group for complete products recall.

5 Working Procedures

5.1 Products Distribution

5.1.1 Once Yuxi Walvax Biotechnology Co., Ltd Products Distribution Center receives "Letter of Advice", connect with first level logistics company in time, confirm products delivery date and related flight information.

5.1.2 Products distribution center confirms delivery date and flight information ■ and distributes products in time according to "Letter of Advice" and prepares relevant information (batch release certificate, products warehousing temperature records, quality report, certification, shipper letter of instruction etc.)

5.1.2.1 Pre-freeze ice pack in – 20°C freezer, continuously for more than 24 hours, until the cool storage liquid in ice pack completely frozen solid, ice-water mixture is not allowed in the ice pack, keep balance for ice pack at room temperature for 15 minutes or 30 minutes in 2 ~ 8°C refrigerator, the Marketing Center put ice pack or water pack according to the temperature situation in shipping destination.

5.1.3 In the process of products distribution, according to the principle "First in First Out", and "Short Term First Out".

5.1.4 Once products are ready, the products must be collected electronic supervision code or traceable code and uploading in time on the same day.

5.1.5 Once products are loaded in the ice storage tank, it must be packaged. After packing, the Products will be delivered to the first level logistics company, and connect immediately with the Local office of delivery destination.

5.1.6 First level logistics company delivers products to airport, and informs flight information to secondary logistics enterprise and Marketing Center in time, Marketing Center informs to Standard Management Procedure of Yuxi Walvax Biotechnology Co., Ltd

local office in time.

5.1.7 Secondary logistics enterprise and Marketing Center local office will take products in airport after receiving flight information. delivery method will be decided according to local temperature situation. to ensure products temperature meet the requirement.

5.1.8 Please send back confirmation letter to our company by fax within 24 hours after receiving the products, if not to send back The Receipt Confirmation in time, this situation is defined as the products has been received and has had no doubt to the above content, if there is any objection, please explain it in attached page.

5.1.9 Products delivery center is responsible for supervising the entire process that company delivery products to first level logistics company, and airport. Marketing Center is responsible for supervising entire process from secondary logistics enterprise transport to CDC.

5.2 Products recall

5.2.1 Classification of recall: according to products' potential risk and severity of damage, the drug recall is divided into three classes:

5.2.1.1 Recall Class I: The use of this product may pose serious health hazards or in this product exists defects, which will pose a potential threat to patients' lives;

5.2.1.2 Recall Class II: The use of this product may pose a temporary or reversible health hazards or in this product defects are able to cause or discomfort, but not as severe as Class I;

5.2.1.3 Recall Class III: The use of this product generally does not causes health hazards, but need to be recalled due to other reasons or the defect may not have a significant impact on the patient's health.

5.2.2 Recall Classification Example Class Example

- 1) Wrong product (label and contents are different products)
 - 2) Correct product but wrong strength, with serious medical consequences
 - 3) Microbial contamination of the vaccine
- Recall Class I
- 4) Chemical contamination with serious medical consequences
 - 5) Mix up of some products with more than one container involved
 - 6) Wrong active ingredient in a multi-component product with serious medical

consequences

- 1) Mislabelling e.g. wrong or missing text or figures
 - 2) Missing or incorrect information (leaflets or inserts)
 - 3) Chemical/physical contamination (significant impurities, cross contamination, Recall Class II particulates)
 - 4) Mix up of products in containers
 - 5) Non-compliance with specification (e.g. content, stability, with serious medical consequences, fill/ weight)
- 1) Faulty packaging (wrong or missing batch number or expiry date)
- Recall Class III
- 2) Faulty closure

5.2.3 Evaluation and Decision for Products Recall

5.2.3.1 In case of quality incident or severe adverse event which may be caused by products quality, Quality Operations Department organizes, investigates and fills in "Products Potential Security Risks Investigation and Assessment Report" to organize evaluation; it should be immediately reported to the Quality Authorized Person, according to the seriousness of the quality incident, Quality Authorized Person will organize relevant leader to determine the final measures including the recall.

5.2.3.2 Decision for recall should be based on investigation and evaluation of products

potential safety hazards.

Investigation content should include details as below (according to actual situation):

- Type, scope and reason of medicine adverse event that has happened;
- The use of medicine whether it meets the requirement of medicine specification and usage of the drug instructions stipulated by labels;
- Whether medicine quality meets the requirement national standards, whether the process of medicine production, meets the requirement GMP etc., whether medicine production coincide with approved process;
- Products storage, transport whether it meets the requirements;
- The component proportion ratio of product's main users;

Procedure for Product 06 Page 9/21
No.
Recall and Distribution
Confidential Document, Copy Prohibited
- Products batch, amount, circulation area or scope in which may exist potential safety hazards;
- Other factors which may affect the safety of medicine.

Main evaluation content should include:

- The possibility of the product causing harm, and whether it has been harmful to human health;
- Harmful impact on main users;
- Harmful impact on special groups, especially on high-risk groups;
- The severity and emergency degree of the hazard;
- The consequences caused by the hazard (short term and long term).

5.2.4 After evaluation and approval, company determines the recall, Quality Assurance Department shall fill in Products Recall Approval Form for approval.

5.2.5 Preparation for the recall

5.2.5.1 Set up a recall task group

Once decided the products recall, company should immediately set up a recall task group, prepare detail recall plan and recall action. If necessary any department can be requested for offering assistance to the recall task group.

5.2.5.2 Recall group member and responsibility (can be modified according to the practical situation)

Role Position Responsibility

1. Organize and supervise implementation of recall;

implement the recall immediately. The recall plan should identify every step, relevant person in charge, participants, the corresponding responsibilities and deadlines.

5.2.5.4 Preparation of Recall Plan

■ Technique preparation:

■ List recall involved products and batch number, amount, quantity of sale, inventory etc.;

■ Freeze materials and products related to recall products;

■ List agents or customers that need to be notified of the recall, this list should include specific contact information and specific address where the recall product sales to;

■ Prepare customers, agents, storage & distribution enterprise recall notification table (should include specific address to send back products and acceptance contact), recall notification table, see appendix 3 for details;

■ Prepare supervision institution "Vaccine Recall Incident Report Table" (supervision institution: the State Food and Drug Administration, products the supervision organization of exporting country, WHO), see appendix 4 for recall incident report;

■ Prepare an alternative supply approaches;

■ Primarily confirm how to return, collect, coordinate and final destruction.

■ Communicate preparation includes but not limited to following content:

■ Prepare different forms of reports, announces and text notifications for different communication objects (employees, cooperation partners, public media, etc.);

■ Solutions for the foreseeable external problems;

■ Different person in charge of communication and their contact information for different communication objects;

■ Choose the way to communication/media: such as meetings, telephone, fax, E-mail, the public media (TV announcement, broadcast);

■ The frequency and manner of communication between recall task group and recall decision group.

■ Financial preparation include but not limited to following content:

■ Customers compensation plan;

■ Relevant funds and other financial preparation.

■ Legal preparation include but not limited to following content:

■ In some cases, companies need to full prepare for possible legal proceedings, including assignment or delegation of lawyer, and the preparation of relevant texts;

■ The preparatory works shall be accurately completed in time, so as to start the recall work as soon as possible.

■ Recall plan should include the following contents:

■ Product sales situation and the quantity of recalled;

■ The specific contents of the recall, including the organization, scope and timelines etc. for implementation;

■ The way to publish recall information and its scope;

■ The expected effect of the recall;

■ Handling measures after product recall;

■ Name and contact information of contact person.

5.2.4 Start Recall

5.2.4.1 Measures and time limit:

Recall Class Measures Start Time Limit

It must quickly pass the recall notice to agents, Quickly take action for the recall

Recall Class I customers (include clinical sample user or minimize latency as possible as the sampling person), reporting to national company can do

Recall Class supervision institution include our National

5.2.6 Treatment of recall products

5.2.6.1 Recall task group is responsible for summarizing recall situation in time, evaluating recall schedule, effect and influence of recall products quality, puts forward recall products specific processing scheme and submit it to general manager for approval, at same time, submit it to National Regulatory Authority for the record or approval

5.2.6.2 According to the approved handling decision, the recalled products should be processed as soon as possible and record information in detail. The products that must be destroyed should be destroyed under the supervision of the National Regulatory Authority.

5.2.7 Corrective & preventive measures during the process of recall

5.2.7.1 During the process of recall, if the company finds that recall system was defective or needed to be further improved, it's necessary to put forward the corrective & preventive measures for the recall system itself.

5.2.7.2 Every group member of recall task group put forward relevant corrective & preventive measure for the defects and insufficiencies in the recall process, submits to specific leader for audit. Once approved, Quality Control Department will organize related department to make rectification and implementation.

5.2.7.3 Quality Assurance Department is responsible for supervising and tracking implementation situation of approved corrective & preventive measures until ?????

5.2.7.4 The recall system should be evaluated regularly to ensure its effectiveness in order to effectively start the recall in any time if necessary

5.2.8 Close recall

5.2.8.1 Once the recall is completed, it should be evaluated the effect of recall, and submit Medicine Recall Summary Report to Drug Supervision and Administration Department of the province, If the recall is not complete or more effective measures are needed to be taken after

investigate of Drug Supervision and Administration Department, company will be required to expand the scope of the recall, the recall shall be closed after completing all requests.

5.2.8.2 Recall is turned off, Quality Management Department is responsible for all related Standard Management Procedure of Yuxi Walvax Biotechnology Co., Ltd

Expiry Date: Feb 04, 2022 Quantity: 141119 vials

The product mentioned above complies with the relevant provisions for lot release of
biological products and is approved for release.

As a minimum, this certificate is based on review of the summary protocol of
manufacturing and control.

1 Objective

Standardize batch number formulation principles and management requirements to ensure traceability of product information, avoid confusion and errors in samples.

2 Defined/Abbreviations

2.1 Batch: In the same production cycle, a certain number of uniform products produced with the same batch of raw materials and the same method.

2.2 Batch quantity: quantity of output in a single batch.

2.3 Batch number: A set of numbers or letters plus numbers used to identify a "batch". The batch number is used to trace and review the production history of a certain batch of drugs.

2.4 Sub-batch: A homogeneous group of bulk or final bulk is filled through several filling machine for filling process or the use of different freeze-drying machine for freeze-drying, that is, the formation of different sub batches. Sub-batches are part of the batch.

2.5 Intermediate Products: refers to the product that has completed part of the processing steps. Intermediate products still need further processing to become pre-packaged products.

2.6 Finished product: The product acquired by inspection, labeling and packaging of final bulk that has been filled (or freeze-dried) and sealed in the final container in an appropriate manner.

2.7 Bulk: A homogeneous substance used in the manufacture of a final preparation or final bulk. For multi-valent products, the final bulk is prepared from monovalent bulk solution.

3 Applicable scope

Applicable to all company product batch usage and management, including production, research and development, validation, etc.

4 Duty

4.1 Production Management Department

--Responsible for the preparation, determination, usage and issuance of batch number;
--Responsible for the management of batch numbers.

4.2 The Production Workshop/Department

SOP of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-PM-SMP-00-08-0001

Batch numbering Version
19 Page 2/16
management procedures number
Confidential files No copy

--Responsible for the implementation of the content of the management discipline.

4.3 Quality Supervision Department

--Responsible for the validation of compilation of batch numbers;
--Responsible for the supervision and management of the usage of batch numbers.

5 Working procedure

5.1 General principles for batch number preparation

5.1.1 The same batch number of products, should be from the same consistent source, with uniform quality, in accordance with the requirements of sampling test, based on which the whole batch of products can be assessed.

5.1.2 The batch number of the same product shall not be duplicated, and different batch number shall be used for different specifications of the same product.

5.1.3 In the compilation principle, the year should be written in 4 digits, month written in 2 digits, year serial number written in 3 digits.

5.1.4 Product Batch and sub-batch preparation should be able to make the whole process clear and easy to trace, in order to ensure that each batch of products processed by the process is consistent.

5.1.5 A single instalment of sub-batches should be limited to one of the following conditions permitting the development of sub-batches.

5.1.5.1 When the bulk or final bulk is prepared, if it is filtered by different filters, it shall be divided into different batches or sub-batches.

5.1.5.2 When the bulk or final bulk is directly filled into the final container, if different filling machines are used, it should be divided into different batches or sub-batches according to different filling machines.

5.1.5.3 If the bulk or final bulk use the same filling machine to be filled into the final container, then different freeze-drying machines are used for lyophilize, they should be divided into different batches or sub-batch according to different freeze-drying machines.

SOP of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-PM-SMP-00-08-0001

Batch numbering Version
19 Page 3/16
management procedures number
Confidential files No copy

5.1.5.4 When the bulk or final bulk is prepared, if it is purified with column chromatography twice or more, it should be divided into different batches or sub-batches according to the number of times it is purified with column chromatography.

5.1.6 The batch number for finished product shall be determined by the preparation time of final bulk, and the formulation date is the production date. Non-homogeneous preparation, mixing, dilution, filtration, filling of final bulk shall not be used as the same batch.

5.2 Definition of Batch Size:

Product

Batch Size Definition

Name

The amount after filling and lyophilization (annual inspection notes remaining

Strain

amount, freeze dry date, bacteria number).

Polysacch The amount of polysaccharide before sampling and after freeze drying when the

aride process is finished.

The amount of bulk in each bottle before sampling and after separation. If multiple bottles are showed on the Batch Record Audit List, batch size is the batch number Bulk

and total batch size on the production instructions (equals the total of batch size of bottles).

Finished Quantity of qualified products by light inspection (excluding production process products sterile test qualified quantity).

The actual amount of preparation for the bulk (if it goes through sterile filtration, Final bulk

the preparation amount before sterile filtration is the batch size).

If not separated by the bottle, the quantity before sampling and after completion of production process is the batch size.

Excipient Aluminum hydroxide Solution: After the completion of the process and separation, the amount before sampling is the batch size.

If multiple bottles are shown on the Batch Record Audit List, batch size is the batch SOP of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-PM-SMP-00-08-0001

Batch numbering Version

19 Page 4/16

management procedures number

Confidential files No copy

number and total batch size on the production instructions (total quantity of bottles).

Bulk Workshop: The amount after preparation before autoclave is the batch size.

Filling-packaging workshop: Before filling, the amount after preparation before Medium autoclave is the batch size. Finished product after the filling: vial: the remaining

amount after capping and removal of defect and empty vials. Pre-filling syringe: the remaining amount after removal of empty vial after filling.

5.3 Principles for compiling batch number of production strains

5.3.1 Compilation of batch number of strains is made up of the bacterium name code+ bacteria serogroup number (serotype) + seed lot category + year + month + annual serial number.

5.3.2 The Strain name code is abbreviated with the corresponding English names, and the seed lot class uses the abbreviation code corresponding to the English name.

Strain name Code table:

Species name Abbreviation

Haemophilus influenzae HI

Neisseria meningitidis NM

Bordetella pertussis BP

Corynebacterium diphtheriae CD

Clostridium tetanus CT

Streptococcus pneumoniae SP

Diphtheria Mutant strain DM

Seed Lot Category Code table

Seed Batch Category English abbreviation Code

Master seed lot M

Working seed lot W

SOP of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-PM-SMP-00-08-0001

Batch numbering Version

19 Page 5/16

management procedures number

Confidential files No copy

For example, HIBW201801001 means the 1st batch of Haemophilus influenzae type b of working seed lot produced in Jan. 2018.

5.4 Production of intermediate products Batch number Preparation principle

5.4.1 The batch number of the intermediate product is compiled with bacterium name code + bacterium serogroup number (model) + intermediate product category + year + month + annual serial number + Bottle number.

Intermediate Product Category Code table

Intermediate Product Category English name English abbreviation Code

Crude polysaccharide (HIB,

Crude polysaccharide CP

meningitis, pneumococcal)

Polysaccharide (HIB, meningitis,

Polysaccharide P

pneumococcal)

Derivative bulk (HIB, meningitis,

Derivative bulk D

pneumococcal)

Conjugate Bulk (HIB, meningitis,

Conjugate Bulk C

pneumococcal)

Bulk (diphtheria, pertussis, tetanus) Bulk B

Purified liquid (tetanus,

Purified liquid L

CRM197■

For example, NMAP201801002 refers to the 2nd batch of group A meningococcal polysaccharide produced in Jan. 2018.

SP1D201908001 refers to the 1st batch of serotype 1 pneumococcal polysaccharide produced

in Aug. 2019.

5.4.2 The batch number of bulk polysaccharide follows the batch number of the polysaccharide used. Batch number of the first dissolution of polysaccharide is followed by "-1", the second is followed by "-2". For example, NMCP201907001-1 refers to the bulk of polysaccharide of the SOP of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-PM-SMP-00-08-0001
Batch numbering Version
19 Page 6/16
management procedures number
Confidential files No copy

first dissolution of polysaccharide NMCP201907001.

5.4.3 Bulk produced with the same process and same equipment that is divided into bottles is distinguished by bottle numbers. If a single bottle is used, then the batch number is followed by "No.1 Bottle". For example, if NMCP201907001-1 bulk was divided into two bottles, then batch numbers were "NMCP201907001-1 (No.1 Bottle)" and "NMCP201907001-1 (No.2 Bottle)". If BPB201907001 acellular pertussis bulk was filled into a single bottle, then batch number was "BPB201907001 (No.1 Bottle)".

5.4.4 The tetanus toxoid bulk used in acellular DTaP vaccine production was divided into bottles after qualified by inspection, bottles used to divide a single mother bottle was numbered: batch number of mother bottle - bottle No. For example, if CTB201901001 (No.1 Bottle) was divided into 15 bottles, then the batch numbers were CTB201901001 (No.1 Bottle-1) to CTB201901001 (No.1 Bottle-15); if CTB201901001 (No.2 Bottle) was divided into 18 bottles, then the batch number were CTB201901001 (No.2 Bottle-1) to CTB201901001 (No.2 Bottle-18)

5.4.5 Bottle number is composed of "Bottle No. + numeric" in brackets.

5.4.6 Process number is composed of operation code + batch number of products. For example, ■NMAP201801003 refers to the 3rd batch produced in upstream process of group A meningitis polysaccharide. ■HibC201803015 (No. 1 Bottle) refers to the 15th batch produced in conjugation process of Hib polysaccharide.

of polysaccharide Process n process

Polysaccharide Purification

■ ■ — — — — —

conjugation process process

5.4.7 The batch number of sub-batch is composed by the original batch number + numeric serial number.

For example, ■NMY201801003-1 refers to the 1st sub-batch of the 3rd batch of group Y meningococcal polysaccharide produced by downstream process in Jan. 2018.

5.4.8 Intermediate products in the production, if the use of strains, intermediate category has not changed, only the process changes, according to the process change point to add the appropriate code.

Process Change Point Code table

NCTB201805001 refers to the 1st batch of tetanus bulk (neopeptone) produced in May 2018.
CSP5P201907001 refers to the 1st batch of serotype 5 polysaccharide of 13-valent pneumococcal polysaccharide conjugate vaccine produced in Jul. 2019.
SP5P201907001 refers to the 1st batch of serotype 5 polysaccharide of 23-valent pneumococcal polysaccharide vaccine produced in Jul. 2019.
PNMCC201909001 refers to the 1st batch of group A meningococcal conjugate bulk of group ACYW135 meningococcal polysaccharide conjugate vaccine produced in Sep. 2019.
5.5 Principles of batch numbers of finished product
5.5.1 The production batch number is compiled with the finished product code + year + month + annual serial number.
5.5.2 Considering the practicality of marking of packages, finished product code is in capital letters.

0.01mol/l phosphate buffer solution P

Aluminum hydroxide solution A

30% sucrose solution U

Troetamol solution M

For example, EP201803009 refers to the 9th batch of phosphate buffer solution produced in Mar. 2018.

5.8 Products, including strains, polysaccharides, bulk sold only to foreign markets, the letter E (Exit) is added before "5.3 Production of bacteria batch number preparation principle", "5.4 Production of intermediate product batch number preparation principle". For example, ESP6BP201805002 refers to the 2nd batch of serotype 6B pneumococcal polysaccharide produced in May 2018 which was sold abroad.

5.9 Principles of batch numbers of products for Non-listed sales (mainly in the compatibility of packaging materials compatibility, stability, etc.) is: G + finished product code (5.5.2 Production Code table) + year + month + annual serial number. For example, G1201805001 refers to the 1st batch of non-listed 13-valent pneumococcal polysaccharide conjugate vaccine produced in May 2018.

5.10 Principles for R&D project batch number.

5.10.1 Principle of compilation of R&D project batch number: add letter R (Research) in front of "5.3 Production of bacteria batch number preparation principle", "5.4 Production of intermediate product batch number preparation principle", "5.5 Principle of compiling batch number of finished products". For example RSP1P201801001 refers to the 1st batch in R&D of serotype 1 pneumococcal polysaccharide produced in Jan 2018.

5.10.2 When a new project is being developed, the project manager/team leader is responsible for compilation of easy to identify, non-repetitive bacterial name code/bacteria serotype number, intermediate product type, process code, finished product code, etc.

5.10.3 The same batch of R & D products using different groping methods is distinguished by SOP of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-PM-SMP-00-08-0001

Batch numbering Version

19 Page 12/16

management procedures number

Confidential files No copy

sub-batch, and sub-batch is used from the groping stage. For example, the batch number of group A meningococcal polysaccharide which is under groping methods are RNMAP201907001-1 and RNMAP201907001-2. If there are two methods used in formulation process of DTaP vaccine, the sub-batch of finished products are RM201907001-1 and RM201907001-2.

5.11 Validation of principles of batch number compilation.

5.11.1 The validation project batch number is mainly used in process validation projects, including product process validation and sterilization process simulation validation.

5.11.2 The principle of batch coding for process validation, to "5.3 Production of bacteria batch number preparation principle", "5.4 Production of intermediate product batch number preparation principle", "5.5 Production Principle of compiling batch number of finished products" letter V (Verify) is added in the front. For example, VCSP5P201907001 refers to the 1st batch of process validation of serotype 5 polysaccharide of 13-valent pneumococcal polysaccharide conjugate vaccine produced in Jul. 2019.

5.11.3 The principle of compiling the batch of sterilization process simulation validation: V + department code + year + month + annual serial number. For example, VFP201801001 refers to the 1st batch of sterilization process validation in filling and packaging workshop in Jan 2018. VPV201801003 refers to the 1st batch of sterilization process validation in pneumococcal vaccine workshop produced in Jan 2018.

5.11.4 When the sterilization process simulation verification involves the packaging workshop and the bulk workshop, the validation batch number is uniformly executed according to the filling and packing workshop validation batch number.

5.11.5 The department codes are detailed in the following table

China Food and Drug Administration

Drug Registration Certificate

Original No.:53110019

Acceptance No.: CXSS1800003 GUO Ratification No.: 2019S00755

Drug Name Generic Name: 13-valent Pneumococcal conjugate vaccine

English Name: 13-valent Pneumococcal conjugate vaccine

Active ingredient Capsular polysaccharides of 13 pneumococcal serotypes (1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C,

19A, 19F, and 23F)

Dosage form Injection Application Domestic drug registration

Strength 0.5ml per syringe. Each 0.5-mL dose Classification Biological products for prevention of vaccine contains:

2.6µg of polysaccharide type 1,

2.5µg of polysaccharide type 3,

3.0µg of polysaccharide type 4,

2.5µg of polysaccharide type 5,

2.5µg of polysaccharide type 6A,

6.0µg of polysaccharide type 6B,

2.85µg of polysaccharide type 7F,

2.5µg of polysaccharide type 9V,

2.75µg of polysaccharide type 14,

3.25µg of polysaccharide type 18C,

2.6µg of polysaccharide type 19A,

2.75µg of polysaccharide type 19F,

3.0µg of polysaccharide type 23F,

Standard YBS00392019 Shelf life 24 months

Conclusion This product complies with the relative requirements of "The Drug Registration Regulations of China", the registration is approved.

Manufacturer Yuxi Walvax Biotechnology Co., Ltd.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.4 NONCLINICAL OVERVIEW

2.4.1 Overview of non-clinical trial strategies

Vaccines are preparations which contain antigens that induce the human body to produce specific active immunity, protecting the body from the damage caused by the original infection, toxins, and also the injury due to original antigen. Non-clinical research on vaccines includes, but is not limited to pharmacological (pharmacodynamics), toxicology (safety) evaluations. The main purpose of the preclinical animal safety evaluation of vaccines is to examine the safety of the vaccine through related animals, including the effects on immune organs and other toxic target organs, the reversibility of toxicity, and clinically relevant parameters, to predict possible adverse reactions in large population, and to reduce the risk faced with clinical trial subjects and clinical users, and to provide a basis for the development of clinical trial protocols. The possible toxic reactions of the vaccine include: direct damage to the body by the component itself as a toxic substance, immunodeficiency-related toxicity induced by the immune system, and toxicity caused by contaminants and residual impurities. Since the vaccine exerts the effects through inducing the immune system to produce antibody and / or by effector T cells, the most important potential toxicity of vaccine is derived from immune system-related toxicities.[1]

Vaccines are different from general chemicals, the pharmacological and toxicological experiments of vaccines are relatively special, and the pharmacological test mainly includes the rationale of action, the relationship between biological valence and dosage, the relationship between immune schedules and administration route and effectiveness, etc.; For toxicological test, major considerations include reactions at vaccination site and systemic pathological reactions, unexpected immune response of body to the vaccine product and the duration of the specific response. Since the above aspects are interrelated, the factors of pharmacology, toxicology and immunogenicity or biological valence should be taken into account comprehensively.[2]

For the toxicity test of the carrier protein in the conjugates of conjugate vaccines, current Chinese Pharmacopeia regulations should be followed if tetanus toxoid and diphtheria toxin are utilized as the carrier protein, to conduct the toxicity test of tetanus toxoid and diphtheria toxin for polysaccharide-protein conjugates.[3]

The vaccine is formulated by compounding the glycoconjugates of the capsular polysaccharide antigen of *Streptococcus pneumoniae* serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F, individually conjugated to tetanus toxoid carrier protein. The individual polysaccharides are extracted from the cultures of *Streptococcus pneumoniae*, and purified through centrifugation, precipitation, ultrafiltration and column chromatography. The polysaccharides are chemically activated and derivatized, and then conjugated to tetanus toxoid carrier protein to form the glycoconjugate, with aluminum phosphate as adjuvant. This vaccine is used to prevent pneumonia, meningitis, otitis media and other diseases caused by *Streptococcus pneumoniae* serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F. The following pharmacological tests were conducted based on product properties and expected function:

- 1) Immunogenicity test in New Zealand White Rabbit with intramuscular injection of various serotypes of antigens and 13 serotypes of antigen mixtures to examine the immunogenicity of monovalent conjugates and the compatibility of conjugates of 13 serotypes.
- 2) The study to determine the relationship between biological valence and immunization doses, aiming to investigate the relationship between antigen content in conjugates, vaccination doses and immunogenicity efficacy, so as to determine the content of various conjugates in finished products, and to provide reference for clinical vaccination procedures.

Confidential 193

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

- 3) Immunogenicity test of vaccine products to determine the immunogenicity of preparation formulated based on the results of "the study to determine the relationship between biological valence and immunization doses", to validate the feasibility and rationality of the prescription of the preparation.

Vaccine antigens could produce the expected immunogenicity effects after vaccination in animals, but at the same time may also induce or cause potentially unexpected safety risks, in accordance with the requirements of relevant regulatory principles, the GLP qualified National Chengdu Center for Safety Evaluation of Drugs was commissioned to perform the following tests to evaluate the vaccine product:

- 1) Acute toxicity test in Kunming mice with intramuscular injection of the vaccine, to investigate the nature, degree, time effect and reversibility of the possible toxic reactions induced by vaccine, to evaluate target organ or target tissue toxicity, so as to define the reference range for clinical study.
- 2) Toxicity test in New Zealand rabbit and rhesus monkey with multiple intramuscular injection of the vaccine, to investigate the nature, degree, dose-response and time effect as well as reversibility of the potential toxic reactions induced by vaccine to immune organs and other target organ toxicity, so as to provide reference information for clinical studies.
- 3) Abnormal toxicity test in mice and guinea pigs with intraperitoneal injection of the vaccine, to examine the presence of exogenous contaminants and potential unexpected unsafe factors, so as to provide reference information for evaluating the safety of clinical use.
- 4) Specific toxicity test and toxicity reversibility test in guinea pigs with subcutaneous injection of the vaccine, to observe the occurrence of tetanus symptoms, presence of local symptoms of purulence, necrosis and other local reactions, so as to provide reference information for evaluating the safety of clinical use.

- 5) Active anaphylaxis test and passive cutaneous anaphylaxis tests in guinea pigs with injection of the vaccine, to observe the occurrence of systemic anaphylactic reactions and skin anaphylactic reactions, so as to provide reference information for evaluating the safety of clinical use.
- 6) Irritation test in rabbits with single-dose injection of the vaccine, to observe the irritations in rabbit's quadriceps induced by the product, so as to provide reference information for evaluating the safety of clinical use.
- 7) In vitro hemolysis test using red blood cells of rabbit with exposure to the vaccine, to observe the effect on the status of rabbit red blood cells, so as to provide reference information for evaluating the safety of clinical use.

The results of the above seven tests strongly underpinned the use of the vaccine in clinical studies. The evaluation results showed that, the dosage of the vaccine is within a safety margin; minor irritation at injection site is observed after use in animals, while may resolve after discontinuation of treatment; in addition, there are no apparent abnormalities regarding the general conditions, body temperature, body weight, food consumption, blood biochemistry, hematology, urine, bone marrow, ophthalmology, electrocardiogram, organ weight, pathological findings of tissues and other measures, no obviously increased or inhibited immune function is noted; specific antibody to vaccine components can be detected; risk of anaphylaxis is present due to the use of carrier protein; agglutination effect is observed in rabbit red blood cells, while no hemolytic reaction is seen.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.4.2 Pharmacology

1) Immunogenicity Test

The New Zealand white rabbit model was established, and the corresponding derivatives of conjugates were included as control, under the same system conditions, 0.5 mL of test articles were injected on Day 0, 14, 28 (except for serotype 6B as 3.2 µg/mL, other serotypes were 1.6 µg/mL), blood was collected on Day 21 and 35, ELISA was utilized to determine animal antigen-specific antibody titers with baseline data as control, to compare the pre- and post-immunization specific antibody titer, in order to determine the animal immunogenicity of polysaccharide conjugates. The results showed that 13 polysaccharide conjugates demonstrated significant immunogenicity relative to the corresponding polysaccharides.

Conjugates were diluted with 1 mg/mL aluminum phosphate solution (obtained by diluting aluminum phosphate using sodium chloride injection) to obtain monotype conjugate solution at 4 µg/mL (8 µg/mL for serotype 6B); Take a certain proportion from each of 13 conjugate dilutions to mix with 1 mg/mL aluminum phosphate solution, to form a uniform suspension containing 4 µg/mL of each serotype (8 µg/mL for serotype 6B), which was formulated to be a compound conjugate solution; 1 mg/mL aluminum phosphate was again used to create 2.5 fold dilution of the monotype conjugate solution, which was then compounded to form conjugates solution, 1.6 µg/mL (3.2 µg/mL for serotype 6B) conjugates solution was applied as test solution, with 0.5 mL injected in New Zealand rabbits on Day 1 and 14 intramuscularly, blood was collected on Day 21, using baseline values as control, to detect antibody level, so as to determine the antibody positive rate. The results indicated that, the 13 polysaccharide conjugates mixture generally imposed no effects on the immunogenicity in animals.

2) Study on the relationship between biological valence and dosage and immune doses

With reference to Wyeth's "7-valent pneumococcal conjugate vaccine" (in each dose of finished product, the polysaccharide content of each serotype is: 4 2 µg, 6B 4 µg, 9V 2 µg, 14 2 µg, 18C 2 µg, 19F 2 µg, 23F 2 µg), 13-valent pneumococcal polysaccharide conjugate vaccine (in each dose of finished product, the polysaccharide content of each serotype is: 1 2.2 µg, 3 2.2 µg, 4 2.2 µg, 5 2.2 µg, 6A 2.2 µg, 6B 4.4 µg, 7F 2.2 µg, 9V 2.2 µg, 14 2.2 µg, 18C 2.2 µg, 19A 2.2 µg, 19F 2.2 µg, 23F 2.2 µg, the following formulations are proposed:

Formulation 1: the polysaccharide content of each serotype in each dose: 1 1.8 µg, 3 1.8 µg, 4 1.8 µg, 5 1.8 µg, 6A 1.8 µg, 6B 3.6 µg, 7F 1.8 µg, 9V 1.8 µg, 14 1.8 µg, 18C 1.8 µg, 19A 1.8 µg, 19F 1.8 µg, 23F 1.8 µg;

Formulation 2: the polysaccharide content of each serotype in each dose: 1 2.0 µg, 3 2.0 µg, 4 2.0 µg, 5 2.0 µg, 6A 2.0 µg, 6B 4.0 µg, 7F 2.0 µg, 9V 2.0 µg, 14 2.0 µg, 18C 2.0 µg, 19A 2.0 µg, 19F 2.0 µg, 23F 2.0 µg;

Formulation 3: the polysaccharide content of each serotype in each dose: 1 2.2 µg, 3 2.2 µg, 4 2.2 µg, 5 2.2 µg, 6A 2.2 µg, 6B 4.4 µg, 7F 2.2 µg, 9V 2.2 µg, 14 2.2 µg, 18C 2.2 µg, 19A 2.2 µg, 19F 2.2 µg, 23F 2.2 µg;

With the same testing system and conditions, animal immunogenicity test was conducted in parallel with the commercially available Wyeth's "7-valent pneumococcal conjugate vaccine":

New Zealand white rabbit model was used, 0.5 mL test vaccines were intramuscularly injected on Day 0, 14 and 28 (samples were obtained by 2.5 fold dilution with 1 mg/mL aluminum phosphate), blood was collected on Day 21 and 35, and were compared with baseline to detect the antibody titer, and GMT was calculated; antigen-specific antibody titers of each serotype were pooled to assess the antigen-specific antibody titer levels of each serotype, and the antigen content of each

Confidential 195

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

serotype in each final bulk of each dose was determined as: 1 2.2 µg, 3 2.2 µg, 4 2.2 µg, 5 2.2 µg, 6A 2.2 µg, 6B 4.4 µg, 7F 2.2 µg, 9V 2.2 µg, 14 2.2 µg, 18C 2.2 µg, 19A 2.2 µg, 19F 2.2 µg, 23F 2.2 µg. The specific antibody titer levels after 2-dose and 3-dose series in animals were compared, showing higher GMT values post 3-dose series than 2-dose series.

3) Immunogenicity test of vaccine product

Three consecutive batches of vaccines formulated as per the formulation of "polysaccharide content of each serotype in each dose (0.5 mL): 1 2.2 µg, 3 2.2 µg, 4 2.2 µg, 5 2.2 µg, 6A 2.2 µg, 6B 4.4 µg, 7F 2.2 µg, 9V 2.2 µg, 14 2.2 µg, 18C 2.2 µg, 19A 2.2 µg, 19F 2.2 µg, 23F 2.2 µg" were diluted for 2.5 fold with 1 mg/mL aluminum phosphate to obtain test articles, respectively; New Zealand white rabbit model was used, and 0.5 mL of test articles were injected intramuscularly on Day 0, 14 and 28, blood was collected on Day 21 and 35, with baseline values as control, to detect antibody levels, the seroconversion rates and GMT were assessed. The results demonstrated good immunogenicity and acceptable lot-to-lot reproducibility and consistency of the vaccine products.

2.4.3 Pharmacokinetics

Not applicable for prophylactic biological products (vaccines).

2.4.4 Toxicology

1) Acute Toxicity Test

Kunming mice were intramuscularly injected with a single dose of the vaccine with a maximum injectable volume of 10 mL/kg, with overall good general conditions during 14 days post

vaccination, without obvious toxic reactions observed.

2) Repeated Dose Toxicity Tests

A New Zealand rabbit model

7-valent pneumococcal conjugate vaccine, adjuvant of aluminum phosphate and 13-JHYM administered to rabbits once every 2 weeks for 5 consecutive intramuscular injections might cause some irritation, while partially recovered after discontinuation. At 21 days after the first injection, the specific antibodies associated with vaccine components could be detected in rabbits. The peak antibody titer was observed 21~35 days after the first administration, and then decreased gradually, while the antibody level remained detectable 28 days after the last injection. In addition, 7-valent pneumococcal conjugate vaccine, adjuvant of aluminum phosphate and 13-JHYM imposed little impact on the rabbit's general condition, body temperature, weight, food consumption, blood biochemistry, hematology, bone marrow, organ weight and other indicators, is no obviously increased or inhibited immune function was noted, and there were no apparent pathological findings in organs or tissues.

B Rhesus Monkey Model

The vaccine product of 0.11 mL/animal and 0.5 mL/animal, and adjuvant of aluminum phosphate of 0.5 mL/animal were administered intramuscularly to monkeys once every 2 weeks for 5 consecutive injections, and the animals were recovered and observed for 6 weeks. The adjuvant of aluminum phosphate was irritant to the muscle at injection site, while might recover after discontinuation. In addition, no obvious abnormalities were observed for monkeys in each group with respect to general condition, body temperature, weight, food consumption, blood biochemistry, hematology, urine, bone marrow, ophthalmology, electrogram, organ weight, histopathology and other indicators, no obviously increased or inhibited immune function was noted, and there were no apparent pathological findings in organs or tissues. On 21 days after administration of the vaccine product, specific antibody associated with vaccine components could

Confidential 196

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

be detected in rhesus monkeys. The peak antibody titer was observed 21~35 days after the first administration, and then decreased gradually, while the antibody level remained detectable 28 days after the last injection.

3) Abnormal Toxicity Test

A Mice

Kunming mice were administered with a single intraperitoneal dose of this vaccine of 0.5 mL/animal (1 dose); from administration to the end of the observation, visual sign, mental and physical states were normal in all mice, with clean natural holes, without obvious abnormal reactions; at Day 7 after administration, the weight of each mouse increased as compared with baseline, demonstrating acceptable findings for abnormal toxicity test.

B Guinea Pigs

Guinea pigs were administered with a single intraperitoneal dose of this vaccine of 5 mL/animal (10 dose); from administration to the end of the observation, visual sign, mental and physical states were normal in all guinea pigs, with clean natural holes, without obvious abnormal reactions; at Day 7 after administration, the weight of each guinea pig increased as compared with baseline, demonstrating acceptable findings for abnormal toxicity test.

4) Test for carrier protein toxicity

A Specific Toxicity Test

Guinea pigs were administered with a single subcutaneous dose of this vaccine of 2 mL/animal; from administration to the end of the observation, visual sign, mental and physical states were normal in all guinea pigs, with clean natural holes, without tetanus symptoms; no abscess or necrosis at administration site were observed; at Day 21 after administration, the weight of each guinea pig increased as compared with baseline, demonstrating acceptable findings for specific toxicity test of carrier protein (tetanus toxoid) in guinea pigs.

B Toxicity Reversibility Test

Guinea pigs were administered with a single subcutaneous dose of this vaccine of 5 mL/animal; from administration to the end of the observation, visual sign, mental and physical states were normal in all guinea pigs, with clean natural holes, without tetanus symptoms; no abscess or necrosis at administration site were observed; at Day 21 after administration, the weight of each guinea pig increased as compared with baseline, demonstrating acceptable findings for the toxicity reversibility test of carrier protein (tetanus toxoid) in guinea pigs.

5) Anaphylaxis tests

A Systemic Active Anaphylaxis Test

Guinea pigs were intramuscularly administered with vaccine bulk at 0.05 mL bulk/kg, 0.5 mL bulk/kg from 3 batches of the product (lot numbers: 20110304, 20110305, 20110406), at the dose of 0.5 mL bulk/kg, positive active anaphylactic reactions were observed, while at the dose of 0.05 mL bulk/kg, negative results were noted for negative anaphylactic reactions in guinea pigs.

B Passive Cutaneous Anaphylaxis Test

Guinea pigs were intramuscularly administered with the vaccine products at 0.05 mL/kg, 0.5 mL/kg from 3 batches of the product (lot numbers: 20110304, 20110305, 20110406), and the anti-serum dilution was 1:2, 1:8, and 1:32, respectively, all were with negative findings in the passive cutaneous anaphylaxis test in the guinea pigs.

Confidential 197

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

6) Irritation Test of Single Intramuscular Injection

Rabbit quadriceps were administered with single intramuscular injection of low- and high-dose (0.5 mL/site, 1.5 mL/site, clinical preparation concentration) aluminum phosphate, 7-valent pneumococcal conjugate vaccine, the vaccine product (lot number 2010304, 20110 305, 2010406), then the low- and high-dose aluminum phosphate, high-dose 7-valent pneumococcal conjugate vaccine, high-dose vaccine products of 3 batches, and low-dose vaccine products of lot number 2010406 showed obvious irritation to rabbit quadriceps. The above muscle irritations partially resolved during a 16-day observation period.

7) In Vitro Hemolysis Test

Aluminum phosphate adjuvant (concentration of 1 mg/mL, the same concentration as aluminum phosphate in the vaccine products), the vaccine products (lot number 2010304, 2010305, 20110406) at different doses (0.5, 0.4, 0.3, 0.2, 0.1 mL/tube) induced significant agglutination effect in red rabbit cells, without hemolytic reaction.

2.4.5 Summary of evaluations and conclusion

The evaluation results showed that, the dosage of the vaccine is within a safety margin; minor irritation at injection site is observed after use in animals, while may resolve after discontinuation

of treatment; in addition, there are no apparent abnormalities regarding the general conditions, body temperature, body weight, food consumption, blood biochemistry, hematology, urine, bone marrow, ophthalmology, electrocardiogram, organ weight, pathological findings of tissues and other measures, no obviously increased or inhibited immune function is noted; specific antibody to vaccine components can be detected; risk of anaphylaxis is present due to the use of carrier protein; agglutination effect is observed in rabbit red blood cells, while no hemolytic reaction is seen.

The pharmacological and toxicological tests studies of the vaccine products demonstrate excellent safety and immunogenicity, and thus can be safely administered clinically.

2.6.1 Introduction

The study product is a prophylactic biological product – vaccine, and is consisted of type 1, type 3, type 4, type 5, type 6a, type 6B, type 7F, type 9V, type 14, Type 18C, type 19A, type 19F and type 23F of pneumococcal capsular polysaccharide antigens covalent binding with tetanus toxoid carrier protein and adsorbed by aluminum phosphate adjuvant. This vaccine is intended to be used in the prevention of invasive infection caused by the above serotypes pneumococcus in infants and children aged 2 months to 2 years. The proposed dosage is 0.5mL per person, and the proposed route is intramuscular injection.

According to the requirements of regulatory authorities, necessary pharmacological and toxicological tests were carried out in preclinical non-clinical studies. Since the vaccine is different from ordinary chemicals, the experimental requirements of pharmacology and toxicology are special. The pharmacological tests of the study product mainly include immunogenicity, antigen compatibility, dose-response relationship, relationship between dose effect, order of administration and the overall effect, etc. In terms of toxicology, we mainly considered the pathological reactions at the injection site and systemic pathological reactions, as well as the unexpected immune response and the duration of these reactions. We carried out local muscle irritation test, hemolysis test, passive cutaneous anaphylaxis test, systemic acute toxicity test, repeat-dose toxicity test, abnormal toxicity test and active anaphylaxis test to evaluate toxicology. The results showed that the study product had good safety and immunogenicity, and could be safely used in clinical settings.

2.6.2 Pharmacology Written Summary

2.6.2.1 Brief Summary

According to the literature, New Zealand white rabbits, a sensitive species, were selected to be used in pharmacological studies and evaluation. The immunogenicity test, antigen compatibility test, dose-response relationship test and Experiment on the relationship between dose effect, order of administration and the overall effect were carried out. The results showed that the 13 types of polysaccharide conjugates had significant animal immunogenicity compared with the corresponding polysaccharides. No interference between the 13 antigens was observed. The contents of each type in each dose were as follows: serotype 1 2.2 µg, serotype 3 2.2 µg, serotype 4 2.2 µg, serotype 5 2.2 µg, serotype 6A 2.2 µg, serotype 6B 4.4 µg, serotype 7F 2.2 µg, serotype 9V 2.2 µg, serotype 14 2.2 µg, serotype 18C 2.2 µg, serotype 19A 2.2 µg, serotype 19F 2.2 µg and serotype 23F 2.2 µg. The antibody positive conversion rate and GMT level of the vaccine were similar to those of the same kind of vaccine sold in the market. The GMT value of 3-dose procedure was higher than that of 2-dose procedure.

2.6.2.2 Primary Pharmacodynamics

2.6.2.2.1 Immunogenicity

2.6.2.2.1.1 Monotype Immunogenicity of 13-type Conjugate Bulk

In order to prove the strong immunogenicity of the self-made polysaccharide conjugate bulk, the titer of specific antibody against animal antigen was detected by Elisa with corresponding derivatives of the conjugates immunizing animals under the same system conditions as control. The titers of specific antibodies before and after immunization were compared to determine whether the polysaccharide conjugates were immunogenic in animals.

2.6.2.2.1.1.1. Materials

Conjugate bulk: Pn1ps-TT 20100701, Pn3ps-TT 20100902, Pn4ps-TT 20100701, Pn5ps-TT 20100701, Pn6Aps-TT 20101102, Pn6Bps-TT 20100701, Pn7Fps-TT20101002, Pn9Vps-TT20100801, Pn14ps-TT20100801, Pn18Cps-TT20100801, Pn19Aps-TT 20101102, Pn19Fps-TT20100801, Pn23Fps-TT20100801; Polysaccharide derivatives Pn1ps-ADH 20100701, Pn3ps-ADH 20100902, Pn4ps-ADH 20100701, Pn5ps-ADH20100701, Pn6Aps-ADH 20101102, Pn6Bps-ADH20100701, Pn7Fps-ADH20101002, Pn9Vps-ADH20100801, Pn14ps-ADH20100801, Pn18Cps-ADH20100801, Pn19Aps-ADH 20101102, Pn19Fps-ADH20100801, Pn23Fps-ADH20100801. Sodium chloride injection A10011661 (manufactured by Kunming Nanjiang Pharmaceutical Co., Ltd). New Zealand white rabbits (1.8-2.2 kg, half male and half female, purchased from Animal Laboratory Center of Kunming Medical University).

2.6.2.2.1.1.2. Methods

(1) Test samples preparation: All types of antigen content referred to Prevnar Wyeth's Pneumococcal 7-Valent Conjugate Vaccine. Type 1, type 3, type 4, type 5, type 6A, type 7F, type 9V, type 14, type 18C, type 19A, type 19F and type 23F conjugates were diluted to 1.6 µg/mL respectively with sodium chloride injection, and type 6B conjugate was diluted to 3.2 µg/mL, serving as the test sample for conjugate bulks; Type 1, type 3, type 4, type 5, type 6A, type 7F, type 9V, type 14, type 18C, type 19A, type 19F and type 23F derivatives were diluted to 1.6 µg/mL respectively with sodium chloride injection, and type 6B derivative was diluted to 3.2 µg/mL, serving as the test sample for derivatives.

(2) Animal immunization: the New Zealand White Rabbit Model was adopted. The test samples were injected on Days 0, 14, 28 and blood samples were collected on Day 21 and Day 35. The antibody levels were detected to evaluate the antibody conversion rate and GMT with self-control.

Figure 1 Positive Conversion Rates of Monotype Immunogenicity in 13-valent Pneumonic

Figure 2 GMT values of monotype immunogenicity in 13-valent pneumonic conjugate bulk

2.6.2.2.1.1.4. Conclusions
For the polysaccharide conjugates, the positive conversion rates of all serotypes were 100%, and the GMT values increased significantly. The results showed that the 13-type polysaccharide conjugates had significant immunogenicity in animals compared to the corresponding polysaccharides.

2.6.2.2.1.2. Immunogenicity Study of Finished Products
In order to evaluate the immunogenicity of the finished products in animals, referring to the methods published in the literatures, New Zealand female white rabbits were immunized with

different dosages of finished products with aluminium phosphate as control. Antiserum was collected after immunization, and the positive conversion rate as well as antibody GMT were detected using Elisa so as to evaluate the immunogenicity of the finished products in animals.

2.6.2.2.1.2.1. Materials

13-valent pneumococcal polysaccharide conjugate vaccine 20110707, aluminium phosphate 8169402 (manufactured by REHEIS General Chemical, US), New Zealand White rabbits (1.8-2.2 kg, half male and half female, purchased from Chengdu Dashuo Biotechnology Co., Ltd).

2.6.2.2.1.2.2. Methods

(1) Test samples preparation: The 13-valent pneumococcal polysaccharide conjugate vaccine was diluted 2.5 times with 1 mg/mL aluminum phosphate solution to 1.6 µg/mL (3.2 µg/mL for type 6B), serving as the test sample in this experiment.

(2) Immunization: The New Zealand female white rabbits were randomly divided into three groups. Rabbits in study group 1 were injected with 0.25 mL test sample through the hind limb (unilateral, 0.25 mL each side), rabbits in study group 2 were injected with 0.5 mL test sample through the hind limb (bilateral, 0.25 mL each side), and rabbits in the control group were injected with 0.5 mL aluminum phosphate (1 mg/mL, bilateral, 0.25 mL each side). The rabbits were immunized once respectively on Day 0, 14 and 28. Blood samples were collected before immunization, 7 days after the second dose and 7 days after the third dose. The serum was separated and the positive conversion rate as well as the antibody GMT were detected using ELISA.

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.6.2.2.1.2.4. Conclusions

The results showed that more than half of the serotypes achieved positive conversion after immunizing rabbits with the study vaccine, therefore the antigens in the vaccine had comparative immunogenicity. The post-immunization antibody titer of each type doubled when compared with the pre-immunization titer. The positive conversion rate was positively correlated with antibody titer and dosage. The body obviously gained resistance and protection against pneumococcus after immunization.

2.6.2.2.1.3. Comparison of Immunogenicity with Similar Licensed Product

In order to compare the immunogenicity of the study vaccine with the similar licensed products, New Zealand white rabbits were immunized with the same dose of the study vaccine and Plevnar Wyeth's 7-Valent PCV. The antiserum was collected after immunization. The positive conversion rate and antibody GMT were detected using ELISA so as to compare the immunogenicity of each serotype between two products.

2.6.2.2.1.3.1. Materials

13-valent pneumococcal polysaccharide conjugate vaccine 20110707, Plevnar Wyeth's Pneumococcal 7-Valent Conjugate Vaccine E61516E52444 (2010.4-2013.3), New Zealand female white rabbits (1.5-2.5 kg, purchased from Chengdu Dashuo Biotechnology Co., Ltd).

2.6.2.2.1.3.2. Methods

(1) Test sample preparation: The Walvax's Pneumococcal 13-Valent Conjugate Vaccine (Lot No. 20110707) and Plevnar Wyeth's Pneumococcal 7-Valent Conjugate Vaccine (Lot No. E61516E52444) were diluted 2.5 times in 1 mg/mL aluminum phosphate solution respectively, each with the monotype concentration of 1.6 µg/mL (3.2 µg/mL for type 6B), serving as the test samples in this experiment.

(2) Immunization: The New Zealand female white rabbits were randomly divided into three groups. Rabbits in study group 1 were injected with 0.25 mL test sample of Walvax's Pneumococcal 13-Valent Conjugate Vaccine through the hind limb, rabbits in study group 2 were injected with 0.5 mL test sample of Plevnar Wyeth's Pneumococcal 7-Valent Conjugate Vaccine through the hind limb, and rabbits in the control group were injected with 0.5 mL aluminum phosphate (1 mg/mL). The rabbits were immunized once respectively on Day 0, 14 and 28. Blood samples were collected before immunization, 7 days after the second dose (Day 21) and 7 days after the third dose (Day 35). The serum was separated and the positive conversion rate as well as the antibody GMT were detected using ELISA.

2.6.2.2.2 Antigen Compatibility of the 13-type Conjugates
In order to determine the antigen compatibility of the 13-type conjugates, the polysaccharide conjugates were diluted to 4 ug/mL (type 6b was diluted to 8 ug/mL) in aluminium phosphate solution referring to the dosage of Pevnar Wyeth's Pneumococcal 7-Valent Conjugate Vaccine. The monotype immunogenicity was compared with that of 13-type conjugates to determine whether the 13-type conjugates were compatible.

2.6.2.2.2.1. Materials
Conjugate bulk: Pn1ps-TT 20100701, Pn3ps-TT 20100902, Pn4ps-TT 20100701, Pn5ps-TT 20100701, Pn6Aps-TT 20101102, Pn6Bps-TT 20100701, Pn7Fps-TT20101002, Pn9Vps-TT20100801, Pn14ps-TT20100801, Pn18Cps-TT20100801, Pn19Aps-TT 20101102Pn19Fps-TT20100801, Pn23Fps-TT20100801; Pevnar Wyeth's Pneumococcal 7-Valent Conjugate Vaccine E61516E52444 (2010.4-2013.3). Aluminum phosphate (Batch No. 8169402, manufactured by REHEIS General Chemical, US). Sodium chloride injection A10011661 (manufactured by Kunming Nanjiang Pharmaceutical Co., Ltd). New Zealand white rabbits (1.8-2.2 kg, half male and half female, purchased from Chengdu Dashuo Biotechnology Co., Ltd).
2.6.2.2.2.2. Methods
(1) Test samples preparation: The conjugates were diluted to 4 ug/mL (6b type 8 ug/mL) in 1 mg/mL aluminum phosphate solution (obtained by diluting aluminum phosphate with sodium chloride injection) to obtain test samples for the monotype conjugate. The 13-type conjugates were mixed with 1 mg/mL aluminum phosphate solution to form a homogeneous suspension containing 4 ug/mL of each type conjugate (8 ug/mL for type 6b), serving as the compounding conjugate in this experiment.
(2) Immunogenicity tests: Test samples mentioned above were diluted 2.5 times to 1.6 ug/mL (3.2 ug/mL for type 6B) with 1 mg/mL aluminum phosphate solution to serve as samples in this test. Based on the New Zealand White Rabbit Model, 0.5 mL samples were intramuscularly injected on Day 0, 14 and blood samples were collected on Day 21. The antibody levels were detected to evaluate the antibody conversion rate with self-control.
2.6.2.2.2.3. Results
No significant difference was observed between the positive conversion rates in the monotype group and the compounding group based on the results obtained from paired data t-test ($p = 0.444 > 0.05$).

Table 6 Summary Table of the Positive Conversion Rates in Immunogenicity tests

2.6.2.2.2.4. Conclusions

The results showed that the monotype immunogenicity of conjugates was basically the same as that of the 13-valent mixture, indicating that the 13-type polysaccharide conjugates were well compatible with each other as expected.

2.6.2.3.1. Experiment on the Relationship between Dose Effect, Order of Administration and the Overall Effect
To be added.

2.6.2.3.2. Validation Test of Formulation Preparation Process
To be added.

2.6.2.4 Safety Pharmacology
For the study product, potential unexpected adverse effects on physiological function, which refers to the effect of vaccine on central nervous system, cardiovascular system and respiratory system, were observed in the repeat-dose toxicity test. Please refer to the data of repeat-dose toxicity test for details

At the end of administration and recovery period, heart rate, no obvious abnormalities were observed in R-R interval, P-R interval, QRS wave time, Q-T interval, corrected Q-T interval and ECG shape of lead II of each monkey.

2.6.2.5 Pharmacodynamic Drug Interactions
Not applicable for vaccines.

2.6.2.6 Discussion and Conclusions
The study product is a multivalent combined vaccine made of 13 types of antigens. After immunization, the animals were able to produce specific immune response to 13 types of antigens. With the increase of the number of immune injections, the antibody level of immune response increased. The results of three consecutive batches of process validation showed that the study product had good immunogenicity and the formulation preparation process was feasible and stable.

2.6.6 Toxicology Written Summary

2.6.6.1 Brief Summary

In terms of toxicology, the pathological reactions at the injection site and the systemic pathological reactions as well as the unexpected immune responses and the duration of the reactions were mainly considered. The local muscle irritation test, hemolysis test, passive cutaneous anaphylaxis test, systemic acute toxicity test, repeat-dose toxicity test, abnormal toxicity test and active anaphylaxis test were carried out to evaluate toxicology.

The results showed that the dosage of the study product was within the safe range. The muscles at the injection site were irritated to some extent after the study product was given to the animals, but the irritation could be recovered after the administration ended. Apart from the local irritation, no obvious abnormalities were observed in the general conditions, body temperature, body weight, food intake, blood biochemistry, hematology, urine, bone marrow, ophthalmology, electrocardiogram, organ weight, histopathological examination and other measurements of the animals, and no obvious enhancement or inhibition of immune function was observed. Specific antibodies related to vaccine components can be detected. Considering the potential risk of allergy induced by the carrier protein, special attention should be paid in clinical use. The study product was able to coagulate rabbit red blood cells, but no hemolytic reaction was observed.

2.6.6.7 Local Tolerance

2.6.6.7.1. Muscle Irritation Test

In accordance with the relevant requirements predefined by the Provisions for Drug Registration on the declaration of new drugs, the single intramuscular injection irritation test of 13-valent pneumococcal conjugate vaccine manufactured by Yunnan Walvax Biotechnology Co., Ltd. was performed by National Chengdu New Drug Safety Evaluation Center in rabbits.

2.6.6.7.1.1. Objectives

To observe the irritant reaction in quadriceps femoris of rabbits induced by 13-Valent pneumococcal conjugate vaccine and to provide a reference for evaluating the safety of clinical use.

2.6.6.7.1.2. Methods

A total of 11 groups were set in this experiment, including a negative control group, a low aluminum phosphate dosage group and a high aluminum phosphate dosage group, a low-dose group and a high-dose group for the 7-valent PCV, as well as a low-dose and a high-dose group

Confidential 228
MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

for each of the 3 batches of 13-valent pneumococcal conjugate vaccine (batch no. 20110304, 20110305 and 20110406). Each group included 4 rabbits, half male and half female. Rabbits in the low-dose groups were given one dose of test sample at the corresponding concentration injected through quadriceps femoris in the volume of 0.5 mL per side, and rabbits in the high-dose groups were given one dose of test sample at the corresponding concentration injected through quadriceps femoris in the volume of 1.5 mL per side. Rabbits in the negative control group was given 0.9% sodium chloride injection in the volume of 1.5 mL per side. Two rabbits of each group were euthanized (CO₂ inhalation) and anatomized respectively 48 hours after administration and 16 days after administration. The injected quadriceps femoris was observed and graded, meanwhile histopathology was performed.

2.6.6.7.1.3. Results

(1) General conditions and gross anatomy results observed by naked eye: No local inflammation and congestion was observed at the injection site during the administration or recovery period.

About 48 hours after administration, in the high-dose group of 7-valent PCV, slight hyperemia was observed at the right injection site of the quadriceps femoris in 1 rabbit and moderate hyperemia was observed at the left injection site of the quadriceps femoris in 1 rabbit; in the high-dose group of 13-valent PCV (batch No. 20110304), moderate hyperemia was observed at the right injection site of the quadriceps femoris in 1 rabbit; in the high-dose group of 13-valent PCV (batch No. 20110406), moderate hyperemia was observed at the right injection site of the quadriceps femoris in 1 rabbit. No significant abnormalities were observed at the injection site of the quadriceps femoris in the rest rabbits. No obvious abnormal changes were observed in the muscle at the injection site in all rabbits 16 days after administration.

(2) Histopathology results: About 48 hours after administration, changes such as mild to severe degenerative necrosis of muscle fiber or muscle interstitial, bleeding, inflammatory cell infiltration were observed in the high-dose group of 7-valent PVC, the high-dose groups of 13-valent PCV of 3 different batch numbers and the low-dose group of 13-valent PCV with batch No. 20110305, indicating muscle irritation at the injection site. After 16 days of administration, mild interstitial inflammatory cell infiltration was still observed in the muscles at the injection site in the low-dose and high-dose group of aluminum phosphate, as well as the high-dose group of 13-valent PCV with batch No.20110305. No obvious abnormalities were observed in the muscles at the injection site in the rest groups, indicating that the above irritation could be partially recovered after the 16-day observation.

2.6.6.7.1.4. Conclusions

Obvious irritation to quadriceps femoris of rabbits was induced by the injection of low-dose and high-dose aluminum phosphate, high-dose 7-valent PCV, high-dose 13-valent PCV of 3 different batch numbers, low-dose 13-valent PCV with batch No.20110406. The muscle irritation can be recovered to some extent after 16-day observation.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.6.6.7.2. Passive Cutaneous Anaphylaxis Test

In accordance with the relevant requirements predefined by the Provisions for Drug Registration on the declaration of new drugs, the passive cutaneous anaphylaxis test of 13-valent pneumococcal conjugate vaccine manufactured by Yunnan Walvax Biotechnology Co., Ltd. was performed by National Chengdu New Drug Safety Evaluation Center through intramuscular injection in Guinea pigs.

2.6.6.7.2.1. Objectives

To observe whether the passive cutaneous anaphylaxis was induced by 13-valent pneumococcal conjugate vaccine in guinea pigs, and to provide a reference for evaluating the safety of clinical use.

2.6.6.7.2.2. Methods

(1) Antiserum preparation: Twenty guinea pigs (half male and half female) were randomly divide into 10 groups including a negative control group, a positive control group, a low-dose group (sensitizing dosage of 0.05 mL bulk/kg, which was double as the clinical proposed dosage) and a high-dose group (sensitizing dosage of 0.5 mL bulk/kg, which was 10 times as the clinical proposed dosage) for the 7-Valent PCV and for each of the 3 batches of 13-Valent PCV (batch no. 20110304, 20110305 and 20110406) respectively. When sensitized, guinea pigs in the 13-valent pneumococcal conjugate vaccine group and the 7-valent pneumococcal conjugate vaccine group were given samples or control through intramuscular injection at the corresponding concentration according to the above prescribed dosage. Guinea pigs in the positive control group were given 10mg/mL ovalbumin solution in a volume of 0.5 mL per guinea pig through intraperitoneal injection, while guinea pigs in the negative control group were given 0.9% sodium chloride injection (normal saline) through intramuscular injection in a volume of 0.5 mL/kg. Sensitization was carried out 5 times continuously (once every other day). On the 10th day after the last sensitization, blood samples were collected through aorta abdominalis for antiserum preparation. The serums of two animals in the same group were mixed and kept in reserve.

Table 7 Summary Table of Administration Methods for Each Group in Passive Anaphylaxis Experiment

Group Administration method (2 Guinea Pigs/Group)

Negative Control Group 0.5mL/kg (0.9% Sodium Chloride)

Positive Control Group 10mg/mL (Ovalbumin Solution)

7-Valent PCV Low-dose Group 0.05mL/kg (Bulk)

Group High-dose Group 0.5mL/kg (Bulk)

Low-dose Group 0.05mL/kg (Bulk)

20110304

High-dose Group 0.5mL/kg (Bulk)

Low-dose Group 0.05mL/kg (Bulk)

20110305

High-dose Group 0.5mL/kg (Bulk)

Low-dose Group 0.05mL/kg (Bulk)

20110306

High-dose Group 0.5mL/kg (Bulk)

(2) Locus coeruleus test: Sixty guinea pigs (half male and half female) were randomly divided into 10 groups at the same setting as the antiserum preparation stage. The antiserum of each group was diluted at the degree of 1:2, 1:8 and 1:32, and serum of each dilution degree was injected intracutaneously to each animal through 3 pre-depilated points (3×4cm²) on the back in the volume of 0.1 mL per point. Four hours after the intradermal injection, 1 mL mixture consisted of the same

Confidential 230

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

dosage of provocative antigens as in step (1) and the same amount of 1% evensland dye was injected intravenously to the guinea pigs. Thirty minutes after the injection, guinea pigs were anesthetized (pentobarbital sodium, about 60 mg/kg, intraperitoneally injected) and euthanized by abdominal aortic bleeding. The length and diameter of the locus coeruleus were measured and the locus coeruleus were photographed

2.6.6.7.2.3. Conclusions

For the negative control group, the diameters of intradermal locus coeruleus at the injection site were 0 mm at all dilution degrees; for the positive control group, the average diameter of locus coeruleus was 15.23 mm when the dilution degree was 1:32, 19.17 mm when the dilution degree was 1:8, and 22.6 mm when the dilution degree was 1:2. The diameters of locus coeruleus for all vaccine groups were 0mm at all dilution degrees.

2.6.6.7.3. Hemolysis Test

In accordance with the relevant requirements predefined by the Provisions for Drug Registration on the declaration of new drugs, the hemolysis test of the study product was performed by National Chengdu New Drug Safety Evaluation Center through intramuscular injection in Guinea pigs, with a purpose to observe the effect of the study product on the state of rabbit red blood cells and to provide reference for the safety evaluation of clinical use.

The groups in this experiment included the negative control group (0.9% sodium chloride injection), the positive control group (sterile water for injection), adjuvant control group (1 mg/mL aluminum phosphate concentration) and the study product of 3 batches (batch No. 20110304, 20110305, 20110406). Five groups of different dosages (0.5, 0.4, 0.3, 0.2, 0.1 mL/tube) were set for aluminum phosphate and the study product of each batch respectively. Rabbit red blood cell suspension (2%), aluminum phosphate adjuvant, the study product, 0.9% sodium chloride injection and sterilized water for injection were mixed in a certain proportion and placed in a 37 ± 0.5 °C incubator. The compound was observed at 0, 15, 30, 45, 60 minutes and 2, 3 hours respectively. Three parallel tubes were made for each dosage.

The results showed that no hemolytic and coagulation reaction were observed in the negative control group and no hemolytic reaction was observed in the positive control group after preserved at 37 ± 0.5 °C for 3 hours. In the aluminum phosphate adjuvant group, red blood cell aggregation was observed in each tube (0.5, 0.4, 0.3, 0.2, 0.1 mL/tube), and the degree of aggregation was dose-dependent, but no hemolytic reaction was observed. Red blood cell aggregation was observed in each tube (0.5, 0.4, 0.3, 0.2, 0.1 mL/tube) of three batches of the study product, and the degree of aggregation was lower than that of the aluminum phosphate group, but no significant dose-dependent relationship and no hemolytic reaction were observed.

In conclusion, under conditions of this experiment, aluminum phosphate adjuvant (concentration of 1 mg/mL, the same as the concentration of aluminum phosphate in the formulation of the study product) and the study product (batch No. 20110304, 20110305, 20110406) at different dosages (0.5, 0.4, 0.3, 0.2, 0.1 mL/tube) had aggregation effect on rabbit red blood cells, but no hemolytic reaction was observed.

2.6.6.8.7 Other studies

2.6.6.8.7.1 Acute Toxicity Study

In accordance with the relevant requirements predefined by the Provisions for Drug Registration on the declaration of new drugs, the acute toxicity test of 13-valent pneumococcal conjugate vaccine manufactured by Yunnan Walvax Biotechnology Co., Ltd. was performed by National Chengdu New Drug Safety Evaluation Center through intramuscular injection in Kunming mice.

2.6.6.8.7.1.1 Objectives

To evaluate the nature, degree, time-effect relationship and reversibility of the possible toxic reaction; to determine the toxic target organs or target tissues; to provide a reference range of safety for clinical use.

2.6.6.8.7.1.2 Methods

The Walvax's 13-Valent PCV samples were divided into 3 groups by batch numbers of 20110304, 20110305, and 20110406, respectively. Mice in each group were administered with 13-Valent PCV of corresponding batch number at a concentration of 64.4 µg/mL (calculated based on the total amount of pneumococcal polysaccharide) in a volume of 10 mL/kg. Another negative control group was set and mice in the control group was injected with 0.9% sodium chloride injection at the volume of 10 mL/kg. Each group included 10 mice, half male and half female. The maximum administration volume for each mouse was a single intramuscular injection with corresponding test sample or sodium chloride injection (intramuscularly injected on bilateral hind legs simultaneously) in a volume of 10 mL/kg. The day of administration was defined as Day 1 in this experiment.

The general conditions of mice in each group was observed daily after administration; the body weight was measured twice and food intake was measured once each week; on the 15th day of this experiment, abdominal aortic blood was collected from all surviving mice after anesthetization (about 60 mg/kg of sodium pentobarbital, intraperitoneal injection) for hematological and biochemical examination. The mice were also systematically autopsied for comprehensive observation of animal appearances and internal organs.

2.6.6.8.7.1.3 Conclusions

The mice were in good condition during the 14-day observation after administration of Pneumococcal 13-Valent Conjugate Vaccine (batch no. 20110304, 20110305, 20110406) in the maximum dosage volume of 10 mL/kg. No obvious toxicity reaction was observed.

2.6.6.8.7.2 Abnormal Toxicity

2.6.6.8.7.2.1 Abnormal Toxicity Test in Mice

In accordance with the relevant requirements predefined by the Provisions for Drug Registration on the declaration of new drugs, the abnormal toxicity test of 13-valent pneumococcal conjugate vaccine manufactured by Yunnan Walvax Biotechnology Co., Ltd. was performed by National Chengdu New Drug Safety Evaluation Center through intraperitoneal injection in mice.

2.6.6.8.7.2.1.1 Objectives

To determine whether the samples were contaminated with foreign substances and whether there were unexpected unsafe factors; to provide a reference for evaluating the safety of clinical use.

2.6.6.8.7.2.1.2 Methods

One dosage group of 13-Valent PCV sample at the clinical proposed dosage (0.5 mL per mouse) was set in this experiment and a total of 5 male mice were included. Each mouse was injected with 0.5 mL of the sample once intraperitoneally. Measurements such as the animals' appearance, general behavior, mental state, inhalation, genitalia, crissum, fecal urine, articulo mortis or death were observed after administration and recorded once a day, for a total of 7 days. The animals were weighed after the 7-day observation ended. Specific results are showed in the table below.

2.6.6.8.7.2.2 Abnormal Toxicity Test in Guinea Pigs

In accordance with the relevant requirements predefined by the Provisions for Drug Registration on the declaration of new drugs, the abnormal toxicity test of 13-valent pneumococcal conjugate vaccine manufactured by Yunnan Walvax Biotechnology Co., Ltd. was performed by National Chengdu New Drug Safety Evaluation Center through intraperitoneal injection in guinea pigs.

2.6.6.8.7.2.2.1 Methods

One dosage group of 13-Valent PCV sample at the clinical proposed dosage (5 mL per guinea pig, 10 doses) was set in this experiment and a total of 6 guinea pigs (half male and half female) were included. Each guinea pig was injected with 5 mL of the sample once intraperitoneally.

Measurements such as the animals' appearance, general behavior, mental state, inhalation, genitalia, crissum, fecal urine, articulo mortis or death were observed after administration and recorded once a day, for a total of 7 days. The animals were weighed after the 7-day observation ended. Specific results are showed in the table below.

2.6.6.8.7.3 Specific Toxicity Test and Test for Reversion to Toxicity - Tetanus Toxoid Toxicity Tests

In accordance with the relevant requirements of the Technical Guidelines for Pre-clinical Research of Prophylactic Vaccines and the Technical Guidelines for Conjugate Vaccine Quality Control and Clinical Research, the specific toxicity test and toxicity irreversibility test targeting the carrier protein (tetanus toxoid) were performed for each type of conjugate bulk. Based on the methods of specific toxicity test and toxicity irreversibility test for tetanus toxoid specified in the "adsorptive

tetanus vaccine" part of Pharmacopoeia of the People's Republic of China (2010 edition, Volume III), the specific toxicity test and test for reversion to toxicity were performed for 13 types of conjugates, and the safety of each type of conjugate bulk was evaluated.

Healthy guinea pigs (250-350 g, purchased from Animal Laboratory Center of Kunming Medical University).

2.6.6.8.7.2.3.2 Methods

(1) Specific Toxicity Test

Each guinea pig (4 guinea pigs in total) was subcutaneously injected with 2 mL conjugate bulk and observed for 21 days.

(2) Test for Reversion to Toxicity

The TT flocculating unit was assigned as A Lf/mL, protein concentration as B µg/mL, and protein concentration in conjugate bulk as C µg/mL. One Lf corresponded to B/A µg protein. Conjugate bulk in a volume of 300 *(b/a)/C ml was diluted to 30ml (sterile operation) with PBS, and set aside at 37■for 42 days. Each guinea pig was subcutaneously injected with 5 mL sample (4 guinea pigs in total) and observed for 21 days.

2.6.6.8.7.2.3.3 Results

The results of specific toxicity test and test for reversion to toxicity were summarized in the table below.

2.6.6.8.7.4. Systemic Active Anaphylaxis Experiment
In accordance with the relevant requirements predefined by the Provisions for Drug Registration on the declaration of new drugs, the systemic active anaphylaxis test of 13-valent pneumococcal conjugate vaccine manufactured by Yunnan Walvax Biotechnology Co., Ltd. was performed by National Chengdu New Drug Safety Evaluation Center through intramuscular injection in Guinea pigs.

2.6.6.8.7.4.1. Objectives
To observe whether the systemic anaphylaxis was induced by 13-valent pneumococcal conjugate vaccine in guinea pigs; to provide a reference for evaluating the safety of clinical use.

2.6.6.8.7.4.2. Methods
A total of 10 groups were set in this experiment, including a negative control group, a positive control group, a low-dose group and a high-dose group for the 7-valent PCV, as well as a low-dose and a high-dose group for each of the 3 batches of 13-valent pneumococcal conjugate vaccine (batch no. 20110304, 20110305 and 20110406). Each group included six guinea pigs, half male and half female. The sensitizing dosage for the low-dose groups was 0.05 mL bulk per kg, which was twice as the proposed clinical dosage; the sensitizing dosage for the high-dose groups was 0.5 mL bulk per kg, which was 10 times as the proposed clinical dosage. When sensitized, guinea pigs in the 13-valent pneumococcal conjugate vaccine group and the 7-valent pneumococcal conjugate vaccine group were given samples or control through intramuscular injection at the corresponding concentration according to the above prescribed dosage. Guinea pigs in the positive control group were given 10mg/mL ovalbumin solution in a volume of 0.5 mL per guinea pig through intraperitoneal injection, while guinea pigs in the negative control group were given 0.9% sodium chloride injection (normal saline) through intramuscular injection in a volume of 0.5 mL/kg. Sensitization was carried out 5 times continuously (once every other day). On the 10th day after the last sensitization, the guinea pigs in each group were stimulated by a single injection through the dorsalis pedis vein at twice the sensitizing dosage. Systemic reactions and death of guinea pigs were observed for at least 30 minutes after irritation injection.

2.6.6.8.7.4.3 Results

No anaphylaxis was observed for guinea pigs in the negative control group, 7-valent pneumococcal conjugate vaccine control group and the low-dose groups of 13-valent pneumococcal conjugate vaccine in three different batch numbers within 30 minutes after injection. All guinea pigs in the positive control group experienced strong positive reaction and all died within 4 minutes. Three guinea pigs in the 13-valent pneumococcal conjugate vaccine (batch No. 20110304, 0.5 mL/kg) group experienced strong positive allergic reaction with a duration of 6-21 minutes; one guinea pig experienced extremely positive reaction and died about 7 minutes after being stimulated. One guinea pig in the 13-valent pneumococcal conjugate vaccine (batch No. 20110305, 0.5 mL/kg) group experienced positive allergic reaction and one experienced strong positive reaction with a duration of 4-6 minutes; one guinea pig experienced extremely positive reaction and died about 7 minutes after being stimulated. Three guinea pigs in the 13-valent pneumococcal conjugate vaccine (batch No. 20110306, 0.5 mL/kg) group experienced positive allergic reaction and one experienced strong positive reaction with a duration of 23-30 minutes.

2.6.6.8.7.4.4. Conclusions

Under a dosage of 0.5 mL bulk/kg, the systemic active anaphylaxis tests on guinea pigs were all positive. Under a dosage of 0.05 mL bulk/kg, the systemic active anaphylaxis tests on guinea pigs were all negative.

2.6.6.8.7.5. Long-Term Toxicity Test

2.6.6.8.7.5.1. Long-Term Toxicity Test in New Zealand Rabbits

In accordance with the relevant requirements predefined by the Provisions for Drug Registration on the researches of new drugs, toxicity test of repeated intramuscular injection (5 times in total) for 13-valent pneumococcal conjugate vaccine manufactured by Yunnan Walvax Biotechnology Co., Ltd. was performed by National Chengdu New Drug Safety Evaluation Center in New Zealand rabbits.

2.6.6.8.7.5.1.1. Objectives

To evaluate the preclinical safety of 13-valent pneumococcal conjugate vaccine, including the nature, extent, dose-response and time-effect relationship, as well as the reversibility of probable toxicities to the immune organs and other toxic target organs induced by the vaccine; to provide a reference for clinical researches.

2.6.6.8.7.5.1.2. Methods

A total of 6 groups were set in this experiment, including a low-dose group (0.13 mL per animal) and a high-dose group (0.5 mL per animal) for the 13-valent PCV, a low-dose group (0.13 mL per animal) and a high-dose group (0.5 mL per animal) for aluminum phosphate adjuvant at a concentration of 1 mg/mL, a 7-valent PCV group (0.5 mL per animal) as well as a negative control group (0.5 mL of 0.9% NaCl solution per animal). A total of 20 New Zealand rabbits were included in each group (half male and half female). The rabbits in each group were injected with corresponding sample or control through quadriceps femoris according to the given dosage. The administration was carried out once respectively on Week 0, 2, 4, 6 and 8 (5 times in total). The animals were observed for 28 days after the last administration. The day of the first injection was defined as Day 1 of this experiment.

The general conditions of the rabbits were observed daily during the administration and recovery period. The body weight and food intake were measured once each week. The rectal temperature was measured about 60 minutes and 24 hours after each administration. Antibodies were detected in the negative control group and the 13-valent PCV group before administration, 21 and 35 days after the first injection, 14 days after the last injection as well as at the end of the recovery period. T lymphocyte (CD4+, CD8+), cytokines (IL-2, IL-6, IFN- γ) and immunoglobulin (IgG) were detected 21 and 35 days after the first injection, 72 hours after the last injection as well as at the end of recovery period. Hematology, blood biochemistry and complements (C3, C4) of each group were detected 72 hours, 21 days and 35 days after the first injection, 72 hours after the last injection, as well as at the end of the recovery period. In each group, 12 rabbits (half male and half female) were euthanized 72 hours after the last injection and 8 rabbits (half male and half female) were euthanized at the end of the recovery period. Urine and bone marrow were examined and systematic autopsy as well as histopathological examination were performed.

2.6.6.8.7.5.1.3 Results

(1) General conditions: On the 12th day after the last administration, one male rabbit (No. 4M09) in the high-dose group of aluminum phosphate adjuvant died. The animal developed severe loose stool for three days before death. The death of this animal was an individual accident and should not be related to the injection of aluminum phosphate adjuvant. Other than that, no death was observed in other groups of rabbits during the period of administration and recovery. The rabbits had normal physical appearance, mental and motor state. The natural pores were clean. No obvious abnormal reactions were observed. No toxic reactions were observed. No local irritant reactions

Confidential 241

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

such as inflammation, ecchymosis, induration, suppuration and fester were observed at the injection site.

(2) Body weight and food intake: No significant abnormalities were observed in the body weight and food intake of the rabbits in each group at the detection time points in the administration and recovery period.

(3) Body temperature: No significant abnormalities were observed in the body temperature of the rabbits in each group at the detection time points after each administration.

(4) Hematology: No significant abnormalities were observed in the WBC count and classification, RBC, HGB, HCT, RET, PLT, PT and APTT at the detection time points in the administration and recovery period.

(5) Blood biochemical measurements: No significant abnormalities were observed in ALP, ALT, AST, GGT, TP, ALB, GLU, TBIL, GHOL, TG, CK, Urea, Crea and the electrolyte concentration (K⁺■Na⁺■Cl⁻) at the detection time points in the administration and recovery period.

(6) Immunological measurements: No significant abnormalities were observed in the complements (C3, C4), T lymphocyte (CD 4+, CD 8+), cytokines (IL-2, IL-6, IFN- γ) and Immunoglobulin (IgG) at the detection time points in the administration and recovery period. All serotypes of polysaccharide antibodies induced by 13-valent pneumococcal conjugate vaccine could be detected in the serum of rabbits in both low-dose and high-dose group 21 days after the

first administration. In the low-dose group, the levels of serotype 1, 3, 4, 5, 7F and 9V polysaccharide antibody peaked 21 days after the first administration, while serotype 6A, 6B, 14, 18C, 19A, 19F and 23F peaked 35 days after the first administration and then decreased gradually. Antibodies of certain titers could still be detected 28 days after the last administration. In the high-dose group, the levels of serotype 1, 3, 4, 5, 6A, 7F 9V 18C and 19A polysaccharide antibody peaked 21 days after the first administration, while serotype 6B, 14, 19F and 23F peaked 35 days after the first administration and then decreased gradually. Antibodies of certain titers could still be detected 28 days after the last administration. Except for serotype 5, 6A, 6B, 19F and 23F, the antibody titers of other polysaccharide serotypes were dose-related, and the serum antibody level of high-dose group was slightly higher than that of low-dose group.

(7) Urine measurements: No obvious abnormalities were observed in the grade distribution or positive rate of urine glucose, bilirubin, acetone bodies, specific gravity, occult blood, PH value, urocholinogen, nitrite and white blood cells in the urine of rabbits in each group 72 hours after the last administration and at the end of the recovery period.

(8) Bone marrow measurements: No obvious abnormalities were observed in granulocyte system, erythroid system, lymphocyte percentage, monocytes percentage, percentage of other cells, granulocyte-erythroid ratio, and megakaryocyte count in the bone marrow of rabbits in each group 72 hours after the last administration and at the end of the recovery period.

(9) Organ weight and coefficients: No obvious abnormalities were observed in the organ weight and coefficient of brain, heart, liver, spleen, lung, kidney, adrenal gland, thymus and reproductive system of the rabbits in each group 72 hours after the last administration and at the end of the recovery period.

(10) Gross anatomy and histopathology examination: Dark red areas of different sizes were observed in the muscles at the injection site of 1 rabbit (1 / 10) respectively in the high-dose group of 7-valent PCV, the high-dose group of aluminum phosphate adjuvant, as well as both the high-dose group and the low-dose group of 13-valent PCV 72 hours after the last administration. Gray areas (0.5×0.5cm) were observed in the muscles at the injection site of 1 Rabbit (1 / 10) in the

Confidential 242 MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

high-dose group of 13-valent PCV. Other than the above changes, no abnormal changes associated with the study vaccine were observed with naked eye in the location, size, shape, color and texture of organs or tissues such as brain, heart, liver, spleen, lung, kidney, gastrointestinal tract and reproductive system. Mild to moderate degeneration of muscle fibers and inflammatory cell infiltration in different proportions were observed in the muscles of rabbits injected with 7-valent PCV, aluminum phosphate adjuvant and 13-valent PCV 72 hours after the last administration. Other than that, no histopathological changes were found in the brain, heart, liver, spleen, lung, kidney, gastrointestinal tract and reproductive system of the rabbits in each group.

At the end of the recovery period, pathological changes in muscles at the injection site could be recovered to a certain extent. The incidence and degree of the pathological changes were lower than that obtained 72 hours after the last administration except some individual animals in the high-dose group of aluminum phosphate adjuvant.

2.6.6.8.7.5.1.4 Conclusions

Certain irritation to the muscles at the injection sites of rabbits were observed for 7-Valent PCV, aluminum phosphate adjuvant and 13-Valent PCV, which partially recovered after the last administration. Relevant specific antibodies could be detected 21 days after the first injection of 13-Valent PCV. The antibody titer peaked 21-35 days after the first injection, and then reduced gradually. The antibody level remained at a certain level 28 days after the last injection. In addition, 7-valent PCV, aluminum phosphate adjuvant, and 13-valent PCV did not have any obvious impacts on measurements including the general conditions, body temperature, body weight, food intake, blood biochemical results, hematology, bone marrow and organ weight. No obvious enhancement or inhibition of the immune function was observed. No obvious abnormal reactions were observed in histopathological examinations of all organs.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.6.6.8.7.5.2 Long-Term Toxicity Test in Macaca mulatta

In accordance with the relevant requirements predefined by the Provisions for Drug Registration on the researches of new drugs, toxicity test of repeated intramuscular injection for 13-valent pneumococcal conjugate vaccine manufactured by Yunnan Walvax Biotechnology Co., Ltd. was performed by National Chengdu New Drug Safety Evaluation Center in Macaca mulatta.

2.6.6.8.7.5.2.1 Objectives

To evaluate the preclinical safety of 13-valent pneumococcal conjugate vaccine, including the nature, extent, dose-response and time-effect relationship, as well as the reversibility of probable toxicities to the immune organs and other toxic target organs induced by the vaccine; to provide a reference for clinical researches.

2.6.6.8.7.5.2.2 Methods

A total of 4 groups were set in this experiment including a negative control group (0.5 ml of 0.9% NaCl solution per animal), an aluminum phosphate group (0.5 mL of 1 mg/mL of aluminum phosphate per animal), as well as a low-dose group and a high-dose group (0.11 mL and 0.5 mL per animal, respectively) of 13-Valent PCV. A total of 8 monkeys were included in each group (half male and half female). The monkeys in each group were injected with corresponding sample or control at the given dose through lateral thigh muscle once every 2 weeks (5 times in total). The monkeys were observed for 6 weeks after the last administration. The day of first injection was defined as Day 1 in this experiment.

The general conditions of the monkeys was observed daily during administration period and recovery period. The body weight and food intake were measured once a week. The body temperature was measured before administration, 60 minutes after, and 3 hours after administration. Hematology, blood biochemical examination, complements (C3 and C4) detection, immunoglobulin (IgG) detection, circulating immune complex (CIC) detection, T lymphocyte subsets (CD3+, CD4+, CD8+) detection, and cytokines (IL-2, IL-6, IFN- γ , TNF- α) were performed 24 hours after the first, the third and the last administration as well as at the end of the recovery period. Urine and bone marrow smears were examined 24 hours after the last administration and at the end of the recovery period on the day of autopsy. II lead ECG and ophthalmologic examination were performed after the last administration and 1 day before the recovery period ended. Antibodies were detected 21 and 35 days before the first administration as well as 24 hours, 15 days and 29 days after the last administration. Four monkeys in each group (half male and half female) were anatomized 24 hours after the last administration and at the end of the recovery period, for systematic autopsy and histopathology examination.

2.6.6.8.7.5.2.3 Results

- (1) General conditions: During the administration and recovering observation period, the monkeys in each group had normal physical appearance, mental and motor state. The natural pores were clean. No obvious abnormal reactions were observed. No abnormal reactions were observed. No local irritant reactions such as inflammation, ecchymosis, induration, suppuration and fester were observed at the injection site.
- (2) Body weight and food intake: The weight gain of monkeys in each group was normal and no significant abnormalities were observed in the food intake at the detection time points in the administration and recovery period.
- (3) Body temperature: No obvious abnormalities were observed in the body temperature of the monkeys in each group at the detection time points in the administration period.

Confidential 244

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

- (4) Ophthalmologic examination: In each group, the dioptric media of the eyes were clear. The fundus veins of the eyes were clear without bleeding and exudation. No edema was observed in the optic papilla. The macula was clear, and the structure of the macula arch was normal. The diameter of the retinal artery was homogeneous, and no obvious dilation or tortuosity of the veins as well as other abnormal symptoms of the retina were observed.
- (5) Hematology: No significant abnormalities were observed in the WBC count and classification, RBC, HGB, HCT, RET, PLT, PT and APTT at the detection time points in the administration and recovery period.
- (6) Blood biochemical measurements: No significant abnormalities were observed in ALP, ALT, AST, GGT, TP, ALB, GLU, TBIL, GHOL, TG, CK, Urea, Crea and the electrolyte concentration (K^{+} ■ Na^{+} ■ Cl^{-}) at the detection time points in the administration and recovery period.
- (7) Immunological measurements: No significant abnormalities were observed in the complements (C3, C4), T lymphocyte (CD 4+, CD 8+), cytokines (IL-2, IL-6, IFN- γ) and Immunoglobulin (IgG) at the detection time points in the administration and recovery period. Serotype 1, 3, 4, 5, 6A, 7F, 9V, 14, 18C, 19A, and 23F polysaccharide antibodies induced by 13-valent pneumococcal conjugate vaccine could be detected in the serum of monkeys in each group 21 days after the first administration. Polysaccharide antibody of all serotypes peaked 21 to 35 days after the first administration and then decreased gradually. Antibodies of certain titers could still be detected 29 days after the last administration. Except for serotype 6B, the antibody titers of other polysaccharide serotypes were dose-related, and the serum antibody level of high-dose group was slightly higher than that of low-dose group.
- (8) Urine measurements: No obvious abnormalities were observed in the grade distribution or positive rate of urine glucose, bilirubin, acetone bodies, specific gravity, occult blood, PH value, urocholinogen, nitrite and white blood cells in the urine of monkeys in each group at the end of the administration and recovery period.
- (9) ECG measurements: No obvious abnormalities were observed in heart rate, R-R interval, P-R interval, QRS wave time, Q-T interval, corrected Q-T interval and the shape of II lead ECG of monkeys in each group at the end of the administration and recovery period.
- (10) Bone marrow measurements: No obvious abnormalities were observed in erythroid cells, granular cells, lymphocytes, monocytes and megakaryocyte percentage in the bone marrow of monkeys in each group at the end of the administration and recovery period.
- (11) Organ weight and coefficients: No obvious abnormalities were observed in the organ weight and coefficient of brain, heart, liver, spleen, lung, kidney, adrenal gland, thymus and reproductive system of the rabbits in each group 72 hours after the last administration and at the end of the recovery period.
- (12) Gross anatomy and histopathology examination: Dark red areas in a size of 0.9 * 0.4 cm – 1.0 * 0.7 cm were observed in the muscles at the injection site of 1 male monkey (1 / 4) in the high-dose group of 13-valent PCV at the end of administration. Other than the above changes, no abnormal changes associated with the study vaccine were observed with naked eye in the location, size, shape, color and texture of organs or tissues such as brain, heart, liver, spleen, lung, kidney, gastrointestinal tract and reproductive system. Mild inflammation was observed at the injection site for 2 monkeys (2/4) in the aluminum phosphate adjuvant group, and mild inflammation was observed at the injection site for 2 monkeys (2/4) in the high-dose group of 13-valent PCV. Other than the changes above, no histopathological changes were found in the rest organs and tissues of the monkeys in each group. The pathological changes in muscles at the injection site of monkeys in each group recovered obviously at the end of the recovery period.

2.6.6.8.7.5.2.4 Conclusions

Certain irritation to the muscles at the injection sites of monkeys were observed for aluminum phosphate adjuvant and 13-Valent PCV, which partially recovered after the last administration. Other than that, no obvious impacts on measurements including the general conditions, body temperature, body weight, food intake, blood biochemical results, hematology, bone marrow, organ weight, ophthalmology and ECG were observed. No obvious enhancement or inhibition of the immune function was observed. Relevant specific antibodies could be detected 21 days after the first injection of 13-Valent PCV. The antibody titer peaked 21-35 days after the first injection, and then reduced gradually. The antibody level remained at a certain level 29 days after the last injection.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.6.6.9. Discussion and Conclusions

The results of toxicological tests showed that the dosage of the study product was within the safe range; the study product had certain irritation to the muscles at the injection site after the product was given to the animals, but the irritation could be recovered after the administration ended; apart from the irritation, no obvious abnormalities were observed in the general conditions, body temperature, body weight, food intake, blood biochemistry, hematology, urine, bone marrow, ophthalmology, electrocardiogram, organ weight, histopathological examination and other measurements of the animals. The specific antibody related to vaccine components could be detected; the carrier protein had a certain risk of allergy, suggesting that special attention should be paid to clinical use; the study product had aggregation effect on rabbit red blood cells, but no hemolytic reaction was observed.

After multiple intramuscular injections of the study product were given to the rabbits in the volume of 0.13 mL and 0.5 mL per rabbit, 13 serotypes of pneumococcal polysaccharide antibodies were detected in 21 days after the first administration. The peak time of antibody titer of different subtypes was slightly different, and the antibody with certain titer level could still be detected 28 days after the last administration. Except for serotypes 5, 6a, 6b, 19F and 23F, the antibody levels of other types of polysaccharides were dose-dependent. The above results showed that the product had good immunogenicity to New Zealand rabbits and could induce the production of specific antibodies. The C3 value of 0.5 mL/mouse group was slightly higher than that of the control group 72 hours after the last administration, which might be related to the activation of complement system by bacterial polysaccharide. However, 13-JHYM had no significant effect on immunological measurements such as T lymphocyte subsets (CD4+, CD8+, CD4+/CD8+) and cytokines (IL-2, IL-6, IFN- γ). After repeated injections, the licensed 7-valent pneumococcal conjugate vaccine, aluminum phosphate adjuvant and the study product could cause slight to moderate degeneration and necrosis of muscle fiber and inflammatory cell infiltration to the muscles at the injection site of rabbits, which indicated that the 7-valent pneumococcal conjugate vaccine, aluminum phosphate adjuvant and the study product had muscle irritation to the animals. The degree of pathological changes in the study product group was similar to that of the 7-valent pneumococcal conjugate vaccine group. After the end of the recovery period, the above pathological changes could be recovered to a certain extent.

After repeated intramuscular injections of the study product were given to the Rhesus macaques in the volume of 0.11 mL and 0.5 mL per animal, 13 serotypes of pneumococcal polysaccharide antibodies were detected in 21 days after the first administration. The peak time of antibody titers of different subtypes was slightly different, and antibodies with certain titer could still be detected 29 days after the last administration. Except for serotype 6B, a certain dose-dependent relationship between the antibody levels was observed for other types of polysaccharides. The above results showed that the study product had immunogenicity to Rhesus macaques and could induce specific antibody production. During the period of administration and recovery observation, no abnormal changes of immune measurements such as complements (C3, C4), immune complex (CIC), T lymphocyte subsets (CD3+, CD4+, CD8+, CD4+/CD8+), cytokines (IL-2, IL-6, IFN- γ , TNF- α), immunoglobulin (IgG) and other immunological measurements were observed for monkeys in each group, indicating that the product had no obvious interference effect on the immune function of the body. After repeated administration, slight to mild inflammation was observed at the injection site of 0.5 mL/monkey group. In the 0.5 mL/animal aluminum phosphate group, the same pathological changes were observed in the muscles at the injection site, and the incidence and degree of the pathological changes were basically the same as that of the 0.5 mL/animal study product group. These results suggested that the high dose of the study product had muscle irritation to the animals, which might be related to the aluminum phosphate adjuvant contained in the

Confidential 247

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

vaccine. The above pathological changes could be recovered 6 weeks after the administration ended.

The study product is made by covalent binding of pneumococcal capsular polysaccharide antigens with tetanus toxoid carrier protein and adsorbed by aluminum phosphate adjuvant. In the experiment, the red blood cells were observed to aggregate and adhere to the test tube wall in varying degrees in the aluminum phosphate adjuvant group and the study product group of 3 batches, showing a certain dose-dependent relationship. Aluminum phosphate had a stronger adsorption effect, which was able to adsorb viruses, bacteria and toxins produced by bacteria. Therefore, the above phenomenon might be caused by the adsorption effect of aluminum phosphate.

2.5.1. Product Development Rational

The vaccine elicits immune response in recipients following immunization, and is indicated for the prevention of invasive disease caused by 13 serotypes (1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F) of Streptococcus pneumoniae.

The vaccine does not protect against diseases caused by Streptococcus pneumoniae serotypes that are not contained in the vaccine.

2.5.4.1. Study Design

The 13-valent pneumococcal polysaccharide conjugate vaccine (PCV13-TT) manufactured by Yuxi Walx Biotechnology Co., Ltd. Is proposed for the active immunization of infants and children 6 weeks through 5 years of age (before 6th birthday) for the prevention of invasive disease and otitis media caused by Streptococcus pneumoniae serotypes 1,3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F.

Two clinical trials (phase I and III) of the vaccine (PCV13-TT) were conducted within China, including 120 and 2760 subjects, respectively; among all subjects, 1754 have been vaccinated with at least one dose of PCV13-TT. In China, the pivotal phase III clinical trial of PCV13-TT was a randomized, blinded, positive control of imported similar vaccine (Prenvar), and non-inferiority study designed to evaluate the immunogenicity and safety of PCV13-TT and Prenvar in 2760 subjects 2 through 71 months of age (at least 6 weeks of age). Table 1 presents an overview of PCV13-TT clinical trials.

Objective Primary To assess the immunogenicity of Walvax PCV13-TT in healthy children aged 3 months and above. The proposed regimen consists of four doses, with a single intramuscular injection at 0, 1, 2 month for primary immunisation schedule and a single intramuscular injection at 12 to 15 months for booster immunisation schedule. To assess the non-inferiority of 7 common pneumococcal serotypes compared to

Prevfromnar 7® and the efficacy of 6 additional pneumococcal serotypes with same immunization schedule.

Secondary (1) To assess the immunogenicity of Walvax PCV13-TT in healthy children aged 2 months (≥6 weeks). The proposed regimen consists of four doses, with a single intramuscular injection at 0, 1 and 2 month for primary immunisation schedule and a single intramuscular injection at 12 to 15 months for booster immunisation schedule.

(2) To assess the non-inferiority of 7 common pneumococcal serotypes compared to Prevfromnar 7® and the efficacy of 6 additional pneumococcal serotypes with same immunization schedule.

(3) To assess antibody opsono-phagocytosis activity (OPA) Walvax PCV13-TT in healthy children aged 2 months (≥6 weeks) to 71months by different immunization procedures.

(4) To assess the safety of Walvax PCV13-TT in healthy children aged 2 months (≥6 weeks) to 71months. Evaluate safety of PCV13 in 6 weeks - 5 years old children

2.5.4.2. Summary of Efficacy Results 2.5.4.2.1. Phase III Clinical Trial

In the main target population (3 months of age)
The common serotypes achieved noninferiority criteria for comparison between PCV13-TT and PCV7 group except for serotype 6B during primary series, meanwhile all common serotypes in PCV13-TT group were noninferior to that in PCV7 group after the booster dose; for additional serotypes, superiority criteria were met for PCV13-TT group vs PCV7 group after primary series; the common serotypes in PCV13-TT group aged 3-71 months were all noninferior to those in PCV7 group during primary series, besides, the additional serotypes in PCV13-TT group were all superior as compared to PCV7 group.

For PCV13-TT (2 months) group vs PCV7 (3 months) group
Both common and additional serotypes had achieved noninferiority or superiority criteria post primary series. For PCV13-TT (2 months) group vs PCV13-TT (3 months) group, 12 serotypes reached noninferiority criteria during primary series except for additional serotype 5; and all 13 serotypes were noninferior to those in PCV13-TT (3 months) group post booster dose.

In PCV13-TT recipients aged 7-11 months, 12-23 months, and 24-71 months
The proportions of subjects with IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ for common serotypes were all noninferior to those in PCV7 group. The additional serotypes in PCV13-TT group of 7-11 months had reached superiority criteria after primary series; for PCV13-TT groups of 12-23 months and 24-71 months, superiority criteria were generally met after immunization. The results before and after booster dose indicated decrease in the antibody levels of several serotypes in the 13 serotypes either in PCV13-TT group or PCV7 group to some extent, while the percentage of subjects with IgG antibody concentration $\geq 3.5 \mu\text{g/mL}$ and antibody GMC after 1 dose of booster immunization both reached or exceeded the levels observed after primary series, demonstrating significant effect of the booster dose, reflecting the immunological memory effect of the conjugate vaccine adequately. The antibody GMC post booster dose had more than 3-fold increase in the 2-6 months olds, and greater than 1-fold increase in subjects aged 7-11 months as compared with the GMC before booster dose.

To sum up, the immunogenicity of 7 common serotypes in main target population aged 3 months met the non-inferiority criteria after booster dose, and that of 6 new serotypes had already achieved the standard of superiority after primary immunizations in this clinical trial. The common and additional serotypes had fulfilled the non-inferiority or superiority standard in subjects 3-71 months of age after primary immunizations. The common and additional serotypes in PCV13-TT group (2 months) were noninferior and/or superior to that in PCV7 (3 months) group. In PCV13-TT (2 months) group, all 13 serotypes were noninferior to those in the PCV13-TT (3 months) group post booster dose. The results of immunogenicity evaluation in this clinical trial had achieved the study objectives predefined in the protocol.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.5.5. Overview of Safety 2.5.5.1. Phase I Clinical Trial

The incidence of vaccine-related adverse events was 80.00%, 53.33%, 66.67% and 70.00% in adults, children, 2-month-old and PCV13-TT (3 months) group, respectively. A total of 6 cases in the adult group experienced grade 3 local adverse reactions, corresponding to an incidence rate of 20% (6 / 30), including 1 case of local redness, 1 case of induration, 2 cases of swelling, 2 cases of redness combined with swelling. The incidence rate of adverse reactions with grade 3 severity in other age groups was less than 15%.

The most common symptoms of systemic adverse reactions were fever in adults and children aged 2-5 years, and were fever and diarrhea in 2-month-old and 3-month-old infants. Common local adverse reactions in adults included redness, pain and swelling at the vaccination site, and were pain and redness in children aged 2-5 years, as compared to redness in infants 2 and 3 months of age.

Adverse events mainly occurred on Day 0-7. No adverse events related to the study vaccine were collected on Day 8-30, and no serious adverse events were collected during the observation period.

2.5.5.2. Phase III Clinical Trial

The overall incidence of adverse events in PCV13-TT group was lower than that in PCV7 group. No significant intergroup difference was observed in the incidence of vaccine-related adverse events. The main symptom of systemic adverse reaction was fever. The incidence of systemic reactions in PCV13-TT group was lower than that in PCV7 group. Local adverse reactions were primarily redness, swelling and pain at the injection site. No significant difference was observed in the incidence of local reactions between PCV13-TT group and PCV7 group.

The incidence of vaccine-related grade 3 adverse events in PCV13-TT group and PCV7 group was 4.21% and 2.41%, respectively. The incidence of local adverse reactions with severity reaching grade 3 in PCV13-TT group was higher than that in PCV7 group, while no significant intergroup difference was observed in subjects aged 3 months.

A total of 80 cases (105 events) of SAEs were observed during primary series and 8 cases (10 events) of SAEs were noted during booster dose. No significant intergroup difference was observed in the incidence of SAEs. SAEs were not related to the study vaccine except for one case in PCV13-TT (3 months) group with fever determined to be probably related to the study vaccine.

The incidence of adverse events/reactions in PCV13-TT group was not higher than that in PCV7 group.

2.2 CTD Introduction

INTRODUCTION

The Applicant has developed the 13-valent Pneumococcal Polysaccharide Conjugate Vaccine (Weuphoria), for use in infants and young children to prevent pneumococcal disease, caused by the 13 pneumococcal serotypes contained in the vaccine.

Weuphoria is a sterile liquid formulation of pneumococcal capsular polysaccharides of serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F, individually conjugated to tetanus toxoid. Phosphate-buffered Saline is also included in the Weuphoria formulation to improve process control and to provide further pH control following the addition of aluminum phosphate.

Manufacturer: Yuxi Walvax Biotechnology Co., Ltd.

Common name of drug product: 13-valent Pneumococcal Polysaccharide Conjugate Vaccine.

This vaccine is produced by culture, extraction and purification of polysaccharide antigens of 13 epidemic and infectious Streptococcus pneumoniae of serotypes of 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F. After being activated and derived, the polysaccharide conjugates with tetanus toxoid carrier protein to form polysaccharide protein conjugate, which is prepared by mixing with a certain proportion and adding aluminum phosphate adjuvant. The vaccine is milky even suspension after shaking. After storage, white precipitates and supernatant can be seen due to the subsidence of adjuvant. No preservatives contained.

Table 1 Product Composition (each dose/0.5mL contains)

Active Substances	Nominal Composition	Function
Pneumococcal polysaccharide serotype 1	2.6 µg	Antigen
Pneumococcal polysaccharide serotype 3	2.5 µg	Antigen
Pneumococcal polysaccharide serotype 4	3.0 µg	Antigen
Pneumococcal polysaccharide serotype 5	2.5 µg	Antigen
Pneumococcal polysaccharide serotype 6A	2.5 µg	Antigen
Pneumococcal polysaccharide serotype 6B	6.0 µg	Antigen
Pneumococcal polysaccharide serotype 7F	2.85 µg	Antigen
Pneumococcal polysaccharide serotype 9V	2.5 µg	Antigen
Pneumococcal polysaccharide serotype 14	2.75 µg	Antigen

Proprietary name:

Route of administration: The vaccine should be shaken well immediately prior to use, and be given intramuscularly. The preferred sites for injection are the anterolateral aspect of the thigh in infants and the deltoid muscle of the upper arm in toddlers and children. Each dose (0.5 mL) is to be injected. The vaccine should not be injected in and/or near the areas where there may be a nerve trunk and/or blood vessel.

2.7.1. Biopharmaceutic Studies and Associated Analytical Methods
Pharmacokinetics
Pharmacokinetic studies were not performed in accordance with the note for guidance on clinical evaluation of new vaccines (CPMP/EWP/463/97).
Pharmacodynamics
As generally done with vaccines, pharmacodynamic studies are essentially comprised by the immunogenicity studies that characterise the immune response to vaccines. The detailed characterisation of the immunological response is discussed below.

2.7.3. Clinical Efficacy
2.7.3.1. Background
Streptococcus pneumoniae (S. pneumoniae) is a gram-positive encapsulated diplococcus and a major cause of mortality and morbidity worldwide with the highest incidence in infants under 2 years of age and in the elderly over 60 years of age. S. pneumoniae has been estimated to cause ~16 million deaths every year, including up to one million in children below 5 years of age. The highest morbidity and mortality rates have been reported from developing countries. The spectrum of disease encompasses invasive pneumococcal disease (IPD), such as sepsis and meningitis, lower respiratory infections, such as bacterial pneumonia and upper respiratory infections, such as acute otitis media (AOM). The relative incidences of the various disease entities are estimated to be that

for 1 case of IPD there are 100 cases of pneumonia and 1000 cases of otitis media. Prevnar, the first pneumococcal conjugate vaccine licensed in the United States (U.S.), was approved by the FDA for active immunization to prevent invasive pneumococcal disease (IPD) in February 2000. The serotypes in the vaccine were originally selected because, at that time, they accounted for approximately 80% of IPD in young children in North America. A high level of efficacy (aggregated for the 7 serotypes) in preventing vaccine serotype IPD was demonstrated in a clinical endpoint vaccine efficacy trial in infants. In October, 2002, an additional Prevnar indication was approved for active immunization of infants and toddlers against otitis media caused by vaccine serotypes. Efficacy against otitis media was supported by data from an acute otitis media efficacy trial, which involved tympanocentesis, as well as information on health care utilization for otitis media.

There are no efficacy studies with the 13-valent pneumococcal polysaccharide conjugate vaccine (Prevenar 13). The overall objective of the clinical development program was to evaluate the immunogenicity and safety of PCV13 in the target population. Non-inferiority of the immune response compared with licensed 7-valent Prevenar was specifically evaluated. Studies were designed to evaluate the immunogenicity and safety of the vaccine when used for primary, catch-up and booster vaccination; and to evaluate the presence of immune memory through administration of a booster dose.

Licensure criteria for pneumococcal conjugate vaccines

Over the past years, regulatory agencies and experts in the field have reflected upon the serological criteria for the evaluation and licensure of new pneumococcal conjugate vaccines. It was agreed to follow the same pathway as used for licensure of Hib and MenC conjugate vaccines, and after the demonstration of a high level of invasive pneumococcal disease efficacy in Northern California with Prevenar, to license future new pneumococcal conjugate vaccines for IPD purely on the basis of immunological data in comparison with the licensed vaccine. A consensus recommendation on criteria for licensure of new pneumococcal conjugate vaccines against IPD was reached at the WHO Expert Committee meeting in 2003 (WHO 2005, Jodar 2004, Lee 2003). The WHO has issued a technical report series (TRS 927, annex 2) with recommendations for the evaluation of new pneumococcal conjugate vaccines that reflect these principles.

The following criteria are recommended for use as the primary end-point for demonstration of non-inferiority against a registered vaccine:

- IgG antibody concentration, as measured by ELISA, in sera collected 4 weeks after a three-dose primary series is considered to be the optimal primary end-point and main licensing parameter.

- A single threshold or reference antibody concentration is recommended for use for all pneumococcal serotypes. A reference antibody concentration of 0.35 µg/mL, that has been

Confidential 255

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

determined through a pooled analysis of data from the efficacy trials with invasive disease end-points that have been completed to date, is recommended. This threshold does not necessarily predict protection in an individual subject.

- The reference value is defined on the basis of data obtained using ELISA without pre-adsorption with serotype 22F. Antibody concentrations determined using an alternative method will need to be bridged to this method to derive an equivalent threshold concentration. It is recommended that the assay used be calibrated against a reference assay.

- Direct clinical comparison of the registered (established) vaccine with the new one is the preferred method for evaluating new vaccine formulations.

- The percentage of responders (those in whom post-immunization antibody concentration is above the threshold) should be used as the criterion to determine non-inferiority.

- For the serotypes present in a registered vaccine, the percentage of responders to each serotype in the new formulation or combination should be compared with the percentage of responders to the same serotype in the registered vaccine in the same population.

Non-inferiority to antibody response for each of the serotypes in the registered vaccine is desirable, but not an absolute requirement. Registration of products in which one or more serotypes do not meet non-inferiority criteria would have to be decided on an individual basis.

- Serotypes not contained in a registered formulation may be evaluated for non-inferiority to the aggregate response to the serotypes in the registered vaccine. Failure of one or more new serotypes to meet this criterion may be considered on an individual basis.

- Additional criteria that must be met to support registration:

- In addition to showing non-inferiority with respect to the primary end-point, additional data to demonstrate the functional capacity of the antibody and induction of immunological memory in a subset of the sera are required for registration.

Functional antibodies

- Opsonophagocytic activity (OPA) as measured by opsonophagocytic assay after a three-dose priming series is required to demonstrate the functionality of antibodies.

- The method used to demonstrate OPA should be comparable to the reference assay.

Immunological memory

- Evidence of memory should be demonstrated. One possible method is to administer a booster dose of pneumococcal polysaccharide vaccine and to compare concentrations between age-matched unprimed and primed individuals; data from non-concurrent controls may be sufficient for the purposes of comparison.

- A full dose of polysaccharide vaccine should be used at this stage because the use of a reduced dose of the polysaccharide vaccine as a booster has not been sufficiently tested.

- Avidity of antibodies is also a useful marker for immunological memory.

- In follow-up of WHO 2003 meeting, a WHO workshop took place in January 2007 with the objective to formulate a plan for the standardisation of the pneumococcal OPA assay (WHO 2007).

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.1.1. Clinical Trial Overview

2.7.3.1.1.1. Phase I clinical trials

Design

This clinical trial was designed as a single center, open, non-controlled trial.

Healthy subjects aged 2 months and above were included. The planned sample size was 120, and subjects were recruited in three stages in the order of: adults (18 years and above), children (2-5 years) and infant and toddlers (2-3 months, minimum 6 weeks).

A total of 30 subjects were enrolled in the first stage. Each subject was administered with 1 dose

of 13-valent pneumococcal polysaccharide conjugate vaccine (PCV13-TT). Blood samples were collected 3 times from all subjects before vaccination, on Day 3 post vaccination (interval 2 days, same below) and Day 30 post vaccination, respectively. The blood samples collected before vaccination and on Day 3 post vaccination were assessed by hematology, liver and kidney function tests, meanwhile, the serum IgG antibody concentration was measured using the blood sample taken before vaccination and on Day 30 post vaccination. Subjects who had no abnormal results of hematology, liver and kidney function tests before vaccination and met other inclusion criteria could proceed to get vaccinated. If no SAE related to study vaccine was identified by the investigators after 7 days' observation and no grade 4 vaccine-related abnormalities determined by the investigators as measured by hematology, liver and kidney function tests were detected on Day 3 after vaccination, then the study proceeded to the next stage.

A total of 30 subjects were enrolled in the second stage. Each subject was administered with 1 dose of PCV13-TT. Blood samples were collected 3 times from all subjects respectively before the vaccination, on Day 3 post vaccination (interval 2 days, same below) and Day 30 days post vaccination. The blood samples collected before vaccination and on Day 3 post vaccination were assessed by hematology, liver and kidney function tests, meanwhile, the serum IgG antibody concentration was measured using the blood sample taken before vaccination and on Day 30 post vaccination. Subjects with testing results within the normal range predefined in the protocol or not within the normal range but were determined by site investigators to be normal and in compliance with other inclusion criteria could be administered with the vaccine. If no SAE related to study vaccine was identified by the investigators after 7 days' observation and no grade 4 vaccine-related abnormalities determined by the investigators as measured by hematology, liver and kidney function tests were detected on Day 3 after vaccination, then the study proceeded to the next stage.

A total of 60 subjects were enrolled in the third stage and subjects were divided into 2 months (minimum age: 6 weeks) group and 3 months group with 30 subjects in each arm. Subjects in the 2 months group were administered with 3 doses of PCV13-TT according to the procedure of one dose each vaccinated at 0, 2 and 4 months and subjects in the 3 months group were administered with 3 doses of PCV13-TT following the procedure of one dose each at 0, 1 and 2 months. Blood samples were collected from all subjects twice respectively before the first dose and 30 days after the third dose. The serum was separated and the IgG antibody concentration was measured.

All subjects were observed for 30 minutes after each dose of PCV13-TT, and were under active observation for adverse events (AEs) within 0-7 days post vaccination, while for 8-30 days post vaccination, AEs were spontaneously reported and collected by subjects. Serious adverse events (SAEs) were monitored for 6 months after full immunization of PCV13-TT which was administered in accordance with the immunization procedure prescribed in the protocol.

Objective

Primary objective:

Confidential 257

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

To evaluate the safety of 13-valent pneumococcal polysaccharide conjugate vaccine (PCV13-TT) in healthy population aged 2-3 months (minimum age: 6 weeks), 2-5 years and 18 years and above.

Population

Healthy subjects aged 2 months and above.

Results

The incidence of adverse events related to the study vaccine in adults, children, 2 months and 3 months group was 80.00%, 53.33%, 66.67% and 70.00%, respectively. A total of 6 subjects in the adults group experienced local adverse reactions with severity reaching grade 3, including 1 case of local redness, 1 case of induration, 2 cases of swelling and 2 cases of redness with swelling, corresponding to an incidence of 20% (6/30) in the adults group. The incidence of adverse reactions with grade 3 severity in other age groups was less than 15%.

The most common symptom of systemic adverse reactions was fever in adults and children aged 2-5 years, while fever and diarrhea were more common in 2 months and 3 months group. Local adverse reactions in adults were mainly redness, pain and swelling at the vaccination site; pain and redness were common local reactions in children aged 2-5 years, and redness was the most common local symptom in 2 months and 3 months group.

Adverse events mainly occurred within 0-7 days post vaccination and no adverse events related to the study vaccine were collected during 8-30 days post vaccination. No serious adverse events were reported during the extended observation period.

Since the primary objective of the Phase I clinical trial was to evaluate the safety of the investigational vaccine, only the safety results of the Phase I clinical trial are presented in this section, while the immunogenicity results, as exploratory measures, are listed in Module 5.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.1.1.2. Phase III clinical trials

Design

This clinical trial was designed as a randomized, blinded, comparable vaccine-controlled, multicenter, non-inferiority clinical study.

This clinical trial was carried out in the healthy population, enrolling healthy children aged 2-71 months (minimum age: 6 weeks). The planned sample size was 2760.

In view of absence of serious adverse reactions 7 days after the first dose vaccination in the third stage of Phase I clinical trial, and the incidence of local and systemic reactions with severity of grade 3 or above was lower than 15%, phase III clinical trial was conducted to further evaluate the immunogenicity and safety of 13-valent pneumococcal polysaccharide conjugate vaccine (PCV13-TT) in the target population with expanded sample size.

Objective

To observe and evaluate the immunogenicity and safety of PCV13-TT in healthy children aged 2-71 months (minimum age: 6 weeks).

Population

This clinical trial was conducted in healthy population and the subjects were healthy children aged 2-71 months (minimum age: 6 weeks).

Results

This clinical trial, with a licensed 7-valent pneumococcal conjugate vaccine as control, was designed to evaluate the immunogenicity and safety of the 13-valent pneumococcal polysaccharide conjugate vaccine, jointly developed by Yunnan Walvax Biotechnology Co., Ltd. and Yuxi Walvax Biotechnology Co., Ltd, in subjects aged 3 months (vaccinated at month 0, 1, 2), 7-11 months (vaccinated at month 0, 2), 12-23 months (2 doses) and 24-71 months (1 dose), respectively, the 13-valent pneumococcal polysaccharide conjugate vaccine was also administered in subjects

2 month of age (minimum age: 6 weeks) enrolled to compare with subjects aged 3 months in terms of immunization procedure.

In the main target population (3 months of age), the common serotypes achieved noninferiority criteria for comparison between PCV13-TT and PCV7 group except for serotype 6B during primary series, meanwhile all common serotypes in PCV13-TT group were noninferior to that in PCV7 group after the booster dose; for additional serotypes, superiority criteria were met for PCV13-TT group vs PCV7 group after primary series; the common serotypes in PCV13-TT group aged 3-71 months were all noninferior to those in PCV7 group during primary series, besides, the additional serotypes in PCV13-TT group were all superior as compared to PCV7 group.

For PCV13-TT (2 months) group vs PCV7 (3 months) group, both common and additional serotypes had achieved noninferiority or superiority criteria post primary series. For PCV13-TT (2 months) group vs PCV13-TT (3 months) group, 12 serotypes reached noninferiority criteria during primary series except for additional serotype 5; and all 13 serotypes were noninferior to those in PCV13-TT (3 months) group post booster dose.

In PCV13-TT recipients aged 7-11 months, 12-23 months, and 24-71 months, the proportions of subjects with IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ for common serotypes were all noninferior to those in PCV7 group. The additional serotypes in PCV13-TT group of 7-11 months had reached superiority criteria after primary series; for PCV13-TT groups of 12-23 months and 24-71 months, superiority criteria were basically met after immunization.

Confidential 259

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

The results before and after booster dose indicated decrease in the antibody levels of several serotypes in the 13 serotypes either in PCV13-TT group or PCV7 group to some extent, while the percentage of subjects with IgG antibody concentration $\geq 3.5 \mu\text{g/mL}$ and antibody GMC after 1 dose of booster immunization both reached or exceeded the levels observed after primary series, demonstrating significant effect of the booster dose, reflecting the immunological memory effect of the conjugate vaccine adequately. The antibody GMC post booster dose had more than 3-fold increase in the 2-6 months olds, and greater than 1-fold increase in subjects aged 7-11 months as compared with the GMC before booster dose.

The overall incidence of adverse events in PCV13-TT group was lower than that in PCV7 group.

No significant intergroup difference was observed in the incidence of vaccine-related adverse events. The main symptom of systemic adverse reaction was fever. The incidence of systemic reactions in PCV13-TT group was lower than that in PCV7 group. Local adverse reactions were primarily redness, swelling and pain at the injection site. No significant difference was observed in the incidence of local reactions between PCV13-TT group and PCV7 group.

The incidence of vaccine-related grade 3 adverse events in PCV13-TT group and PCV7 group was 4.21% and 2.41%, respectively. The incidence of local adverse reactions with severity reaching grade 3 in PCV13-TT group was higher than that in PCV7 group, while no significant intergroup difference was observed in subjects aged 3 months.

A total of 80 cases (105 events) of SAEs were observed during primary series and 8 cases (10 events) of SAEs were noted during booster dose. No significant intergroup difference was observed in the incidence of SAEs. SAEs were not related to the study vaccine except for one case in PCV13-TT (3 months) group with fever determined to be probably related to the study vaccine. To sum up, the immunogenicity of 7 common serotypes in main target population aged 3 months met the non-inferiority criteria after booster dose, and that of 6 new serotypes had already achieved the standard of superiority after primary immunizations in this clinical trial. The common and additional serotypes had fulfilled the non-inferiority or superiority standard in subjects 3-71 months of age after primary immunizations. The common and additional serotypes in PCV13-TT group (2 months) were noninferior and/or superior to that in PCV7 (3 months) group. In PCV13-TT (2 months) group, all 13 serotypes were noninferior to those in the PCV13-TT (3 months) group post booster dose. The incidence of adverse events/reactions in PCV13-TT group was not higher than that in PCV7 group. The results of immunogenicity and safety evaluation in this clinical trial had achieved the study objectives predefined in the protocol.

The phase III clinical trial of 13-valent pneumococcal polysaccharide conjugate vaccine was intended to evaluate the immunogenicity and safety of 13-valent pneumococcal polysaccharide conjugate vaccine in healthy children aged 2-71 months (minimum age: 6 weeks) in a relatively large population (2760 subjects enrolled). Therefore, phase III clinical findings of safety and immunogenicity are exhibited in this section.

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.1.2. Immunogenicity assessment

2.7.3.1.2.1. Immunogenicity observations

Immunogenicity observation in Phase III clinical trial:

Venous blood was collected before the first dose of vaccination and 30 days after the primary series; besides, venous blood was also collected before and 30 days after the booster dose in subjects indicated for booster immunization. All subjects were tested for 13 serotypes specific IgG antibodies before the first dose of vaccination, 30 days after primary immunization, 30 days before and 30 days after booster immunization, with the purpose to compare the proportion of subjects whose specific IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ and the geometric mean concentration of specific IgG antibody after vaccination between the investigational vaccine and the comparator vaccine.

Serum specific antibody opsonophagocytic activity (OPA) was detected in totally 900 subjects (100 subjects in each PCV13-TT and PCV7 group of different age strata). A total of 300 subjects aged 2-6 months (minimum age: 6 weeks) were tested for OPA 30 days after primary immunization, 30 days before and 30 days after booster immunization; a total of 200 subjects aged 7-11 months were tested for OPA before the first dose of vaccination, 30 days after primary immunization, before booster immunization and 30 days after booster immunization; and a total of 400 subjects aged 12-71 months were tested for OPA before the first dose of vaccination and 30 days after the full immunizations.

Blood collection performed before the first dose of vaccination, 30 days after primary immunizations and/or before booster immunization, 30 days after booster immunization was determined as valid blood collection. The valid blood collection rate should be not less than 85%.

2.7.3.1.2.2. Immunogenicity endpoints

2.7.3.1.2.2.1. Primary immunogenicity endpoints

(1) Percentage of subjects with pneumococcal serotype-specific IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ 30 days post-dose 3 in PCV13-TT group and PCV7 group

(2) Pneumococcal serotype-specific IgG geometric mean concentration (GMC) 30 days post-dose 3 in PCV13-TT group and PCV7 group

2.7.3.1.2.2.2. Secondary immunogenicity endpoints

- (1) Percentage of subjects with pneumococcal serotype-specific OPA antibody titer $\geq 1:8$ one month post-dose 3 in PCV13-TT group and PCV7 group
- (2) Percentage of subjects with pneumococcal serotype-specific OPA GMT one month post-dose 3 in PCV13-TT group and PCV7 group
- (3) Percentage of subjects with pneumococcal serotype-specific IgG antibody concentration ≥ 1.0 $\mu\text{g/mL}$ 30 days post-dose 3 in PCV13-TT group and PCV7 group
- (4) Percentage of subjects with pneumococcal serotype-specific IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ 30 days post-dose 4 in PCV13-TT group and PCV7 group
- (5) Pneumococcal serotype-specific IgG GMC 30 days post-dose 4 in PCV13-TT group and PCV7 group
- (6) Percentage of subjects with pneumococcal serotype-specific OPA antibody titer $\geq 1:8$ one month post-dose 4 in PCV13-TT group and PCV7 group

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.1.2.3.2. Criterion for immunogenicity hypothesis testing

Common 7 serotypes: non-inferiority test

The evaluation of non-inferiority criterion for comparison of common 7 serotypes in PCV13-TT group and PCV7 group includes:

- (1) The lower limit of the 2-sided 97.5% CI for the rate difference of percentage of subjects with IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ (PCV13-TT – PCV7) was greater than -10%
- (2) The lower limit of the 2-sided 97.5% CI for IgG antibody GMC ratio (GMR, PCV13-TT relative to PCV7) is greater than 0.5.

Any common serotype that meets the evaluation criteria 1) or 2) will be judged to be immunogenically non-inferior.

Additional 6 serotypes: superiority test

The evaluation of superiority criterion for comparison of additional 6 serotypes in PCV13-TT group and PCV7 group includes:

- (1) The lower limit of the 2-sided 95% CI for the rate difference of percentage of subjects with IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ (PCV13-TT – PCV7 seroresponse or PCV7 reference) was greater than 0.
- (2) The lower limit of the 2-sided 95% CI for IgG antibody GMC ratio (GMR, PCV13-TT relative to PCV7 seroresponse or PCV7 reference) is greater than 1.
- (3) The lower limit of the 2-sided 95% CI for percentage of subjects with IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ was greater than 70% in PCV13-TT group.

Any additional serotype, which simultaneously meets the evaluation criterion (1), (2) and (3), is judged to be superior.

PCV7 reference is referred to as the lowest response among the 7 common serotypes contained in PCV7 achieved by subjects who received PCV7.

The evaluation of non-inferiority criterion for secondary endpoints, including percentage of subjects with IgG antibody concentration ≥ 1.0 $\mu\text{g/mL}$, OPA titer $\geq 1:8$, GMT and GMT ratio were same as the above described evaluation criterion.

Sequential tests

In the hypothesis test, if the non-inferiority of PCV13-TT (3 months) group vs PCV7 group was established and additional 6 serotypes met the pre-specified superiority criterion, the non-inferiority test of PCV13-TT group (2 months) vs PCV7 group was performed. Then, if all the serotypes met the pre-specified evaluation criterion in PCV13-TT (2 months) group, the non-inferiority test of PCV13-TT group (2 months) vs PCV13-TT group (3 months) was performed. Strict statistical analysis was performed for the comparison of PCV13-TT (3 months) vs PCV7 (3 months), PCV13-TT (2 months) vs PCV7 (3 months), and PCV13-TT (2 months) vs PCV13-TT (3 months) in a sequential fashion, while other comparisons for non-primary populations (including age groups of 7-11, 12-23, 24-71 months) were statistically analyzed while without strict statistical inference.

The immunogenicity analysis would be performed in all eligible subjects with evaluable serum for testing as per the study protocol. Immunogenicity analysis was performed with the PPS data set as the primary analysis set.

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.2. Summary of Results of Individual Studies

2.7.3.2.1. Study Populations for phase III clinical trials

Inclusion Criteria:

- Healthy infants (aged 2-71 months) as evidenced by medical history, physical examination, and investigators' judgement
- Subjects are in compliance with age requirements for this clinical trial (children from 6 weeks to 5 years old or adults over 18 years old)
- Parents / legal guardians of subjects must sign and date the informed consent in person
- Parents / legal guardians of subjects have been informed of all information related to the trial
- Subjects / legal guardians of subjects are able to follow requirements of the trial
- Subjects who have not been vaccinated with pneumococcal vaccines, and have not been administered any other preventive products within 7 days
- Axillary temperature $\leq 37^{\circ}\text{C}$

Exclusion Criteria:

Exclusion Criteria for First Vaccination

- Previously vaccination listed or vaccinated with trial pneumococcal vaccine
- History of invasive disease caused by *Streptococcus pneumoniae*, which was confirmed by bacterial culture
- Prior history of allergic reactions to any drug, vaccine, or vaccine-related serotype
- Vaccination-related fever of 39°C or more has occurred with biological products used for vaccination
- Birth weight $< 2.5\text{ kg}$
- There is a history or family history of allergies, convulsions, seizures, encephalopathy, and psychosis
- Abnormal births of infants (difficult labors, aided by instruments) or a history of asphyxia, neurological organ damage
- History of diagnosed thrombocytopenia or other coagulation disorders
- Infants with diagnosed pathological jaundice
- Known or suspected to suffer from diseases, including: respiratory system disease, acute infection or chronic disease, serious cardiovascular disease, kidney disease, malignant tumor, skin diseases, mothers with HIV infection (as evidenced by test report)
- Known serious congenital malformations or severe chronic disease; congenital deformities, developmental disorder, or a clinical diagnosis of severe chronic diseases (such as Down's syndrome, diabetes, sickle cell anemia, or neurological disorders, Guillain-Barre Syndrome)
- Known or suspected co-morbidities including: respiratory disorders, acute infections or active attack of chronic disease, serious cardiovascular disorders, liver and kidney disorders, malignant neoplasms, skin diseases.
- Received blood products or globulin. Hepatitis B hyper-immune globulin can be used
- Participating in other clinical trials
- Any condition that the investigator considered to have the potential to affect the evaluation of the study

Exclusion Criteria for 2nd, 3rd Vaccination or Booster Dose

- Subjects who had severe allergic reactions during the first or second vaccination
- Subjects who experienced serious adverse effects from the previous vaccination with causal relationship demonstrated
- After the first vaccination, the newly discovered or newly occurred conditions not conforming to the first dose of the inclusion criteria or to the exclusion criteria for the first dose
- Other exclusion criteria affirmed by investigators

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.2.2. Pneumococcal immunogenicity results of Phase III Clinical Trial

2.7.3.2.2.1. Pneumococcal immunogenicity results for main population

2.7.3.2.2.1.1. Pneumococcal immunogenicity results for subjects aged 3 months in PCV13-TT group and PCV7 group

2.7.3.2.2.1.1.1. Comparison of percentage of subjects achieving IgG antibody concentration $\geq 0.35\text{ }\mu\text{g/mL}$ and the IgG antibody geometric mean concentrations (GMCs)

Post dose 3 IgG pneumococcal immunogenicity results with comparison to the PCV7 seroresponse for the 7 common serotypes

With the exception of serotype 6B, all common serotypes met the noninferiority criterion after primary series. The proportion of responders $\geq 0.35\text{ }\mu\text{g/mL}$ in the PCV13-TT group were all higher than 97% (except 6B). For serotype 6B, the GMC was $1.25\text{ }\mu\text{g/mL}$, with a lower limit of the 2-sided 97.5% CI of 0.30% (Table 2). For serotype 6B, the proportion of responders was 90.45%. The rate difference of proportions of responders to 6B was -8.53%, with a lower limit of the 2-sided 97.5% CI of -11.73%. All 7 common (except 6B) serotypes met the non-inferiority criterion.

Post dose 3 IgG pneumococcal immunogenicity results with comparison to the PCV7 seroresponse for the 6 additional serotypes

For the 6 additional serotypes, the proportions of responders in the PCV13-TT group were all higher than 96% and all additional serotypes met the pre-specified superiority criteria.

Post dose 3 IgG pneumococcal immunogenicity results with comparison to the PCV7 reference for the 6 additional serotypes

The PCV7 reference value for the 6 additional serotypes was based on serotype 23F from the PCV7 group. For serotype 18C, the proportion of responders was 97.74%. All additional serotypes met the non-inferiority criterion.

The PCV7 reference value for the 6 additional serotypes was serotype 6B from the PCV7 group. For serotype 6B, the GMC was 3.52. Five (5) of the 6 additional serotypes met the non-inferiority criterion for GMR (lower limit of the 2-sided 95% CI for the GMR >0.5). The exception was serotype 3 with a GMR of 0.48 (95% CI, 0.42 to 0.58).

Among the 6 additional serotypes, the serotypes 3, 5 and 6A did not meet the prespecified noninferiority criterion. The lower limits of the 2-sided 97.5% CI for serotypes 3, 5 and 6A were 0.42, 0.47 and 0.48, respectively. Other additional serotypes met the pre-specified noninferiority criterion.

N=number of subjects included in FAS for PCV13-TT and PCV7.

- number of subjects with a determinate IgG antibody concentration to the given serotype for PCV13-TT group.
 - number of subjects with a determinate IgG antibody concentration to the given serotype for PCV7 group.
 - The rate difference of PCV13-TT – PCV7.
 - GMC ratio: PCV13-TT to PCV7.
 - Two-sided 95% CI is for additional serotypes, and two-sided 97.5% CI is for common serotypes.
 - Difference in proportions: (PCV13-TT – PCV7 seroresponse) expressed as a percentage.
- GMC ratio: PCV13-TT to PCV7 seroresponse. IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ was calculated respectively, with 95% CI given.
- Difference in proportions: (PCV13-TT – PCV7 reference) expressed as a percentage. For the additional serotypes, the reference value is derived from serotype 18C from the PCV7 group.
- GMC ratio: PCV13-TT to PCV7 reference. For the additional serotypes, the reference value is derived from serotype 6B from the PCV7 group.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Booster Dose

Post dose 4 IgG pneumococcal immunogenicity results with comparison to the PCV7 seroresponse for the 7 common serotypes

The non-inferiority criterion at the 0.35 $\mu\text{g/mL}$ level was met for all the common serotypes after the booster dose. The lower limit of the 2-sided 97.5% CI for the rate difference of percentage of subjects with IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ (PCV13-TT – PCV7) was greater than -10% for all common serotypes. (Table 4)

The non-inferiority criterion with a lower limit of the 2-sided 97.5% CI for the GMR (PCV13-TT relative to PCV7) greater than 0.5 was met for all the common serotypes after the booster dose.

Post dose 4 IgG pneumococcal immunogenicity results with comparison to the PCV7 seroresponse for the 6 additional serotypes

With the exception of serotype 19A, all common serotypes met the superiority criterion after booster dose. For serotype 9A, the rate difference was 0.21% with a lower limit of the 2-sided 95% CI of -0.20%.

All additional serotypes met the pre-specified superiority criteria for GMC.

Post dose 4 IgG pneumococcal immunogenicity results with comparison to the PCV7 reference for the 6 additional serotypes

The PCV7 reference value for the 6 additional serotypes was based on serotype 9V from the PCV7 group (the lowest response among the 7 serotypes contained in PCV7 achieved by subjects who received PCV7). For serotype 9V, the proportion of responders was 99.59%. All additional serotypes met the non-inferiority criterion for IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$.

The PCV7 reference value for the 6 additional serotypes was serotype 9V from the PCV7 group (the lowest response among the 7 serotypes contained in PCV7 achieved by subjects who received PCV7). For serotype 9V, the GMC was 3.87. Four (4) of the 6 additional serotypes met the non-inferiority criterion for GMR (lower limit of the 2-sided 95% CI for the GMR > 0.5). The exception was serotype 3 and 5 with a GMR of 0.49 (95% CI, 0.44 to 0.54) and 0.41 (95% CI, 0.37 to 0.46), respectively.

Among the 6 additional serotypes, serotypes 3, and 5 did not meet the prespecified noninferiority criterion. The lower limits of the 2-sided 97.5% CI for serotypes 3 and 5 were 0.42 and 0.37, respectively. Other additional serotypes meet the prespecified noninferiority criterion.

The geometric mean fold rises (GMFRs) of antibody concentrations from pre- to post-booster for the 7 common serotypes ranged from 4.13 (serotype 14) to 6.38 (18C) in the PCV13-TT group.

For the 6 additional serotypes, the fold rises ranged from 3.57 (serotype 7F) to 7.08 (serotype 19A) in the PCV13-TT group.

2.7.3.2.2.1.1.3. Comparison of percentage of subjects achieving IgG antibody concentration ≥ 1.0 $\mu\text{g/mL}$ with comparison to the PCV7 seroresponse
Primary series
Data for the 7 common serotypes
With the exception of serotypes 6B and 23F, all common serotypes met the noninferiority criterion

after primary series. For serotype 6B and 23F, the lower limit of the 2-sided 95% CI was -35.86 and -12.81, respectively. (Table 6)
 Data for the 6 additional serotypes
 All common serotypes met the noninferiority criterion after primary series. The lower limit of the 2-sided 95% CI was all greater than 0.

Table 6. Comparison of percentage of subjects aged 3 months achieving a pneumococcal IgG antibody concentration ≥ 1.0 $\mu\text{g/mL}$ post dose 3 of the primary series (PPS)

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Booster Dose

Data for the 7 common serotypes

With the exception of serotypes 4 and 18C, the proportion of responders ≥ 1.0 $\mu\text{g/mL}$ in the PCV13-TT group were all higher than 95%. For serotype 4 and 18C, the proportion of responders ≥ 1.0 $\mu\text{g/mL}$ was 93.26% and 88.84%. All common serotypes met the noninferiority criterion after booster dose. The rate difference of percentage of subjects with IgG antibody concentration ≥ 1.0 $\mu\text{g/mL}$ (PCV13-TT – PCV7) was all greater than -10% (Table 8).

Data for the 6 additional serotypes

The proportion of responders ≥ 1.0 $\mu\text{g/mL}$ was higher than 95% except serotypes 1, 3, and 5A. The lower limit of the 2-sided 95% CI for the rate difference of percentage of subjects with IgG antibody concentration ≥ 1.0 $\mu\text{g/mL}$ (PCV13-TT – PCV7) was greater than 0 for all additional serotypes.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.2.2.1.1.4. Comparison of percentage of subjects achieving an OPA antibody $\geq 1:8$ and the IgG antibody geometric mean titers (GMTs)
Primary series
Data for 7 common serotypes
For the 7 common serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was 100% except serotypes 6B (89.25%) and 23F (95.70%) in PCV13-TT group. With the exception of serotypes 6B, the lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than -10% for the common serotypes (Table 9). The lower limit of the 2-sided 95% CI of GMT ratio was greater than 0.5 for serotypes 9V, 14 and 19F. For other serotypes including 4, 6B, 18C and 19F, the lower limit of the 2-sided 95% CI of GMT ratio was ≥ 0.5 .
Data for 6 additional serotypes
For the 6 additional serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was higher than 96% except serotype 1 (83.87%) in PCV13-TT group. The lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than 0 for all the additional serotypes. The lower limit of the 2-sided 95% CI of GMT ratio for the additional serotypes was all greater than 1.

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Booster Dose

Data for 7 common serotypes

For the 7 common serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was 100% except serotypes 6B (98.96%) and 23F (98.96%) in PCV13-TT group. The lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than -10% for all the common serotypes (Table 11). With the exception of serotypes 6B and 23F, the lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than -10% for the common serotypes.

Data for 6 additional serotypes

For the 6 additional serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was higher than 95% in PCV13-TT group. With the exception of serotypes 6A, the lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than 0 for the additional serotypes. For the serotype 6A, the lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was -3.47%. The lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than 1 for all the additional serotypes.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.2.2.1.2. Pneumococcal immunogenicity results for subjects in PCV13-TT (2 months) group and PCV7 (3 months) group

2.7.3.2.2.1.2.1. Comparison of percentage of subjects achieving IgG antibody concentration $\geq$

0.35 $\mu\text{g/mL}$ $\mu\text{g/mL}$ and the IgG antibody geometric mean concentrations (GMCs)

Post dose 3 IgG pneumococcal immunogenicity results with comparison to the PCV7

seroresponse for the 7 common serotypes

The IgG seroresponse rates $\geq 0.35 \mu\text{g/mL}$ were all higher than 97% for subjects using 0th, 2nd, and

4th month dosing schedule in the PCV13-TT (2 months) group. The IgG seroresponse rates ≥ 0.35

$\mu\text{g/mL}$ of all common serotypes met the noninferiority criterion after primary series for subjects

in PCV13-TT group compared with subjects using 0th, 1st, and 2nd month dosing schedule in PCV7

group (Table 13). With the exception of serotypes 4 and 18C, all common serotypes met the

noninferiority criterion after primary series. For serotypes 4 and 18C, the GMC was 2.43 $\mu\text{g/mL}$

and 2.04 $\mu\text{g/mL}$, respectively.

Post dose 3 IgG pneumococcal immunogenicity results with comparison to the PCV7

seroresponse for the 6 additional serotypes

With the exception of serotype 5, the IgG seroresponse rates $\geq 0.35 \mu\text{g/mL}$ were all higher than

96% for subjects using 0th, 2nd, and 4th month dosing schedule in the PCV13-TT (2 months) group.

For serotype 5, the IgG seroresponse rates $\geq 0.35 \mu\text{g/mL}$ was 90.87%. The lower limit of the 2-

sided 95% CI for the IgG seroresponse rate was greater than 70% for all additional serotypes. The

lower limit of the 2-sided 95% CI for rate difference (PCV13-TT group - PCV7) was greater than

0. The lower limit of the 2-sided 95% CI for GMR (PCV13-TT relative to PCV7) was greater than

0.5 and all additional serotypes met the superiority criterion.

N=number of subjects included in FAS for PCV13-TT (2M) and PCV7 (3M).

a. number of subjects with a determinate IgG antibody concentration to the given serotype for PCV13-TT (2M) group.

b. number of subjects with a determinate IgG antibody concentration to the given serotype for PCV7 (3M) group.

c. The rate difference of PCV13-TT (2M) – PCV7 (3M).

d. GMC ratio: PCV13-TT (2M) to PCV7 (3M).

e. Two-sided 95% CI is for additional serotypes, and two-sided 97.5% CI is for common serotypes.

Booster dose
Post dose 4 IgG pneumococcal immunogenicity results with comparison to the PCV7 seroresponse for the 7 common serotypes
The non-inferiority criterion at the 0.35 µg/mL level was met for all the common serotypes after the booster dose (Table 15). The lower limit of the 2-sided 97.5% CI for the rate difference of percentage of subjects with IgG antibody concentration ≥0.35 µg/mL (PCV13-TT – PCV7) was greater than -10% for all common serotypes
Post dose 4 IgG pneumococcal immunogenicity results with comparison to the PCV7 reference for the 6 additional serotypes
The superiority criterion was met for all the additional serotypes (except serotype 19A) after the booster dose. For serotype 19A, the lower limit of the 2-sided 95% CI for the rate difference of percentage of subjects with IgG antibody concentration ≥0.35 µg/mL (PCV13-TT – PCV7) was -0.20%
The geometric mean fold rises (GMFRs) of antibody concentrations from pre- to post-boost for the 7 common serotypes ranged from 3.42 (serotype 14) to 5.69 (9V) in the PCV13-TT (2 months) group. For the 6 additional serotypes, the fold rises ranged from 3.00 (serotype 1) to 5.67 (serotype 19A) in the PCV13-TT (2 months) group.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.2.2.1.2.3. Comparison of percentage of subjects achieving IgG antibody concentration ≥ 1.0 $\mu\text{g/mL}$ with comparison to the PCV7 seroresponse

Booster Dose

Data for the 7 common serotypes

With the exception of serotypes 4 and 18C, the proportion of responders ≥ 1.0 $\mu\text{g/mL}$ in the PCV13-TT (2M) group were all higher than 94% (Table 17). For serotype 4 and 18C, the proportion of responders ≥ 1.0 $\mu\text{g/mL}$ was 81.51% and 80.67%. The rate difference of percentage of subjects with IgG antibody concentration ≥ 1.0 $\mu\text{g/mL}$ (PCV13-TT – PCV7) was all greater than -10% except the serotypes 4 (-15%) and 18C (-13.68%).

Data for the 6 additional serotypes

The proportion of responders ≥ 1.0 $\mu\text{g/mL}$ was higher than 95% except serotypes 1, 3, and 5A. The lower limit of the 2-sided 95% CI for the rate difference of percentage of subjects with IgG antibody concentration ≥ 1.0 $\mu\text{g/mL}$ (PCV13-TT – PCV7) was greater than 0 for all additional serotypes.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.2.2.1.2.4. Comparison of percentage of subjects achieving an OPA antibody $\geq 1:8$ and the IgG antibody geometric mean titers (GMTs)

Primary series

Data for 7 common serotypes

For the 7 common serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was all higher than 92% in PCV13-TT (2 months) group. With the exception of serotypes 6B, the lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than -10% for the common serotypes (Table 18). The lower limit of the 2-sided 95% CI of GMT ratio was greater than 0.5 for serotypes 9V and 19F. For other serotypes including 4, 6B, 14 18C and 23F, the lower limit of the 2-sided 95% CI of GMT ratio was $\blacksquare$ 0.5.

Data for 6 additional serotypes

For the 6 additional serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was 100% except serotypes 1 (91.75%) and 6 (97.94%) in PCV13-TT (2 months) group. The lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than 0 for all the additional serotypes. The lower limit of the 2-sided 95% CI of GMR (PCV13-TT relative to PCV7) for the additional serotypes was all greater than 1.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Booster dose
Data for 7 common serotypes
For the 7 common serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was all 100% in PCV13-TT (2 months) group. The lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than -10% for all

the common serotypes (Table 20.).The lower limit of the 2-sided 95% CI of GMT ratio was greater than 0.5 for serotypes 14 and 19F. For other serotypes including 4, 6B, 9V 18C and 23F, the lower limit of the 2-sided 95% CI of GMT ratio was ■ 0.5. The lower limit of the 2-sided 95% CI of GMT ratio for serotypes 4 and 9V was 0.40 and 0.49, respectively.

Data for 6 additional serotypes

For the 6 additional serotypes, the percentage of subjects achieving an OPA antibody titer ≥1:8 was all higher than 95% in PCV13-TT (2 months) group. For serotypes 3, 5 and 19A, the percentage of subjects achieving an OPA antibody titer ≥1:8 was all 100%.

With the exception of serotype 6A (-0.91%), the lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer ≥1:8 was greater than 0 for all the additional serotypes. With the exception of serotype 6A (0.90%), the lower limit of the 2-sided 95% CI of GMR (PCV13-TT relative to PCV7) for the additional serotypes was all greater than 1.

Booster Dose

Post dose 4 IgG pneumococcal immunogenicity results for the 13 serotypes in subjects in PCV13-TT (2 months) and PCV13-TT (3 months) groups

After booster dose, all the 13 serotypes met the noninferiority criterion with respect to rate difference of proportion of responders (PCV13-TT [2 months] – PCV13-TT [3 months]) or GMR (PCV13-TT [2 months] relative to PCV13-TT [3 months]) for subjects in PCV13-TT groups 2 months of age and 3 months of age (Table 24).

2.7.3.2.2.1.3.3. Comparison of percentage of subjects achieving IgG antibody concentration ≥ 1.0 µg/mL with comparison to the PCV7 seroresponse
Booster Dose
The proportion of responders (IgG antibody concentration ≥ 1.0 µg/mL) were relatively lower in terms of serotypes 4 (81.51%), 18C (80.67%), 1 (81.30%), and 3 (71.01%), with nadir value observed for serotype 5 (53.78%), while all other serotypes were with ≥ 94% of subjects with IgG antibody concentration ≥ 1.0 µg/mL. With the exception of serotype 4, 18C, 1, and 5 with the lower limits of 2-sided 97.5% CI for rate difference of proportion of responders (PCV13-TT [2 months] – PCV13-TT [3 months]) being < -10% (-15.90%, -12.71%, -13.80%, and -24.25%, respectively), all other serotypes met the non-inferiority criterion (Table 51.).

2.7.3.2.2.1.3.4. Comparison of percentage of subjects achieving an OPA antibody $\geq$ 1:8 and the IgG antibody geometric mean titers (GMTs)

Primary series

The proportion of subjects achieving an OPA antibody titer $\geq$ 1:8 was mostly $\geq$ 95% except for serotype 1 (91.75%) and 6B (92.78%), however, the lower limits of 2-sided 97.5% CI for rate difference of percentage of subjects achieving an OPA titer $\geq$ 1:8 (PCV13-TT [2 months] – PCV13-TT [3 months]) after primary series were greater than -10% of all serotypes (Table 52.).The lower limit of 2-sided 97.5% CI for GMR (PCV13-TT [2 months] relative to PCV13-TT [3 months]) was lower than 0.5 for serotypes 18C, 23F, and 7F, and all other serotypes were compliant with the non-inferiority criterion.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00

2.7.3.2.2.1.4. Pneumococcal immunogenicity results for subjects aged 3-71 months in PCV13-TT group and PCV7 group

2.7.3.2.2.1.4.1. Comparison of percentage of subjects achieving IgG antibody concentration $\geq$

0.35 $\mu\text{g/mL}$ and the IgG antibody geometric mean concentrations (GMCs)

Post dose 3 IgG pneumococcal immunogenicity results with comparison to the PCV7

seroresponse for the 7 common serotypes

The IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ in the PCV13-TT group were all higher than 95%.

The lower limit of rate difference for the proportion of responders $\geq 0.35 \mu\text{g/mL}$ was all greater than -10%. With the exception of serotype 6B, the GMCs for all common serotypes were greater than 3.0 $\mu\text{g/mL}$. For serotype 6B, the GMC was 2.68 $\mu\text{g/mL}$. All of the 7 common serotypes met the non-inferiority criterion for the IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ and GMC after primary series (Table 56).

Post dose 3 IgG pneumococcal immunogenicity results with comparison to the PCV7 seroresponse for the 6 additional serotypes

For the 6 additional serotypes, the proportions of responders in the PCV13-TT group were all higher than 96% and all additional serotypes met the pre-specified superiority criteria.

All additional serotypes met the pre-specified superiority criteria for the IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ and GMC.

Post dose 3 IgG pneumococcal immunogenicity results with comparison to the PCV7 reference for the 6 additional serotypes

The PCV7 reference value for the 6 additional serotypes was based on serotype 23F from the PCV7 group. For serotype 23F, the proportion of responders was 98.31%. All additional serotypes met the non-inferiority criterion. The PCV7 reference value for the 6 additional serotypes was serotype 6B from the PCV7 group. For serotype 6B, the GMC was 3.11. Four (4) of the 6 additional serotypes met the non-inferiority criterion for GMR (lower limit of the 2-sided 97.5% CI for the GMR >0.5). The exceptions were serotypes 3 and 5 with a GMR of 0.42 (97.5% CI, 0.38 to 0.45).and 0.45 (97.5% CI, 0.41 to 0.50)., respectively.

2.7.3.2.2.1.4.2. Comparison of percentage of subjects achieving IgG antibody concentration $\geq$
1.0 $\mu\text{g/mL}$ with comparison to the PCV7 seroresponse
Primary series
Data for the 7 common serotypes
With the exception of serotypes 6B, all common serotypes met the noninferiority criterion after
primary series. For serotype 6B, the lower limit of the 2-sided 95% CI for rate difference of
subjects achieving antibody concentration ≥ 1.0 $\mu\text{g/mL}$ was -11.51(Table 58)
Data for the 6 additional serotypes
All common serotypes met the noninferiority criterion after primary series. The lower limit of the
2-sided 95% CI was all greater than 0.

Table 58. Comparison of percentage of subjects aged 3-71 months achieving a pneumococcal IgG antibody
concentration ≥ 0.35 $\mu\text{g/mL}$ and GMCs post booster dose(PPS)
IgG antibody concentration ≥ 1.0 $\mu\text{g/mL}$

 Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.2.2.2. Pneumococcal immunogenicity results for non-primary population
 2.7.3.2.2.2.1. Pneumococcal immunogenicity results for subjects aged 7-11 months in PCV13-TT group and PCV7 group
 2.7.3.2.2.2.1.1. Comparison of percentage of subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ and the IgG antibody geometric mean concentrations (GMCs)
 Post dose 3 IgG pneumococcal immunogenicity results with comparison to the PCV7 seroresponse for the 7 common serotypes
 The IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ in the PCV13-TT group were all higher than 96%. The lower limit of rate difference for the proportion of responders $\geq 0.35 \mu\text{g/mL}$ was all greater than -10%. The GMCs for all common serotypes were greater than $2.0 \mu\text{g/mL}$. With the exception of serotype 14, 6 of the 7 common serotypes met the non-inferiority criterion for GMR after primary series. For serotype 14, the GMR was 0.53, with a lower limit of the 2-sided 97.5% CI of 0.45 (Table 60).

Post dose 3 IgG pneumococcal immunogenicity results with comparison to the PCV7 seroresponse for the 6 additional serotypes
 All additional serotypes met the pre-specified superiority criteria for the IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ and GMC.

Post dose 3 IgG pneumococcal immunogenicity results with comparison to the PCV7 reference for the 6 additional serotypes
 The PCV7 reference value for the 6 additional serotypes was based on serotype 23F from the PCV7 group. For serotype 23F, the proportion of responders was 96.83%. All additional serotypes met the non-inferiority criterion. The PCV7 reference value for the 6 additional serotypes was serotype 6B from the PCV7 group. For serotype 6B, the GMC was 2.20. All the 6 additional serotypes met the non-inferiority criterion for GMR (lower limit of the 2-sided 95% CI for the GMR >0.5).

N=number of subjects included in PPS for PCV13-TT and PCV7.
a. number of subjects with a determinate IgG antibody concentration to the given serotype for PCV13-TT group.
b. number of subjects with a determinate IgG antibody concentration to the given serotype for PCV7 group.
c. The rate difference of PCV13-TT – PCV7.
d. GMC ratio: PCV13-TT to PCV7.
e. Two-sided 95% CI is for additional serotypes, and two-sided 97.5% CI is for common serotypes.
f. Difference in proportions: (PCV13-TT – PCV7 seroresponse) expressed as a percentage. GMC ratio: PCV13-TT to PCV7 seroresponse.
g. Difference in proportions: (PCV13-TT – PCV7 reference) expressed as a percentage. For the additional serotypes, the reference value is derived from serotype 23F from the PCV7 group. GMC ratio: PCV13-TT to PCV7 reference. For the additional serotypes, the reference value is derived from serotype 6B

from the PCV7 group.

Booster Dose

Post dose 4 IgG pneumococcal immunogenicity results with comparison to the PCV7 seroresponse for the 7 common serotypes
All common serotypes met the noninferiority criterion after Booster dose for the IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$, the IgG antibody concentration ≥ 1.0 and GMC (Table 62).

Post dose 4 IgG pneumococcal immunogenicity results with comparison to the PCV7 seroresponse for the 6 additional serotypes
With the exception of serotype 19A, all common serotypes met the superiority criterion after booster dose for the IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$. For serotype 19A, the rate difference was 0.00% with a lower limit of the 2-sided 95% CI of -1.93%. all common serotypes met the superiority criterion after booster dose for the IgG antibody concentration $\geq 1.0 \mu\text{g/mL}$. and GMC. The geometric mean fold rises (GMFRs) of antibody concentrations from pre- to post-boost for the 7 common serotypes ranged from 1.27 (serotype 4) to 1.96 (6B) in the PCV13-TT group. For the 6 additional serotypes, the fold rises ranged from 1.28 (serotype 7F) to 1.86 (serotype 6A) in the PCV13-TT (Table 63).

2.7.3.2.2.1.2. Pneumococcal Serotype antibody concentrations in the subjects aged 7-11 months in PCV13-TT group and PCV7 group

(1) Primary Series
The results of pneumococcal serotype antibody concentrations for subjects aged 7-11 months after primary series in PCV13-TT group and PCV7 group were shown in Table 64. to Table 76. The reverse cumulative distribution curves were shown in Figure 27 to 39.

(2) Booster dose
The results of pneumococcal serotype antibody concentrations for subjects aged 7-11 months after booster dose in PCV13-TT group and PCV7 group were shown in Table 77. to Table 89. The reverse cumulative distribution curves were shown in Figure 40 to 52.

2.7.3.2.2.1.3. Comparison of percentage of subjects achieving IgG antibody concentration ≥ 1.0 µg/mL with comparison to the PCV7 seroresponse
Primary series

Data for the 7 common serotypes

With the exception of serotype 9V, all common serotypes met the noninferiority criterion after primary series. For serotype 9V, the lower limit of the 2-sided 95% CI was -13.12. (Table 90)
Data for the 6 additional serotypes

All common serotypes met the noninferiority criterion after primary series. The lower limit of the 2-sided 95% CI was all greater than 0.

Table 90 Comparison of percentage of subjects aged 7-11 months achieving a pneumococcal IgG antibody concentration $\geq 1.0 \mu\text{g/mL}$ post dose 3 of the primary series (PPS)

Module 2 Summaries

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

Booster Dose

Data for the 7 common serotypes

All the common serotypes met the pre-specified noninferiority criteria for the IgG antibody concentration $\geq 1.0 \mu\text{g/mL}$ and GMC (Table 92).

Data for the 6 additional serotypes

The superiority criterion was met for all the additional serotypes (except serotype 19A) for the proportion of responders $\geq 0.35 \mu\text{g/mL}$ after the booster dose. For serotype 19A, the lower limit of the 2-sided 95% CI for the rate difference of percentage of subjects with IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ (PCV13-TT – PCV7) was -1.93%. The superiority criterion was met for all the additional serotypes for the proportion of responders $\geq 1.0 \mu\text{g/mL}$ and GMC after the booster dose.

The geometric mean fold rises (GMFRs) of antibody concentrations from pre- to post-boost for the 7 common serotypes ranged from 1.27 (serotype 4) to 1.96 (6B) in the PCV13-TT group. For the 6 additional serotypes, the fold rises ranged from 1.28 (serotype 7F) to 1.86 (serotype 6A) in the PCV13-TT group (Table 93).

2.7.3.2.2.2.1.4. Comparison of percentage of subjects achieving an OPA antibody $\geq 1:8$ and the IgG antibody geometric mean titers (GMTs)

Primary series

Data for 7 common serotypes

For the 6 of 7 common serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was all higher than 90% in PCV13-TT group (Table 94). The exceptions were serotypes 6B, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was 81.25%. With the exception of serotypes 6B and 23F, the lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than -10% for the common serotypes. And the lower limit of the 2-sided 95% CI of GMR was greater than 0.5 except serotypes 6B and 23F.

Data for 6 additional serotypes

For the 5 of 6 additional serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was all higher than 90% in PCV13-TT group. The exceptions were serotypes 6A, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was 89.58%. The lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was all greater than 0 for the additional serotypes. The lower limit of the 2-sided 95% CI of GMR was all greater than 1 for all the additional serotypes.

Booster dose
Data for 7 common serotypes
For the 7 common serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was all higher than 90% in PCV13-TT-TT group (Table 96). The lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than -10% for all the common serotypes. And the lower limit of the 2-sided 95% CI of GMR was greater than 0.5 except serotypes 6B and 23F.

Data for 6 additional serotypes
For the 6 additional serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was all higher than 90% in PCV13-TT-TT group. The lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was all greater than 0 for the additional serotypes. The lower limit of the 2-sided 95% CI of GMR was all greater than 1 for all the additional serotypes.

Module 2 Summaries

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.2.2.2.2. Pneumococcal immunogenicity results for subjects aged 12-23 months in PCV13-TT group and PCV7 group

2.7.3.2.2.2.2.1. Comparison of percentage of subjects achieving IgG antibody concentration $\geq$ 0.35 μ g/mL and the IgG antibody geometric mean concentrations (GMCs)

Data for 7 common serotypes

The proportion of responders $\geq$ 0.35 μ g/mL in the PCV13-TT-TT group were all higher than 99% and all common serotypes met the noninferiority criterion for the proportion of responders $\geq$ 0.35 μ g/mL (Table 98). With the exception of serotype 9V (2.97 μ g/mL), the GMCs for common serotypes were all higher than 4 μ g/mL. All common serotypes met the noninferiority criterion for the GMC.

Data for 6 additional serotypes with comparison to the PCV7 seroresponse for the 6 additional serotypes

The proportion of responders $\geq$ 0.35 μ g/mL in the PCV13-TT group were all higher than 96%, and the lower limit of the 2-sided 95% CI of proportion of responders $\geq$ 0.35 μ g/mL was all greater than 70%. With the exception of serotype 19A, all the additional serotypes were all met superiority criterion. For serotype 19A, the rate difference for the proportion of responders $\geq$ 0.35 μ g/mL was 0.53, with a lower limit of the 2-sided 95% CI of -0.51.

Data for 6 additional serotypes with comparison to the PCV7 reference for the 6 additional serotypes

The PCV7 reference value for the 6 additional serotypes was based on serotype 6B from the PCV7 group (the lowest response among the 7 serotypes contained in PCV7 achieved by subjects who received PCV7). For serotype 6B, the proportion of responders was 98.41%. All additional serotypes met the non-inferiority criterion.

The PCV7 reference value for the 6 additional serotypes was serotype 6B from the PCV7 group (the lowest response among the 7 serotypes contained in PCV7 achieved by subjects who received PCV7). For serotype 6B, the GMC was 2.71. All the additional serotypes met the non-inferiority criterion for GMC. Four (4) of the 6 additional serotypes met the non-inferiority criterion for GMR (lower limit of the 2-sided 95% CI for the GMR $>$ 0.5). The exceptions were serotype 3 and 5 with a GMR of 0.39 (95% CI, 0.33 to 0.46) and 0.37 (95% CI, 0.31 to 0.44), respectively.

N=number of subjects included in PPS for PCV13-TT and PCV7.

- number of subjects with a determinate IgG antibody concentration to the given serotype for PCV13-TT group.
- number of subjects with a determinate IgG antibody concentration to the given serotype for PCV7 group.
- The rate difference of PCV13-TT – PCV7.
- GMC ratio: PCV13-TT to PCV7.
- Two-sided 95% CI is for additional serotypes, and two-sided 97.5% CI is for common serotypes.
- Difference in proportions: (PCV13-TT – PCV7 seroresponse) expressed as a percentage. GMC ratio: PCV13-TT to PCV7 seroresponse.
- Difference in proportions: (PCV13-TT – PCV7 reference) expressed as a percentage. For the additional serotypes, the reference value is derived from serotype 6B from the PCV7 group. GMC ratio: PCV13-TT to PCV7 reference. For the additional serotypes, the reference value is derived from serotype 6B from the PCV7 group.

N=number of subjects included in PPS for PCV13-TT and PCV7.

- number of subjects with a determinate IgG antibody concentration to the given serotype for PCV13-TT group.
- number of subjects with a determinate IgG antibody concentration to the given serotype for PCV7 group.
- The rate difference of PCV13-TT – PCV7.
- GMC ratio: PCV13-TT to PCV7.
- Two-sided 95% CI is for additional serotypes, and two-sided 97.5% CI is for common serotypes.
- Difference in proportions: (PCV13-TT – PCV7 seroresponse) expressed as a percentage. GMC ratio: PCV13-TT to PCV7 seroresponse.
- Difference in proportions: (PCV13-TT – PCV7 reference) expressed as a percentage. For the additional

serotypes, the reference value is derived from serotype 6B from the PCV7 group. GMC ratio: PCV13-TT to PCV7 reference. For the additional serotypes, the reference value is derived from serotype 6B from the PCV7 group.

2.7.3.2.2.2.2.2. Pneumococcal Serotype antibody concentrations in the subjects aged 12-23 months in PCV13-TT group and PCV7 group
The results of pneumococcal serotype antibody concentrations for subjects aged 12-23 months after full immunizations in PCV13-TT group and PCV7 group were shown in Table 100. to Table 112 The reverse cumulative distribution curves were shown in Figure 53 to 65.

2.7.3.2.2.2.3. Comparison of percentage of subjects achieving IgG antibody concentration $\geq 1.0 \mu\text{g/mL}$ with comparison to the PCV7 seroresponse
Data for the 7 common serotypes
All common serotypes met the noninferiority criterion after immunization. The lower limit of the 2-sided 95% CI for rate difference of IgG seroresponse rates $\geq 1.0 \mu\text{g/mL}$ was all greater than -10% (Table 113).
Data for the 6 additional serotypes
All additional serotypes met the noninferiority criterion after primary series. The lower limit of the 2-sided 95% CI rate difference of IgG seroresponse rates $\geq 1.0 \mu\text{g/mL}$ was all greater than 0.

Table 113. Comparison of percentage of subjects aged 12-23 months achieving a pneumococcal IgG antibody concentration $\geq 1.0 \mu\text{g/mL}$ post full immunizations (PPS)

2.7.3.2.2.2.4. Comparison of percentage of subjects achieving an OPA antibody $\geq 1:8$ and the IgG antibody geometric mean titers (GMTs)
Data for 7 common serotypes
For the 7 common serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was all higher than 90% in PCV13-TT group (Table 115). The lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than -10% for all the common serotypes. With the exception of serotypes 6B and 23F, the lower limit of the 2-sided 95% CI of GMR was greater than 0 % for the common serotypes.
Data for 6 additional serotypes
With the exception of serotype 1 (88.04%), the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was all higher than 90% in PCV13-TT group. The lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than 0 for all the additional serotypes. The lower limit of the 2-sided 95% CI of GMR was greater than 1 for all the additional serotypes.

2.7.3.2.2.2.3. Pneumococcal immunogenicity results for subjects aged 24-71 months in PCV13-TT group and PCV7 group
2.7.3.2.2.2.3.1. Comparison of percentage of subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ $\mu\text{g/mL}$ and the IgG antibody geometric mean concentrations (GMCs)

Data for the 7 common serotypes

The proportion of responders ≥ 0.35 $\mu\text{g/mL}$ in the PCV13-TT group were all higher than 98% and all common serotypes met the noninferiority criterion for the proportion of responders ≥ 0.35 $\mu\text{g/mL}$ (Table 117). The GMCs were all greater than 3.84 $\mu\text{g/mL}$. With the serotype 14, all common serotypes met the noninferiority criterion for GMC. The GMR to serotype 14 was 0.65, with a lower limit of the 2-sided 95% CI of -0.49.

Data for the 6 additional serotypes with comparison to the PCV7 seroresponse

With the exception of serotype 3 (88.89%), the proportion of responders ≥ 0.35 $\mu\text{g/mL}$ in the PCV13-TT group were all higher than 96%. The lower limit of the 2-sided 95% CI for the proportion of responders ≥ 0.35 $\mu\text{g/mL}$ was all greater than 70%. The lower limit of the 2-sided 95% CI for the rate difference for the proportion of responders ≥ 0.35 $\mu\text{g/mL}$ was all greater than 0 for all additional serotypes except serotypes 6A (-0.07) and 19A (-0.48). The GMR was all greater than 1 for all the additional serotypes.

Data for the 6 additional serotypes with comparison to the PCV7 reference

The PCV7 reference value for the 6 additional serotypes was based on serotype 23F from the PCV7 group (the lowest response among the 7 serotypes contained in PCV7 achieved by subjects who received PCV7). For serotype 23F, the proportion of responders was 97.99%. All additional serotypes met the non-inferiority criterion except serotype 3. For serotype 3, the lower limit of the 2-sided 95% CI for the proportion of responders ≥ 0.35 $\mu\text{g/mL}$ was -13.89.

The PCV7 reference value for the 6 additional serotypes was serotype 6B from the PCV7 group (the lowest response among the 7 serotypes contained in PCV7 achieved by subjects who received PCV7). For serotype 6B, the GMC was 3.63. The GMR >0.5 was met for 4 of 6 additional serotypes. The exceptions were serotype 3 and serotype 5. The lower limit of the 2-sided 95% CI for the GMR was met for 3 of 6 additional serotypes. The exceptions were serotype 1, 3 and 5.

N=number of subjects included in PPS for PCV13-TT and PCV7.

a. number of subjects with a determinate IgG antibody concentration to the given serotype for PCV13-TT group.

b. number of subjects with a determinate IgG antibody concentration to the given serotype for PCV7 group.

c. The rate difference of PCV13-TT – PCV7.

d. GMC ratio: PCV13-TT to PCV7.

e. Two-sided 95% CI is for additional serotypes, and two-sided 97.5% CI is for common serotypes.

f. Difference in proportions: (PCV13-TT – PCV7 seroresponse) expressed as a percentage. GMC ratio: PCV13-TT to PCV7 seroresponse.

g. Difference in proportions: (PCV13-TT – PCV7 reference) expressed as a percentage. For the additional serotypes, the reference value is derived from serotype 23F from the PCV7 group. GMC ratio:

PCV13-TT to PCV7 reference. For the additional serotypes, the reference value is derived from serotype 6B from the PCV7 group.

Table 118. Comparison of percentage of subjects aged 24-71 months achieving a pneumococcal IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ and GMCs post full immunizations (FAS)

2.7.3.2.2.3.2. Pneumococcal Serotype antibody concentrations in the subjects aged 24-71 months in PCV13-TT group and PCV7 group
The results of pneumococcal serotype antibody concentrations for subjects aged 24-71 months after full immunizations in PCV13-TT group and PCV7 group were shown in Table 119. to Table 131. The reverse cumulative distribution curves were shown in Figure 66 to 78.

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.2.2.3.4. Comparison of percentage of subjects achieving an OPA antibody $\geq 1:8$ and the IgG antibody geometric mean titers (GMTs)

Data for 7 common serotypes

For the 7 common serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was higher than 96% except serotypes 14 (92.93%) in PCV13-TT group (Table 134). The lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than -10% for the common serotypes. With the exceptions of serotypes 14 and 23F, the lower limit of the 2-sided 95% CI of GMR was greater than 0.5. For serotypes 14 and 23F, the lower limit of the 2-sided 95% CI of GMR was 0.75 (95% CI, 0.39 to 1.41) and 0.58 (95% CI, 0.37 to 0.97), respectively.

Data the 6 additional serotypes

For the 6 additional serotypes, the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was higher than 94% except serotypes 1 (43.43%) in PCV13-TT group. With the exceptions of serotype 6A, the lower limit of the 2-sided 95% CI of rate difference of the percentage of subjects achieving an OPA antibody titer $\geq 1:8$ was greater than 0 for all the common serotypes. For serotype 6A, the rate difference was -0.05(95% CI, -6.12 to 6.02). The lower limit of the 2-sided 95% CI of GMR was greater than 1 for all the additional serotypes.

Module 2 Summaries

2.7.3.2.3. Discussion and conclusion

2.7.3.2.3.1. Discussion of immunogenicity

2.7.3.2.3.1.1. Discussion of subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ and the IgG antibody geometric mean concentrations (GMCs).

2.7.3.2.3.1.1.1. Primary series

Analysis of common serotypes

After primary immunization series, the IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ was high, though in common serotypes, the positive rate of 6B was 90.45% PCV13-TT (3 months) group, besides this, the subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ of all other serotypes in remaining age groups was above 95%, with antibody GMC consistently over $2.0 \mu\text{g/mL}$. Apart from the serotype 6B in subjects aged 3-71 months, 6B and 23F in subjects aged 3 months, and 9V in subjects aged 7-11 months, the lower limit of two-sided 95% CI for percentage difference (PCV13-TT – PCV7) of other IgG antibody with concentration $\geq 1.0 \mu\text{g/mL}$ was greater than -10%. The percentage of IgG antibody concentration $\geq 1.0 \mu\text{g/mL}$ in subjects of PCV13-TT group aged 12-23 months and 24-71 months were higher than that in PCV7 group. The lower limit of 97.5% CI was $> -10\%$ for the rate difference of antibody positive rate of 7 common serotypes (PCV13-TT – PCV7) in subjects aged 3-71 months after primary immunization series, the lower limit of 97.5% CI for antibody GMC ratio (PCV13-TT / PCV7) was > 0.5 , demonstrating the noninferiority between PCV13-TT group and PCV7 group for common serotypes.

In the 3-month main target population, 6 out of 7 common serotypes (except serotype 6B) met the noninferiority criterion after primary series, and serotype 6B met the noninferiority criterion after booster dose.

For PCV13-TT group subjects aged 2 months vs PCV7 group subjects aged 3 months, the lower limit of 97.5% CI was $> -10\%$ for the rate difference for the subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ of 7 common serotypes; the lower limit of 2-sided 97.5% CI was > 0.5 for the antibody GMC ratio of serotypes 6B, 9V, 14, 19F, and 23F. The 7 common serotypes in PCV13-TT group subjects aged 2 months were noninferior to PCV7 group subjects aged 3 months.

For PCV13-TT (2 months) group vs PCV13-TT (3 months) group, the additional serotype 5 was observed with a lower limit of 2-sided 97.5% CI $> -10\%$ (-10.84%) for the rate difference of the subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$, and a lower limit of 2-sided 97.5% CI < 0.5 for antibody GMC ratio, besides, the common serotype 4 was with a lower limit of 2-sided 97.5% CI < 0.5 for antibody GMC, apart from the exceptions above, all other serotypes achieved noninferiority criteria in this comparison.

For 7-11 months age group, the lower limit of 95% CI was $> -10\%$ for the rate difference of the subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ (PCV13-TT – PCV7), the lower limit of 95% CI was > 0.5 for GMC ratio (PCV13-TT / PCV7) of 6 common serotypes except serotype 14. In 12-23 months age group and 24-71 months age group, the lower limit of 95% CI was $> -10\%$ for rate difference of the subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ (PCV13-TT – PCV7), and the lower limit of 95% CI was > 0.5 for GMC ratio (PCV13-TT / PCV7) for 7 common serotypes.

Confidential 399

Module 2 Summaries

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

Analysis of additional serotypes

In 3-71 months age groups, the subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ of all additional serotypes were $> 90\%$, and the lower limit of 95% CI was > 0 for the rate difference of the subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ (PCV13-TT – PCV7), besides, the lower limit of 95% CI was > 1 for GMC ratio (PCV13-TT / PCV7) of each additional serotype, demonstrating the achievement of superiority of each additional serotype in PCV13-TT group. The serotypes with lower subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ were 23F in 3-71 months age group, 18C in 3 months age group, 23F in 7-11 months age group, 6B in 12-23 months age group, and 23F in 24-71 months age group; serotype 6B was confirmed to be with the lowest antibody GMC in all PCV7 groups.

Of all comparisons, apart from the serotype 5 in 7-11 months and serotype 3 in 24-71 months age group, the lower limit of 97.5% / 95% CI was $> -10\%$ for the rate difference of subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ of additional serotypes with lowest subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$, and thus were considered to be noninferior to common serotypes with lowest subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ according to noninferiority criteria.

2.7.3.2.3.1.1.2. Discussion of booster immunizations

Analysis of common serotypes

After booster dose, in PCV13-TT (3 months) group, the subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ and antibody GMC of 7 common serotypes were noninferior to those in PCV7 group, both the t PCV13-TT group and PCV7 group had more than 3.5-fold increase in antibody GMC compared to that before booster dose. The subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ of 7 common serotypes in PCV13-TT (2 months) group were noninferior to PCV7 (3 months) group. The subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ and antibody GMC of 7 common serotypes in PCV13-TT group aged 7-11 months were noninferior to those in PCV7 group.

Analysis of additional serotypes

As to the 6 additional serotypes, the lower limit of 95% CI for subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ of 19A was -0.2%, though other serotypes were superior to PCV7 group; all the 6 additional serotypes attained superiority criteria with respect to antibody GMC, with > 3.5 -fold increase compared to that before booster dose in PCV13-TT (3 months) group. As to the 6 additional serotypes, despite the lower limit of 95% CI for antibody positive rate of 19A was -0.2%, other serotypes were superior to PCV7 group; all the 6 additional serotypes attained superiority criteria with respect to antibody GMC in PCV13-TT (2 months) group. The antibody positive rates and antibody GMC of 13 serotypes in PCV13-TT (2 months) group were noninferior to those in PCV13-TT (3 months) group, with > 3.5 -fold increase in GMC after

booster dose compared to that before.

For the 6 additional serotypes in PCV13-TT group aged 7-11 months, the lower limit of 95% CI for the rate difference of serotype 19A was -1.93%, though all other serotypes were superior to PCV7 group; all the 6 additional serotypes attained superiority criteria with respect to antibody GMC. The antibody GMC of 13 serotypes in PCV13-TT group aged 7-11 months and 7 serotypes in PCV7 group were with more than 1-fold increase after booster dose.

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.2.3.1.2. Proportion of subjects with OPA antibody titer $\geq 1:8$ (OPA positive rate) and OPA geometric mean titer

2.7.3.2.3.1.2.1. Primary series

In subjects aged 3 months, after primary series of PCV13-TT, the OPA positive rates of 6 out of 7 common serotypes all exceeded 95% except for serotype 6B (89.25%), achieving the lower limit defined in non-inferiority test compared to PCV7 group. The OPA positive rates exceeded 95% in 5 additional serotypes except serotype 1 (83.87%). All of the 6 additional serotypes met the lower limit defined in superiority test compared to PCV7 group.

In subjects aged 2 months after primary series of PCV13-TT, the OPA positive rates of 13 serotypes all exceeded 90%, and 11 serotypes were with positive rates exceeding 95%. Except for serotype 6B, the remaining 6 of the 7 common serotypes met the lower limit defined in non-inferiority test compared to PCV7 (3 months) group. All of the 6 additional serotypes met the lower limit defined in superiority test.

In subjects aged 7-11 months, and in PCV13-TT group in PPS after immunization, the OPA positive rates of 11 serotypes among 13 serotypes exceeded 90%. The OPA positive rate of serotype 6B and 6A was respectively 81.25% and 89.58%. For OPA positive rate, the lower limit of 95% CI for the intergroup difference (PCV13-TT – PCV7) was greater than -10% (lower reference limit) in 5 of the 7 common serotypes for PCV13-TT group vs PCV7 group in PPS. The only two serotypes in PCV13-TT group with lower limit of 95% CI for the intergroup difference of OPA positive rate lower than -10% (lower reference limit) were serotype 6B and 23F. The lower limit of 95% CI for the intergroup difference of OPA positive rate all exceeded 0% in all 6 additional serotypes.

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.2.3.1.2.2. Booster Dose

In subjects aged 3 months, after booster dose of PCV13-TT, the OPA positive rates of all common serotypes exceeded 98%, reaching the lower limit defined in non-inferiority test compared to PCV7 group. The OPA positive rates of additional serotypes all exceeded 95% and reached the lower limit defined in superiority test except for serotype 6A as compared with PCV7 group. The positive rate of serotype 6A was 95.83% in PCV13-TT group and 92.78% in PCV7 group, which were both at a relatively high level. The lower limit of 95% CI for difference of positive rates was -3.47%, which was consistent with the reported evidence of possible cross-protection between pneumococcal serotype 6B and 6A in prior literature. The GMT of serotype 7F in PCV13-TT (3 months) group post booster dose rose to a similar level as that after primary series, while GMTs of other serotypes after booster dose were higher than that after primary series to varied degrees. In subjects aged 2 months, after booster dose of PCV13-TT, the OPA positive rates of 10 serotypes reached 100%, meanwhile the positive rates of other 3 serotypes exceeded 95%. The OPA positive rates of 7 common serotypes all reached the lower limit defined in non-inferiority test when compared with PCV7 (3 months) group. Five of the 6 additional serotypes reached the lower limit defined in superiority test except for 6A. The positive rate for serotype 6A was 97.83% after booster dose in PCV13-TT (2 months) group. The lower limit of 95% CI for the difference between the PCV13-TT (2 months) group and PCV7 (3 months) group was -0.91%, which was similar to the result obtained in PCV13-TT (3 months) group for serotype 6A, consistent with the reported evidence of possible cross-protection between pneumococcal serotype 6B and 6A. The overall trend of the OPA positive rates for all serotypes was similar in PCV13-TT (2 months) group vs PCV7 (3 months) and PCV13-TT (3 months). Through booster dose, the GMT of serotype 3 rose to a similar level as that after primary series, while GMTs of other serotypes after booster dose were higher than that after primary series to varied degrees.

In subjects aged 7-11 months, after booster dose of PCV13-TT, the OPA positive rates of 13 serotypes all exceeded 90%, among which the positive rates of 8 serotypes reached 100%. For OPA positive rates, the lower limit of 95% CI for the difference of OPA positive rates (PCV13-TT - PCV7) was greater than -10% (lower reference limit) for the 7 common serotypes in PCV13-TT group vs PCV7 group. The lower limit of 95% CI for the difference of OPA positive rates all exceeded 0% in all 6 additional serotypes. For the GMT of OPA, the lower limit of 95% CI for GMT ratio (PCV13-TT / PCV7) was greater than 0.5 (lower reference limit) for 5 of the 7 common serotypes in PCV13-TT group vs PCV7 group. The only two serotypes with lower limit of 95% CI for GMT ratio lower than 0.5 (lower reference limit) in PCV13-TT group were serotype 6B and 23F, while GMTs (PPS) of serotype 6B and 23F in PCV13-TT group had achieved 110- and 197-fold increase as compared with the positive threshold (1:8), respectively. The lower limits of 95% CI for intergroup GMT ratio in 6 additional serotypes were all higher than 1.

In subjects aged 12-23 months, after full immunizations, the OPA positive rates of 12 serotypes among 13 serotypes in PCV13-TT group (PPS) all exceeded 90%. The OPA positive rate for serotype 1 was 88.04%. For OPA positive rate, the lower limit of 95% CI for the difference of OPA positive rates (PCV13-TT - PCV7) was greater than -10% (lower reference limit) for the 7 common serotypes in PCV13-TT group vs PCV7 group. The lower limit of 95% CI for the intergroup difference of OPA positive rates all exceeded 0% in all 6 additional serotypes. Considering the GMT of OPA, the lower limit of 95% CI for the intergroup GMT ratio was greater than 0.5 (lower reference limit) for 5 of the 7 common serotypes in PCV13-TT group vs PCV7 group. The only two serotypes in PCV13-TT group with lower limit of 95% CI for the intergroup GMT ratio lower than 0.5 were serotype 6B and 23F. The lower limit of 95% CI for intergroup GMT ratio in 6 additional serotypes was all higher than 1.

Module 2 Summaries

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

In subjects aged 24-71 months, after full immunizations, the OPA positive rates of 12 serotypes among 13 serotypes in PCV13-TT group (PPS) all exceeded 90%. The OPA positive rate for

serotype 1 was 43.43%. For OPA positive rate, the lower limit of 95% CI for the intergroup difference of the OPA positive rates (PCV13-TT - PCV7) was greater than -10% (lower reference limit) for the 7 common serotypes in PCV13-TT group vs PCV7 group. The lower limit of 95% CI for the intergroup difference of OPA positive rate all exceeded 0% in 5 serotypes among the 6 additional serotypes. The OPA antibody positive rates of 6A in PCV13-TT group and PCV7 group in PPS were 94.95% and 95.00%, respectively, for the GMT of OPA, the lower limit of 95% CI for the GMT ratio was greater than 0.5 (lower reference limit) for 5 of the 7 common serotypes in PCV13-TT group vs PCV7 group. The only two serotypes in PCV13-TT group with lower limit of 95% CI for GMT ratio lower than 0.5 were serotype 14 and 23F. The lower limit of 95% CI for GMT ratio in 6 additional serotypes was all higher than 1.

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.3.2.3.2. Immunogenicity Results

This clinical trial, with a licensed 7-valent pneumococcal conjugate vaccine as control, was designed to evaluate the immunogenicity and safety of the 13-valent pneumococcal polysaccharide conjugate vaccine, jointly developed by Yunnan Walvax Biotechnology Co., Ltd. and Yuxi Walvax Biotechnology Co., Ltd, in subjects aged 3 months (schedule of vaccination at 0, 1, 2 months), 7-11 months (month 0, 2 schedule), 12-23 months (2 doses) and 24-71 months (1 dose), respectively, the 13-valent pneumococcal polysaccharide conjugate vaccine was also administered in subjects 2 month of age (minimum age: 6 weeks) enrolled to compare with subjects aged 3 months in terms of immunization procedure.

In the main target population (3 months of age), the common serotypes achieved noninferiority criteria for comparison between PCV13-TT and PCV7 group except for serotype 6B during primary series, meanwhile all common serotypes in PCV13-TT group were noninferior to that in PCV7 group after the booster dose; for additional serotypes, superiority criteria were met for PCV13-TT group vs PCV7 group after primary series; the common serotypes in PCV13-TT group aged 3-71 months were all noninferior to those in PCV7 group during primary series, besides, the additional serotypes in PCV13-TT group were all superior as compared to PCV7 group.

For PCV13-TT (2 months) group vs PCV7 (3 months) group, both common and additional serotypes had achieved noninferiority or superiority criteria post primary series. For PCV13-TT (2 months) group vs PCV13-TT (3 months) group, 12 serotypes reached noninferiority criteria during primary series except for additional serotype 5; and all 13 serotypes were noninferior to those in PCV13-TT (3 months) group post booster dose.

In PCV13-TT recipients aged 7-11 months, 12-23 months, and 24-71 months, the proportions of subjects with IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ for common serotypes were all noninferior to those in PCV7 group. The additional serotypes in PCV13-TT group of 7-11 months had reached superiority criteria after primary series; for PCV13-TT groups of 12-23 months and 24-71 months, superiority criteria were generally met after immunization.

The results before and after booster dose indicated decrease in the antibody levels of several serotypes in the 13 serotypes either in PCV13-TT group or PCV7 group to some extent, while the percentage of subjects with IgG antibody concentration $\geq 3.5 \mu\text{g/mL}$ and antibody GMC after 1 dose of booster immunization both reached or exceeded the levels observed after primary series, demonstrating significant effect of the booster dose, reflecting the immunological memory effect of the conjugate vaccine adequately. The antibody GMC post booster dose had more than 3-fold increase in the 2-6 months olds, and greater than 1-fold increase in subjects aged 7-11 months as compared with the GMC before booster dose.

Module 2 Summaries

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.4.1.1. Overall safety assessment plan and safety study description

2.7.4.1.1.1. Phase I clinical trial

All subjects were observed for 30 minutes after each dose of 13-valent pneumococcal polysaccharide conjugate vaccine (PCV13-TT), and were under active observation for adverse events (AEs) within 0-7 days post vaccination, while for 8-30 days post vaccination, AEs were spontaneously reported and collected by subjects. Serious adverse events (SAEs) were collected for 6 months after full immunization of PCV13-TT which was administered in accordance with the immunization procedure prescribed in the protocol. Venous blood was collected from subjects in stage 1 and 2 before receiving the first dose and in 3 days after the first dose of PCV13-TT, so as to assess the changes in measures of hematology, liver and kidney function test.

Stage 1 (adults aged 18 and above): Adult subjects aged 18 years and above were recruited and the venous blood samples (no less than 5.0 ml) were collected after informed consenting to assess related measures of hematology, liver and kidney function test. One dose of PCV13-TT was administered to subjects with normal testing results and demonstrating eligibility by other inclusion criteria, and 30 subjects were enrolled in the stage. Thirty-minute medical observation was carried out after vaccination. Venous blood (no less than 3.5 ml) was collected on Day 3 after vaccination to assess related measures of hematology, liver and kidney function test, as well as to observe the changes in these measures, all subjects were actively observed to evaluate safety until Day 7 after vaccination. If no vaccine-related SAE was identified by the investigators, and no grade 4 vaccine-related abnormalities determined by the investigators as measured by hematology, liver and kidney function test on Day 3 after vaccination were detected, then the study proceeded to stage 2. The serum samples collected before vaccination were retained, and another round of venous blood (no less than 3.0 ml) collection was performed 30 days after one dose of vaccine in these subjects. The serum was separated, and the serum IgG antibody concentration was measured before and 30 days post vaccination.

Stage 2 (children aged 2-5 years old): Children subjects aged 2-5 years were recruited, and the venous blood samples (no less than 5.0 ml) were collected after the informed consent form was signed by their legal guardians to detect related measures of hematology, liver and kidney function tests. Subjects with testing results within the normal range predefined in the protocol or not within the normal range but were determined by site investigators to be normal and in compliance with

other inclusion criteria were given 1 dose of PCV13-TT, a total of 30 subjects were enrolled in this stage. If the results of hematology, liver and kidney function tests before vaccination were not within the normal range defined in study protocol while not exceeding 50% of the normal range (below the lower limit or above the upper limit), the results were to be evaluated by site investigators to determine whether the subjects were eligible for enrollment and vaccination. Thirty-minute medical observation was carried out after vaccination. Venous blood (no less than 3.5 ml) was collected on Day 3 after vaccination to assess related measures of hematology, liver and kidney function tests, as well as to observe the changes in these measures, all subjects were actively observed for safety until Day 7 after vaccination. If no SAE related to the study vaccine was identified by the investigators, and no grade 4 vaccine-related abnormalities determined by the investigators as measured by hematology, liver and kidney function tests were detected on Day 3 after vaccination, then the study proceeded to stage 3. The serum samples collected before vaccination were retained, and another round of venous blood (no less than 3.0 ml) collection was performed 30 days after one dose of vaccine administered in these subjects. The serum was separated, and the serum IgG antibody concentration was measured before and 30 days post vaccination.

Confidential 407

Module 2 Summaries

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

Stage 3 (2 months old group): Infant subjects aged 2 months (minimum age: 6 weeks) were recruited, and venous blood samples (no less than 3.0 ml) were collected after the informed consent form was signed by their legal guardians. The serum was separated and the serum IgG antibody concentration before immunization was detected. Three doses of PCV13-TT were administered according to the procedure of one dose each in 0, 2 and 4 months. A total of 30 subjects were enrolled. Thirty-minute medical observation was carried out after each vaccination, and all subjects were actively observed until Day 7 day after vaccination. Venous blood (no less than 3.0 ml) was collected 30 days after the 3rd dose of vaccine. The serum was separated and the serum IgG antibody concentration 30 days post immunization was detected.

Stage 3 (3-month group): Infant subjects aged 3 months (minimum age: 6 weeks) were recruited, and venous blood samples (no less than 3.0 ml) were collected after the informed consent form was signed by their legal guardians. The serum was separated and the serum IgG antibody concentration before immunization was detected. Three doses of PCV13-TT were administered according to the procedure of one dose each in 0, 1 and 2 months. A total of 30 subjects were enrolled. Thirty-minute medical observation was carried out after each vaccination, and all subjects were actively observed until Day 7 day after vaccination. Venous blood (no less than 3.0 ml) was collected 30 days after the 3rd dose of vaccine. The serum was separated and the serum IgG antibody concentration 30 days post immunization was detected.

All subjects were observed for 30 minutes after each dose of PCV13-TT, and were under active observation for AEs within 0-7 days post vaccination, while for 8-30 days post vaccination, AEs were spontaneously reported and collected by subjects. SAEs were collected for 6 months after full immunization PCV13-TT which was administered in accordance with the immunization procedure prescribed in the protocol.

In the third stage of phase I clinical trial, after the first dose of PCV13-TT was administered to the 2-month and 3-month group followed by 7-day active observation, the safety of phase I clinical trial was preliminarily evaluated. If no serious adverse events related to study vaccine were determined by the investigators, or the incidence of local or systemic adverse events with a severity of grade 3 or above was not higher than 15%, and no vaccine-related grade 4 abnormalities in hematology, liver and kidney function tests were observed on Day 3 after the first dose of vaccine administered to subjects in the first and second stage, then the program proceeded to phase III clinical trial. In the meantime, the follow-up immunization procedure and corresponding safety observation for the subjects in stage 3 of phase I clinical trial were continued and the data were collected to be included in the final safety analysis.

Data collation and clarification were finished within two months after the completion of stage 3 full immunization at each site. Phase I clinical study report was issued within one month of receiving immunogenicity test results after serious adverse events were collected 6 months after completing all stages of vaccination.

Confidential 408

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.4.1.1.2 Phase III clinical trial

All subjects were actively observed for 30 minutes and 0-7 days post vaccination as part of systematic safety monitoring, and the AEs were spontaneously reported by the subjects within 8-30 days post vaccination. SAEs occurred during 6 months after the full primary immunizations and / or 6 months after the full booster immunization were collected.

Safety observation was carried out after the administration of each dose of vaccine.

Immunogenicity was observed before the first dose of vaccine and 30 days after the primary immunizations. Immunogenicity observation was also performed before and 30 days after booster immunization for subjects in age group requiring booster immunization. Data collation and clarification were completed after finishing the on-site sampling. Statistical analysis and clinical study reports were completed after the blood test results returned.

2.7.4.2. Adverse events

2.7.4.2.1 Incidence of adverse event

2.7.4.2.1.1. Phase I clinical trial

Solicited adverse events in phase I clinical trials are by default associated with the study vaccine, and the relatedness of unsolicited adverse reactions was adjudicated by investigators. The overall adverse events in each stage is summarized in Table 142.

A total of 24 (80.00%) subjects in adults group experienced adverse events related to the study vaccine, of which 10 cases (33.33%) experienced systemic adverse reactions, but no grade 3 systemic adverse reaction was reported; 23 cases (76.67%) experienced local reactions, of which the severity of the reaction for 6 cases (20.00%) reached grade 3.

A total of 16 (53.33%) subjects in children group experienced adverse events related to the study vaccine, of which 7 cases (23.33%) experienced systemic adverse reactions, and the severity of 2 cases (6.67%) reached grade 3; 8 cases (26.67%) experienced local reactions, of which the severity of the reaction for 1 case (3.33%) reached grade 3.

A total of 20 (66.67%) subjects in the 2-month age group experienced adverse events related to the study vaccine, of which 18 cases (60.00%) experienced systemic adverse reactions, and the severity of 2 cases (6.67%) reached grade 3; 12 cases (40.00%) experienced local reactions, of which the severity of the reaction for 2 cases (6.67%) reached grade 3. Another case of adverse event which was unrelated to the study vaccine was reported as herpangina and the severity reached grade 3.

A total of 21 (70.00%) subjects in the 3-month age group experienced adverse events related to the study vaccine, of which 17 cases (56.67%) experienced systemic adverse reactions, but no grade 3 systemic adverse reaction was reported; 11 cases (36.67%) experienced local reactions, of which the severity of the reaction for 1 case (3.33%) reached grade 3. Another case of adverse event which was unrelated to the study vaccine was reported as upper respiratory tract infection and the severity reached grade 3.

No serious adverse event was collected during the observation period, and no drop-outs due to adverse events were noted.

2.7.4.2.1.2. Phase III clinical trial

2.7.4.2.2.1 Primary series

In Phase III clinical trial, 790 (2282 events) cases of adverse events were observed in the 3-71 months group, and 851 (2440 events) cases of adverse events were observed in the PCV7 group. The overall incidence of adverse events was 70.73% and 76.05% in the PCV13-TT group and the PCV7 group, respectively. There was significant difference in the incidence of adverse events between groups, and the overall incidence of adverse events in the PCV13-TT group was lower than that in the PCV7 group.

The incidence of adverse events related to the study vaccine was 60.79% in the PCV13-TT group and 64.79% in the PCV7 group. The PCV13-TT group was slightly lower than the PCV7 group but no significant difference was observed.

The incidence of vaccine-independent adverse events was 35.00% in the PCV13-TT group and

2.7.4.2.2.2. Booster immunization stage

2.7.4.2.2.2.1. Overall incidence of adverse events

The subjects with booster immunization included subjects aged 2 months and 3 months receiving 3-dose series, and those aged 7-11 months who received 2 doses of vaccination during Primary series, and booster dose was given as 1 dose.
 The incidence of adverse events was 35.46% in the PCV13-TT group and 34.50% in the PCV7 group for 3-11 month of age who received booster immunization. The severity was mainly grade 1 and 2. Thirteen and seven grade 3 adverse events were reported in the PCV13-TT group and the PCV7 group, and the incidence rate was respectively 1.93% and 1.02%. No significant difference was observed between the groups. One case of grade 4 adverse event was observed in each group (reported as SAE), which were both not related to the study vaccine.
 There was no significant difference in the incidence of adverse events among PCV13-TT and PCV7 groups in subjects 3 months and 7-11 month of age.
 Adverse events after booster immunization in the PCV13-TT and PCV7 group were shown in Table 148 to Table 150.

Table 148 Overall incidence in PCV13-TT and PCV7 groups post booster dose in subjects aged 3-11 months

2.7.4.2.2.2. Adverse events occurred 30 minutes and 7 days post vaccination
The incidence of adverse events occurred 30 minutes and 7 days post vaccination is shown in tables Table 151 to Table 162.
No significant difference was observed in the incidence of adverse events within 30 minutes after vaccination between the PCV13-TT group and the PCV7 group of 3 month of age and 7-11 month of age.

2.7.4.2.2.3. Occurrence of adverse events with different procedures in the PCV13-TT (2 months) group, PCV13-TT (3 months) group and PCV7 (3 months) group
The incidence of vaccine-related adverse events after the booster immunization in the PCV13-TT (2 months) group was significantly lower than that in the PCV13-TT (3 months) group and PCV7 (3 months) group (p=0.0180). The incidence of fever and diarrhea in the PCV13-TT (2 months) group was lower than that in the PCV13-TT (3 months) and PCV7 (3 months) group (fever: p=0.0360, diarrhea: p=0.0156). No significant difference was observed among other symptom groups, please refer to

2.7.4.2.2. Analysis of adverse events
 2.7.4.2.2.1. Phase I clinical trial
 2.7.4.2.2.1.1. Adverse reactions after each vaccination in 2 months old group and 3 months old group
 The incidence of adverse events in the 2 months old group (vaccinations were given at 0, 2, 4 months) and the 3 months old group (vaccinations were given at month 0, 1, 2) are shown in Table 165 to Table 166.
 No growing tendency was observed for adverse reaction as the doses of vaccination increased in subjects administered with either immunization procedure. No significant difference was observed in the incidences of adverse events among each dose in the schedule of vaccination at 0, 2, 4 months, and a downward trend was noted as the doses increased in the schedule of vaccination at 0, 1, 2 months.

2.7.4.2.3.1.2. Solicited adverse events – systemic and local reactions
 See Table 167-Table 170 for the incidences of systemic and local reactions.
 The most common systemic reaction was fever in all age groups, the incidence of fever in infants and toddlers was higher than that in adults and children aged 2-5 years. The severity of fever was

mainly grade 1, while 2 cases in 2-5 years old group and 1 case in 2 months old group reach grade 3. The incidences of vomiting, diarrhea, abnormal crying and other symptoms were also higher in subjects aged 2 and 3 months. Except for fever, one case in the 2 months old group had grade 3 fatigue / somnolence. The severity of other systemic reactions was mainly grade 1, and no grade 3 reaction was reported.

Common local reactions in adults and children aged 2-5 years were pain, redness and swelling. The severity of local pain for 1 case in the children group reached grade 3; the severity of local redness for 3 adults and 1 child reached grade 3; the severity of local swelling for 4 cases in the adults group reached grade 3; the severity of local induration for 1 case in the adults group reached grade 3. Other local adverse reactions were mainly grade 1. The most common symptoms were local tenderness, redness and induration in 2 months old group; tenderness, redness and swelling were more common in 3 months old group. The severity of local redness and local induration for 1 case in 2 months old group reached grade 3, and the severity of swelling for 1 case in 3-month group reached grade 3.

Within 30 minutes after vaccination, the primarily observed adverse reactions were fever, fatigue (mainly observed among adults) and local redness, including 1 case of fever, one case of fatigue and 7 cases of local redness in the adults group who received 1 dose of vaccine; one case of fever was observed in the children group who received 1 dose of vaccine; eight cases of fever and 7 cases of local redness were observed in the 2 months old group who received three-dose series given at 0, 2, 4 months; four cases of fever and 4 cases of local redness were observed in the 3 months old group who received three-dose series at 0, 1, 2 months.

2.7.4.2.3.1.3. Unsolicited adverse events
A total of 70 unsolicited adverse events including laboratory tests were observed in 44 cases, including 13 vaccine-related cases (16 events) and 35 vaccine-independent cases (54 events). In the adult and 2-5-year-old children group, 9 cases (11 events) were observed with abnormal laboratory findings related to vaccination. The severity of abnormal laboratory results related to vaccine was grade 1, and were determined as clinically irrelevant events by investigators. Five other unsolicited adverse events, other than laboratory tests, were determined as "probably related to study vaccine" by the investigators, including one case of lymphadenopathy in adult group, one case of rhinorrhea (runny nose) in children group, 1 case of decreased appetite in 2 months old group, 1 case of dyspepsia and 1 case of vomiting in 3-month group. See Table 171-Table 174 for analysis of unsolicited events.

Module 2 Summaries

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.4.2.3.1.4. Discussions and conclusions of safety

The incidence rates of vaccine-related adverse events in adults, children, 2 months old and 3 months old group were 80.00%, 53.33%, 66.67% and 70.00%, respectively. Over all 6 cases reported grade 3 local reactions in the adult group and the incidence rate was 20% (6 / 30), including 1 case of local redness, 1 case of induration, 2 cases of swelling and 2 cases of redness combined with swelling. The incidence rate of grade 3 adverse reactions in other age groups was all less than 15%.

Common symptoms of systemic adverse reactions were fever in adults and children aged 2-5 years, and fever and diarrhea in 2 months old and 3 months old infants; common local reactions were primarily redness, pain and swelling at the vaccination site in adults; pain and redness were the most common local reactions in children aged 2-5 years, and redness was common in infants 2 months and 3 months of age.

Adverse events mainly occurred within 0-7 days. No adverse events related to study vaccine were collected during 8-30 days, and no serious adverse events were collected during the observation period.

2.7.4.2.2.2. Phase III clinical trial

2.7.4.2.2.2.1. Primary series

2.7.4.2.2.2.1.1. Solicited events

(1) Systemic reactions in PCV13-TT (3-71 months) group and PCV7 group
The incidence of systemic adverse reactions in the PCV13-TT and the PCV7 group was 54.52% and 58.98%, respectively, and the incidence of systemic adverse reactions in the PCV13-TT group was lower than that in the PCV7 group ($p=0.0364$). The main symptom of systemic adverse reaction was fever, which was less in PCV13-TT group than in PCV7 group ($p=0.0035$). No significant difference was observed for the incidence of other systemic reactions between groups. The systemic reactions were primarily grade 1 or 2, similar incidence rates of grade 3 systemic reactions were noted between PCV13-TT group and PCV7 group.
Systemic reactions and their incidence at different time observed in PCV13-TT and PCV7 group of the 3-71 months olds are shown in Table 175.

(2) Local reactions in PCV13-TT (3-71 months) and PCV7 group
The incidence of local adverse reaction was 15.67% in the PCV13-TT group and 14.66% in the PCV7 group, indicating no significant difference. The most common symptom of local adverse reaction was redness at injection site, followed by swelling and pain. The severity of local reactions was mainly grade 1. The incidence of local reactions with severity of grade 3 in the PCV13-TT group was higher than that in the PCV7 group ($p=0.0007$). The symptoms of local reactions achieving grade 3 in the PCV13-TT group were mainly redness, swelling and induration, however, no intergroup difference was observed with respect to redness, swelling and induration in 3-month-old population. The symptoms mainly occurred in the population over 7-month-old.
Local reactions and their incidence at different time observed in PCV13-TT and PCV7 group of the 3-71 months olds are shown in Table 176.

(3) The onset time of systemic and local reactions in PCV13-TT (3-71 months) and PCV7 group
 The occurrence of systemic and local adverse reactions in the PCV13-TT group and the PCV7 group 30 minutes and 7 days post vaccination are shown in Table 177 and Table 178. Within 30 minutes, only fever was observed as systemic reaction. The incidence of fever in the PCV7 group was higher than that in the PCV13-TT group. Redness was the main local reaction, and was similar between groups in terms of incidence rate.

(4) Systemic reactions and local reactions observed in PCV13-TT and PCV7 group of different age groups

No significant difference was observed in the incidence of systemic and local adverse reactions between PCV13-TT (3 months) and PCV7 (3 months) groups, the 7-11 months olds, the 12-23 months olds and the 24-71 months olds.

Fever was the most common systemic reaction in all age groups. The incidence of fever in 3-month age PCV13-TT group was lower than that in the PCV7 group ($p=0.0072$), and the incidence of allergies in 7-11 month age PCV13-TT group was lower than that in the PCV7 group ($p=0.0301$), the incidence of local itching in 24-71 months old PCV13-TT group was higher than that in the PCV7 group ($p=0.0358$). No significant difference was observed between PCV13-TT and PCV7 group of other ages in fever and other systemic or local symptoms.

The incidence of systemic and local reactions in the PCV13-TT and PCV7 group of each age stratification is shown in Table 179 to Table 182.

Module 2 Summaries

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.4.2.3.2.1.2. Vaccine-related unsolicited adverse events

Unsolicited adverse events (coincidental) that occurred 0-30 days post vaccination collected from the PCV13-TT and PCV7 groups during the observation period are shown in Table 183 to Table 189.

Vaccine-related unsolicited events in the PCV13-TT and PCV7 groups were mainly respiratory, thoracic and mediastinal disorders, gastrointestinal disorders, infections and infestations, general disorders and administration site conditions. General disorders and administration site conditions occurred mainly in 8-30 days post vaccination, and the most common symptom was fever.

Considering from the time of occurrence, unsolicited adverse events related to the study vaccine occurred mainly within 7 days post vaccination. In view of age groups, more types and higher incidence rates of unsolicited adverse events related to the vaccine were reported in the 3-month age group, and a decreasing trend was observed in 7-11-month age group, 12-23 months age group and 24-71-month age group sequentially.

No significant difference was observed between the PCV13-TT and PCV7 group in the incidence of any vaccine-related unsolicited adverse events.

2.7.4.2.3.2.1.3. Discussions and conclusions of safety

A total of 790 cases (2282 events) were observed in the PCV13-TT group (3-71 months), and 851 cases (2440 events) were observed in the PCV7 group. The overall incidence rate of adverse events in the PCV13-TT and PCV7 group was 70.73% and 76.05%, respectively. Significant difference was observed in the incidence of adverse events between groups, and the overall incidence of adverse events in the PCV13-TT group was lower than that in the PCV7 group. The incidence of adverse events related to the study vaccine was 60.79% in the PCV13-TT group and 64.79% in the PCV7 group, with merely numerical difference noted.

The incidence rates of adverse events were higher in 2-6 months group and 7-11 months group. The intergroup difference of adverse events was mainly observed in 7-11 months group. The incidence of systemic adverse reactions was 54.52% in the PCV13-TT group and 58.98% in the PCV7 group (p=0.0364). The incidence of local adverse reactions was 15.67% in the PCV13-TT group and 14.66% in the PCV7 group, with no significant difference observed between groups. Fever was the most common symptom of systemic adverse reaction. The incidence of fever was 47.54% in the PCV13-TT group, and was significantly lower compared to 53.80% in the PCV7 group (p=0.0035). The most common symptom of local adverse reaction was redness at injection site, followed by swelling and pain.

The severity of adverse events in the 3-71 months group was mainly grade 1 and 2, while grade 3 systemic reactions related to the study vaccine occurred in 4.21% and 2.41% in PCV13-TT and PCV7 group subjects, respectively. No significant difference was observed in the incidence of systemic reaction with severity of grade 3 between the PCV13-TT group and the PCV7 group. The incidence of local reactions assessed as grade 3 in the PCV13-TT group was higher than that in the PCV7 group (p=0.0007). The symptoms mainly included redness, swelling and induration observed in subjects aged over 7 months. No intergroup difference was observed in the incidence of grade 3 adverse events in infants 3 months of age.

Totally, 80 cases (105 events) of SAE were collected in primary series, including 12 cases (13 events) in 2 months group, and 34 cases (49 events) and 34 cases (43 events) in the PCV13-TT group and PCV7 group of the 3-71 months olds, respectively. No significant difference was observed in SAE incidence between the PCV13-TT and PCV7 group. With the exception of 1 case of SAE in the PCV13-TT group of the 3 months olds had fever that was possibly related to the study vaccine, other SAEs were not related to the study vaccine.

No intergroup difference was observed with regards to the incidence of adverse events resulting in drop-out or vaccine-independent solicited /unsolicited events.

2.7.4.2.2.2.2.2. Unsolicited adverse events related to the study vaccine

Unsolicited adverse events related to the study vaccine as determined by the investigators are listed in Table 193 to Table 195.

Five and nine cases of unsolicited adverse events in the PCV13-TT group and PCV7 group were judged to be related to the study vaccine. No significant difference was observed in the intergroup incidences.

Module 2 Summaries

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

2.7.4.2.2.2.2.3. Discussions and conclusions of safety

The incidence of adverse events was respectively 35.46% and 34.50% in the PCV13-TT (3 months) and PCV7 (3 months) group. The incidence of adverse events with grade 3 severity was 1.93% and 1.02%, respectively, with no significant difference observed between groups. No significant difference was observed regarding the incidence of adverse events between the PCV13-TT and

PCV7 group in subjects aged 3 months and 7-11 months. The incidence of vaccine-related adverse events in the PCV13-TT (2 months) group was lower than that in the PCV13-TT (3 months) and PCV7 (3 months) groups.

As with primary immunization, the adverse reactions occurred in the stage of booster immunization were fever and local swelling. No significant difference was observed for the incidence of symptoms between the age groups of 3 months and 7-11 months. The incidence rates of fever and diarrhea in the subjects 2 months of age were significantly lower than that in the PCV13-TT (3 months) and PCV7 (3 months) groups.

The severity of adverse events was mainly grade 1 and 2. Thirteen cases of grade 3 adverse events were observed in the PCV13-TT group and seven cases were observed in the PCV7 group, corresponding to an incidence rate of respectively 1.93% and 1.02%. with no significant difference was observed between groups.

A total of 8 cases (10 events) of SAE were observed after booster immunization, including 3 cases in the PCV13-TT group of the 3-11 months olds, 4 cases in the PCV7 group of the 3-11 months olds and 1 case among the 2 months olds. No significant difference was observed between groups. All SAEs were not related to the study vaccine.

2.7.4.2.3.2. Phase III clinical trial
2.7.4.2.3.2.1. Primary series
2.7.4.2.3.2.1.1. Solicited events unrelated to study vaccine

A total of 231 cases (313 events) were determined by the investigators as solicited adverse events unrelated to study vaccine, including 109 cases in the PCV13-TT group and 122 cases in the PCV7 group, and the incidence rate was 9.76% and 10.90% respectively. No significant intergroup difference was observed for the incidence of vaccine-independent solicited adverse events.

Symptoms of solicited adverse events unrelated to study vaccine were mainly fever, cough, diarrhea, and nausea / vomiting.

The severity of vaccine-independent solicited adverse events was concentrated on grade 1 and 2. The severity of 6 cases (0.54%) in the PCV13-TT group and 13 cases (1.16%) in the PCV7 group were determined to be grade 3. No significant intergroup difference was observed in the incidence. Fever, cough, and diarrhea were the most common vaccine-independent solicited adverse events in all age groups.

Incidences of solicited adverse events unrelated to study vaccine are shown in Table 196 to Table 200.

2.7.4.2.3.2.1.2. Unsolicited events unrelated to study vaccine

A total of 717 cases (1155 events) of unsolicited adverse events unrelated to study vaccine were collected during the observation period, including 325 cases in the PCV13-TT group and 365 cases in the PCV7 group, with incidence rates being 31.51% and 32.62%, respectively. No significant intergroup difference was observed for the incidence of vaccine-independent unsolicited adverse events.

Unsolicited adverse events unrelated to study vaccine were primarily infections and infestations, followed by gastrointestinal disorders, respiratory, thoracic and mediastinal disorders, general disorders and administration site conditions. Fever was observed with the highest proportion within the class of general disorders and administration site conditions, and was of relatively higher incidence rates among subjects aged 3 months, 7-11 months, and 12-23 months that were within 2 years old. No significant difference was observed for unsolicited adverse events between the PCV13-TT group and the PCV7 group.

Incidences of vaccine-independent unsolicited adverse events in the PCV13-TT and PCV7 group of each age group are shown in Table 201 to Table 209

2.7.4.2.3.2.2. Booster dose
2.7.4.2.3.2.2.1. Solicited events unrelated to study vaccine
Solicited adverse events unrelated to study vaccine were all systemic reactions. Twelve solicited cases (occurred within 7 days post vaccination) were observed in the PCV13-TT group of the 3-11 months olds and 18 cases in the PCV7 group, which mainly occurred in subjects 3 months of age, and there was only 1 case observed in the PCV13-TT group of 7-11 months olds. No significant difference was observed for vaccine-independent solicited adverse events between groups (Table 210 to Table 211).

2.7.4.2.3.2.2.2. Unsolicited events unrelated to study vaccine
The incidence rate of unsolicited adverse events was respectively 9.5% and 9.21% in the PCV13-TT and PCV7 group during the observation period. No intergroup difference was observed for the incidence of unsolicited adverse events in each age group, which were mainly infections and infestations (Table 212 to Table 214).

2.7.4.2.5. Severe adverse events
2.7.4.2.5.1. Phase I clinical trial
Fourteen subjects experienced grade 3 adverse events, including 1 case of local redness, 1 case of induration, 2 cases of swelling, 2 cases of redness with swelling after one dose of vaccine in adults ≥ 18 years old; 1 case of fever and 1 case of fever with local reaction in children group aged 2-5 years; 1 case of local redness (2 episodes), 1 case of local induration, 1 case of somnolence, 1 case of herpangina with fever (herpangina was not related to vaccination, while fever was determined to be probably related to vaccination) in subjects of 2 months old; 1 case of local reaction and 1 case of upper respiratory tract infection in the 3 months olds. Except for 3 cases receiving outpatient treatment, most of the patients recovered spontaneously. No serious adverse events were observed in this trial.
Adverse events with grade 3 severity were summarized in Table 215.

2.7.4.2.5.2. Phase III clinical trial
2.7.4.2.5.2.1. Primary series
A total of 80 cases (105 events) of SAE were collected in the Primary series, including 34 cases (49 events) in the PCV13-TT group and 34 cases (43 events) in the PCV7 group of subjects aged 3-71 months. No significant difference was observed with respect to SAE incidence between the PCV13-TT and PCV7 group; a total of 12 cases (13 events) of SAE were reported in the subjects 2 months of age.
With the exception of 1 case of SAE in 3-month-old PCV13-TT group whose fever symptom was determined to be possibly related to the study vaccine, other SAEs were all independent of study vaccine. The SAE incidence in subjects aged 2 months and 3 months subjects was higher than that of other age groups. The major SAEs were "infections and infestations".
The severity of solicited symptoms or the most severe symptoms in SAEs was assessed in accordance with Guidelines for The Classification of Adverse Reactions in Clinical Trials of Prophylactic Vaccines, with a purpose to timely understand and analyze the possible risks of SAE. Results showed that the severity was grade 4 in 32 cases, grade 3 in 34 cases, and grade 2 in 2 cases, notwithstanding no intergroup difference was observed for SAEs with different severity.
See Table
Table 216 to Table 223for analysis of SAE incidence.

On 20161119, the subject had cough with wheezing and mild suffocation due to cold, and was admitted to hospital on 20161122. After physical examination and auxiliary examination, the subject was diagnosed as asthmatic suffocating pneumonia, and was then treated with medications. After admission, examinations indicated elevated myocardial enzymes and myocardial cell damage, supplementary diagnosis showed myocardial injury, all symptoms were resolved and the subject was discharged after hospitalization on 20161202, with medicines prescribed after discharge. Since 20160901, the subject had gurgling in throat without obvious cause, no evident cough or fever, and the parents did not pay attention to it. On 20161015 the subject was taken by parents to the village clinic for examination while without definite diagnosis. After 3 days of treatment with Respiratory, oral medicines (unspecified type and dosage), there Hospitalization Third thoracic and Pneumonia was little improvement observed. For further n or prolonged Possibly 1067 PCV7 Male 3.2 Hebei 105 12 Grade 4 dose mediastinal nia diagnosis and treatment, the subject was taken to length of unrelated disorders Dingxing county hospital on 20161104. At hospital stay 20161104 12:00, the subject was hospitalized for "pneumonia". Physical examination on hospital admission indicated hyperemia of pharynx, heavy breathing sounds of both lungs, with crackles. Small patchy opacities were observed in the right upper lung field. On 20160721 the subject had cough and fever with no obvious cause. Antipyretic treatment (unspecified) was administered by village health room, followed by oral medication and enema therapy which resulted in poor response. On 0726, Infectio another episode of fever occurred (as high as Hospitalization Third Infections and us 40.0 ■), with frequent coughing and evident n or prolonged Possibly 1107 PCV13-TT Female 3.6 Hebei 30 6 Grade 3 dose infestations pneumo wheezing, and in poor mental state. On 20160727 length of unrelated nia the subject was examined in Zhengding County hospital stay People's Hospital, with body temperature being 40.0 ■, poor mental state, slight shortness of breath, small bubbling sound in both lungs, a small amount of wheezing sound, CRP 19.5 mg/L, chest X-ray showed thickened markings and disorder in

 2506 PCV13-TT Female 23.8 Henan 71 7 Grade 4
 last infestations pneumo response. On June 21, cough aggravated with length of unrelated
 vaccin nia sputum and occasional shortness of breath, hospital stay
 ation intramuscular "cefoperazone sulbactam" and

atomization (unspecified) were administered in Wenquan Town Hospital, while with poor response, on June 24, "bronchopneumonia" was hospitalized in county hospital. Physical examination indicated poor mental state, hyperemia of pharynx, heavy breathing sounds in both lungs, with rhonchi and crackles. WBC: $11.28 \times 10^9/L$, N: 23%, L: 66.2%, HGB: 93 g/L, indicating viral infection and mild anemia. Weakly positive MP-IgM.

On 20160624 the subject had cough, fever at $37.3^\circ C$, with sputum difficult to cough up, combined with low-grade fever at $37.3^\circ C$, the subject was treated in the individual outpatient 1-6 treatment of the village, while poor response was month Hospitalization achieved, and then the subject was admitted to s after Infections and Bronchitis or prolonged Possibly 2581 PCV7 Male 27.6 Hebei hospital on 20160709, physical examination 89 9 Grade 3 last infestations is length of unrelated indicated slight pharyngeal congestion, heavy vaccin hospital stay breathing sounds in both lungs, with mild gurgling ation in throat, chest X-ray showed thickened markings in both lungs, which was diagnosed as acute bronchitis, the subject recovered on 20160717 after symptomatic treatment and was discharged. Hospitalization On 20160722 the subject developed fever of n or prolonged $38.6^\circ C$ without obvious cause, combined with length of headache which was most significant in the hospital stay forehead, while might be relieved in standing position, the subject had projectile vomiting, and was gastric content. The subject was treated in the 1-6 neighboring village health center, but still had month recurrent fever and headache, and vomiting was not Viral s after Infections and obviously relieved, the subject was further treated Possibly 2589 PCV7 Female 63.5 Hebei encephalitis 103 17 Grade 3 last infestations in hospital on 20160723. Physical examination unrelated litis vaccin indicated hyperemia of pharynx, WBC ation $16.2 \times 10^9/L$, cerebrospinal fluid findings showed WBC $150 \times 10^6/L$, biochemical pressure 130 mmH₂O, diagnosed as viral encephalitis. After antiviral, anti-infection, reducing cranial pressure, anti-inflammatory, nutritional support for brain and organs, the subject recovered on 20160808 and was discharged.

1-6 Fever at $38.9^\circ C$, throat swelling and pain, mental month Bacteria malaise, poor appetite, yellow tongue with greasy Hospitalization Shanx s after Infections and I yellow tongue coating, floating pulse, hyperemia of n or prolonged Possibly 2752 PCV7 Male 32.1 176 10 Grade 2 i last infestations tonsillitis oral and pharyngeal cavity, hyperemia of bilateral length of unrelated vaccin s tonsils in bright red, swollen, with pus on the hospital stay ation surface.

2.7.4.2.5.2.2. Booster dose
A total of 8 cases (10 events) of SAE were observed after the booster immunization, including 3 cases in the PCV13-TT group and 4 cases in the PCV7 group of subjects aged 3-11 months (no significant intergroup difference was observed); and 1 case in PCV13-TT (2 months) group. SAEs after booster immunization were not related to the study vaccine (Table 224 to Table 229).

2.7.4.2.8. Adverse events narratives
SAE1: Bronchopneumonia (No. 190)
A 1.9-month boy, 46 days after PCV13-TT dose 2, was hospitalized for rhinorrhea, cough,
asthmatic suffocation, fever, heavy breathing sounds in both lungs, with fine crackles and stridor.
Chest X-ray: bronchopneumonia. Significant physical exam findings on hospital admission
included 37 0■. Treatment was discharged from 08 to 16 2016. This SAE is bronchial pneumonia
(asthma type).

SAE2: Bronchitis (No. 1107)
An 7-month girl, 16 days after PCV13-TT dose 1, had cough and fever with no obvious cause.
Antipyretic treatment (unspecified) was administered by village health room, followed by oral
medication and enema therapy which resulted in poor response. On 20160726, another episode of
fever occurred (as high as 40.0 ■), with frequent coughing and evident wheezing, and in poor
mental state. On 20160727 the subject was examined in Zhengding County People's Hospital,
with body temperature being 40.0 ■, poor mental state, slight shortness of breath, small bubbling
sound in both lungs, a small amount of wheezing sound, CRP 19.5 mg/L, chest X-ray showed

thickened markings and disorder in both lungs, with scattered high-density patchy opacity in both lung field, diagnosed as bronchopneumonia, and was hospitalized. On 20160801, the symptoms resolved and the subject was discharged.

SAE3: Upper respiratory and digestive tract infection (No. 2004)

A 19.4-month boy, 11 days after PCV13-TT dose 2, was hospitalized for fever with the maximum temperature of 38.5 °C. On June 27, the subject vomited. The subject vomited immediately after eating, accompanied by poor mental state. The subject hospitalized 3 days and recovered 5 days after discharge.

2.7.4.3.1.2. Serum antibody detection

All serum samples detection were entrusted to National Institutes for Food and Drug Control.

The antibody concentration of IgG in serum samples was detected using enzyme-linked immunosorbent assay (ELISA), the subjects achieving IgG antibody concentration ≥0.35 μg/mL and the geometric mean concentration (GMCs) were calculated.

Opsonophagocytic Assay (OPA) was used to detect the antibody opsonophagocytic activity of serum samples, meanwhile the subjects achieving an OPA antibody ≥1:8 and the geometric mean titers (GMTs) were calculated.

Testing standard samples and quality control standards were provided by the laboratory. The method and quality control of ELISA and OPA can be found in the standard procedure of laboratory.

2.7.4.3.2. Phase III clinical trial

2.7.4.3.2.1. Processing, sorting, storage and transportation of blood samples

Venous blood should be left at room temperature for at least 2 hours or other measures should be taken to allow the blood samples to fully coagulate after collection. The serum should be separated within 24 hours. If the collected blood sample could not be centrifuged on the same day, it should be stored in a refrigerator at 2-8 °C. The separated serum was divided into two tubes for samples that required detection of only IgG: the testing tube 1 and the spare tube, and the sorting of serums gave priority to meet the needs of detection. For samples that needed to be tested for both IgG and OPA, the separated serum was divided into three tubes: testing tube 1, testing tube 2 and the spare tube, and the serum was collected according to the priority order of testing tube 1, testing tube 2 and the spare tube.

All sorted serums were stored at -20 °C or below and were kept frozen during the transportation.

2.7.4.3.2.2. Coding of serum samples

In principle, study numbers were used for the serum samples collected from the subjects and were labeled with different sampling time. Specific numbering standards referred to the SOP of Biological Sample Numbering in Clinical Trials.

Safety evaluation measures:

Local reactions: administration site pain, itching, redness, swelling, induration, rash (injection site)
size and severity, and body movement
disorders.

Systemic reactions: observation of fever, allergy, headache, tiredness/fatigue, nausea/vomiting,
diarrhea, myalgia, cough and other discomfort or
Efficacy measures clinical adverse reactions.

Laboratory tests: hematology and urinalysis, hepatic and renal function correlates in blood biochemistry.

Immunogenicity evaluation measures:

Proportion of subjects with specific pneumococcal IgG antibody concentration ≥ 0.35 µg/mL (positive rate)

Specific pneumococcal IgG geometric mean concentration (GMC).

Safety:

The incidence of vaccine-related adverse events was 80.00%, 53.33%, 66.67% and 70.00% in adults,
children, 2-month-old and PCV13-TT (3
months) group, respectively. A total of 6 cases in the adult group experienced grade 3 local adverse
reactions, corresponding to an incidence rate
of 20% (6 / 30), including 1 case of local redness, 1 case of induration, 2 cases of swelling, 2 cases of
redness combined with swelling. The
incidence rate of adverse reactions with grade 3 severity in other age groups was less than 15%.

Clinical trial

The most common symptoms of systemic adverse reactions were fever in adults and children aged 2-5 years,
and were fever and diarrhea in 2-
evaluation

month-old and 3-month-old infants. Common local adverse reactions in adults included redness, pain and
swelling at the vaccination site, and
were pain and redness in children aged 2-5 years, as compared to redness in infants 2 and 3 months of
age.

Adverse events mainly occurred on Day 0-7. No adverse events related to the study vaccine were collected
on Day 8-30, and no serious adverse
events were collected during the observation period.

Immunogenicity:

Module 2 Summaries

Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

High IgG antibody positive rates and antibody levels were observed in adults and children aged 2-5 years
before immunization for all 13

serotypes. The IgG antibody positive rates of all serotypes reached 100% or over 80% after immunization,
the antibody level increased more than

2 folds after immunization. In 2-month-old and PCV13-TT (3 months) group, all the 13 serotypes were with
lower IgG antibody positive rates

and antibody levels than those in the adult and children groups before immunization, while after
immunization, the antibody positive rates all

reached 100% except for serotype 3, 5, 6A and 6B, and the fold increase of antibody was significantly
higher in the two infants groups compared
to adult group and children group.

The positive rates and antibody levels of OPA were lower than that of IgG in each age PCV7efore
immunization, while the level of OPA

antibody after immunization significantly increased with a higher fold increase compared with IgG. The
OPA positive rate of each serotype was $\geq$

90% in subjects aged 3 months after immunization.

The correlation analysis between IgG and OPA indicated high consistency between post-immunization
antibody positive rates of the two
measures, while some bias might exist due to the small sample size.

clinical trial

Number of 2760

subjects

Result of the National Institutes for Food and Drug Control certified that this vaccine's quality
complied with the Enterprise Registration Standard of 13-valent

investigational pneumococcal polysaccharide conjugate vaccine. Report No.: SZ201511716
vaccine
Investigational 13-valent pneumococcal polysaccharide conjugate vaccine, manufactured by Yuxi Walvax
Biotechnology Co., Ltd, Batch No.: 201511003
vaccine for injection, 0.5 mL/vial, each dose contains 2.2 µg of polysaccharide from pneumococcal
serotype 1, 3, 4, 5, 6A, Expiration date: November,
7F, 9V, 14, 18C, 19A, 19F, and 23F, and 4.4 µg polysaccharide for 6B. 2017

Comparator 7-valent pneumococcal conjugate vaccine, manufactured by Pfizer (Wyeth) Pharmaceutical Inc.,
for injection, 0.5 Batch No.: H29315H13880
vaccine mL/vial, each dose contains 2 µg of polysaccharide from pneumococcal serotypes 4, 9V, 14, 18C,
19F, 23F and 4 µg Expiration date: May, 2017
polysaccharide for 6B.

12-15 months of age (≥
PCV7 200 Month 0, 2 2 doses 2 months apart from
the second dose)
PCV13-TT 200 Month 0, 2 2 doses //
12-23 months
PCV7 200 Month 0, 2 2 doses //
PCV13-TT 200 Month 0 1 dose //
24-71 months
PCV7 200 Month 0 1 dose //
Efficacy Immunogenicity:
measures ■ The percentage of subjects with vaccine-type specific IgG antibody concentration ≥0.35 µg/mL
and ≥ 1.0 µg/mL as well as the IgG geometric mean
concentration (GMC) measured 30 days after primary series.
■ The percentage of subjects with IgG vaccine-type specific IgG antibody concentration ≥0.35 µg/mL and ≥
1.0 µg/mL, as well as the IgG geometric
mean concentration (GMC) measured before and 30 days after booster dose.
■ The percentage of subjects with vaccine-type specific anti-pneumococcal OPA titer ≥1:8 and the
geometric mean titer (GMT) measured 30 days
after primary series and 30 days after booster dose.

Safety:
■ Adverse events within 30 days after full primary immunizations and within 30 days after booster dose.
Clinical trial In the main target population (3 months of age)
evaluation The common serotypes achieved noninferiority criteria for comparison between PCV13-TT and PCV7
group except for serotype 6B during primary
series, meanwhile all common serotypes in PCV13-TT group were noninferior to that in PCV7 group after the
booster dose; for additional serotypes,
superiority criteria were met for PCV13-TT group vs PCV7 group after primary series; the common serotypes
in PCV13-TT group aged 3-71 months
were all noninferior to those in PCV7 group during primary series, besides, the additional serotypes in
PCV13-TT group were all superior as compared
to PCV7 group.
For PCV13-TT (2 months) group vs PCV7 (3 months) group
Both common and additional serotypes had achieved noninferiority or superiority criteria post primary
series. For PCV13-TT (2 months) group vs
PCV13-TT (3 months) group, 12 serotypes reached noninferiority criteria during primary series except for
additional serotype 5; and all 13 serotypes
were noninferior to those in PCV13-TT (3 months) group post booster dose.
In PCV13-TT recipients aged 7-11 months, 12-23 months, and 24-71 months
The proportions of subjects with IgG antibody concentration ≥ 0.35 µg/mL for common serotypes were all
noninferior to those in PCV7 group. The
additional serotypes in PCV13-TT group of 7-11 months had reached superiority criteria after primary
series; for PCV13-TT groups of 12-23 months
and 24-71 months, superiority criteria were generally met after immunization.

The results before and after booster dose indicated decrease in the antibody levels of several serotypes
in the 13 serotypes either in PCV13-TT group or
PCV7 group to some extent, while the percentage of subjects with IgG antibody concentration ≥ 3.5 µg/mL
and antibody GMC after 1 dose of booster
immunization both reached or exceeded the levels observed after primary series, demonstrating significant
effect of the booster dose, reflecting the
immunological memory effect of the conjugate vaccine adequately. The antibody GMC post booster dose had
more than 3-fold increase in the 2-6
months olds, and greater than 1-fold increase in subjects aged 7-11 months as compared with the GMC
before booster dose.

Confidential 520
Module 2 Summaries
Version No. Walvax-202006-00 Yuxi Walvax Biotechnology Co., Ltd.

The overall incidence of adverse events in PCV13-TT group was lower than that in PCV7 group. No
significant intergroup difference was observed in
the incidence of vaccine-related adverse events. The main symptom of systemic adverse reaction was fever.
The incidence of systemic reactions in
PCV13-TT group was lower than that in PCV7 group. Local adverse reactions were primarily redness,
swelling and pain at the injection site. No

significant difference was observed in the incidence of local reactions between PCV13-TT group and PCV7 group.

The incidence of vaccine-related grade 3 adverse events in PCV13-TT group and PCV7 group was 4.21% and 2.41%, respectively. The incidence of local adverse reactions with severity reaching grade 3 in PCV13-TT group was higher than that in PCV7 group, while no significant intergroup difference was observed in subjects aged 3 months.

A total of 80 cases (105 events) of SAEs were observed during primary series and 8 cases (10 events) of SAEs were noted during booster dose. No significant intergroup difference was observed in the incidence of SAEs. SAEs were not related to the study vaccine except for one case in PCV13-TT (3 months) group with fever determined to be probably related to the study vaccine.

To sum up, the immunogenicity of 7 common serotypes in main target population aged 3 months met the non-inferiority criteria after booster dose, and that of 6 new serotypes had already achieved the standard of superiority after primary immunizations in this clinical trial. The common and additional serotypes had fulfilled the non-inferiority or superiority standard in subjects 3-71 months of age after primary immunizations. The common and additional serotypes in PCV13-TT group (2 months) were noninferior and/or superior to that in PCV7 (3 months) group. In PCV13-TT (2 months) group, all 13 serotypes were noninferior to those in the PCV13-TT (3 months) group post booster dose. The incidence of adverse events/reactions in PCV13-TT group was not higher than that in PCV7 group. The results of immunogenicity and safety evaluation in this clinical trial had achieved the study objectives predefined in the protocol.

2.3 QUALITY OVERALL SUMMARY

2.3.S DRUG SUBSTANCE

2.3.S.1 General Information

1. Streptococcus Pneumoniae serotype 1 was obtained from CMCC (No. 31404)
For pneumococcal polysaccharide serotype 1:
Chemical Name: Serotype 1 Polysaccharide consists of a trisaccharide repeating subunit of -4-(D-galacturonopyranosyl-1-α)-3-(D-galacturonopyranosyl-1-α)-3-(2-acetamido-4-amino-2,4,6-trideoxy-D-galactopyranosyl-1-α) residues. The galacturonopyranosyl residues are partially O-acetylated. Each mole of the saccharide repeat unit carries a non-stoichiometric amount of O-acetyl groups per repeating unit.

2. Streptococcus Pneumoniae serotype 3 was obtained from CMCC (No. 31441)

For pneumococcal polysaccharide serotype 3:

Chemical Name: Serotype 3 Polysaccharide consists of a disaccharide repeating subunit of -3-(D-glucuronopyranosyl-1-β)-4-(D-glucopyranosyl-1-β) residues.

3. Streptococcus Pneumoniae serotype 4 was obtained from CMCC (No. 31448)

For pneumococcal polysaccharide serotype 4:

Chemical Name: Serotype 4 Polysaccharide consists of a repeating subunit of -3-(D-2-acetamido-2-deoxy-D-mannopyranosyl-1-β)-3-(L-2-acetamido-2-deoxy-D-fucopyranosyl-1-α)-3-(D-2-acetamido-2-deoxy-D-galactopyranosyl-1-α)-4-(D-2,3-S-pyruvyl-galactopyranosyl-1-α) residues.

2.3.S.2.2.2 Brief Description of Manufacturing Process
Walvax carries out production in accordance with the Drug Registration Standard for 13-valent
Pneumococcal Conjugate Vaccine (Standard No.: YBS00392019) approved by the National
Medical Products Administration.
The manufacturing process includes the following process: establishment and passage of the seed
batches, amplification of strain and large tank cultivation, sterilization of bacteria and harvest of
fermentation liquor, preparation of the crude polysaccharide and refined polysaccharide,
polysaccharide derivatization, polysaccharide conjugation with tetanus toxoid carrier protein.
After purification, sterilization and filtration, the conjugate bulk was obtained and stored at 2-8■.
The preparation of tetanus toxoid protein carrier includes the establishment and passage of seed
batches, amplification of bacteria and large tank fermentation, sterilization and harvest of
fermentation liquid after culture, ultrafiltration, two-stage salting out and formaldehyde
detoxification to obtain tetanus toxoid original liquid, and further purification to obtain the purified
tetanus toxoid liquid.

2.3.S.2.3 Quality Control of Materials
2.3.S.2.3.1 Strain for Production
(1) Source of Strain
The strains used in the manufacturing are pneumococcus serotype 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14,
18C, 19A, 19F and 23F strains, which are purchased from National Centre for Medical Culture
Collections of NIFDC.

Table 1 The name and CMCC code of pneumococcal strains
Serotypes Strain Name CMCC Code
1 Streptococcus pneumoniae serotype 1 31404
3 Streptococcus pneumoniae serotype 3 31441
4 Streptococcus pneumoniae serotype 4 31448

5 Streptococcus pneumoniae serotype 5 31457
6A Streptococcus pneumoniae serotype 6A 31476
6B Streptococcus pneumoniae serotype 6B 31492
7F Streptococcus pneumoniae serotype 7F 31510
9V Streptococcus pneumoniae serotype 9V 31547
14 Streptococcus pneumoniae serotype 14 31605
18C Streptococcus pneumoniae serotype 18C 31689
19A Streptococcus pneumoniae serotype 19A 31708
19F Streptococcus pneumoniae serotype 19F 31696
23F Streptococcus pneumoniae serotype 23F 31761

Clostridium tetani (CMCC 64008), which is used for producing the tetanus toxoid carrier protein, was purchased from National Centre for Medical Culture Collections of NIFDC.

(2) Establishment of Seed Lot
According to the Chinese Pharmacopoeia, Walvax established the Bacteria Management procedure (WSYX-QA-SMP-00-05-0001) for the bacteria bank establishment and the three-level seed bank management. The three-level seed bank includes original seed lot, master seed lot and working seed lot. The original seed is lyophilized after culturing two generations, as well as the working seed lot. The working seed lot is used for vaccine production. The biological characteristics of the working seed lot is consistent with the original seed lot, and each seed lot is stored below -60 ■.

(3) Strain detection
Based on Bergey's Manual of Determinative Bacteriology (the 8th Edition), Testing Methods for Streptococcus Pneumoniae on Experimental Animals (GB/T 14926.15-2001), and Vaccines (2004 Edition), Walvax established testing items and standards for the Streptococcus Pneumoniae strains and Clostridium tetani strains.
According to the test items and specifications in the Table 4, the three-level seed lot of 13 types Streptococcus Pneumoniae were tested. The results showed from the Table 5 to Table 17, which indicate that the master seed lot and working seed lot have the same biological, biochemical and serological characteristics as the original seed lot.

According to the test items and specifications in the Table 18, the three-level seed lot of Clostridium Tetani were tested. The results showed in the Table 19, which indicate that the master seed lot and working seed lot have the same biological, biochemical and serological characteristics as the original seed lot.

Table 18 Testing Items and Standards of Clostridium Tetani Strain
Test items Specifications
Obligate anaerobic, preferential temperature at 37 ■,
turbid with gas produced and rotten stench in cooked
Growth Characteristic meat culture, permeated bacteria colony in blood agar
medium, flagellar motility in semi-solid puncture
Cultural
culture.
Characteristic
Gram negative, rod-shaped bacteria with little amount
of spores at the beginning of cultivation; transformed to
Staining Microscopy
Gram positive, drumstick-shaped bacteria with round
spores on the top after 48 h of cultivation.
Glucose Negative
Lactose Negative
Xylose Negative
Saccharose Negative
Biochemical Galactose Negative
Reactions Fructose Negative
Nitrate Negative
Gelatin liquefaction Positive
Hydrogen sulfide Positive

(4) Study on the heredity stability of pneumococcal strains
[Pneumococcal strain]
In order to ensure the stability of both process and product quality, Walvax carried out heredity stability studies for strains of all 13 serotypes. Each strain is passed continuously to the 20th generation. During the process, bacteria from the 10th, 15th, and 20th generations are comprehensively tested. The process diagram is as follows:

Open a vial of lyophilized Working Seed Lot

Culture on solid medium for 20±4 h, then
↓ transfer the bacteria
2nd Generation

Culture on solid medium for 20±4 h, then

Figure 10 The Process of Heredity Stability for Pneumococcal Strains

Testing results of strains from all generations have been constant with the Working Seed Lot.
There has been no change in biological, biochemical, or serological characteristics of the strains.
The stability of the strains used in production is proven.

[Clostridium tetani strain]
In order to ensure the stability of vaccine production process and product quality, Walvax carried out heredity stability studies of Clostridium tetani strain. Each strain is passed and cultured in the cooked meat semi-solid medium every year. The storage strain has been passed three times, and the production strain has been passed five times, without any decline in virulence and morphological variation. The test results of the strain show that its culture characteristics, staining microscopy, biochemical reaction and specific neutralization tests are same as the seed lot, which confirmed that the production strains of Clostridium tetani had good stability.

(5) Study on the virulence stability of pneumococcal strains
[Study Objective]
To investigate the virulence and virulence stability of pneumococcal serotype 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F production strain.
[Reference]
Manual of medical biological products, 235-241
[Experiment material]
The 3rd generation and the 20th generation of pneumococcal serotype 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F production strain.
[Experiment method]
The strain was diluted with normal saline and inoculated on solid medium containing 10% sheep blood. After incubation at 37±1 °C and CO₂ for 20±4 hours, the coating of pneumococcus was washed with normal saline and gradient diluted. The dilution was 1:10, 1:100, 1:103 until 1:108, the last three dilutions (1:106, 1:107, 1:108) were used to inject 18-22 g healthy mice (3 mice for each dilutions) into abdominal cavity at 0.5 ml/mouse.
[Criteriaions]
In 72 hours, if 2 of the 3 mice injected with 1:107 and 1:108 dilutions died, the strain is a strong virulent strain, otherwise it is a weak virulent strain.

From Table 20, it can be seen that the 13 strains (pneumococcus serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F) used for production are attenuated vaccine strain. After 20 generations of continuous transplanting, the strain virulence did not change and the strain was still attenuated vaccine strain. It showed that the virulence of the strain is stable and the strains are suitable for vaccine development and production.

2.3.S.2.3.2 Other Raw Materials
The company has formulated the Material Management Control Procedure (WSYX-P-05-0005) to guide and control the management and storage of the company's materials. All purchased materials are from qualified suppliers approved by the quality management director. For each kind of material, the company has established the inspection standard operating procedures according to the legal standards of the material to check whether the quality indicators of the material meet the quality requirements of the product production. At the same time, collect documents to prove whether the raw materials used in production contain ingredients of animal derived materials. If the materials contain ingredients of animal derived materials, further collect animal safety certification materials of the materials to ensure the safety of materials used in production and further ensure the safety of products. See the Table 21 and Table 22 for the composition of culture medium.

2.3.S.2.5 Process Validation and/or Evaluation

The manufacturing process of 13 serotypes of Pneumococcal Conjugate Polysaccharide can be divided mainly into establishment of seed lot, preparation of crude polysaccharide, purification of polysaccharide, activation and derivatization of polysaccharide, conjugation with tetanus toxoid. The critical process parameters and the control range of each step were determined by the evaluation, and the key process parameters were strictly controlled within the predetermined range in the production process verification of the three batches of 13 serotypes of Pneumococcal Polysaccharide, Polysaccharide Derivate, Pneumococcal Conjugate Polysaccharide, each and all test item complies with the requirements as set forth in Manufacturing and Control Tests on 13-valent Pneumococcal Conjugate Vaccine. Through 13 types of Pneumococcal Polysaccharide Bulk Conjugate manufacturing validation, it proved that: 13 types of Pneumococcal Polysaccharide manufacturing process can sustainably produce desired products in accordance with Manufacturing and Control Tests on 13-valent Pneumococcal Polysaccharide Conjugate Vaccine, critical process parameters and quality attributes in the process of the entire process are under control.

2.3.S.3 Characterization

2.3.S.3.1 Elucidation of Structure and other Characteristics

Walvax carried out 1H-NMR tests of the 13 serotypes of pneumococcal polysaccharides, and analyzed the corresponding spectra by comparison with ATCC standard polysaccharides. The results showed that the structures of Walvax's polysaccharides are in full accord with ATCC standard polysaccharides.

Table 26 General Information of 1H-NMR Tests of the 13 Serotypes of Pneumococcal Polysaccharides

Test information Walvax ATCC
 NMR machine Varian Inova 500 Varian Inova 500
 Frequency 500 MHz 500 MHz
 For serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 18C,
 For all 13 serotypes: D2O + 19A, 19F, 23F: D2O + 0.01%DMSO + 0.01%
 Solution system 0.05%wt TSP + 0.5 mg/mL DSS-d6
 maleic acid For serotype 14: D2O + 0.05%wt TSP +
 0.5mg/ml maleic acid
 Polysaccharide
 5 mg/mL 5 mg/mL
 concentration

Given the information in Table 26, test instrument and test frequency of Walvax's polysaccharides tests match those of ATCC standard polysaccharides tests. Walvax's polysaccharides used a solution system of D2O + 0.05% wt TSP + 0.5 mg/mL maleic acid, while ATCC serotypes 1, 3, 4, 5, 6A, 7F, 9V, 18C, 19A, 19F, 23F polysaccharides used a solution system of D2O + 0.01% DMSO + 0.01% DSS-d6, and serotype 14 used a solution system of D2O + 0.05% wt TSP + 0.5 mg/mL maleic acid. The two systems used maleic acid and DMSO respectively as quantitative and TSP and DSS-d6 respectively as internal standard, which has no influence on test results.

Table 27 Abbreviations for Polysaccharide 1H-NMR Spectra

Abbreviations	Name	Abbreviations	Name
D2O	Heavy water	Gal	Galactose
HDO	half-heavy water	GlcA	Glucuronic acid

2.3.S.3.2 Impurities

2.3.S.3.2.1 Impurities and their Limits in Polysaccharide Purification Process

(1) C-polysaccharide, nucleic acid and protein are the main impurities in refined polysaccharide production.

The quality of pneumococcal polysaccharides manufactured by Walvax are controlled according to the European Pharmacopeia. Control of C-polysaccharide are implemented via various purification steps. Table x shows residual C-polysaccharide contents in 12 serotypes of polysaccharides derived from NMR spectrum analysis, which are all below 20%, indicating the purification process can effectively remove C-polysaccharide impurities.

*: Since signature peak(s) and content of C-polysaccharide cannot be analyzed in NMR spectrum of serotype 5 polysaccharide due to its structural features, no result for serotype 5 is available.

During approval process of new drug of PPSV23, Walvax completed process optimization and validation studies, including impurities removal process validation. According to the established purification process of serotypes 1, 3, 4, 5, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F, 3 continuous batches of the above serotypes are purified, sampled in each step, and impurities removal rate was calculated with nucleic acid and protein content derived from polysaccharide content, and viability, reproducibility and stability was evaluated.

Crude polysaccharide solution, concentrated phenol extraction ultrafiltration solution and concentrated solution after precipitation of nucleic acid of serotypes 1, 4, 5, 6B, 7F, 9V, 14, 18C, 19A, 19F and 21F were sampled and analyzed for nucleic acid, protein and polysaccharide content, percentages of nucleic acid and protein were calculated, and impurities removal rate of each step was evaluated by comparison of data from before/after each steps. Table X shows the removal rate of nucleic acid and protein.

Table 30 shows that the nucleic acid and protein removal rate of 3 batches of serotype 3 polysaccharide was relatively stable, which indicates the purification process is stable. Nucleic acid and protein impurity contents were monitored in the established purification process

of serotypes 1, 3, 4, 5, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F, and removal rates of each step was calculated. The test results show the removal rates were high and stable, content homogeneity was well controlled, which indicates good reproducibility and stability for the purification process in pneumococcal polysaccharide vaccine manufacture.

(2) Studies on organic solvents (reagents) removal in polysaccharide production
I. Types and purposes of organic reagents used in polysaccharide manufacture
In the production process of pneumococcal polysaccharide, organic solvents (reagents) are used. According to the Chinese Pharmacopeia (2010 version), similar reagents are used in pneumococcal polysaccharide vaccine, Vi capsular polysaccharide vaccine and Hib conjugate vaccine productions, which indicates this as a feature related to bacterium capsular polysaccharide vaccines.
Table 31 shows organic reagents used in 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine.

II. Organic solvents (reagents) removal process
Table 32 Description of Organic Solvents (Reagents) Removal Process
Organic solvent
Removal process
(reagent)
After fermentation, DOC is added for sterilization, after which several steps are done, including ultrafiltration of crude polysaccharide, ethanol precipitation, ultrafiltration of DOC refined polysaccharide and ethanol precipitation. Due to low molecular size and good water solubility, DOC can be effectively removed from capsular polysaccharide.
Phenol is used in the removal of protein, after extraction with phenol, the mixture goes through ultrafiltration to remove phenol, after which several stages of ethanol precipitation and ultrafiltration were conducted. In the ultrafiltration and ethanol Phenol precipitation process, phenol can be effectively removed due to its low molecular size and good solubility in both water and organic solution. Moreover, in the process of washing with ethanol, acetone and ether, phenol was further separated and removed.
95% ethanol is used in precipitation of crude and refined polysaccharide and can be 95% ethanol effectively removed with ultrafiltration. Vacuum drying and washing with acetone and ether of refined polysaccharide can further remove ethanol.
Anhydrous Anhydrous ethanol is used to wash refined polysaccharides, it can be removed with ethanol acetone, ether and vacuum drying.
Acetone is used to wash refined polysaccharide; it can be removed by washing with Acetone ether and vacuum drying.
Ether Ether is used to wash refined polysaccharide; it can be removed by vacuum drying.
CTAB is used for removal of nucleic acid in serotype 3 polysaccharide; freezing, CTAB centrifugation and ethanol precipitation can remove most of the CTAB used, residual CTAB can be removed with washing using anhydrous ethanol.

III. Residual organic solvents (reagents) content
Table 33 shows the test results of residual organic reagents content (DOC, phenol, CTAB, ethanol, ether and acetone) of continuous 3 batches of polysaccharide.

 Notes: "-" indicates this item was not tested for this sample, "*" indicates the 3 continuous batches of serotype
 6A polysaccharide produced in process validation approval.

Those test results show good reproducibility of ethanol, ether and acetone concentration between continuous 3 batches. There's difference between different serotypes, but residual contents remain low, the average residual ethanol is 119.22 µg/mL (polysaccharide concentration at 3.0 mg/mL), the average residual ether is 8.87 µg/mL (polysaccharide concentration at 3.0 mg/mL), the average residual acetone is 47.09 µg/mL (polysaccharide concentration at 3.0 mg/mL). According to the chemical handbook, the boiling points of ethanol, ether and acetone at 1 atm is 78.37 °C, 34.6 °C and 56.48 °C respectively, the lower the boiling point, the easier it is to be removed with vacuum drying, which accounted for the lowest average residual of ether and highest average residual of ethanol.

The results of residual DOC, phenol and CTAB show that no residual phenol was present in 13 serotypes of polysaccharide. No CTAB was detected in the only serotype that used CTAB in the process, serotype 3. The average residual DOC concentration was low at 0.575 µg/mL (polysaccharide concentration at 3 mg/mL). The production process can effectively remove DOC, phenol and CTAB.

According to ICH and Chinese Pharmacopeia (2010 version), ethanol, ether and acetone are low toxicity solvents (type 3 solvents) and have limited impact on human health. Acute toxicity and short-term toxicity tests show they're almost non-toxic and non-genotoxic. No discussion is needed if content intake is 50 mg/day or lower.

Walvax conducted further validation of removal of product-related and process-related impurities through planning to be listed commercial-scale process validation during clinical studies. The

Confidential 74

results showed the removal of the above impurities is effective. The results are shown in Table 34 to Table 46.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Conclusion

The pneumococcal polysaccharides of serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F produced by Walvax were stored at -20 °C for 0 months, 1 year, 2 years, 3 years and 4 years respectively. The detection values of each test item at each test time point were in accordance with the Quality Standard for 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine (WSYX-QC-TS-06-09-0005).

This stability study was conducted by the quality control laboratory in strict accordance with the stability study protocol, which can provide the basis for the safety, immunogenicity and validity of pneumococcal polysaccharide stored at -20 °C. To sum up, the pneumococcal polysaccharide produced by Walvax can meet the requirements of 4 years storage at -20 °C.

Conclusion
 Serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, 23F Pneumococcal Bulk Conjugate were stored at 2-8 ■, tested at 0th month, 1st month, 2nd month, 3rd month, 6th month, 9th month, 12th month, test results were all complied with Quality Standard of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine (Document code: WSYX-QC-TS-06-09-0005).
 This stability study was conducted by the quality control laboratory strictly sampled at each test point, could provide evidence for safety, effectiveness and validity of pneumococcal bulk conjugate stored at 2-8 ■. In conclusion, shelf life of 13 serotypes of pneumococcal bulk conjugate manufactured Walvax stored at 2-8 ■ is 12 months.

 MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES
 Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.3.P DRUG PRODUCT

2.3.P.1 Description and Composition of the Drug Product
 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine is a sterile liquid suspension of capsular polysaccharide antigens of *Streptococcus pneumoniae* serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F, with each saccharide individually conjugated to Tetanus Toxoid protein. The vaccine contains 2.6 µg/dose of serotype 1 and 19A, 2.5 µg/dose of serotype 3, 5, 6A, 9V, 3.0 µg/dose of serotype 4 and 23F, 6 µg/dose of serotype 6B, 2.85 µg/dose of serotype 7F, 2.75 µg/dose of serotype 14 and 19F, 3.25 µg/dose of serotype 18C. The vaccine is formulated in Phosphate-buffered Saline containing 4.25 mg/dose NaCl, 44.35 µg/dose NaH₂PO₄, 19.0 µg/dose Na₂HPO₄, and contains 0.5 mg/dose of aluminum phosphate as an adjuvant.
 Each 1 mL syringe or vial contains a single 0.5 mL dose of vaccine for intramuscular administration, with no preservative.

 Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.3.P.2 Pharmaceutical Development

2.3.P.2.1 Components of the Drug Product

2.3.P.2.1.1 Drug Substances

Tetanus toxoid was chosen as the carrier protein for the 13-valent Pneumococcal Polysaccharide Vaccine based on the previous Walvax experience with tetanus toxoid in the *Haemophilus influenzae* type b conjugate vaccine.
 Activation and derivation are two key steps in polysaccharide protein conjugation. After a thorough investigation on the 13 polysaccharide structures, different activation agents are used according to different structures of capsular polysaccharides, and polysaccharide-protein conjugates are prepared with indirect conjugation method. The method uses cyanide as activation agent to activate capsular polysaccharides, the activated polysaccharides are bonded with the linker, ADH, through covalent bonding to form polysaccharide-ADH derivatives. The derivatives are banded with carrier protein through covalent bonding with condensation agent EDAC to form polysaccharide-ADH-carrier protein conjugates.
 The immunogenicity of the combination containing 13 polysaccharide-protein conjugates and aluminum phosphate was compared to single antigen during compatibility test in pre-clinical research. Test results showed no difference between the mitogenicity of the combination and single antigen, which proves good immunogenicity of the combination.

2.3.P.2.1.2 Excipients

The excipients in the 13-valent Pneumococcal Polysaccharide Vaccine are NaCl at 8.5 mg/mL, sodium dihydrogen at 88.7 µg/mL, disodium hydrogen phosphate at 38 µg/mL and aluminum

phosphate at 0.5 mg/mL.
The phosphate/saline buffer was added to the formulation to provide pH control and suitable osmolality. Aluminium phosphate was added as an adjuvant to enhance immunogenicity.

2.3.P.2.2 Drug Product

2.3.P.2.2.1 Formulation Development

(1) Adjuvant selection

Aluminium adjuvant has been used in clinic for more than 80 years, which is the first classical adjuvant approved by FDA for human vaccine. In the development of 9-valent pneumococcal conjugate vaccine preparation process, Walvax referred to the successful experience of Wyeth 7-valent pneumococcal conjugate vaccine containing aluminium phosphate adjuvant, and the requirements of European Pharmacopoeia Adsorbed Pneumococcal Conjugate Vaccine (Annex 3-6) for aluminium adjuvant, and determined to add aluminium adjuvant in the preparation of 9-valent Pneumococcal Polysaccharide Conjugate Vaccine final bulk.

Walvax used aluminium hydroxide and aluminium phosphate as adjuvants to formulate 9-valent Pneumococcal Polysaccharide Conjugate Vaccine final bulk. After visual inspection, the

Confidential 148

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

appearance of final bulk with aluminium hydroxide adjuvant is milky uneven suspension with coagulum after shaking, and the appearance of final bulk with aluminium phosphate adjuvant is milky homogeneous suspension after shaking. Therefore, in the preparation of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine final bulk, we choose aluminium phosphate as the adjuvant of the vaccine.

In addition, we checked the instructions of PCV10 (GSK) and PCV13 (Pfizer) which were launched in 2009 and 2010 respectively, and both of them also adopted the formula containing aluminium phosphate adjuvant. Up to now, the vaccine composition of pneumococcal conjugate vaccine approved for marketing in the world is shown in the Table 101.

Table 101 Vaccine Composition of PCV7, PCV13 and PCV10

Product

It can be seen from the Table 101 that all the three approved pneumococcal conjugate vaccines in the world are adsorbed with aluminium adjuvant without exception, and all of them use aluminium phosphate adjuvant, which can effectively induce the production of high-efficient protective antibodies.

(2) Specification and dose study

In the pre-clinical study of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine, Walvax referred to the actual situation that the content of each antigen in all kinds of listed conjugate vaccines was 1-10 µg, and referred to the specification of PCV7 (Pfizer) and PCV13 (Pfizer), our company designed and carried out the specification and dose research comparing to PCV7 (Pfizer), and determined the product specification and dose through the immunogenicity test.

Confidential 149

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.3.P.2.3 Manufacturing Process Development

2.3.P.2.3.1 Determination of Adjuvants

According to the European Pharmacopoeia (5.0) Pneumococcal polysaccharide conjugate vaccine (adsorption) and other related literature, the characteristics (structure, charge, molecular size, etc.) of pneumococcal polysaccharide conjugate antigen, aluminium adjuvant is proposed. Aluminium hydroxide and aluminium phosphate commonly used in vaccines as adjuvant. After compounding with aluminium hydroxide and aluminium phosphate, respectively, the appropriate adjuvant can be determined through observing the appearance of complex.

Table 102 Appearance after Compounding with Adjuvant

Sample Appearance

Aluminium hydroxide milky uneven suspension with coagulum after shaking

Aluminium phosphate milky homogeneous suspension after shaking

The results in the Table 102 shows that aluminium phosphate has good compatibility with polysaccharides, while aluminium hydroxide is incompatible. Aluminium phosphate is selected as the adjuvant for this vaccine.

2.3.P.2.3.2 Determination of Buffer System

Antigenicity of an antigen is affected by its primary (molecular formula) and higher order (secondary and higher) structures. Higher order structures of antigen are dramatically affected by the solution system it's in, factors include pH, osmotic pressure, ionic strength, and so on, among which pH more drastically affects its higher order structures. Apart from controlling the osmotic pressure the same to that of body fluid and ionic strength within bearing range of human body, a suitable buffer system should be developed as well to keep constant pH.

In reference to Chinese Pharmacopeia 2010 Version, Volume III, Manufacturing and Testing Procedure of Diphtheria, Tetanus and Acellular Pertussis Combined Vaccine, Adsorbed, and Walvax's Production Process of Final Bulk Diphtheria, Tetanus and Acellular Pertussis Combined Vaccine, adsorbed, final bulk was added to a phosphate buffer solution of pH 6.5, then filled to vials and conducted accelerated experiment at 37 °C. Appearance and pH of the sample were constantly tested to ensure a constant pH, thus evaluate the phosphate buffer system. The test results showed that while formulating the final bulk, the NaH₂PO₄-Na₂HPO₄ buffer can stabilize the pH value effectively and ensure that the final bulk maintains a good physical appearance. The buffer system for final bulk is as follow:

NaH₂PO₄ 88.7 µg/mL
 Na₂HPO₄ 38.0 µg/mL
 NaCl 8.5 mg/mL

Confidential 150

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.3.P.2.3.3 Establishment of Final Bulk Preparation Process

In reference to Chinese Pharmacopeia 2010 Version, Volume III, Manufacturing and Testing Procedure of Diphtheria, Tetanus and Acellular Pertussis Combined Vaccine, Adsorbed, and Walvax's Manufacturing Process of Final Bulk Diphtheria, Tetanus and Acellular Pertussis Combined Vaccine, adsorbed, and Walvax's Production and Testing Procedure of 9-valent Pneumococcal Conjugate Vaccine, Walvax established the operation procedure of final bulk. Through the detection of appearance, pH, antigen content, aluminium phosphate content, sodium chloride content, sterility, pyrogen, abnormal toxicity index, to investigate whether it meets the predetermined standard.

The preparation process of final bulk is determined as follows:

(1) Preparation of the excipients stock solution

Weigh the medicinal grade sodium chloride in the container according to the formula amount, dry heat sterilization and remove the pyrogen; weigh the medicinal grade phosphate in another container according to the formula amount, dry heat sterilization and remove the pyrogen; add the formula amount of WFI into the container, mix well, autoclave and obtain the excipients stock solution, place at 2-8 °C for use;

(2) Weigh the formula amount of each serotype polysaccharide bulk conjugate, mix well to obtain the mixture.

(3) Measure the formula amount of aluminium phosphate adjuvant, phosphate stock solution (pH 6.5), sodium chloride stock solution and WFI, mix well to obtain the excipients mixture.

(4) Pump the polysaccharide bulk conjugate mixture into the excipients mixture while stirring to obtain the final bulk.

2.3.P.2.4.2 Vial Compatibility Research

The compatibility research of vial packaging was conducted on neutral borosilicate glass vial (produced by Ningbo Zhengli Pharmaceutical Packaging Co., LTD) and halogenated butyl rubber plugs for injection (chlorinated) (produced by Jiangsu Hualan Pharmaceutical New Materials Co., Ltd).

Compatibility summary and conclusion on neutral borosilicate glass vial

Objective:

This test is to investigate the compatibility of PCV13 and middle-boro glass injection vials (hereinafter referred to as vials) manufactured by Ningbo Zhengli as inner packing material, to evaluate the migration of the packaging material and its safety, the influence of vaccine on packing systems, and then to provide basis of selection of packaging materials and safety of drug usage.

Basis:

1 The compatibility trial guidelines between pharmaceutical packaging materials and drug substances (YBB00142002-2015)

2 The compatibility research technology guidelines of chemical pharmaceutical injection and glass pharmaceutical packaging container (trial implementation)

3 The criterion of neutral borosilicate glass vial (YBB00292005-2-2015)

4 Chinese pharmacopoeia, 4th edition, 2015

5 ICH Q3D, Introduction of elements and impurities, Step 4, 16 December 2014

6 United States Pharmacopeia <1660>

Experimental design:

1.The influence of glass container on drug substances

1.1 Migration tests: 1 batch of neutral borosilicate glass vial were used to package 3 batches of vaccine to conduct compatibility test and placed upright or upside down. At the test points of

accelerated test and long-term test, elements of extraction were studied with validated method, estimating possibly migration of elements to drug substance.

1.2 Migration of organics of rubber plugs: testing small molecules antioxidants content such as 2, 6-tert-butyl-4-methyl phenol (BHT) in every point. (Test results are used to evaluate compatibility and whether to continue the test.)

2 The test items of influences of pharmaceuticals on inner surface of glass containers.

2.1 The trend of packaging materials damage and erosion: 1 batch of vaccine were filled to 3 batches of neutral borosilicate glass vial placed upright or upside down to test compatibility. At the test points of accelerated test and long-term, samples were taken to study inner surface erosion and silicon, boron elements in the drug by staining, atomic absorption spectrum, etc. The influence of drug substances on vials was evaluated by analysis of trends of silicon and silicon/boron rate.

Compatibility summary and conclusion on halogenated butyl rubber plugs

Objectives:

The test is conducted to evaluate the compatibility of PCV13 with halogenated butyl rubber plugs which used to injection were made by Jiangsu Hualan Pharmaceutical New Materials Co., Ltd, and to evaluate possible migration substances and its safety, test the influence of vaccine to package system, and then provide bases of selecting package materials and using drug safely.

Basis:

- 1 Compatibility test guideline for pharmaceutical packaging material and drug substance (YBB00142002-2015)
- 2 Compatibility research technology guidelines for chemical pharmaceutical and elastomeric seal (trial implementation)
- 3 Standard of halogenated rubber plugs (YBB00042005-2015)
- 4 Chinese pharmacopoeia, 4th edition, 2015
- 5 ICH Q3D, Introduction of elements and impurities, Step 4, dated 16 December 2014
- 6 United States Pharmacopeia <1663>
- 7 United States Pharmacopeia <1664>

Experimental design

1 Extraction test

1.1 Elements Extraction: Elements are the easiest extractable substances in rubber plugs.

Referencing Compatibility research technology guideline for chemical pharmaceutical and elastomeric seal (trial implementation), and ICH Q3D, we focus on detection of the following elements: magnesium, silicon, titanium, cadmium, lead, arsenic, mercury, cobalt, vanadium, nickel, antimony, lithium and copper. If high content of other elements, they shall be listed as test items for compatibility test.

1.2 Organics extraction: organics are mainly used as assistant agents during rubber plugs manufacturing process. Referencing Compatibility research technology guideline for chemical pharmaceutical and elastomeric seal (trial implementation), major assistant agents are

antioxidants (BHT and its degradants), sulfides (disulfuric alkyl phenol and its degradants), volatile organic compounds (C13, C21 rubber oligomers), lubricants (dimethyl silicone oil).
2 Rubber plugs will age as time goes by, physical properties will change, and it may influence fragments for the rubber plugs, thus it was investigated.

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

In conclusion, the PCV13 manufactured by Walvax uses neutral borosilicate glass vial for injection
manufactured by Ningbo Zhengli Pharmaceutical Packaging Co., LTD and halogenated butyl
rubber plugs of inner package injection syringes manufactured by Jiangsu Hualan Pharmaceutical
New Materials Co., Ltd. Compatibility studies of drug substances and packaging materials showed
that no high risk extractum was migrated to the drug substance, and no destruction to the packaging
materials by the drug substance was observed, quality and stability of PCV13 were maintained.
Walvax will follow compatibility research protocols and continue conducting research for 24
months and 36 months under 5±3 ■, then provide an objective and scientific basis for selecting
halogenated butyl rubber plugs for inner package injection syringe manufactured by Ningbo
Zhengli Pharmaceutical Packaging Co., LTD and Jiangsu Hualan Pharmaceutical New Materials
Co., Ltd.

2.3.P.2.4.4 Pre-filled Syringes Compatibility
The compatibility research of pre-filled syringe packaging was conducted on Rubber plug for pre-

filled syringe (produced by Shandong Weigao Group Medical Polymer Co., Ltd) and Pole for pre-filled syringe (produced by Shandong Weigao Group Medical Polymer Co., Ltd).

Compatibility summary and conclusion on pre-filled syringe
Walvax conducted compatibility studies of pre-filling syringes manufactured by Shandong Weigao Group Medical Polymer Products Co. LTD and PCV13 to investigate the influence of packaging materials on formulation stability and potential migration, as well as safety and applicability in use.

So far, migration test and compatibility study of packaging material for 24 months under 5±3■ and 6 months under 25±2■ had completed. The detailed research is shown as follows.

Objective

The test is to investigate compatibility of PCV13 and pre-filled syringes manufactured by Shandong Weigao Group Medical Polymer Products Co. LTD to evaluate potential migration and its safety, and the influence of vaccine on packaging systems, then to provide basis about selection of packaging material and safety of drug usage.

Basis

- 1 guideline for compatibility for pharmaceutical packaging material and drug (YBB00142002-2015)

Experimental design

Migration tests were conducted with 3 batches of PCV13 and the corresponding 1 batch of packaging material, to evaluate migration of glass tubing to PCV13, and to evaluate corrosion of the surface of the pre-filled syringe glass tubing by PCV13, and to conduct safety assessment on the migration quantity. The tests used 3 batches of PCV13 and corresponding 1 batch of packaging material to evaluate the corrosion of pre-filled syringe glass tubing by PCV13. Detailed experimental design is shown in Table 107.

Conclusion:

PCV13 manufactured by Walvax uses pre-filled syringes packaging manufactured by Shandong Weigao Group Medical Polymer Products Co. Ltd.

Compatibility studies showed no high-risk extractum in PCV13 and no destruction to the packaging material, PCV13 maintained good quality and safety.

Walvax will continue conducting research following compatibility research protocols of 36 months under 5±3■, providing an objective and scientific basis of selecting Shangdong Weigao's pre-filled syringes packaging.

2.3.P.3.3.2 Discription of Manufacturing Process

Walvax issued Standard Operation Procedures for fill and finish of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine according to Regulation of registration for 13-valent Pneumococcal Conjugate Vaccine approved by National Medical Products Administration (Standard No: YBS00392019). The product is a finished product after formulation, filling, capping, visual inspection, labelling, and packaging.

Manufacturing process steps include:

(1) Perpetration the excipients stock solution

Weigh the medicinal grade sodium chloride in the container according to the formula amount, dry heat sterilization and remove the pyrogen; weigh the medicinal grade phosphate in another container according to the formula amount, dry heat sterilization and remove the pyrogen; add the formula amount of WFI into the container, mix well, autoclave and obtain the excipients stock solution, place at 2-8 °C for use;

(2) Weigh the formula amount of each serotype polysaccharide bulk conjugate, mix well to obtain the mixture.

(3) Measure the formula amount of aluminium phosphate adjuvant, phosphate stock solution (pH 6.5), sodium chloride stock solution and WFI, mix well to obtain the excipients mixture.

(4) Pump the polysaccharide bulk conjugate mixture into the excipients mixture while stirring, sterile filtrate to obtain the final bulk.

(5) Fill the final bulk into vials or pre-filled syringes, after labelling and packaging to obtain finished products.

2.3.P.3.5 Process Validation and/or Evaluation

The 13-valent Pneumococcal Polysaccharide Conjugate Vaccine production process includes six process steps: final bulk formulation, filling, capping, physical appearance inspection, labelling, and packaging. Through evaluate the critical process parameters and control of each step, in 2013, a total of 6 batches of process validation were carried out for 13-valent Pneumococcal Conjugate vaccines, including 3 batches of vials packaging (GI201708001, GI201708002, GI201708001), and 3 batches of pre-filled syringe packaging (GK201709001, GK201709002, GK201709003). The validation of the production process of the batch of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine shows that the production process of 13-valent pneumococcal conjugate vaccine can continuously produce products that meet the quality standards within the specified process parameters in a controlled state, the process is stable.

2.3.P.4 Control of Excipients

Excipients included in the manufacturing of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine are: sodium chloride, disodium hydrogen phosphate, sodium dihydrogen phosphate, aluminium phosphate, in which sodium chloride, disodium hydrogen phosphate, sodium dihydrogen phosphate are tested according to CP. Aluminium phosphate is not included in CP,

Conclusion:
Through the analysis of the data of the above batches of products, it is shown that: appearance, volume,
pH value, aluminium content, sodium chloride
content, polysaccharide content, abnormal toxicity test, bacterial endotoxin and sterility test all met
the Quality Standard of 13-Valent Pneumococcal
Polysaccharide Conjugate Vaccine.

2.3.P.7 Container Closure System
There are two kinds of packaging forms for 13-valent Pneumococcal Polysaccharide Conjugate Vaccine, which are the packaging of vials and pre-filled syringes. The packaging materials for direct contact drugs used in vials are neutral borosilicate glass vial, halogenated butyl rubber plugs for injection (chlorination) and aluminum-plastic combined caps; the packaging materials for direct contact drugs used in pre-filled syringes are rubber plug for pre-filled syringe and pole for pre-filled syringe.

2.3.P.7.1 Primary Packaging (Vial)

According to the following Unqualified classification inspection method, Class A, B and C should not appear.

Class A: There are stains, impurities, bubbles and cracks in the needle ring or there are bubbles and cracks on surface of sealing face. N/AC=315/3

Appearance

Class B: The surface is stained, impurities, rubber filaments, rubber chips, spongy, wool edge, neck plug rough, obvious glue deficiency. N/AC=315/10

Class C: incomplete and zigzag edges, uneven marks and colors caused by moulds. N/AC=200/21

(1) produce white or yellow sediment

Identification

(2) coincident with reference chromatogram

Puncture and crumb The number of chips should not exceed 5.

Self-sealability Methylene blue solution must not penetrate into the bottle.

Adhesion between

rubber stopper and Methylene blue solution must not penetrate into the bottle.

container

Puncture force The force needed to puncture the rubber stopper should not exceed 10N

Insoluble particles Particles larger than 10um per ml: NMT 30 particles, (photoresist method) Particles larger than 25um per ml: NMT 3 particles.

Residue on ignition NMT45%

Should not form sulfur spots or color of sulfur spots should not be more strength

Volatile sulfide

than standard sulfur spots. (less than 50ugNa₂S/20cm²)

The solution should be clear. If it is muddy, it should not be more strength than

Clarity and color No. 2 standard solution. if it shows color, it should not be more strength than No.5 standard yellow-green solution.

pH difference between test solution and reference solution should not more than

pH variation

1.0

UV absorbance The maximum absorbance at 220-360nm should not exceed 0.1.

Nonvolatile matter

The difference between the two should not exceed 4.0mg

(mg)

Readily oxidizable The difference of the consumption of titrant between the two should not exceed substance (ml) 3.0ml.

The color displayed in the third tube is not lighter than that in the first tube, and

Heavy metal the color displayed in the second tube should not be more strength than that in the first tube. NMT 1ppm.

The color of the test solution should not be more strength than that of the standard

Ammonium ion

solution, ammonium ion should be not more than 0.0002%.

Zinc ion The color of the test solution is not more strength than that of standard solution.

The conductivity of blank control solution should not exceed 3.0uS/cm (20■ ±

Conductivity (uS/cm) 1■).

The conductivity of test solution should not exceed 40.0uS/cm (20■±1■).

in the preliminary test. the body temperature of all the 3 rabbits increased less

than 0.6■, sum of elevated temperature was less than 1.4■, or in the retest, there

Pyrogen is not more than 1 rabbit of the 5 whose body temperature raise for 0.6■ or more

than 0.6■, the sum of elevated temperature of preliminary test and retest study is

about 3.5■ or less than 3.5■. should meet the requirements.

Hemolysis

Hemolysis rate should be less than 5%.

(hemolysis test)

Acute systemic During the 72 hours observation period, the response of the animals in the test toxicity test group should not be greater than that in the control group.

Table 124 Specification of Rubber Plug for Pre-filled Syringe

Test Items Specification

The surface color should be uniform, without stains, impurities, bubbles and cracks, impurities, rubber filaments, rubber chips, spongy and wool edge; Appearance incomplete and zigzag edges caused by cutting, uneven marks and colors caused by mould. If there is a sprue, it should not be it should not protrude from the surface of the rubber plug. N/AC=125/2
Particles larger than 10um per ml: NMT 60 particles,
Insoluble particles
Particles larger than 25um per ml: NMT 6 particles.
(1) produce white or yellow sediment
Identification
(2) coincident with reference chromatogram
Residue on ignition NMT50%
1. White precipitates should be produced
Identification
2. It should be consistent with the standard chromatography.
The lead acetate test paper for the test solution should not form sulfur spots, if Volatile sulfide sulfur spot is formed, color of sulfur spots should not be more strength than that of standard lead acetate test paper. (less than 50ug/20cm²)
Clarity and color The solution should be clear and colorless.
pH difference between test solution and reference solution should not more than pH variation
1.0
UV absorbance The maximum absorbance at 220-360nm should not exceed 0.1.
Nonvolatile matter
The difference between the two should not exceed 4.0mg
(mg)
Readily oxidizable The difference of the consumption of titrant between the two should not exceed substance (ml) 3.0ml.
The color displayed in the third tube is not lighter than that in the first tube, and Heavy metal the color displayed in the second tube should not be more strength than that in the first tube. NMT 1ppm.
The color of the test solution should not be more strength than that of the standard Ammonium ion
solution, ammonium ion should be not more than 0.0002%.
Zinc ion The color of the test solution is not more strength than that of standard solution.
The conductivity of blank control solution should not exceed 3.0uS/cm (20±1 ■).
Conductivity (uS/cm)
The conductivity of test solution should not exceed 40.0uS/cm (20±1 ■).
Sterility Should comply with requirements.
Bacterial endotoxin Should be less than 0.5 EU/mL
in the preliminary test. the body temperature of all the 3 rabbits increased less than 0.6 ■, sum of elevated temperature was less than 1.4 ■, or in the retest, there Pyrogen is not more than 1 rabbit of the 5 whose body temperature raise for 0.6 ■ or more than 0.6 ■, the sum of elevated temperature of preliminary test and retest study is about 3.5 ■ or less than 3.5 ■. should meet the requirements.
Hemolysis
Hemolysis rate should be less than 5%.
(hemolysis test)

Acute systemic During the 72 hours observation period, the response of the animals in the test toxicity test group should not be greater than that in the control group.

Table 125 Specification of Pole for Pre-filled Syringe

Test Items Specification

It should be colorless and transparent; the surface should be clean and smooth, and Appearance there should be no obvious defects. No crack should be found in any part.
(N/AC=125/2)
Internal surface water
The volume of consumed should be less than 2.0ml
resistivity
Pinhole patency The needle with a diameter of 0.18 should be able to pass freely. N/AC=20/2
121■ particles water Volume of hydrochloric acid titrant (0.02mol/L) consumed by each gram of glass resistance particles should be ≤ 0.10 mL.
Sterility Should comply with requirements.
Bacterial endotoxin Should be less than 0.5 EU/mL

2.3.P.7.3 Secondary Packaging

The secondary packaging form of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine (packed with vial and pre-filled syringe) is 0.5ml/vial (syringe) per box. Each small box is marked with product name, specification, batch number, manufacturing date, expiration date, indication, eligibles, adverse reactions, contraindications, precautions, etc. at the same time, each small box is marked with the vaccine traceability code, which can be queried through the system to each vaccine information.

2.3.P.8 Stability

In accordance with the requirements of GMP, Walvax has compiled the document Product Stability Inspection Management rules (Document code: WSYX-QA-SMP-0009-0030). According to this document, we have placed accelerated stability test and long-term stability test on six batches of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine.

Conjugate protein Release standard shall be not less than 85%, standard in expiry date shall be not content less than 80%

Total protein content 41-150 µg/dose

Abnormal toxicity Should comply with requirements.

Bacterial endotoxin Should be not more than 12.5 EU/dose

Sterility test Should comply with requirements

Osmolarity 220-310 mOsm/Kg

Conclusion:

According to the analysis of stability study test results, it showed that the six batches (three vials and three pre-filled syringe) of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine were stored at 25±2 °C for 9 months accelerated stability study met the 13-valent Pneumococcal Polysaccharide Conjugate Vaccine registration standards (code: YBS00392019) approved by NMPA.

The long-term stability experiment has now completed the 24th month study. The test results showed that six batches (three vials and three pre-filled syringe) of products were stored at 5±3 °C for long-term stability study met the 13-valent Pneumococcal Polysaccharide Conjugate Vaccine registration standards (code: YBS00392019) approved by NMPA.

MODULE 2 COMMON TECHNICAL DOCUMENT SUMMARIES

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.3.A APPENDICES

2.3.A.1 Facilities and Equipment

Walvax has established the Plant and Facilities Management Control Procedures (document code: WSYX-P-03-0003) specifying the maintenance cycle and scope of the plant and facilities. The engineering supply department conducts a monthly inspection on the periphery of the clean plant to see whether the floor, walls, ceiling, doors and windows of the plant are free of cracks and shedding and are intact; and whether the main bearing structure is overload, corroded and so on. Each manufacturing workshop shall inspect the inside of the clean plant every month to see whether the ground, wall, ceiling, doors and windows of the clean plant are free of cracks and shedding and are intact; and whether the main bearing structure is overload, corroded and so on. During the inspection process, it shall be timely reported and handled in case of abnormalities according to the relevant requirements. After inspection, the inspection records shall be filed monthly to the engineering supply department, so as to know about the situations inside the plant in a timely manner.

Main equipment lists are showed as following:

2.3.A.2 Adventitious Agents Safety Evaluation
Walvax establishes a comprehensive and scientific material management and storage system.
Developed Material Management Control Procedure (Document code: WSYX-P-05-0005). For
animal source materials, in addition to strict quality test, the suppliers should provide proof of
origin or safety certification. This vaccine's production is involved with animal-derived materials
of sheep blood. Detailed information as below:

Note: 1. The order in the above table is divided in the order of the expected delivery date of the samples. The specific delivery date is filled in according to the actual delivery; each type of Pneumococcal Polysaccharide

Derivatives will be tested for 3 samples.

2. The test samples were taken from the on-site inspection production batch, including 3 batches of Type 4, Type 6B, Type 7F, Type 14 and Type 23F and 1 batch of Type 23F. These batches were sent by August 25, 2019.

Therefore the five serotype of 13 batches will be used for stability studies with late-production Pneumococcal

4 / 8

Code WSYX-QC-SP-0609-0099 Version 00

Protocol of Product Stability Test Quality Control Laboratory

Polysaccharide Derivatives; specific test batches (Batch No.), information such as the date of the first test date, the date of the first submission, the estimated completion time, etc. shall be included in the table in Annex 1.

II Purpose

1. In order to monitor the quality of the 13 serotype of Pneumococcal Polysaccharide Derivatives used in the 13-valent Pneumococcal Polysaccharide Conjugate Vaccine within the validity period, and to determine that it can or is expected to meet the requirements of the quality standard under the labeled storage conditions, Yuxi Walvax conducts the stability test of 113 serotype of Pneumococcal Polysaccharide Derivatives.

III Basis for the stability test

1. Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010).
2. The Pharmacopoeia of the People's Republic of China 2015 Edition Volume II: Stability Testing of Drug Substances and Products (XIX C).
3. Standard Operation Procedure for Continuous Stability Study of Products, code: WSYX-QA-SMP-0009-0030.
4. Quality Standard of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine, code: WSYX-QC-TS-0609-0005.
5. Standard Operation Procedure for Determination of Molecular Size by SEC-MALS Method, code: WSYX-QC-SOP-00-09-0143.

IV Responsibility

1. Quality Assurance Department:

- Provide the Application of Conducting the Stability Study for Products and Plan of Conducting the Stability Study for Products to Quality Assurance Laboratory;
- Review the Protocol of Product Stability Test;
- Review the Report of Product Stability Study;

2. Quality Control Laboratory:

- Draft the Protocol of Product Stability Test;
- QC manager review the Protocol of Product Stability Test;
- Store the test sample under the 2-8■ according to the Protocol of Product Stability Test;
- Sampling at the time point according to the Protocol of Product Stability Test;
- Test the sample and issue the report for results of test;
- Analysis and summarize the product quality according to test results, draft and review the periodical

5 / 8

Code WSYX-QC-SP-0609-0099 Version 00

Protocol of Product Stability Test Quality Control Laboratory

and finalized Study Report of Product Stability Test;

3. Production Management Department:

- According to the documents and Protocol of Product Stability Test approved by Quality Assurance Department, issue the manufacture order to related workshop;

4. Bacterial Vaccine Workshop II:

- According to the manufacture order approved by Production Management Department, arrange the manufacture for the samples required in Protocol of Product Stability Test, send the samples to Quality Control Laboratory;

5. Quality Management Department:

-Review the Protocol of Product Stability Test

6. Quality Responsible Person:

-Review and approval the Protocol of Product Stability Test;

-Review and approval the Study Report of Product Stability Test;

V Study design

1. Sample storage condition: 2-8■

2. Test time: 0 day, 10 days, 20 days, 30 days, 35 days;

3. Test items:

The Pneumococcal Polysaccharide Derivatives is liquid form and stored at 2-8■. According to the requirements of product quality standards, the indicators that need to be tested include: total solids, derivation rate, residual cyanide, and molecular size.

The total solids detection result is to provide data support for the combination process. This indicator monitors the weight of the substance contained in each 1ml of the Pneumococcal Polysaccharide Derivatives, which is less affected by the storage time.

The derivation rate is the concentration of the Pneumococcal Polysaccharide Derivatives Adipic acid hydrazide (hereinafter referred to as ADH) divided by the polysaccharide content (glucose measured by the anthrone method). Adipic acid hydrazide (ADH) is chemically stable under normal temperature and pressure. In addition, the derivatization rate is monitored as a ratio of total ADH content to polysaccharide content in the derivative homogenate, and this method does not identify free ADH and Polysaccharide-derived ADH, so it is of little significance to evaluate the stability of derivatives by this index.

The residual amount of cyanide is the residual impurity in the sample and will not increase

6 / 8

Code WSYX-QC-SP-0609-0099 Version 00

Protocol of Product Stability Test Quality Control Laboratory

with the increase of the sample storage time.

The molecular size will affect the conjugation of the conjugate: the degradation of the derivatives will reduce the molecular weight of the conjugate, which will affect the quality of the product. Therefore, the molecular size of the derivative should be monitored.

The specific test items are as follows:

Time Test Items

0 day, 10 days, 20 days, 30 days, 35 days Molecular Size by SEC-MALS Method

4. Description of the container closure system: the test samples are packed in the stopper glass bottles.

VII Evaluation of test results

According to Quality Standard of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine (WSYX-QC-TS-03-009-0002), Yuxi Walvax conducts test for all Serotypes of Pneumococcal Polysaccharide Derivatives placed under 2-8 ■, different periods of time were tested, results were evaluated and Study Report of Product Stability Test was issued.

VIII Annexes

1. Please find the Annex 1 for sample information on the Pneumococcal Polysaccharide Derivatives for 3 batches of Types 4, 6B, 7F, 14 and 1 batch of Type 23F;

2. Please find the Annex-2 for The molecular size (SEC-MALS method) records.

II Purpose

In order to monitor the quality of the 13 serotype of Pneumococcal Polysaccharide Derivatives used in the 13-valent Pneumococcal Polysaccharide Conjugate Vaccine within the validity period, and to determine that it can or is expected to meet the requirements of the quality standard under the labeled storage conditions, Yuxi Walvax conducts the stability test of 113 serotype of Pneumococcal Polysaccharide Derivatives.

According to the version 00 of the protocol, except for 3 batches each of type 4, 6B, 7F, 14 and 1 batch of type 23F pneumococcal polysaccharide derivatives, the stability of the other types of derivatives have been done, therefore the 01 version of protocol is only for the stability of pneumococcal polysaccharide derivatives of 3 batches each of type 4, 6B, 7F, 14 and 1 batch of type 23F, a total of 13 batches of pneumococcal polysaccharide derivatives.

III Basis for the stability test

1. Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010).
2. The Pharmacopoeia of the People's Republic of China 2015 Edition Volume II: Stability Testing of Drug Substances and Products (XIX C).

IV Responsibility

1. Quality Assurance Department:

- Provide the Application of Conducting the Stability Study for Products and Plan of Conducting the Stability Study for Products to Quality Assurance Laboratory;
- Review the Protocol of Product Stability Test;
- Review the Report of Product Stability Study;

2. Quality Control Laboratory:

- Draft the Protocol of Product Stability Test;
- QC manager review the Protocol of Product Stability Test;
- Store the test sample under the 2-8℃ according to the Protocol of Product Stability Test;
- Sampling at the time point according to the Protocol of Product Stability Test;
- Test the sample and issue the report for results of test;
- Analysis and summarize the product quality according to test results, draft and review the periodical and finalized Study Report of Product Stability Test;

3. Production Management Department:

- According to the documents and Protocol of Product Stability Test approved by Quality Assurance Department, issue the manufacture order to related workshop;

4. Bacterial Vaccine Workshop II:

- According to the manufacture order approved by Production Management Department, arrange the manufacture for the samples required in Protocol of Product Stability Test, send the samples to Quality Control Laboratory;

5. Quality Management Department:

- Review the Protocol of Product Stability Test

6. Quality Responsible Person:

II Purpose
To conduct the stability test of Process Validation Products, Yuxi Walvax sdraft the Protocol of Product Stability Test according to the Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010) and its implementation guidelines, Technical Guidelines for Biological Product Stability Research (pilot edition) and the Standard Operation Procedure for Continuous Stability Study of Products.

III Basis for the stability text
1. Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010).
2. The Pharmacopoeia of the People's Republic of China 2015 Edition Volume ■: Stability Testing of Drug Substances and Products (9001).
3. Standard Operation Procedure for Continuous Stability Study of Products, code: WSYX-QA-SMP-0009-0030.

4. Quality Standard of 23- valent Pneumococcal Polysaccharide Vaccine, code: WSYX-QC-TS-0609-0004.
5. Quality Standard of 13-valent Pneumococcal Conjugate Vaccine, code: WSYX-QC-TS-0609-0005.

IV Responsibility

1. Quality Control Laboratory:

- Draft the Protocol of Product Stability Test after receiving the Protocol of Continuous Stability Study of Products draft by Quality Assurance Department;
- Taking sample at the time point and store the test sample under the -20℃ according to the Protocol of Product Stability Test;
- Test the sample and issue the report for results of test;

2. Quality Assurance:

- Taking sample according to the Protocol of Product Stability Test;
- Analysis and summarize the product quality according to test results, draft and review the periodical and finalized Study Report of Product Stability Test;

4 / 6

Code WSYX-QC-SPR-0609-0012 Version 00

Protocol of Product Stability Test Quality Control Laboratory

- Review the Protocol of Product Stability Test;

3. Quality Management Department:

- Approval the Study Report of Product Stability Test;

4. Quality Responsible person:

- Review and approval the Protocol of Product Stability Test;

V Study design

1. Storage condition: below -20℃.

2. Test points: 0th month, 1 year, 2 years, 3 years, 4 years, 4 years and 6 months, 5 years, 5 years and 6 months.

3. Test items

Identification test, total solid content, nucleic acid content, protein content, total nitrogen content, phosphorus content, methylpentose, molecular size, organic solvent (ethanol, ether, acetone) residues, bacterial endotoxin, sodium deoxycholate residues.

4. Description of container closure system: test sample are packaged in glass bottles with rubber plugs for good sealing.

Conclusion:
 3 batches of Tetanus Toxoid Bulk 201511004(Bottle No.1), CTB201606005(Bottle No.1), CTB201610006(Bottle
 No.1) were kept at 2-8■ for
 48 months, 42months and 36months respectively■test results were all complied with specification of
 Diphtheria, Tetanus and Acellular Pertussis
 Combined Vaccine, Adsorbed (Code■WSYX-QC-TS-00-09-0001)■It shows that the tetanus toxoid bulk produced by
 the Yuxi Walvax can meet the
 requirement of 36 months stored at 2-8■.

II Purpose
To conduct the stability test of Process Validation Products, Yuxi Walvax draft the Protocol of Product Stability Test according to the Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010) and its implementation guidelines, Technical Guidelines for Biological Product Stability Research (pilot edition) and the Standard Operation Procedure for Continuous Stability Study of Products.

III Basis for the stability text
1. Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010).
2. The Pharmacopoeia of the People's Republic of China 2015 Edition Volume ■: Stability Testing of Drug Substances and Products (9001).
3. Standard Operation Procedure for Continuous Stability Study of Products, code: WSYX-QA-SMP-0009-0030.

4. Quality Standard of 23- valent Pneumococcal Polysaccharide Vaccine, code: WSYX-QC-TS-0609-0004.
5. Quality Standard of 13-valent Pneumococcal Conjugate Vaccine, code: WSYX-QC-TS-0609-0005.

IV Responsibility

1. Quality Control Laboratory:

- Draft the Protocol of Product Stability Test after receiving the Protocol of Continuous Stability Study of Products draft by Quality Assurance Department;
- Taking sample at the time point and store the test sample under the -20■ according to the Protocol of Product Stability Test;
- Test the sample and issue the report for results of test;

2. Quality Assurance:

- Taking sample according to the Protocol of Product Stability Test;
- Analysis and summarize the product quality according to test results, draft and review the periodical and finalized Study Report of Product Stability Test;

4 / 6

Code WSYX-QC-SPR-0609-0007 Version 00

Protocol of Product Stability Test Quality Control Laboratory

- Review the Protocol of Product Stability Test;

3. Quality Management Department:

- Approval the Study Report of Product Stability Test;

4. Quality Responsible person:

- Review and approval the Protocol of Product Stability Test;

V Study design

1. Storage condition: below -20■.

2. Test points: 0th month, 1 year, 2 years, 3 years, 4 years, 4 years and 6 months, 5 years, 5 years and 6 months.

3. Test items

Identification test, total solid content, nucleic acid content, protein content, total nitrogen content, phosphorus content, uronic acid content, O-acetyl content, molecular size, organic solvent (ethanol, ether, acetone) residues, bacterial endotoxin, sodium deoxycholate residues.

4. Description of container closure system: test sample are packaged in glass bottles with rubber plugs for good sealing.

Name Batch No. First Test Date Estimated Note completion time	
Purified Liquid CTL201909018 (Bottle No.1)	2019.09.22 2022.03.22
of Tetanus CTL201909020 (Bottle No.1)	2019.09.24 2022.03.24 2-8■
Toxoid CTL201909019 (Bottle No.1)	2019.10.02 2022.04.02

II Purpose
1. In order to monitor the quality of the tetanus toxoid purified liquid within the validity period, and to determine that it can or is expected to meet the requirements of the quality standards under the labelled storage conditions, Yuxi Walvax is conducting a stability test of the three batches of tetanus toxoid purified liquid .

III Basis for the stability test
1. Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010).
2. The Pharmacopoeia of the People's Republic of China 2015 Edition Volume ■: Stability Testing of Drug Substances and Products (9001).

3. Standard Operation Procedure for Continuous Stability Study of Products, code: WSYX-QA-SMP-00-09-0010.
4. Quality Standard of Purified Liquid of Tetanus Toxoid, code: WSYX-QC-TS-06-09-0002.

IV Responsibility

1. Quality Assurance Department:

- Provide the Application of Conducting the Stability Study for Products and Plan of Conducting the Stability Study for Products to Quality Assurance Laboratory;
- Review the Protocol of Product Stability Test;
- Review the Report of Product Stability Study;
- In January of each year, integrate the results of the continuous stability test of all finished products completed in the previous year, and issue the Review of Product Stability Test;

2. Quality Control Laboratory:

- Draft the Protocol of Product Stability Test;
- QC manager review the Protocol of Product Stability Test;
- Store the test sample under the 2-8℃ according to the Protocol of Product Stability Test;

4 / 6

Code WSYX-QC-SPR-0209-0003 Version 00

Tetanus Toxoid CTL201909019 (Bottle 6 months, 9 months, 15

No.1) 4ml

months, 18 months, 24

months

Note: Total amount: 48ml package form: 42ml/bottle $\times 1$ (Sterility)

3ml/bottle $\times 1$ (Protein content)

1ml/bottle $\times 2$ (Bacterial endotoxin)

1ml/bottle×1 (Purity)
4ml package form: 3ml/bottle×1 (Protein content)
1ml/bottle×1 (Purity)

VII Evaluation of test results

According to Quality Standard of Purified Liquid of Tetanus Toxoid, code: WSYX-QC-TS-06-09-0002 the samples of tetanus toxoid purified liquid placed at different time points under 2-8■ were tested. The results will be evaluated and a stability study report will be issued.

II Purpose
To conduct the stability test of Process Validation Products, Yuxi Walvax draft the Protocol of Product Stability Test according to the Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010) and its implementation guidelines, Technical Guidelines for Biological Product Stability Research (pilot edition) and the Standard Operation Procedure for Continuous Stability Study of Products.

III Basis for the stability text
1. Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010).
2. The Pharmacopoeia of the People's Republic of China 2015 Edition Volume ■: Stability Testing of Drug Substances and Products (9001).
3. Standard Operation Procedure for Continuous Stability Study of Products, code: WSYX-QA-SMP-0009-0030.

4. Quality Standard of 23- valent Pneumococcal Polysaccharide Vaccine, code: WSYX-QC-TS-0609-0004.
5. Quality Standard of 13-valent Pneumococcal Conjugate Vaccine, code: WSYX-QC-TS-0609-0005.

IV Responsibility

1. Quality Control Laboratory:

- Draft the Protocol of Product Stability Test after receiving the Protocol of Continuous Stability Study of Products draft by Quality Assurance Department;
- Taking sample at the time point and store the test sample under the -20℃ according to the Protocol of Product Stability Test;
- Test the sample and issue the report for results of test;

2. Quality Assurance:

- Taking sample according to the Protocol of Product Stability Test;
- Analysis and summarize the product quality according to test results, draft and review the periodical and finalized Study Report of Product Stability Test;

4 / 6

Code WSYX-QC-SPR-0609-0010 Version 00

Protocol of Product Stability Test Quality Control Laboratory

- Review the Protocol of Product Stability Test;

3. Quality Management Department:

- Approval the Study Report of Product Stability Test;

4. Quality Responsible person:

- Review and approval the Protocol of Product Stability Test;

6 Work procedures
6.1 preparation method of digestive agent: weigh 0.5g copper sulfate and 4.5g potassium sulfate respectively, mix them in a mortar, pour the finely ground mixture into the reagent bottle, label it, and reserve it.
6.2 the first method: trichloroacetic acid precipitation and filtrate determination of non protein nitrogen method
6.2.1 preparation of test solution
6.2.1.1 preparation of total nitrogen determination solution
The appropriate amount of the test sample was accurately diluted with water to 1.0-2.0 mg of nitrogen per 1 ml.
6.2.1.2 preparation of non-protein nitrogen determination solution
Accurately measure 10.0 ml of the test sample, add 10.0 ml of 10% trichloroacetic acid, mix well, stand for 30 minutes, filter, and take the filtrate as the non protein nitrogen test sample.
6.2.2 Digestion
6.2.2.1 accurately measure a certain volume of the test solution and reference substance (equivalent to the nitrogen content of 1.0-2.0 mg), put them into the digestion tube, add about 5 g of digestive agent, add 10ml of sulfuric acid, and digest at 420■ for 40 minutes until the solution is clear and bright green.
6.2.2.2 take 14.0 ml of non-protein nitrogen test sample and 14.0 ml of water (blank control) into digestion tube of Kjeldahl nitrogen analyzer. Make 2 tubes of each test sample in parallel, Standard operating procedures of Yuxi Walvax Biotechnology Co., Ltd.

add about 5 g of digestive agent, 10 ml of sulfuric acid, and digest at 420■ for 40 minutes until the solution is clear and bright green.
6.2.3 Distillation
Before distillation, steam and wash the distiller for more than 15 minutes. When the receiving liquor is purple red and the cooking solution is reduced to room temperature, take a triangular flask to the right of Kjeldahl nitrogen analyzer, insert the condenser tube and boric

acid absorption solution feeding tube, and then install the digested digestion tube on the evaporator on the left side of the Kjeldahl nitrogen analyzer. Run the program, the instrument starts automatic distillation. After stopping the distillation, remove the triangular flask and use the Rinse the condenser tube with water, collect the eluent in a triangular flask, and prepare for titration.

6.2.4 Titration

Titrate with hydrochloric acid titration solution (0.02 mol/L) until the solution changes from blue-green to gray purple, and the titration results are corrected by blank test.

6.2.5 Result calculation

$$(\text{VX1} - \text{VX0}) \times c \times 14.01 \times \frac{1}{n}$$

Non protein nitrogen content (mg/ml) =

n is the dilution multiple of the test sample;

V1 is the volume of non protein nitrogen test solution, ml;

V2 is the volume of total nitrogen test solution, ml;

14.01 is the relative atomic mass of nitrogen;

6.25 is a constant (1 g nitrogen is equivalent to 6.25 g protein).

6.3 the second method: trichloroacetic acid precipitation to determine protein nitrogen detection method

6.3.1 Preparation of protein nitrogen

Accurately measure the appropriate volume of test sample (protein content of each 1ml is about 4-10 mg) into a suitable sharp bottom centrifuge tube, add equal volume of 10% trichloroacetic acid, and mix well. After standing for 30 minutes, centrifuge at 4000 rpm for 10 minutes, discard the supernatant, and wash the precipitate into the digestion tube of Kjeldahl analyzer with about 3ml water. At the same time, blank control was made.

6.3.2 Digestion

In the blank and the digestion tube of Kjeldahl nitrogen determinator with test sample, add about 5 g digestive agent, 10ml sulfuric acid, and digest at 420■ for 40 minutes until the solution is clear and bright green.

6.3.3 Distillation

Before distillation, steam and wash the distiller for more than 15 minutes. When the receiving liquor is purple red and the cooking solution is reduced to room temperature, take a triangular flask to the right of Kjeldahl nitrogen analyzer, insert the condenser tube and boric acid absorption solution feeding tube, and then install the digested digestion tube on the evaporator on the left side of the Kjeldahl nitrogen analyzer. Run the program, the instrument starts automatic distillation. After stopping the distillation, remove the triangular flask and use the Rinse the condenser tube with water, collect the eluent in a triangular flask, and prepare for titration.

V0 is the volume of hydrochloric acid titration solution consumed by blank, ml;

c is the concentration of hydrochloric acid titration solution, mol/L;

V is the volume of the test solution, ml;

14.01 is the relative atomic mass of nitrogen;

6.25 is a constant (1 g nitrogen is equivalent to 6.25 g protein).

7 Flow chart

No

8 Precautions

8.1 the range of blank 2 should not be greater than 0.05 ml, the blank value is usually 0.02-0.3 ml, and the blank value of 0 ml is normal.

8.2 the distilled ammonia receiving solution should be titrated as soon as possible, so as to avoid

the influence of too long storage time on the determination results.

8.3 if there is no black CuO precipitated in the distillation process, it means that the amount of alkali added is insufficient, and the alkali amount should be supplemented or the experiment should be repeated.

8.4 after adding 2% boric acid absorption solution into the triangular flask, it should be purple red. If it turns green, it indicates that the triangular flask is polluted by alkaline substances.

8.5 the interference of ammonia and alkaline gas should be avoided in the operation
