1. According to the Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010) and Technical Guidelines for Biological Product Stability Research and Standard Operation Procedure for Continuous Stability Study of Products Yuxi Walvax is conducting a stability test study of an intermediate for three consecutive batches of the Diphtheria, Tetanus and Acellular pertussis Combined Vaccine, Adsorbed.

III Basis for the stability test
1. Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010).
2. The Pharmacopoeia of the People's Republic of China 2015 Edition Volume ■: Stability Testing of Drug Substances and Products (9001).
3. Standard Operation Procedure for Continuous Stability Study of Products, code: WSYX-QA-

SMP-0009-0030.

4. Quality Standard of Diphtheria, Tetanus and Acellular pertussis Combined Vaccine, Adsorbed, code: WSYX-QC-TS-0609-0003.

IV Responsibility

1. Quality Control Laboratory:

- Draft the Protocol of Product Stability Test;
- Store the test sample under the $6\pm 2^{\circ}\text{C}$ according to the Protocol of Product Stability Test;
- Sampling at the time point according to the Protocol of Product Stability Test;
- Test the sample and issue the report for results of test;

2. Quality Assurance Department:

- Taking sample according to the Protocol of Product Stability Test;
- Analysis and summarize the product quality according to test results,
- Review the Protocol of Product Stability Test;

3. Quality Management Department:

4 / 6

Code WSYX-QC-SPR-0209-0001 Version 00

6 Working procedure

6.1 Principle

According to this method, the peptide bond contained in protein molecules is chelated with Cu^{2+} in alkaline solution to form a protein copper complex. The complex reduces the phosphomolybdic acid of phenol reagent to produce blue compound. At the same time, under alkaline conditions, phenol reagent is easily reduced by tyrosine, tryptophan and cysteine in protein to produce blue reaction. In a certain range, the color depth is directly proportional to the protein concentration. The protein content in the test sample was determined by colorimetry with the protein standard solution as the standard curve. Before the determination, deoxycholate trichloroacetic acid was added into the sample, and the interfering substances were removed by protein precipitation. This method can also be used to concentrate protein in dilute solution.

SOP for the protein content 3/6

Version 02 Page

test (Lowry method 2)
Confidential files No copy

6.2.1 1% sodium hydroxide solution

Weigh 1g sodium hydroxide into a beaker, dissolve it with purified water and transfer it to a 100ml volumetric flask. Add a small amount of purified water to moisten the beaker for three times and transfer it to the volumetric flask. Fix the volume to the scale line and mix well.

6.2.2 5% sodium carbonate solution

Weigh 5g anhydrous sodium carbonate into a beaker, dissolve it with purified water and transfer it to a 100ml volumetric flask. Add a small amount of purified water to moisten the beaker for three times and transfer it to the volumetric flask. Fix the volume to the scale line and mix well.

6.2.3 test solution A

Take 200ml of 1% sodium hydroxide solution and 200ml of 5% sodium carbonate solution into a 500ml volumetric flask, add purified water to the scale line, mix well, label and set aside.

6.2.4 2.98% sodium tartrate dihydrate solution

Weigh 2.98g of disodium tartrate dihydrate into a beaker, dissolve with purified water and transfer to a 100ml volumetric flask. Add a small amount of purified water to moisten the beaker for 3 times and transfer to the volumetric flask. Fix the volume to the scale line, mix well, label and reserve.

6.2.5 1.25% copper sulfate solution

Weigh 1.25g copper sulfate pentahydrate into a beaker, dissolve it with purified water and transfer it to a 100ml volumetric flask. Add a small amount of purified water to moisten the beaker for 3 times and transfer it to the volumetric flask. Fix the volume to the scale line, mix well, label and reserve.

6.2.6 test solution B (ready to use)

Take 2.98% sodium tartrate dihydrate solution, 1.25% copper sulfate solution and purified water according to the volume ratio of 2:2:1, and mix well. (according to the amount needed in the experiment, it is prepared in proportion).

6.2.7 test solution c (ready to use)

Take the test solution a and test solution B according to the volume ratio of 50:1, and mix SOP of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-0009-0134

SOP for the protein content 4/6

Version 02 Page

test (Lowry method 2)

Confidential files No copy

well. (according to the amount needed in the experiment, it is prepared in proportion).

6.2.8 Folin phenol test solution (ready to use)

Take the stock solution (2mol / L acid concentration) 1 → 2 (i.e. take 1000 μl of Folin phenol into a triangular flask, add purified water to make 2000 μl Folin phenol test solution, and mix well. According to the experimental requirement, the mixture was prepared according to 1 → 2. The prepared Folin phenol test solution should meet the following requirements: 1000 μl of test sample, 5000 μl of test solution and 500 μl of prepared Folin phenol test solution, and the pH value of the solution obtained should be 10.3 ± 0.3).

6.2.9 sodium deoxycholate test solution

Weigh 0.15g sodium deoxycholate into a beaker, dissolve it with purified water and transfer it to a 100ml volumetric flask. Add a small amount of purified water to moisten the beaker for 3 times and transfer it to the volumetric flask. Fix the volume to the scale line, mix well, label and reserve.

6.2.10 72% trichloroacetic acid solution

Weigh 7.2g trichloroacetic acid in a beaker, add purified water to dissolve it into a 10ml volumetric flask, add a small amount of purified water, repeatedly wash the beaker for three times, transfer it to the volumetric flask, and fix the volume to the scale line, mix well, then get the product, label it for use.

6.2.11 200 μg / ml protein national standard solution

Please refer to wsyx-qc-sop-0009-0801 for preparation details

6.3 test procedure

6.3.1 treatment of test articles

A pipette with a range of 100-1000 μl was used to accurately measure 1000 μl of the test sample (containing about 20-80 μg of protein) into the test tube in duplicate.

6.3.2 preparation of standard curve

0 1 2 3 4 5

200 μg / ml protein national standard solution

0 100 200 300 400 500

Purified water (μl) 1000 900 800 700 600 500

Protein content (μg/ml) 0 20 40 60 80 100

6.3.3 add 100 μL sodium deoxycholate test solution into the above tubes, mix well, and place at room temperature for 10min.

6.3.4 add 100 μl of 72% trichloroacetic acid solution into the above tubes, mix well, centrifugate at 3000g for 30min, gently pour out the supernatant, remove the remaining liquid with a pipette, and retain the protein precipitate.

6.3.5 protein precipitate: dissolve each tube with C 1000 μl of test solution, then add 5000 μl of test solution, and mix well.

6.3.6 place the above tubes in the electric constant temperature water bath at 25■ for 10 minutes, add 500 μl of Folin phenol test solution, mix one tube immediately after adding one tube, and place the electric heating constant temperature water bath at 25■ for 30 minutes.

6.3.7 read the absorbance at 750 nm.

6.4 result calculation

6.4.1 take standard 0 tube as blank, calculate the linear regression equation with the

concentration of standard solution and its corresponding absorbance, and then substitute the absorbance of the test solution into the linear regression equation to calculate the protein concentration of the test solution.

Protein concentration of test sample = average protein concentration of test sample × dilution multiple

6.4.2 Results judgment

Carry out according to corresponding quality standard.

7 Flow chart

No

8 Matters need attention

8.1 Temperature and time have influence on protein content detection and should be strictly controlled.

Note: According to the version 00 and 01 of the protocol (WSYX-QC-SPR-0609-0055), the acceleration stability test under 25■ has been completed. Therefore, the version 02 will not conduct the acceleration stability test under 25■, only remain this part of acceleration stability test under 25■ to ensure the integrity of the protocol.

II Purpose

1. According to the Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010), Technical Guidelines for Biological Product Stability Research, The Pharmacopoeia of the People's Republic of China 2015 Edition, ICH Q1A Stability Testing of New Drug Substances and Productions, ICH Q5C Stability Testing of Biotechnological/Biological Products and Standard Operation Procedure for Continuous Stability Study of Products, Yuxi Walvax conducts stability studies on 3 batches of 13-valent pneumococcal polysaccharide conjugate vaccines for vaccines to provide a basis for the storage validity period.

2. According to the Manufacturing and Test Procedure of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine effective on July 03, 2019: and Quality Standard of 13-valent Pneumococcal Conjugate Vaccine, code: WSYX-QC-TS-06-09-0002, Yuxi Walvax adjusted the test items of the 13-valent pneumococcal polysaccharide conjugate vaccine. The detection of the adsorption rate will be cancelled, and the detection of the content of conjugate protein and total protein will be added, so the content of the protocol needs to be modified.

III Basis for the stability test

1. Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010).
2. The Pharmacopoeia of the People's Republic of China 2015 Edition Volume ■: Stability Testing of Drug Substances and Products (9001).

3. Sample placement method: Horizontal

4. Test time:

5±3■ continuous stability: 0 months, 3 months, 6 months, 9 months, 12 months, 18 months, 24 months, 30 months;

25±2■ accelerated stability: 0 months, 1 month, 2 months, 3 months, 6 months.

Note: a. The expected purpose of this stability test is to investigate under the above conditions until the product expires, that is, to the time point when there is at least one inconsistency in the product quality parameter. However, due to the limitation of the planned sample volume, if the continuous stability under 5±3■, the parameters still meet the requirements after 30 months, it needs to be delayed to 36 months, 42 months, and 48 months; Accelerated stability need to postpone 9 months after 6 months;

b. As of July 03, 2019, the continuous stability of the 3 batches for 13-valent pneumococcal polysaccharide conjugate vaccines involved in the protocol at 2-8°C has been investigated to 18 months, so this version of the protocol is only for 24 months and after the inspection time point (The test protocol at each time point before 24 months is subject to the

Note: According to the version 00 and 01 of the protocol (WSYX-QC-SPR-0609-0056), the acceleration stability test under 25■ has been completed. Therefore, the version 02 will not conduct the acceleration stability test under 25■, only remain this part of acceleration stability test under 25■ to ensure the integrity of the protocol.

2. VVM information

Manufacturer: Temptime Corporation

This stability test involves vaccine VVM label heat stability data.

VVM Type No. of days to end point at +25°C Time to end point at +5°C

VVM 30: high stability 193 days > 4 years

VVM 14: medium stability 90 days > 3 years

II Purpose

1. According to the Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010), Technical Guidelines for Biological Product Stability Research, 2. The Pharmacopoeia of the People's Republic of China 2015 Edition, ICH Q1A Stability Testing of New Drug Substances and Productions, ICH Q5C Stability Testing of Biotechnological/Biological Products and Standard Operation Procedure for Continuous Stability Study of Products, Yuxi Walvax conducts stability studies on 3 batches of 13-valent pneumococcal polysaccharide conjugate vaccines for vaccines to provide a basis for the storage validity period.

2. Based on the stability data of Vaccine Vial Monitor (VVM), the stability test of vaccine VVM (VVM14, VVM30) was carried out at 5±3■ and 25±2■, and the optical density value of VVM on the sample vial was detected. Combined with the test results of various quality test of the stability sample, to confirm the stability of the thermal sensitivity of the vaccine heat label and the stability of the 13-valent pneumococcal polysaccharide conjugate vaccine, to provide basis for the selection of VVM for 13-valent pneumococcal polysaccharide conjugate vaccine.

4 / 9

Code WSYX-QC-SPR-0609-0056 Version 02

Protocol of Product Stability Test Quality Control Laboratory

3. According to the Manufacturing and Test Procedure of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine effective on July 03, 2019: and Quality Standard of 13-valent Pneumococcal Conjugate Vaccine, code: WSYX-QC-TS-06-09-0002, Yuxi Walvax adjusted the test items of the 13-valent pneumococcal polysaccharide conjugate vaccine. The detection of the adsorption rate will be cancelled, and the detection of the content of conjugate protein and total protein will be added, so the content of the protocol needs to be modified.

III Basis for the stability test

1. Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010).
2. The Pharmacopoeia of the People's Republic of China 2015 Edition Volume ■: Stability Testing of Drug Substances and Products (9001).
3. Technical Guiding Principles for Compatibility Research of Chemical Injection and Pharmaceutical Glass Packaging Containers (Trial)
4. ICH Q1A Stability Testing of New Drug Substances and Productions
5. ICH Q5C Stability Testing of Biotechnological/Biological Products
6. Standard Operation Procedure for Continuous Stability Study of Products, code: WSYX-QA-SMP-0009-0030.
7. Quality Standard of 13-valent Pneumococcal Conjugate Vaccine, code: WSYX-QC-TS-06-09-0002.

IV Responsibility

1. Quality Assurance Department:

- Provide the Application of Conducting the Stability Study for Products and Plan of Conducting the Stability Study for Products to Quality Assurance Laboratory;
- Review the Protocol of Product Stability Test;
- Review the Report of Product Stability Study;
- In January of each year, integrate the results of the continuous stability test of all finished products completed in the previous year, and issue the Review of Product Stability Test;

2. Quality Control Laboratory:

- Draft the Protocol of Product Stability Test;
- QC manager review the Protocol of Product Stability Test;
- Store the test sample under the 5±3■, 25■ according to the Protocol of Product Stability Test;
- Sampling at the time point according to the Protocol of Product Stability Test;

5 / 9

Code WSYX-QC-SPR-0609-0056 Version 02

Protocol of Product Stability Test Quality Control Laboratory

- Test the sample and issue the report for results of test;
- Analysis and summarize the product quality according to test results, draft and review the periodical and finalized Study Report of Product Stability Test;

3. Animal Laboratory

- Review the Protocol of Product Stability Test;
- Test the sample and report the results of test to Quality Control Laboratory;
- Review the Report of Product Stability Study;

4. Production Management Department:

- According to the documents and Protocol of Product Stability Test approved by Quality Assurance Department, issue the manufacture order to related workshop;

5. Fill & Finish Center

- According to manufacture order and Protocol of Product Stability Test, manufacture the required sample;

6. Quality Supervision Department

- According to Protocol of Product Stability Test, send the required sample amount to Quality Control Laboratory;

7. Quality Management:

-Review the Protocol of Product Stability Test;

8. Quality Responsible person:

-Review and approval the Protocol of Product Stability Test;

-Review and approval the Study Report of Product Stability Test;

V Study design

1. Package information

a. Neutral borosilicate glass injection vial

Manufacturer: Shuangfeng Gerresheimer pharmaceutical glass (Danyang) Co., Ltd;

b. Halogenated butyl rubber plug for injection (chlorination)

Manufacturer: Shengzhou pharmaceutical packaging material technology (China) Co., Ltd;

c. Aluminium-plastics combined caps

Manufacturer: Jingjiang Huaxin Capping Co., Ltd;

2. Sample storage condition: $5\pm 3^\circ\text{C}$, $25\pm 2^\circ\text{C}$

3. Sample placement method: Vial inversion

6 / 9

Code WSYX-QC-SPR-0609-0056 Version 02

Protocol of Product Stability Test Quality Control Laboratory

4. Test time:

$5\pm 3^\circ\text{C}$ continuous stability: 0 months, 3 months, 6 months, 9 months, 12 months, 18 months, 24 months, 30 months;

$25\pm 2^\circ\text{C}$ accelerated stability: 0 months, 1 month, 2 months, 3 months, 6 months.

Note: a. The expected purpose of this stability test is to investigate under the above conditions until the product expires, that is, to the time point when there is at least one inconsistency in the product quality parameter. However, due to the limitation of the planned sample volume, if the continuous stability under $5\pm 3^\circ\text{C}$, the parameters still meet the requirements after 30 months, it needs to be delayed to 36 months, 42 months, and 48 months; Accelerated stability need to postpone 9 months after 6 months;

b. As of July 03, 2019, the continuous stability of the 3 batches for 13-valent pneumococcal polysaccharide conjugate vaccines involved in the protocol at $2-8^\circ\text{C}$ has been investigated to 18 months, so this version of the protocol is only for 24 months and after the inspection time point (The test protocol at each time point before 24 months is subject to the version 01 protocol).

5. Test items

Items Appearance, extractable volume,

Polysaccharide content, conjugate pH, aluminum phosphate content,

II Purpose

1. To conduct stability test on 3 batches of process validation for each serotype pneumococcal bulk conjugate of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine.

III Basis for the stability test

1. Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010).
2. The Pharmacopoeia of the People's Republic of China 2015 Edition Volume II: Stability Testing of Drug Substances and Products (XIX C).
3. Standard Operation Procedure for Continuous Stability Study of Products, code: WSYX-QA-SMP-0009-0030.
4. Quality Standard of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine, code: WSYX-QC-TS-0609-0005.

IV Responsibility

1. Quality Control Laboratory:
-Draft the Protocol of Product Stability Test after receiving Plan of Conducting the Product Stability Test;

5 / 11

Code WSYX-QC-SPR-0609-0053 Version 00

Protocol of Product Stability Test Quality Control Laboratory

- Sampling at the time point according to the Protocol of Product Stability Test;
- Test the sample and issue the report for results of test;

2. Quality Assurance Department:

- Taking sample according to the Protocol of Product Stability Test;
- Analysis and summarize the product quality according to test results,
- Review the Protocol of Product Stability Test;

3. Quality Management Department:

- Review the Protocol of Product Stability Test;

4. Quality Responsible person:

- Review and approval the Protocol of Product Stability Test;

V Study design

1. Sample storage condition: 2-8■

2. Test plan:

Time Test Items

Full test: Sterility, bacterial endotoxin, polysaccharide content, protein content, EDAC residue, polysaccharide-protein ratio, 0 month, 12 months

free polysaccharide content, free protein content, molecular size, identification, ADH content

Polysaccharide content, protein content, polysaccharide-

II Purpose
To conduct the stability test of Process Validation Products, Yuxi Walvax sdraft the Protocol of Product Stability Test according to the Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010) and its implementation guidelines, Technical Guidelines for Biological Product Stability Research (pilot edition) and the Standard Operation Procedure for Continuous Stability Study of Products.

III Basis for the stability text
1. Good Manufacturing Practice for Pharmaceutical Products (Amended in 2010).
2. The Pharmacopoeia of the People's Republic of China 2015 Edition Volume ■: Stability Testing of Drug Substances and Products (9001).
3. Standard Operation Procedure for Continuous Stability Study of Products, code: WSYX-QA-SMP-0009-0030.

4. Quality Standard of 23- valent Pneumococcal Polysaccharide Vaccine, code: WSYX-QC-TS-0609-0004.
5. Quality Standard of 13-valent Pneumococcal Conjugate Vaccine, code: WSYX-QC-TS-0609-0005.

IV Responsibility

1. Quality Control Laboratory:

- Draft the Protocol of Product Stability Test after receiving the Protocol of Continuous Stability Study of Products draft by Quality Assurance Department;
- Taking sample at the time point and store the test sample under the -20℃ according to the Protocol of Product Stability Test;
- Test the sample and issue the report for results of test;

2. Quality Assurance:

- Taking sample according to the Protocol of Product Stability Test;
- Analysis and summarize the product quality according to test results, draft and review the periodical and finalized Study Report of Product Stability Test;

4 / 6

Code WSYX-QC-SPR-0609-0022 Version 00

Protocol of Product Stability Test Quality Control Laboratory

- Review the Protocol of Product Stability Test;

3. Quality Management Department:

- Approval the Study Report of Product Stability Test;

4. Quality Responsible person:

- Review and approval the Protocol of Product Stability Test;

V Study design

1. Storage condition: below -20℃.

2. Test points: 0th month, 1 year, 2 years, 3 years, 4 years, 4 years and 6 months, 5 years, 5 years and 6 months.

3. Test items

Identification test, total solid content, nucleic acid content, protein content, total nitrogen content, phosphorus content, methylpentose, molecular size, organic solvent (ethanol, ether, acetone) residues, bacterial endotoxin, sodium deoxycholate residues.

4. Description of container closure system: test sample are packaged in glass bottles with rubber plugs for good sealing.

SOP for pH Value test Version 07 Page 1/4
Confidential files No copy

1 Objective

Standardize operating procedure for pH value test.

2 Definition/abbreviation

None

3 Scope of application

It applies to test operation for pH value of solution.

4 Responsibility

All operators shall perform the tests in strict accordance with this SOP.

5 Equipments and Materials

5.1 Equipments

Equipment

No. Equipment name Manufacturer Notes

model

1 PH meter φ390 BECKMAN Or equivalent equipment

5.2 Reagents

No. Reagent name Grade

1 PH4 RED BUFFER Imported reagent

2 PH7 GREEN BUFFER Imported reagent

3 PH10 BLUE BUFFER Imported reagent

5.3 Materials

No. Material name No. Material name

1 Beaker 2 Plastic tube

3 Filter paper

6 Working procedure

6.1 Power-on preheating: Plug in the power, open the pH meter switch, preheat at least 30 minutes.

6.2 Calibrate pH meter: Operate according <φ390 pH meter use, clean and maintenance SOP>.

SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0110

SOP for pH Value test Version 07 Page 2/4

6.3 Test sample preparation

6.3.1 Intermediate Product: Take the sample from the refrigerator, and put in room temperature, the appropriate sample is taken out into the plastic tube, pending test.

6.3.2 Vial/prefilled syringe: Take the sample from the refrigerator, and put in room temperature, the appropriate sample is taken out into the plastic tube, pending test.

6.3.3 Freeze dried preparation for injection: Take the sample from the refrigerator, and put in room temperature. Reconstitute the final product with diluents of 0.5ml/vial. Mix well, then the appropriate sample is taken out into the plastic tube, pending test.

6.4 Test the sample, the operation follows <φ390 pH meter use, clean and maintenance SOP>.

7 Flowchart

N/A

8 Matters need attention

8.1 The standard buffer is taken from the refrigerator until its temperature rises to room temperature for use.

8.2 Before test, according to each product item stipulation, chooses two kinds of pH value difference vary approximate 3 units of standard buffer solution, and make the pH value of test product solution is in the correction pH range.

8.3 Taking the first buffer solution which is close to the pH value of the test sample solution to calibrate the instrument, make that the instrument display value is consistent with the buffer value.

8.4 After the instrument positioning, and then check instrument value, the error should not be larger than the ±0.02pH unit, if greater than this deviation, it should be carefully adjusted the slope, so that the value and the second table column values match. Repeat the above positioning and slope adjustment operation, to the instrument value and standard buffer solution of the specified value difference is not greater than ±0.02pH unit. Otherwise, it is necessary to check the instrument or replace the electrode, then to be corrected to comply with the regulations.

SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0110

SOP for pH Value test Version 07 Page 3/4

Confidential files No copy

8.5 The buffer correction slope should be between 90%-110% (internal control standard 96%-102%). Exit the correction display, enter the reading display, select the buffer solution close to the test solution pH value to retest. The instrument value and standard buffer value difference is not greater than ±0.02pH unit.

8.6 Each time of change buffer or test solution, use purified water to fully wash the electrodes, and make the water suction completely, also can use standard buffer or test solution for washing.

8.7 To determine the high pH value of the test sample and standard buffer, it should pay attention to the problem of alkali error, if necessary, select the appropriate glass electrode to test.

8.8 For the determination of the pH value of the solution without buffer effect, unless otherwise specified, the pH4.00 standard buffer is used to calibrate the instrument and to test the solution, and then retest the test solution until the pH reading changes within one minute not more than ±0.05; then use the borax standard buffer to calibrate the instrument and test again. The difference of two pH readings should be no more than 0.1, and the average of two readings should be the pH value of the test sample.

8.9 The membrane of the glass electrode is used for ion exchange and is fragile, so it can not be collided, touched, and the new electrode should be soaked for 24 hours by injection water

before use.

8.10 In the electrode cap, the 3mol/L potassium chloride solution should always keep the electrode immersed to prevent the electrode from drying up and damaging.

8.11 If the sample is concentrated protein, it can be used saline to immerse electrode after test, and then rinse with purified water.

11 Beaker 12 Triangular flask

13 Disposable syringe 14 Disposable latex gloves

15 Hemostatic forceps

6 Work procedures

6.1 PBS solution preparation (pH 7.0-7.4)

Weigh 0.106 g disodium hydrogen phosphate (Na₂HPO₄.12H₂O), 0.0144 g potassium dihydrogen phosphate (KH₂PO₄) and 0.9 g sodium chloride (NaCl) into suitable triangular flasks, add water for injection to dissolve and dilute to 100 ml, adjust pH 7.0-7.4, pack separately, sterilize at 121.1■ for 20min, store at 2-8■ for standby, and the validity period is 25 days.

6.2 Test procedure

Samples were taken from each bottle, diluted with PBS solution (pH 7.0-7.4) to 10 Lf/ml, and placed in 37■ incubator for 42 days. Four guinea pigs weighing 250-350 g were injected subcutaneously with 5 ml each. The observation was carried out on the 7th, 14th and 21st days after injection, and the results were recorded according to the regulations.

6.3 Criteria

Standard Operating Procedures of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-02-09-0002

SOP for toxicity reversal

Version 07 Pages 3/4

test of tetanus toxoid bulk

Confidential documents, no copying.

The animals were observed on the 7th, 14th and 21st days after injection, and the animals were not allowed to have tetanus symptoms; the weight of each animal at the end of the period was qualified if the body weight increased compared with that before injection.

7 Flowchart

No

8 Precautions

8.1 Experimental animals must have a certificate of conformity.

8.2 Samples rarely must be strictly in accordance with the requirements of sterile operation

9 References or standard basis

Stability data of 13 serotypes of pneumococcal polysaccharides Yuxi Walvax Biotechnology C., Ltd.

Conclusion:
pneumococcal polysaccharide serotype 1, 3,4,5,6A,6B,7F,9V,14,18C,19A,19F,23F manufactured by Yuxi Walvax
were kept at■20■, test at 0th
month■1st year■2nd year■3rd year■4th year■test results were all complied with specification of 13-valent
pneumococcal polysaccharide conjugate
vaccine (WSYX-QC-TS-06-09-0005).
This experiment was conducted by the quality control laboratory strictly sampled at each test point,
could provide evidence for safety,
effectiveness and validity of pneumococcal polysaccharide stored at -20■. In conclusion, shelf life of 13
serotypes of pneumococcal polysaccharide
manufactured by Yuxi Walvax stored at -20■ is 4th year.

SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0202
Sterility Test SOP Version 12 Page 1/15
Confidential files No copy

1 Objective

Standardize operating procedure for sterility test.

2 Definition/abbreviation

Sterility test: Test for sterility is a method to detect whether medicines, biologics, medical devices, raw materials, excipients or other articles, which are required to be sterile according to the Chinese Pharmacopoeia, are aseptic.

3 Scope of application

Membrane filtration test is applicable for intermediate products, final products and related excipients of Haemophilus Influenzae Type b Conjugate Vaccine, Group A and C Meningococcal Polysaccharide Vaccine, Meningococcal Group A, C Bivalent Polysaccharide Conjugate Vaccine, Group ACYW135 Meningococcal Polysaccharide Vaccine, Diphtheria, Tetanus and Acellular Pertussis Combined Vaccine, adsorbed, 23-valent Pneumococcal Polysaccharide Vaccine and 13-valent Pneumococcal Polysaccharide Conjugate Vaccine and other test samples.

4 Responsibility

Personnel of QC Laboratory shall perform the tests in strict accordance with this SOP.

5.2 Materials

No. Material name

1 Disposable sealed sterility test system

2 sterile syringes

3 pipettes sterilized by hot air

5.3 Reagents

No. Reagent name Type

1 Fluid thioglycollate medium Medium

2 Trypticase soy broth medium Medium

3 NaCl-peptone buffer Buffer

4 0.9% NaCl solution solution

5 Staphylococcus aureus Positive bacteria

6 Working procedure

6.1 Medium, diluent and rinsing solution

6.1.1 Fluid thioglycollate medium (dehydrated medium)

6.1.1.1 Preparation method: take 1000ml of preparation as an example

a) Composition: fluid thioglycollate medium 30g

Water 1000ml

b) Preparation: mix fluid thioglycollate medium with the water, heat the solution to boil.

Dispense the medium in suitable containers which provide a ratio of surface to depth of medium such that no more than the upper half of the medium has undergone a color change (pink color) indicative of oxygen uptake at the end of the incubation period. Sterilize using a validated process (at 121℃ for 15min), and adjust the pH so that after sterilization the solution will have a pH of 7.1±0.2. Reserve the prepared solution for use. Unless otherwise specified, cultivate in fluid thioglycollate medium at 30-35℃.

6.1.2 Trypticase soy broth medium (dehydrated medium)

6.1.2.1 Preparation method: take 1000ml of preparation as an example

a) Composition: Trypticase soy broth medium 30g

SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0202
Sterility Test SOP Version 12 Page 3/15
Confidential files No copy

Water 1000ml

b) Preparation: Mildly heat until dissolved, dispense the media into containers and sterilize using a validated process (at 121℃ for 15min). Adjust the pH so that after sterilization the solution will have a pH of 7.3±0.2. Reserve the prepared solution for use. Cultivate in trypticase soy broth medium at 20-25℃.

6.1.3 Traptcase soy agar medium (dehydrated medium)

6.1.3.1 Preparation method: take 1000ml of preparation as an example

a) Composition: Traptcase soy agar medium 40g

Water 1000ml

b) Preparation: Mildly heat until dissolved, dispense the media into containers and sterilize using a validated process (at 121■ for 15min). Adjust the pH so that after sterilization the solution will have a pH of 7.3±0.2. Reserve the prepared solution for use.

6.1.4 Sabouraud dextrose agar medium

6.1.4.1 Preparation method: take 1000ml of preparation as an example

a) Composition: Sabouraud dextrose agar medium 65 g

Water 1000ml

b) Mildly heat until dissolved, dispense the media into containers and sterilize using a validated process (at 121■ for 15min). pH of the solution shall be 5.6±0.2 after cooling to room temperature. Reserve the prepared solution for use.

6.1.5 Sabouraud glucose broth medium

6.1.5.1 Preparation method: take 1000ml of preparation as an example

a) Composition: Sabouraud glucose broth medium 30 g

Water 1000ml

b) Preparation: Mildly heat until dissolved, dispense the media into containers and sterilize using a validated process (at 121■ for 15min). pH of the solution shall be 5.6±0.2 after cooling to room temperature. Reserve the prepared solution for use.

6.1.6 pH 7.0 sodium chloride-peptone buffer

SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0202

Sterility Test SOP Version 12 Page 4/15

Confidential files No copy

a) Composition: take 1000ml of preparation as an example

Potassium dihydrogen phosphate 3.56g

Anhydrous sodium hydrogen phosphate 5.77g

Sodium chloride 4.3g

peptone 1.0g

b) Preparation method: mix the above components in 1000ml of water, mildly heat to dissolve, filter and dispense into containers. Sterilize using a validated process (at 121■ for 15min).

6.1.6.1 pH 7.0 sodium chloride-peptone buffer (According to the finished product formula ratio)

a) Composition: Sodium chloride-peptone buffer 14.63g

water 1000ml

b) Preparation method: mildly heat to dissolve, filter and dispense into containers. Sterilize using a validated process (at 121■ for 15min).

6.1.7 0.9% sodium chloride solution (rinsing solution). Dissolve 9g of sodium chloride in 1000ml of water, filter and dispense into containers. Sterilize using a validated process(at 121■ for 15min).

6.2 Sterility test of samples

Techniques of sterility test includes membrane filtration method and direct inoculation method. As long as the character of test sample permitted, the technique of membrane filtration shall be used. The test methods and conditions used for sterile examination of test samples shall be the same as those of validation test of the applicable method.

If any reagents, such as surfactants, inactivators and neutralizers, are used in the process of the sterility test, their effectiveness and non-toxic to microorganisms shall be confirmed.

6.2.1 Number of products to be tested

It is the number of minimum package (ampoule/vial/bottle) of products to be tested in one sterility test. Each single sub-lot of the final product shall be examined for sterility test. Unless otherwise specified, the minimum number of the products to be tested is specified in SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0202

Sterility Test SOP Version 12 Page 5/15

Confidential files No copy

the following table, which is not included the quantity of test samples for positive control test.

bulk of

or not less than 10ml. Bulk and final bulk shall be

biological

sampled as described above at each opening of the

products

container.)

6.2.2 Quantity of product to be tested

It is the minimum quantity (g or ml) of each container of the product in test for sterility once.

Unless otherwise specified, the minimum quantity of each container of the product for each medium is defined in the following table. When the amount of each ampoule (vial) for the test sample is sufficient to fill the two kinds of culture medium, it shall be incubated to fluid thioglycollate medium and traptcase soy broth medium respectively. When using the technique of membrane filtration■as long as the character of test sample permitted, the whole contents of each container shall be filtered for testing.

Minimum quantity of product to be tested

V■100 10%, but not less than 20ml
Bulk or final bulk of
Half the contents of each container
biological products
6.3 Membrane filtration method
Sealed sterility testing system shall be used in the technique of membrane filtration. The
SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0202
Sterility Test SOP Version 12 Page 6/15
Confidential files No copy

membrane used in the test for sterility has a nominal pore size which is not greater than 0.45μm and a diameter about 50mm. Selection of filtration membrane type shall be performed according to the characters of product to be tested and solvent used. Integrity of the membrane in the apparatus shall be kept during the process filtration.

When filtering aqueous solution, the membrane in the filter shall be pre-wetted with a small quantity of rinsing fluids. When the samples tested are oily preparations, the filtration apparatus and membrane must be thoroughly dried before use. The sample solution and rinsing fluid shall be kept always to cover the whole surface of the membrane throughout the operation for maximal filtration efficiency. If necessary, wash the membrane by filtering through it with 100ml of rinsing fluid each time, and the total volume used shall not exceed 1000ml for one single membrane to avoid any damage to the microorganisms held by the membrane, after filtering the sample solution.

So far, the rinsing fluid amount used in the test related to production is 0 ml.

6.3.1 Measure specific quantity of test samples, filter directly, or transfer the samples into aseptic vessels containing not less than 100ml of the sterile diluent, mix up and filter immediately. If the products being examined contain preservatives or have inherent antimicrobial activity, the membrane shall be washed not less than 3 times and the quantity of the rinsing fluid and the method to wash the membrane shall be the same as that described Validation test.

6.3.2 After washing the biological product samples, add 100ml of fluid thioglycolate medium into two filters respectively and 100ml of Trapticase soy broth medium into one of the filter, stick the sterility test sample label.

6.3.3 The above-mentioned culture medium containers after inoculating the test samples shall be cultured for 14 days under the specified temperature; the containers of thioglycolate fluid culture medium inoculating the test samples of biological products shall be divided into two parts, one cultured at 30-35■ and the other cultured at 20-25■.

6.4 Direct inoculation method
SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0202
Sterility Test SOP Version 12 Page 7/15
Confidential files No copy

6.4.1 Equally inoculate the specified quantity of test sample into a container of thioglycollate liquid medium and a container of trapticase soy broth medium respectively. The volume of fluid thioglycollate medium shall not be less than 15ml/tube, and the volume of trapticase soy broth medium shall not be less than 10ml/tube. The quantity of containers with fluid thioglycollate medium and trapticase soy broth medium shall be 2:1.

6.4.2 The containers of thioglycollate liquid medium which inoculated should be divided into two parts, one cultured at 30-35■ for 14 days and the other cultured at 20-25■ for 14 days. Observe and record the results day by day.

6.5 Incubation and observation

Culture the test samples inoculated in the above medium at the specified temperature of each medium for 14 days. For biological products, the thioglycollate liquid medium containers shall be divided into two equal parts, half of the containers are incubated at 30-35■ and another half at 20-25■. Observe and record each medium container for evidence of microbial growth every day during incubation period. If the medium which is inoculated test samples appears turbid during the incubation period, and it cannot be readily determined by visual examination after 14-day of incubation, the defined amount medium can transfer to the same fresh medium. Observe whether the medium inoculated appears turbid after 3-day of incubation. If necessary, bacterial identification test, such as microscopic examination of stained smears, should be conducted.

6.6 Positive control

6.6.1 Strain recovery: Swab one ring of Staphylococcus aureus to trapticase soy broth medium. Culture at 30-35■ for 18-24 hours.

6.6.2 Preparation and counting of bacterial liquid: Dilute it with 0.9% sterile sodium chloride solution to 10-6 times, obtain the bacteria suspension which is containing bacteria less than 100cfu/1ml.

6.6.3 Measure 0.1ml of 10-5 bacteria suspension respectively and inoculate respectively in two culture dishes of trapticase soy broth medium for counting. Count the colony counts after
SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0202
Sterility Test SOP Version 12 Page 8/15
Confidential files No copy

cultured at 30-35■ for 18-24h hours. The colony counts in the two culture dishes shall be among 10-100 cfu.

6.6.4 Take one of the thioglycollate liquid medium, inoculate less than 100CFU positive bacterial in it as the positive control. Culture it at 30-35■ for 48-72h, the bacterial colony should growth well.

6.6.5 Except the above positive control preparation, it also can be carried out that the less than 100CFU positive bacterial is inoculated into the one of the thioglycollate liquid medium cultured after 14-day test sample sterility test as the positive control. Culture it at 30-35■ for 48-72h, the bacterial colony should growth well.

6.7 Negative control

Take the corresponding solvent, diluent and rinsing fluid as a negative control for sterility test. No bacterial should be found in negative control.

6.8 Results judgment

Microbial growth shall be well in the positive control container, and must be not found in the negative control container. Otherwise, the test may be considered invalid.

Except the positive control container, if no evidence of microbial growth is found in all of the test containers described above, the test sample complies with the requirement of sterility test; if evidence of microbial growth is found in any one of the test containers, the test sample does not comply with the requirement of sterility test, unless it can be clearly demonstrated that the test was invalid for causes unrelated to the product to be examined. The test may be considered invalid only when one or more of the following conditions are fulfilled:

(1) The result of the microbiological monitoring of the sterility testing facility shows that it does not meet the requirements of the test for sterility.

(2) A review of the testing procedure used during the test in question reveals a fault.

(3) After determination of the identification of the microorganisms isolated from the test, the growth of this species (or these species) may be ascribed unequivocally to faults in respect with the material or the technique used in conducting the sterility test procedure.

SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0202

Sterility Test SOP Version 12 Page 9/15

Confidential files No copy

If the test is validated to be invalid, it shall be repeated with the same number of the samples and procedure as in the original test. If no evidence of microbial growth is found in the test repeated, the product examined complied with the test for sterility; if microbial growth is found, the product examined does not comply with the test for sterility.

6.9 Dynamic monitoring

During each sterility test operation, the sedimentated bacteria in the sterile room, the sedimentated bacteria and dust particles in the purification platform are monitored and recorded. Test personnel should be sampled in every sterility test, sampling points are the left hand, right hand, left forearm, right forearm, left shoulder, right shoulder, forehead and masks. Record the monitoring results of sedimentated bacteria in sterile rooms and sedimentated bacteria and dust particles on the clean benches.

Sterility Test SOP Version 12 Page 14/15
Confidential files No copy

8.1 All the procedures from the preparation of the equipment to the end of the experiment
shall be strictly sterile according to the standard operation.
8.2 Equipment related to sterility test shall be sterilized regularly and placed in a clean
environment.
8.3 The environmental monitoring shall be carried out throughout the experimental process.
Microbiological monitoring of personnel should be carried out before and after each sterility
test.
8.4 Sterility test should ensure that the upper interface of the culture device is connected to
3mm and above.
8.5 When observing the sterile samples, the operator should hold the bottle body of the culture
incubator, not the connecting hose at the upper end of the culture device.

1 Objective

Standardize operating procedure for appearance check.

2 Definition/abbreviation

Colorless: It means the color of test solution is similar to water or the used reagent.

3 Scope of application

It applies to the tests of all products produced in the company.

4 Responsibility

All the operators shall perform the tests in strict accordance with this SOP.

5 Equipment and Materials

5.1 Equipment

Equipment Equipment Equipment

No. Manufacturer Notes

name model code

Tianjin Optical Or equivalent

1 Clarity detector YB-II WYQCF0078

Instrument Factory equipment

6 Working procedure

6.1 Requirements of inspectors

By both near and distant vision, the visual acuity of inspectors should be equal to or above 4.9 (the corrected visual acuity should be equal to or above 5.0), and the inspectors shall not have color blindness, check for every three months.

6.2 Checking illuminance requirements

Test sample variety Illuminance Illuminance

requirements in stipulated in lab

Pharmacopeia

Colorless sample solution 1000-1500lx 1300lx

Transparent plastic container or color test solution 2000-3000lx 2300lx

Suspension type of test sample or milky solution About 4000 lx 4000lx

6.3 Visible foreign matter: metal chips, glass chips, fibers with a length of more than 2mm, lumps with a maximum particle size of more than 2 mm, smoke like particle deposits, uncountable particle groups or unshakable precipitates visible to the naked eye when rotating
SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0108

Confidential files No copy

slightly after a certain period of time, and protein floccules which are difficult to count within a specified period of time, etc. Slight visible foreign matters: dots, short fibers and lumps below 2mm, etc., and semitransparent small protein floccules or protein particles less than 1mm of biochemical drugs or biological products.

6.4 Description of slight visible foreign matter

Name of foreign matter Specific character

White dot It means the white particle without clear plane or edges.

Slight protein floccule or protein It means a translucent protein floccules or protein particles particles of less than approximate 1mm.

Small amount of floccule or It means the protein floccules or protein particle that is protein particles difficult to count within the specified time limit for the examination.

micro sediment It means a trace of precipitate formed after stationary standing, which appears as a floating fog-like precipitate by gently inverting the container and disappears on gently shaking.

Precipitate not dispersed on It means a trace of precipitate formed in protein shaking solutions after storage for a long time, which can not be dispersed on gently shaking.

6.5 Preparation before examine

6.5.1 Before the examine, start-up, preheating, adjust illuminance according to the clarity detector's requirement.

6.5.2 According to the test sample type to take the corresponding amount, remove the container label, clean the stain on outer wall of the bottle, place at room temperature for 30 minutes. The specific sample number is in the table below:

Test sample type Sample number Retest number

Lyophilization preparation

Lyophilization preparations

for 5 vials, diluents for 5 Another 10 vials

for injection

vials

Diluent 20 vials Another 20 vials

Pneumococcal

polysaccharide conjugate 5ml Another 5ml

bulk

6.6 Test method

6.6.1 Injection: Takes 2 vials (syringes) each time, hold the neck of the containers at the edge of light baffle in an appropriate distance to inspector's eyes (usually 25 cm), and view against black and white backgrounds respectively by gently rotating and inverting the containers to suspend the visible foreign particles possibly existing in solution (care shall be taken to avoid the production of air bubbles). The time limit of visual examination is 20 seconds. Record the observation result.

6.6.2 Lyophilization preparation for injection: Take corresponding diluents for test sample to reconstitute in indicated volume (0.5ml/vial). Rotate and shake gently to dissolve the test sample, keep container wall clean, and observe the reconstitution appearance. Hold the neck of the containers at the edge of light baffle in an appropriate distance to inspector's eyes (usually 25 cm), and view against black and white backgrounds respectively by gently rotating and inverting the containers to suspend the visible foreign particles possibly existing in solution (care shall be taken to avoid the production of air bubbles). The time limit of visual examination is 20 seconds. Record the observation result and determine according to the corresponding sample specification.

6.6.3 Pneumococcal polysaccharide conjugate bulk: Take the test sample 5ml into 10ml Nessler colorimetric tube and keep the tube wall clean. Holding the upper end of Nessler SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0108

Appearance check SOP Version 10 Page 4/6

Confidential files No copy

colorimetric tube, gently rotate the tube to suspend the visible foreign matters in the test object under the background of black and white respectively at the distance from the test object to the human eye (usually 25cm) for visual inspection. The inspection time limit is 20 seconds, and the test object shall be clear and transparent liquid or slightly white floccules after shaking.

6.6.4 Solution color examination method

6.6.4.1 This method is applicable to the test sample which is specified in the quality standard to use solution color examination method.

6.6.4.2 Examine method: Take the appropriate amount of the test sample into 10ml Nessler colorimetric tube. Take the same amount of water into another 10ml Nessler colorimetric tube as control tube. The two tubes are placed under white background, take the top-to-down perspective, or head-up observation, compare the test tube and control tube color.

6.7 Result evaluation

6.7.1 Injections: according to the corresponding specification

Sample name Specification

23-valent Pneumococcal polysaccharide

It should be colorless transparent liquid.

vaccine

After shaking, it is milky white uniform

13-valent Pneumococcal conjugate vaccine

suspension

There are no more than 3 slight visible foreign matters in each test sample (vial). If only one sample (vial) exceeds the limit, it meets the requirements. If two samples (vials) exceed the limit, another 20 samples (vials) shall be taken for retest in the same way, 40 samples (vials) for primary and retest. If more than two samples (vials) exceed the limit, it does not meet the requirements.

6.7.2 Lyophilization preparation for injection

The test sample should be crisp cake, which reconstitute rapidly once adding diluents. It shall be colorless and transparent solution without foreign matters after the test sample is

SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0108

Appearance check SOP Version 10 Page 5/6

Confidential files No copy

completely reconstituted. No visible foreign particles shall be found in all the 5 containers. If one container is found with visible particle, the test shall be repeated with additional 10 containers in the same procedures. In both primary and repeat tests the total number of containers with visible particles shall be not more than one.

6.7.3 Pneumococcal polysaccharide conjugate bulk

It shall be clear and transparent liquid or slightly white floccules after shaking.

6.7.4 Solution color examination method

The color in test sample tube shall not be darker than the control tube.

7 Flowchart

N/A

8 Matters need attention

8.1 Requirements of inspectors: by both near and distant vision, the visual acuity of inspectors should be equal to or above 4.9 (the corrected visual acuity should be equal to or above 5.0), and the inspectors shall not have color blindness.

8.2 Check the illuminance before examine.

8.3 When checking the Lyophilization preparation, the rubber crumb produced by the needle punching latex plug is not counted as visible foreign matters.

7 Parafilm 8 Disposable syringe

9 Disposable latex gloves 10 Hemostatic forceps

6 Work procedures

6.1 Test procedure:

At least two guinea pigs weighing 300-400 g were injected subcutaneously with 500 Lf per bottle. It can also be diluted into 100Lf/ml with sodium chloride injection and injected subcutaneously with 5 ml. The observation was carried out on the 7th, 14th and 21st days after injection.

6.2 Criteria

The animals were observed on the 7th, 14th and 21st days after injection, and the animals should not have tetanus symptoms. At the end of the period, the body weight of each animal should not be reduced compared with that before injection, and the healthy ones were qualified. Weight loss should double the number of animals for retest. In case of tetanus symptoms, the original solution should continue to be detoxified.

7 Flow chart

No

8 Precautions

8.1 Experimental animals must have a certificate of conformity.

8.2 Samples rarely must be strictly in accordance with the requirements of sterile operation

Stability Data of PCV13-TT Yuxi Walvax Biotechnology Co.,Ltd.

Stability data of
13-valent Pneumococcal Polysaccharide Conjugate vaccine

Note■According to TS requirements of 13-valent Pneumococcal Polysaccharide Conjugate vaccine■
1. According to specification version 01-03, specification of polysaccharide content is■
Each dose of vaccine (0.5ml) contains:
For Serotype 1, 3, 4, 5, 6A, 7F, 9V, 14, 18C, 19A, 19F and 23F: 2.2-3.3µg, for serotype 6B: 4.4-6.6µg.
2. According to specification version 04, specification of polysaccharide content is■
Serotype 1: 3.6-6.8µg/ml, Serotype 3: 3.5-6.5µg/ml, Serotype 4:4.2-7.8µg/ml, Serotype 5:3.5-6.5µg/ml,
Serotype 6A:3.5-6.5µg/ml, Serotype 6B:8.4-15.6µg/ml, Serotype 7F:4.0-7.4µg/ml, Serotype 9V:3.5-6.5µg/ml,
Serotype 14:3.8-7.2µg/ml, Serotype 18C:4.6-8.4µg/ml, Serotype 19A:3.6-6.8µg/ml, Serotype
19F:3.8-7.2µg/ml,
Serotype 23F:4.2-7.8µg/ml
3. Conjugate antigen content, Conjugate protein content and Total protein content were added in
specification of 13-valent Pneumococcal
Polysaccharide Conjugate vaccine version 04
4. Based on the time frame for the entry into force of each version, the quality standard for the
polysaccharide content of the following six
batches of 13-valent pneumococcal polysaccharide conjugate vaccine, from 1 month to 18 months, the
standards used for the period are those
specified in item 1; for the period 24 months and later, the standards used are those specified in item
2.

Conclusion:
3 batches of 13-valent pneumococcal polysaccharide conjugate vaccine GK201709001, GK201709002, GK201709003 were kept at 6±2 for 24months. Test results at all the test point were all complied with requirements of Specification of 13-valent pneumococcal polysaccharide conjugate vaccine Code WSYX-QC-TS-06-09-0002, in conclusion, 13-valent pneumococcal polysaccharide conjugate vaccine could be kept at 6±2 for 24months.

Conclusion:

3 batches of 13-valent pneumococcal polysaccharide conjugate vaccine GK201709001, GK201709002, GK201709003 were kept at $25\pm 2^{\circ}\text{C}$ for 9months. Test results at all the test point were all complied with requirements of Specification of 13-valent pneumococcal polysaccharide conjugate vaccine Code WSYX-QC-TS-06-09-0002, in conclusion, 13-valent pneumococcal polysaccharide conjugate vaccine could be kept at $25\pm 2^{\circ}\text{C}$ for 9months.

SOP for sodium chloride

Version 06 page 2/4

content determination

Confidential files No copy

6 Procedures

6.1 Principle

In this method, the protein in the test sample is destroyed by nitric acid. Then, excess silver nitrate is added to reacts with the chloride ion contained in the test sample completely, and silver chloride precipitation is generated. The excess silver nitrate is titrated with ammonium thiocyanate titrant. According to the consumption of ammonium thiocyanate titrant, the content of sodium chloride in the test sample can be calculated.

6.2 Reagent preparation

6.2.1 Ammonium thiocyanate titrating solution (0.1mol/L)

Weigh 8.0g of ammonium thiocyanate, dissolve with water and dilute to 1000ml. Shake well. Precisely measure 25ml of silver nitrate titration solution (0.1mol/L), add water 50ml, nitric acid 2ml, 2ml of 8% Ammonium ferric sulfate indicator solution, titrate with this solution until the solution is slightly reddish brown; it still does not fade after a violent shake, that is the end. The concentration of the liquid is calculated according to the consumption of the liquid.

6.2.2 Preparation of ammonium thiocyanate titration solution (0.05mol/L)

Precisely measure 100ml of ammonium thiocyanate titrating solution (0.1mol/l) with one-mark pipette and put it into a 200ml volumetric flask, add purified water to dilute it to the marking line, shake well (it can be prepared according to the required amount).

6.2.3 0.1mol/L silver nitrate solution

Weigh 17.0g of silver nitrate into a beaker, dissolve with purified water, transfer it to a 1000ml volumetric flask and fix the volume to the marking line, mix well. Transfer to a 1000ml brown reagent bottle, labelled standby.

6.2.4 Saturated potassium permanganate solution

Weigh at least 6.38g of potassium permanganate, add 100ml of purified water and boil for 15 minutes to make it dissolve into saturated solution, put it into a brown reagent bottle, and close the plug. Take the supernatant to use.

SOP of Yuxi Walvax Biotechnology Co., Ltd

Code WSYX-QC-SOP-00-09-0120

SOP for sodium chloride

Version 06 page 3/4

content determination

Confidential files No copy

6.2.5 8.0mol/L nitric acid solution

In the 100ml volumetric flask, add the proper amount of purified water. Measure 50ml of concentrated nitric acid and lowly inject into volumetric flask, shake while adding. Place to cool before to scale, then add purified water to 100ml, mix well, labelled, stand by.

6.2.6 8% Ammonium ferric sulfate indicator solution

Weigh 8g of ammonium ferric sulfate dodecahydrate into beaker, dissolve with purified water to 100ml and transfer to a 100ml volumetric bottle, wash the beaker with purified water for 3 times and transfer the lotion to the volumetric flask, fix the volume to the scale, mix well,

filter it and transfer it to the reagent flask, label it for standby.

6.3 Test procedure

6.3.1 Digestion

Accurately measure 1000μl of test samples using a pipette with a measuring range of 100-1000μl (two parallel samples for each test sample), add 5000μl of 0.1mol/L silver nitrate solution (if the protein content is high, add 2.0ml of saturated potassium permanganate solution) using a pipette with a measuring range of 0.5-5ml, mix well. Add 10ml of 8.0mol/L nitrate solution, heat and digest until the solution is clear, place to cool.

6.3.2 Titration

Add 50ml purified water into the above solution, mix well. Add 1000μl of 8% ammonium ferric sulfate indicator solution, mix well, titrate with ammonium thiocyanate titration solution (0.05mol/L) until the solution is light brown red, and still does not fade after shaking, that is the end point. The results of titration were corrected by blank test (not digested, two parallel).

6.4 Result calculation

Sodium chloride content (g/L) = $(V_0 - V_x) \times C \times 58.45$

V_0 : volume of ammonium thiocyanate titrating solution consumed in blank test, ml;

V_x : Volume of ammonium thiocyanate titrate consumed by test sample, ml;

C: Concentration of ammonium thiocyanate titrating solution, mol/L;

6.5 Result judgment

Carry out according to corresponding quality standard

7 Flow chart

No

8 Notes

8.1 When digesting, use small fire, in case it is boiled dry. During the digestion process, the triangular bottle should be picked up and shake to make it evenly heated and prevent the solution from ejecting.

8.2 When digesting, please take precautions, wear masks and cotton gloves

8.3 When titrating, do not drop the titrating solution too fast; when it is near the end, slow down the titration rate, pay attention to the operation of half drop (if the titrant remains on the bottleneck of the triangular flask, wash it with appropriate amount of purified water).

3 4 Pipette tips

reference solution

6 Working procedure

6.1 principle

In general, the drop of freezing point of the solution is used to indirectly measure its osmolality.

6.2 Test procedure

6.2.1 Verification calibration: take 250μl Clinitrol™ 290 mOsm/kg reference solution into sample tube and put into the freezing chamber. Press START key and input 290, press the ENTER button and START button. The readings are displayed on the screen. The standard for SOP of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-00-09-0135

Edition

Osmolality test SOP 02 Page 2/3

No.

Confidential files No copy

verifying calibration is 290±2mOsm/kg and should be tested at least for 2 reference solution.

6.2.2 Sample test: Take sample 250μl to clean sample tube and put into the freezing chamber. Press START key, then enter sample batch number, press ENTER key, press START button. The reading is displayed on the screen while the printer prints the results. At least 2 samples should be tested for testing.

6.2.3 After each test, gently wipe the probe, stirring/freezing line, mandrel and freezing chamber top with a soft, dry, cotton-free, non-ionic paper towel in order to avoid contamination of the next sample to be tested.

6.2.4 After testing, insert an empty sample tube in the freezing chamber to avoid the scrap falling into the chamber.

6.2.5 Press TEST key, the screen displays "Select Test Item". Then press < key to scroll the screen menu, select "Head Up/Down Test", press START key to show "[START]Test[STOP]", press START key and the probe runs up and down, press the STOP key when the probe runs to bottom, shut up the Osmometer when the probe stops.

6.3 Results judgment:

Judge according to the corresponding quality standard.

7 Flowchart

N/A

8 Matters need attention

8.1 Be careful not to bend the probe or stir/freezing line after each test cleaning.

8.2 Cold enzymes contain harmful chemicals, and appropriate personal protective measures should be taken when testing.

9 Hydrochloric acid titrant (0.02 mol/L) Titrant
6 Work procedures
6.1 Preparation of test solution
Accurately measure 4.0 mL of the test sample, add 28.0 ml of water, add 4.0 mL of 10% sodium tungstate solution and 4.0 mL of sulfuric acid solution (0.33 mol/L), shake well, stand for 30 minutes, and then filter.
6.2 precisely measure 10 ml of protein filtrate and put it into the digestion tube. Make two parallel tubes. Then add 1.0 ml of 4% sodium hydroxide solution and 10 ml of water to each tube.
6.3 Distillation
Before distillation, steam and wash the distiller for more than 15 minutes. When the receiving liquor is purple red, take a triangular flask on the right side of Kjeldahl nitrogen analyzer, insert the condenser tube and boric acid absorption solution feeding tube, and then install the digester tube with added sample to the distiller on the left side of Kjeldahl nitrogen analyzer. Run the program, the instrument will start automatic distillation. After stopping the distillation, take down the triangular flask, rinse the condenser tube with water, and collect the eluent in a triangular flask and prepare for titration.
6.4 Titration
Titrate with hydrochloric acid titration solution (0.02 mol/L) until the solution changes from blue-green to gray purple, and the titration results are corrected by blank test.
6.5 Result calculation
$$(\text{V}_1 - \text{V}_0) \times c \times 14.01 \times 4.715$$

Ammonium sulfate content (%) = $\frac{\text{V}_1 - \text{V}_0}{\text{V}_1} \times 100$
1000
Where: V1 is the volume of hydrochloric acid titrant consumed by the test sample, ml;
V0 is the volume of hydrochloric acid titrant consumed by blank control, ml;
c is the concentration of hydrochloric acid titration solution, mol/L;
4.715 is a constant (1 g nitrogen is equivalent to 4.715 g ammonium sulfate);
14.01 is the relative atomic mass of nitrogen.

7 Flow chart
No
8 Precautions

8.1 Distilled ammonia receiving fluid should be titrated as soon as possible, so as to avoid placing it too long, affecting the measurement results.
8.2 In the distillation process, if there is no black CuO, indicating that the amount of alkali added is insufficient, the amount of alkali should be replenished or redo experiment.
8.3 The triangular bottle should be fuchsia after adding 2% boric acid absorption, such as green, indicating that the triangle bottle has alkaline substance pollution.
8.4 Interference with ammonia and alkaline gases should be avoided in the operating environment.

5 Volumetric flask
6 Work procedures
6.1 Working principle: according to the toxoid and the corresponding antitoxin in the appropriate content, proportion, temperature, reaction time and other conditions, antigen antibody binding occurs in the test tube to produce flocculent reaction visible to the naked eye.
6.2 Reagents
6.2.1 national standard for tetanus flocculent antitoxin: China Academy of food and drug control
6.2.2 national standard for diphtheria flocculent antitoxin: China Academy of food and drug control
6.2.3 Borate buffer solution
6.2.3.1 Preparation method: weigh 0.5 g sodium tetraborate (Na₂B₄O₇·10H₂O), 4.5 g boric acid and 8.5 g sodium chloride, dissolve them with water and dilute to 1000 ml, adjust the pH value to 7.0-7.2
6.3 Test procedure:
6.3.1 preparation of standard solution: take diphtheria or tetanus flocculent antitoxin national standard, and accurately dilute it with borate buffer solution to a solution containing 100 Lf per 1 ml.
6.3.2 Preparation of test solution: take appropriate amount of test sample, add borate buffer solution to dilute to appropriate flocculent unit.
6.3.3 Determination
According to the need, accurately measure 300, 400, 500, 600 and 700 µl of antitoxin flocculent reaction standard solution per 1 ml, and add them into the flocculent reaction tube respectively.

2Page5Page
Standard Operation Procedures of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-00-09-0011
SOP for Flocculent Units
Version 08 Pages 3/5
of Toxoid Test
Confidential documents, no copying.

Accurately measure 1000 µl of the test solution, quickly and accurately add it into the flocculent reaction tubes, shake well, place in a 45-50℃ water bath for continuous observation, and record the order and time of flocculent appearance (if flocculent occurs first) The volume of antibody was not in the middle tube and could be adjusted before detection; Then take 5 flocculent reaction tubes and repeat the above test. Put the first flocculent tube in the middle, add two tubes of antitoxin flocculent reaction standard solution in front of and after each tube, with an interval of 50 µl, and then add 1000 µl of test sample to each tube to observe the flocculent appearance; According to the results, repeat the test again. Put the first flocculent tube in the middle, add two tubes of different amount of antitoxin flocculent reaction standard solution before and after each tube, with an interval of 20 µl, and then add 1000 µl of test sample to each tube to observe the flocculent appearance, and take the same value 2-3 times as the final measurement value.

6.4 Result calculation

6.4.1 calculate according to the following formula:

Flocculent unit (LF/ml) = $V \times n \times 100$

Where V is the volume of antitoxin flocculent reaction standard solution containing

100Lf per 1 ml when flocculent occurs first, ml;

n is the dilution ratio of the test sample.

7 Flow chart

No

8 Precautions

8.1 during the determination, the reaction condition of the sample should be observed at any time to avoid missing the optimal reaction volume.

8.2 for the first flocculent antibody volume, whether the highest tube or the lowest tube appears, the dilution ratio of the test sample can be adjusted for detection, and the sample volume of antibody volume can be adjusted for detection (if the flocculent antibody volume is 300 µl, the antibody volume of 100, 200, 300, 400 and 500 µl can be detected again).

964g sodium dihydrogen phosphate ($\text{NaH}_2\text{PO}_4 \cdot 2\text{H}_2\text{O}$) and 29.0 g sodium hydrogen phosphate ($\text{Na}_2\text{HPO}_4 \cdot 12\text{H}_2\text{O}$) were accurately weighed and dissolved in 1000 ml of water for injection or ultra-pure water. After mixing, the mixture was filtered with 0.45 μM filter membrane and ultrasonic was obtained.

——0.05% DMSO solution (i.e. 0.05% DMSO)

First take about 50 ml of water for injection or ultrapure water into a 100 ml volumetric flask, then precisely add 50 μL dimethyl sulfoxide, and finally fix the volume with water for injection or ultra pure water, and mix evenly. This solution should be prepared immediately.

6.2. Test procedure

6.2.1 column efficiency determination

6.2.1.2 determination parameters of column efficiency

Mobile phase: water for injection or ultrapure water, filtered with 0.45 μM filter membrane, and obtained by ultrasonic.

Injection volume: 20 μL , detection wavelength: 210 nm, flow rate: 1.0ml/min

Column temperature: 30 $\square$, sample: 0.05% DMSO, running time: 30min

6.2.1.2 column efficiency determination steps: after confirming that the instrument is stable, inject a blank needle and a 0.05% DMSO solution, record the chromatogram, and calculate the number of theoretical plates with 0.05% DMSO chromatographic peak, and the number of theoretical plates should not be less than 5000.

6.2.2 test article detection

6.2.2.1 preparation of test sample: dilute the test sample with water for injection to the protein concentration of 2000-3000 $\mu\text{g}/\text{ml}$, filter it with 0.45 μM filter membrane, bottle and load the sample; if the protein concentration is lower than 2000-3000 $\mu\text{g}/\text{ml}$, filter directly with 0.45 μM filter membrane, bottle and load the sample.

6.2.2.2 test parameters

Chromatographic column: TSK-gel G5000PW (7.5 mm * 300 mm)

Mobile phase: 0.1 mol/LPB buffer (pH 7.5)

Standard Operating Procedures of Yuxi Walvax Biotechnology Co., Ltd.

SOP for purity test of
tetanus toxoid purified Version 00 Pages 3/3
liquid
Confidential documents, no copying.

Injection volume: 10 μL , detection wavelength: 280nm

Flow rate: 1.0 ml/min column temperature: 30 $\square$, running time: 30min

6.2.2.3 detection steps: after confirming that the instrument is stable, inject a blank needle, and then inject the test sample. The purity of purified tetanus toxin was calculated by area normalization method.

6.3 result determination

According to the corresponding quality standards.

7 Flow chart

No

8 Precautions

8.1 after use, wash the chromatographic column and pipeline with filtered water for injection or ultra pure water for at least 1 h to prevent salt out from blocking the column and pipeline and corrosion of chloride ion. When the chromatographic column needs to be stored for a long time (more than 30 days), wash the column with 0.05% sodium azide aqueous solution and save the column.

6 Working procedure

6.1 Principle

In this method, the peptide bond contained in the protein molecule is chelated with Cu²⁺ in the alkaline solution to form the protein-copper complex, which can reduce the phosphomolybdic acid of the phenol reagent and produce a blue compound. At the same time, under alkaline condition, the phenol reagent is easily reduced by the tyrosine, tryptophan and cysteine in the protein to form blue. In a certain range, the strength of color is directly proportional to the protein concentration. The protein content in the test sample is determined by colorimetry with the protein reference solution as the standard curve.

6.2 Solution

6.2.1 Protein detection solution A

Respectively weigh 10g of sodium hydroxide and 50g of anhydrous sodium carbonate into beaker, add 400ml of purified water, dissolve and mix together, pour it into plastic bottle, labeled as protein detection solution A, standby;

SOP of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-0009-0102

determination

Confidential files No copy

6.2.2 Protein detection solution B

Weigh 0.5g of potassium tartrate into beaker, add 50ml of purified water to dissolve it.

Weigh 0.25g of copper sulfate pentahydrate into beaker, add 30ml of purified water to dissolve it, then mix the two solutions as protein detection solution B, labeled, standby;

6.2.3 Alkaline copper test solution (Prepare the solution immediately before use)

Before use, mix well according to the volume proportion of protein detection solution A:

protein detection solution B: purified water (20:4:1), labeled, standby.

6.2.4 Foline-phenol test solution (Prepare the solution immediately before use)

Take the foline-phenol stock solution (2mol/L acid concentration) 1→16 (take 1000μl foline-phenol stock solution and put it into a triangular flask, add the purified water to 16ml, mix well, or prepare according to the experiment required amount).

6.2.5 200μg/ml national standard protein working solution

refer to the <operation procedures for preparation of standard solution> WSYX-QC-SOP-0009-0801

6.3 Test procedure

6.3.1 Treatment of test samples

6.3.1.1 Dilute the test sample with purified water to a solution contains 20-40μg/ml of protein, to be tested.

6.3.1.2 Group A and C meningococcal polysaccharide conjugate vaccine: measure 2000μl

purified water with a pipette and put it into a 3K ultrafiltration cup, mark the lower liquid level scale as 1 with a mark pen, pour out the purified water, take 10 vials of lyophilized vaccines and reconstitute with 0.5ml/vial of diluent, take 4000μl and put it into the ultrafiltration cup, mark the lower liquid level scale as 2, and carry out ultrafiltration concentration at 7000rpm/min, 5■ for 30min; Centrifuge again under the same conditions after adding water to the scale line 2; after centrifugation, add water to the scale line 1, after fully blow wash, and dilute 8 times before use (take 0.5ml of the solution after ultrafiltration and mixing, add 3.5ml of purified water, and mix well), to be tested.

6.3.2 preparation of standard curve

SOP of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-0009-0102

SOP for the protein content 4/5

Version 09 Page

determination

Confidential files No copy

0 1 2 3 4 5

National standard protein working solution (μl) 0 50 100 150 200 250

Purified water (μl) 1000 950 900 850 800 750

Protein content (μg/ml) 0 10 20 30 40 50

6.3.3 Accurately measure 1000μl of the test sample into the test tube using a pipette with a range of 100-1000μl, in duplicate. After the above steps, add 1000μl of alkaline copper test solution to each tube, mix well, and place it in a 25■ Electro-thermostatic water tank for 10 minutes. After taking it out, quickly add 4000μl of folin-phenol test solution to each tube, mix the tube immediately. After mixing, place tubes in a 25■ electro-thermostatic water tank for 30 minutes, and measure the absorbance at the wavelength of 650nm using the UV-VIS spectrophotometer.

6.4 Results calculation

6.4.1 Take tube 0 as the blank, calculate the linear regression equation with the national standard working solution series concentration and its corresponding absorbance, then substitute the absorbance of the test solution into the linear regression equation, and calculate the protein concentration.

Protein concentration of test sample (μg/ml) = Average protein concentration of test sample × dilution multiple

Protein content of test sample (μg/ml) = (Average protein concentration of test sample/2) × dilution multiple

Protein content of test sample (mg/g) = protein concentration of test sample/total solid

Protein content of test sample (%) = (Protein concentration of test sample/1000/total solid) × 100

6.4.2 Results judgment

Carry out according to corresponding quality standard.

6 Work procedures

6.1 Test procedure:

Samples were taken from each bottle, diluted to 250 Lf/ml with sodium chloride injection.

Four guinea pigs weighing 250-350 g were injected subcutaneously into abdomen of each guinea pig. The observation was carried out on the 7th, 14th and 21st days after injection, and the results were recorded according to the regulations.

6.2 Criteria

On the 7th, 14th and 21st days after injection, there was no local suppuration and necrosis.

The animals should not have tetanus symptoms, and the weight of each animal at the end of the injection was qualified.

Bacterial Endotoxin
Version 12 Page 1/13
Test SOP
Confidential Photocopy Prohibited

1 Objective

Standardize operating procedure for bacterial endotoxin test.

2 Definitions and Abbreviations

2.1 bacterial endotoxin test method: using limulus reagent to detect or quantify bacterial endotoxin produced by gram-negative bacteria, in order to judge whether the limit of bacterial endotoxin in the sample is in accordance with the prescribed method.

2.2 standard product of bacterial endotoxin: calibration of its titer based on the national standard of bacterial endotoxin, used for the reexamination of the sensitivity, interference test and positive control in the test.

2.3 water for bacterial endotoxin test: Sterile Water for Injection with less than 0.015EU/ml (gel method) or 0.005 EU/ml (used for photometry) and no interfering effect on endotoxin test.

2.4 gel method: the method of limit detection or semi quantitative detection of endotoxin is based on the principle of agglutination reaction between limulus reagent and endotoxin.

3 Scope of application

This SOP applies to detect the bacterial endotoxin of:

intermediate products, final products and related excipients of Haemophilus Influenzae Type b Conjugate Vaccine, Group A and C Meningococcal Polysaccharide Vaccine, Meningococcal Group A, C Bivalent Polysaccharide Conjugate Vaccine, Group ACYW135 Meningococcal Polysaccharide Vaccine, Diphtheria, Tetanus and Acellular Pertussis Combined Vaccine, adsorbed, 23-valent Pneumococcal Polysaccharide Vaccine and 13-valent Pneumococcal Polysaccharide Conjugate Vaccine and other test samples.

4 Responsibility

The quality control laboratory personnel strictly operate according to the SOP.

6 Working procedure

6.1 Sensitivity test of limulus reagent

6.1.1 under the conditions stipulated in the bacterial endotoxin test method, the lowest concentration of the agglutinating endotoxin produced by the limulus reagent, that is, the labeling sensitivity of the limulus reagent, is expressed as EU/ml. When the new batch number of limulus reagent or test conditions has any effect that may affect the test results, the sensitivity test of limulus lysate should be carried out.

6.1.2 Preparation of bacterial endotoxin standard solution

Take one of the bacterial endotoxin standard products, light the wall of the bottle, make the powder fall into the bottom of the bottle, then use the grinding wheel to gently scratch the top of the bottle neck. After the 75% alcohol cotton ball is wiped and open, the glass chips should be prevented from falling into the bottle.

SOP of Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-00-09-0203
Bacterial Endotoxin
Version 12 Page 3/13
Test SOP
Confidential Photocopy Prohibited

In accordance with the standard specification, add the prescribed amount of bacterial endotoxin to check water to dissolve its contents, seal the bottle with the sealing membrane and mix the swirl mixer for 15 minutes. Then the standard solution of four concentrations of bacterial endotoxin was prepared, that is, 2λ , λ , 0.5, and 0.25 λ (λ as the labeling sensitivity of the reagents of the reagents), and each dilution should be mixed on the vortex mixer for 30 seconds each.

6.1.3 Preparation of limulus reagent to be rechecked

Take the 18 branches of the limulus reagent with the specification of 0.1ml/tube, light the wall of the bottle, make the powder fall into the bottom of the bottle, gently scratch the bottle with the grinding wheel in the bottle neck, and open the spare after the 75% alcohol cotton ball

wiping, and prevent the glass from falling into the bottle. Each 0.1ml is added with test water to dissolve, gently rotating the bottle wall, so that the contents are fully dissolved and avoid bubbles.

6.1.4 adding sample

The 18 limulus reagents, which were fully dissolved, were divided into 5 rows, of which 4 were listed in 4 columns, 1 in 2. The 4 column was added each with 0.1ml of 2λ , λ , 0.5λ , and 0.25λ of the endotoxin standard solution, and the other 1 column with 2 tubes were added with 0.1ml bacterial endotoxin test water as negative control.

6.1.5 After added, the limulus reagent was sealed with a sealing membrane and mixed gently to avoid producing bubbles. It was placed vertically into the thermostat at $37\pm 1^\circ\text{C}$ or in a suitable thermostat. The heat preservation was 60 ± 2 minutes.

6.1.6 Observe and record the results. Remove the test tube gently from the thermostat or thermostat to avoid vibration, and change each tube slowly to 180 degrees. If the gel is formed in the tube, the gel is not deformed and the glide from the tube is positive, recorded as (+); the gel is not formed or the gel is not solid, deformed and negative from the tube wall, recorded as (-).

6.1.7 Results calculation

SOP of Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-00-09-0203

Bacterial Endotoxin

Version 12 Page 4/13

Test SOP

Confidential Photocopy Prohibited

When the 4 tubes with maximum concentration of 2λ were all positive, the 4 tubes with minimum concentration of 0.25λ were negative, negative tube was negative, the test side was effective. The geometric mean value of the reaction end point concentration was calculated as the rechecking result, which is the sensitivity of the limulus reagent (λ_c).

$\lambda_c = \text{antilg}(\sum X/4)$

The value of X in the formula is the value of the end point of the reaction (lg). The end point of the reaction is the concentration of the last positive result in a series of reduced endotoxin concentrations.

6.1.8 Result judgment

When λ_c was between 0.5λ to 2λ (including 0.5λ and 2λ), the sensitivity of this batch of limulus reagent was determined to be qualified, which could be used for bacterial endotoxin test and the sensitivity of the limulus reagent was determined by λ (marked sensitivity)

6.2 Interference test

6.2.1 Test method

6.2.1.1 The purpose is to test whether the test product at a certain concentration has any interference effect on the reaction of limulus reagent and endotoxin. The test solution should be a solution which does not detect endotoxin and does not exceed the maximum effective dilution factor (MVD).

6.2.1.2 Limulus reagent labeling sensitivity control series preparation

1 bacterial endotoxin standard sample was obtained and diluted with bacterial endotoxins test water with 4 concentrations, namely 2λ , λ , 0.5λ and 0.25λ .

6.2.1.3 Preparation of interference test series solution

Dilute the test sample, and then the diluted test sample solution is used to dilute the same bacterial endotoxin standard in sensitivity control series of limulus reagent to 4 concentrations, namely, bacterial endotoxin with concentrations of 2λ , λ , 0.5λ and 0.25λ .

6.2.1.4 Preparation limulus reagent

The 28 tubes of the limulus reagent with the specification of 0.1ml/tube were taken. The light SOP of Walvax Biotechnology Co., Ltd.

Confidential Photocopy Prohibited

projectile wall makes the powder fall into the bottom of the bottle, gently scratches the bottle with the grinding wheel in the bottle neck. After the 75% alcohol cotton ball is wiped, it opens reserve to prevent the glass from falling into the bottle. Each 0.1ml is added with test water dissolved, gently rotating the bottle wall, so that the contents are fully dissolved and avoid bubbles.

6.2.1.5 Adding samples

The 10 limulus reagents, which were fully dissolved, were divided into 5 rows, of which 4 were listed in 4 columns, 1 in 2. The 4 column was added each with 0.1ml of 2λ , λ , 0.5λ , and 0.25λ of the endotoxin standard solution, and the other 1 column with 2 tubes were added with 0.1ml bacterial endotoxin test water as negative control.

The other 18 limulus reagents, which were fully dissolved, were divided into 5 rows, of which 4 were listed in 4 columns, 1 in 2. The 4 column was added each with 0.1ml of 2λ , λ , 0.5λ , and 0.25λ of the endotoxin standard solution, and the other 1 column with 2 tubes were added with 0.1ml bacterial endotoxin test water as negative control.

After the addition, the limulus reagent was sealed with a sealing membrane and mixed gently to avoid producing bubbles. It was placed vertically into the thermostat at $37\pm 1^\circ\text{C}$ or in a suitable thermostat.

6.2.2 Results calculation

All the parallel tubes in negative control and negative control were negative, and the maximum concentration of 2λ tube in the standard solution of endotoxin was positive, and the test was effective when the lowest concentration of 0.25λ tube was negative. The reaction end point calculated by the geometric concentration of standard solution made of endotoxin test water of the average value (E_s) and endotoxin test with geometric solution made of diluent for the reaction end point average concentration value (E_t) are calculated by the formula.

$E_s = \text{antilg}(\sum X_s/2)$

$E_t = \text{antilg}(\sum X_t/4)$

The X_s and X_t are numeric values of the test water and end point concentration of the SOP of Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-00-09-0203

Bacterial Endotoxin

Version 12 Page 6/13

endotoxin solution (lg), which is made from the diluent, respectively.

6.2.3 Result judgment

When Es is 0.5 λ to 2 λ (including 0.5 λ and 2 λ), and Et is 0.5 Es to 2.0Es (including 0.5 Es and 2.0Es), the test product is considered to have no interference effect at this concentration, and the bacterial endotoxin test can be carried out at this concentration. If the test solution is disturbed by the dilution of less than MVD, the test solution should be further diluted with no more than MVD and repeat the interference test.

6.3 Test method

The test methods are divided into two methods: gel limit test and gel semi quantitative test.

6.3.1 Gel limit test

6.3.1.1 determine the maximum valid dilution multiple (MVD) with the following formula.

$$MVD = \frac{C \times L}{\lambda}$$

Where: L is the bacterial endotoxin limit for the test products

C is the concentration of the solution. When L is expressed in EU/ml, C equals 1.0ml/ml.

When L is expressed as EU/mg or EU/U, the unit of C needs to be mg/ml or U/ml.

λ is the labelling sensitivity (EU/ml) of the Limulus amebocyte lysate in gel method, or the lowest endotoxin concentration on the standard curve used in photometric determination.

6.3.1.2 take a bacterial endotoxin work standard, break from the top of the ampoule, add a proper amount of bacterial endotoxin to check water according to the label, mix for 15 minutes on the vortex mixer.

6.3.1.3 diluted the test product to MVD according to the limit of the tested product and the sensitivity of the limulus reagent.

6.3.1.4 The preparation of test solution: use the solution with Dilution Times of MVD and has eliminated the interfering solution to prepare the solution in the following table:

Preparation of gel limit test solution

Confidential Photocopy Prohibited

0.2ml 0.2ml 0.5ml

Test sample 10-fold dilution 100-fold dilution

1.8ml 1.8ml 1.8ml

0.8ml

400-fold dilution 800-fold dilution

1.5ml

mix well, take the 800-fold diluted for testing

Test sample positive control Take the maximum valid dilution multiple (MVD) 1/2 of the test sample, add the equivalent 4λ endotoxin standard solution, and mix it well.

Positive control the standard solution of 2λ endotoxin was used as a positive control

6.3.1.5 takes the specification of 0.1ml/tube limulus reagent and 0.1ml limulus reagent reconstituted by bacterial endotoxin test water.

6.3.1.6 according to the above table, add two samples to each test solution and add 0.1ml to each one.

6.3.1.7 preserved at 37 ±1■ for 60 ±2 minutes then observe.

6.3.1.8 Result judgment

a) if the parallel tubes of the negative control solution were all negative, the parallel tubes of test samples control solution were all positive, and the parallel tubes in the positive control solution were all positive, and the test was effective.

b) if the two parallel tubes of the sample solution were all negative, the test samples were found to be in accordance with the standard. If the two parallel tubes of the test samples were all positive, the test samples were not in accordance with the standard.

c) if a tube in the two parallel pipes of the test solution is positive and the other tube is negative, it is necessary to have a reexamination. During the reexamination, 4 parallel tubes should be made for the test solution. If all parallel tubes are negative, the sample should be SOP of Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-00-09-0203
Bacterial Endotoxin
Version 12 Page 9/13
Test SOP
Confidential Photocopy Prohibited

found to be in conformity with the standard. Otherwise, the sample will not meet the requirements.

6.3.2 Gel semi quantitative test

6.3.2.1 determine the maximum valid dilution multiple (MVD) with the following formula.
 $MVD = \frac{C}{L}$
Where, L is the bacterial endotoxin limit for the test products
C is the concentration of the solution. When L is expressed in EU/ml, C equals 1.0ml/ml.
When L is expressed as EU/mg or EU/U, the unit of C needs to be mg/ml or U/ml.
 λ is the labelling sensitivity (EU/ml) of the Limulus reagent in gel method, or the lowest endotoxin concentration on the standard curve used in photometric determination.

6.3.2.2 take a bacterial endotoxin work standard, break from the top of the ampoule, add a proper amount of bacterial endotoxin with test water according to the label, mix for 15 minutes on the vortex mixer.

6.3.2.3 The preparation of the test solution Uses a dilution multiple of no more than MVD and an interfered test solution to prepare the solution in the follow table. It is diluted to 1 times, 2 times, 4 times and 8 times by the dilution multiple of the interference test, and the final dilution multiple must not exceed MVD:

Endotoxin	The Parallel	concentration / Dilution	Solution name	Diluent concentration	tube	solution added	multiple	of endotoxin	number	to endotoxin
1	2									
Test sample	No/test sample	test 2	2							

solution	solution	water	4	2						
8	2									
Test sample	2 λ /test sample	1	2 λ	2

positive control solution	Limulus reagent	1	2 λ	2	marked test	2	λ	2	2 λ /test water	sensitivity water	4	0.5 λ	2	control series	8	0.25 λ	2	Negative	No/test water	-----	-----	-----	2	control

6.3.2.4 takes the specification of 0.1ml/tube limulus reagent and 0.1ml limulus reagent reconstituted by bacterial endotoxin test water.

6.3.2.5 according to the above table, add two samples to each test solution and add 0.1ml to each one.

6.3.2.6 preserved at 37 ±1■ for 60 ±2 minutes then observe.

6.3.2.7 Result judgment

a) if the parallel tubes of the negative control solution were all negative, the parallel tubes of the test sample positive control solutions were all positive, and the geometric mean of the reaction point concentration of the control series of the limulus reagent sensitivity of the control series was between 0.5 and 2 λ , then the test was effective.

b) the end-point dilution multiple of each series of parallel tubes in the sample solution multiplied by λ . For each series of reaction endpoints, the geometric mean of the end point concentration of all parallel tubes was the endotoxin concentration of the sample solution [according to formula $CE = \text{anti}lg(\sum X/2)$]. If the diluent for the test is used, the result should be multiplied by the dilution multiple when calculating the concentration of endotoxin in the original solution.

c) if all the parallel tubes of the test solution in the test are negative, it should be noted that the concentration of endotoxin is less than λ (if the tested is the diluted test sample, it is calculated as less than λ multiplied by the initial dilution multiple of the semi quantitative SOP of Walvax Biotechnology Co., Ltd.

test). If all parallel tubes in the test sample solution are positive, it should be noted that the concentration of endotoxin is greater than or equal to the maximum dilution multiplied by λ .
d) if the concentration of endotoxin is less than the specified limit, the product is determined to conform to the requirement. If the concentration of endotoxin is greater than or equal to the specified limit, it is judged that the test sample does not meet the requirements.

7 Flow chart

None

8 Matters need attention

8.1 The pH value of the solution is suitable for the range is 6 to 8 after the mixture of common sample solution and limulus reagent. The pH value of the tested solution (or its diluent) should be adjusted for the test products with excess acid, excess alkali or its own buffer capacity. The pH value can be adjusted by acid, alkali solution or suitable buffer solution. Acid or alkaline solutions must be tested with bacterial endotoxins for use in containers containing endotoxin. The buffer must be validated without endotoxin and interfering factors.

8.2 Interference test should be carried out before establishing the endotoxin test before or after the new drug has been tested. When any changes in the test results are likely to be affected by the lysate reagent, the prescription of the test product, the production process change or the test environment, the interference test must be carried out again.

8.3 The utensils used in the test should be treated to remove potential exogenous endotoxins. The usual method is to bake at 180 degrees for at least 120 minutes, and other suitable methods to confirm the test of bacterial endotoxins.

8.4 If plastic appliances are used, such as microporous plates and suction heads matching with micro sample feeder, it should be noted that to use instruments that indicate no endotoxin and interfere with the test.

8.5 Test operation should prevent contamination of endotoxin.

8.6 If there is a test sample that has interference with the limulus reagent, such as the adsorption of acellular pertussis combined vaccine, the test should be removed after the SOP of Walvax Biotechnology Co., Ltd.

interference (3000rpm, 20min, 10 minutes' centrifugation, and the supernatant is tested).

8.7 When the new batch number of limulus reagent or test conditions has any influence on the test results, the sensitivity test of limulus lysate reagent should be carried out.

8.8 Preparation of test samples for prefilling syringe: take at least 3 samples, take water or sodium chloride injection for bacterial endotoxin test to the marked capacity, pull the push rod back to the opening, vibrate twice, and seal it in a 37±2℃ incubator for 2 hours. After taking out, collect the test solution in prefilling syringe in a glassware without pyrogen, and carry out bacterial endotoxin test within 2 hours.

1 Purpose
Standardize the detection method of the total solids determination.
2 Definitions/abbreviations
Constant weight: unless otherwise provided, refers to the weight difference of less than 0.3 mg after two consecutive dryings or scorching test products; the second and subsequent weighing of drying to constant weight shall be carried out after 1 consecutive drying under specified conditions; and the second weighing to constant weight shall be carried out after 30 minutes of continuous burning.
3 Scope of application
Suitable for the company's production products haemophilus influenzae type b polysaccharide, group A meningococcal polysaccharides (bulk), group C meningococcal polysaccharides (bulk), group Y meningococcal polysaccharides (bulk), group W135 meningococcal polysaccharides (bulk), pneumococcal polysaccharides (bulk), pneumococcal polysaccharides derivatives.

dryer and weighed. Until two consecutive weighing result errors of 0.0001 g, and record the constant weight result M2.
6.3 Dry roasting at 50■

6.3.1 Constant weight of weighing bottle

6.3.2 Put the weighing bottle simply in the ultrasonic cleaner for 15 minutes and repeat 3 times (replace the new purified water after each cleaning) by placing the weighing bottle in the ultrasonic cleaner for 15 minutes.

6.3.3 Put the washed weighing bottle in a 50℃ tank, after baking drying (the first baking time is not less than 72 hours), set the dryer to cool and weigh. Until two consecutive weighing result errors of 0.0001 g, and record the constant weight result M1.

6.3.4 Pipette with a dosage range of 100-1000 µl is accurately taken for the test 1000 µl in a weighing bottle that has been dried to a constant weight, and after baking and drying at 50℃ (the first baking time is not less than 72 hours), cooled in the dryer and weighed. Until two consecutive weighing result the error is 0.0001 g, and the constant weight result M2 is recorded.

6.4 Press calculation:
Total weight of solid weigh $M(\text{mg/ml}) = (M2 - M1) \times 1000 \div 1$
where:
The weight of the test product and weighing bottle is M2, g;
The weight of the weighing bottle is M1, g;
1 is the volume of 1 ml of precision quantity for test products.

7 Flow chart
N/A

8 Precautions

8.1 Note that during operation, it is forbidden to touch the weighing bottle directly by hand, and you must wear clean silk gloves to prevent sweat from staining on the bottle to affect the test results.

8.2 During operation, the action should be gentle, weighing bottle out of the dry box bottle cap

Standard Operating Procedures of Yuxi Walvax Biotechnology Co., Ltd.

6 Work procedures

6.1 Principle

Under acidic condition, cyanogen bromide reacts with pyridine benzidine, and the content of cyanogen bromide in the sample is determined by ultraviolet visible spectrophotometry.

6.2 Reagents

6.2.1 Pyridine benzidine solution (ready to use)

According to the preparation amount of 30ml: weigh 0.25g benzidine into a 100ml triangular flask, add 5ml of 2% hydrochloric acid solution and 25ml of 60% pyridine solution to dissolve and mix them evenly.

6.2.2 2% hydrochloric acid solution (ready to use)

According to the preparation amount of 5ml: take 0.25ml hydrochloric acid, add 4.75ml purified water, and mix well.

6.2.3 60% pyridine solution (ready to use)

According to 25 ml preparation amount: take 15 ml pyridine, add purified water to 25ml, mix well.

6.2.4 0.1 mg/ml CNBr reference stock solution

Weigh 0.01 g of cyanogen bromide in a beaker, dissolve it with purified water immediately and transfer it to a 100ml volumetric flask. Rinse the beaker three times and transfer the lotion Standard Operating Procedures of Yuxi Walvax Biotechnology Co., Ltd.

to the volumetric flask. Fix the volume with purified water to the scale mark and mix well to obtain 0.1 mg/ml cyanogen bromide reference stock solution. Prepare it before use.

6.2.5 500 ng/ml CNBr control working solution

Pipette 1000 UL of 0.1 mg/ml cyanogen bromide reference stock solution into a 200 ml volumetric flask, add purified water to constant volume to the scale line, and mix well to obtain 500 ng/ml cyanogen bromide control working solution.

6.3 Test procedure

6.3.1 test article treatment

A pipette with a range of 100-1000 ul was used to precisely transfer 2000 ul of the test sample into the test tube in duplicate.

6.3.2 Preparation of standard curve:

Tube No.

Reagent 0 1 2 3 4 5 6

CNBr control

working solution 0 100 200 400 600 800 1000

6.4.2 Result judgment

According to the appropriate quality standards.

7 Flow chart

No

8 Precautions

8.1 CNBr is highly toxic and volatile, pyridine benzidine has a certain smell, so safety protection measures should be taken.

8.2 the whole test process is carried out in the fume hood.

8.3 CNBr is easy to volatilize, so it should be dissolved immediately after weighing. In the process of the experiment, the standard curve should be made after taking the supply solution. When adding the working solution of the reference substance, it should be added from high concentration to low concentration. After adding, pyridine benzidine solution should be added immediately for sealing, so as to avoid the linear unqualified curve caused by the volatilization of cyanogen bromide.

8.4 type 1, 4, 6A, 6B, 7F, 18C, 19A, 19F and 23F pneumococcal polysaccharides were activated by 1-cyano-4-dimethylaminopyridine tetrafluoroborate (CDAP). The molecular weight of cyanogen bromide and CDAP was 105.92 and 234.99 respectively.

6 Working procedure

6.1 In this method, the excessive EDTA-2Na reacts with aluminum ion firstly, and the residual EDTA-2Na is titrated with zinc titrant. According to the consumption of zinc titrant, the content of aluminum hydroxide (or aluminum phosphate) in the test sample can be calculated.

6.2 Reagent preparation

6.2.1 Phosphoric acid solution (6→100)

Take 6ml of phosphoric acid to 100ml volumetric flask, dilute it with purified water to the scale, mix it evenly.

6.2.2 EDTA-2Na titrant (0.05mol/L)

Calibration according to the <Operation procedures of titrant preparation>, WSYX-QC-SOP-0009-0802.

6.2.3 Zinc titrant (0.05mol/L)

Calibrating according to the <Operation procedures of titrant preparation >, WSYX-QC-SOP-0009-0802.

6.2.4 Zinc titrant (0.025mol/L)

Accurately measure 50ml of zinc titration solution (0.05mol/L), add the purified water to 100ml, shake well.

6.2.5 Acetate acid-ammonium acetate buffer (pH4.5)

Weigh 7.7g of ammonium acetate, dilute with 50ml of purified water, add 6ml of glacial acetic acid and appropriate amount of purified water to constant volume of 100ml.

6.2.6 Xylenol orange indicate solution

SOP of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-00-09-0117

Aluminum hydroxide (or

Aluminum phosphate) Version 07 Page 3/4

content test SOP

Confidential files No copy

Weigh 0.2g of xylenol orange, add 100ml of purified water to dissolve it, and mix well.

(Prepare the solutions immediately before use)

6.3 Test procedures

6.3.1 Accurately measure the appropriate amount of the test sample to make the aluminum content about 1-10mg (generally, 1000μl is taken when the test sample is aluminum hydroxide solution; 5000μl is taken when the test sample is 13-valent pneumococcal conjugate vaccine),

place it in a conical flask (set two parallel), add 1500μl of phosphoric acid solution (6→100) to make it completely dissolved. If necessary, warm it up in a water bath (increase the amount of phosphoric acid if it is difficult to dissolve).

6.3.2 Add 10ml of EDTA-2Na titrating solution (0.05mol/L) and 10ml of acetic acid-ammonium acetate buffer solution (pH4.5) precisely, heat it on boiling water bath for 10min, and take it out and cool to room temperature.

6.3.3 Add 1000μl xylenol orange indicator solution, titrate with zinc titrant (0.025mol/L), when the solution changes from bright yellow to orange, it is the end point, and calibrate the titration result with blank test (test two parallel).

6.3.4 Results calculation

6.3.4.1 Calculation formula

Aluminum hydroxide content (mg/ml) = $(V_0 - V_1) \times c \times 78.01 / V_2$

Aluminum phosphate content (mg/ml) = $(V_0 - V_1) \times c \times 121.95 / V_2$

Aluminum content (mg/ml) = $(V_0 - V_1) \times c \times 26.98 / V_2$

V_0 : the volume of zinc titrant consumed in blank test, ml;

V_1 : the volume of zinc titrant consumed by the test samples, ml;

C : the concentration of zinc titrant, mol/L;

V_2 : the volume of the test samples, ml;

78.01, 121.95 and 26.98 are the molecular weight or relative molecular mass of aluminum hydroxide, aluminum phosphate and aluminum, respectively.

6.3.4.2 Results judgment

According to the corresponding quality standard.

SOP of Yuxi Walvax Biotechnology Co., Ltd.

Aluminum hydroxide (or

Aluminum phosphate) Version 07 Page 4/4

content test SOP

Confidential files No copy

7 Flow chart

No

8 Matters need attention

8.1 The temperature and humidity should be controlled during titration;

8.2 The burette and the volumetric flask shall be checked for leakage before use;

8.3 Take the titrant in strict accordance with the management of the titrant.

9 Reference or standard basis

9.1 "Chinese Pharmacopoeia" edition 2015, volume III, general rule 54

ethanol, ether and
acetone residues Non-photocopying, confidential documents

6.1.1 Mixed reference solution (Containing 0.08% ethanol, 0.03% acetone, 0.01% ether)
Respectively take 80 µl of Ethanol, 30 µl of acetone, 10 µl of ether (Note: after adding
one kind of solvent, the volumetric flask should be sealed immediately and mixed quickly),
diluted with purified water to 100 ml. mix well. This solution should be used immediately.
6.2 According to the following instrument parameter settings, the residual amount of ethanol,
ether and acetone was detected on the gas chromatograph.
Residual organic solvent detection parameters
detector FID■flame ionization ditector■
terminal time 8min
SPL temperature 230■
Temperature of Column temperature box 40■
Detector temperature 250■
Carrier gas type nitrogen
Sampling mode split-flow
pressure 74.3kPa
total flow 14 ml/min
Chromatographic column flow 1 ml/min
Nitrogen flow rate 40 ml/min
Hydrogen flow rate 40 ml/min
Air velocity 400 ml/min
Sample volume 0.5 µl
chromatographic column Wondacap-WAX(30 m×0.25 mm×0.25 µm)
6.3 test procedure: operating procedures: take about 1 ml to 1.5 ml of mixed reference
solution into the injection bottle, and inject two parallel needles; take parallel samples of the
test sample, take about 1ml to 1.5 ml in two injection bottles respectively, inject 1 needle for
each, and test according to the above detection parameters.
6.4 results
6.4.1 The peak area was regressed by the concentration of each component in the reference
solution. Then the peak area of the sample solution is calculated with the equation■get the
concentration of each organic solvent.
Concentration of test product = $Cr \times \frac{Ax}{Ar}$ ■
Cx: Concentration of test product, %; Cr: Concentration of external standard, %

1
2 5 4
3
6.3.2 Preparation of the test sample: dilute the protein concentration or polysaccharide content of the test sample to the appropriate concentration with physiological sodium chloride solution.
6.3.2.1 For the test sample of polysaccharide, the polysaccharide content was diluted to about

100 ug/ml (generally, the test sample was diluted by 30 or 40 times).

6.3.2.2 The bulk conjugate was loaded twice

6.3.2.3 The finished product can be concentrated or diluted for sample loading:

Six samples of haemophilus influenzae type b conjugate vaccine were mixed and centrifuged at 8000 rpm/min for 15 minutes, then ultrafiltration was detected.

The meningococcal polysaccharide vaccine was detected after three lyophilized preparations were dissolved with one diluent.

The meningococcal polysaccharide conjugate vaccine was detected after 7 lyophilized preparations were dissolved with 1 diluent

6.3.2.4 For tetanus toxoid immune serum, the flocculent unit was diluted to 30 Lf/ml for sample loading.

6.3.3 According to the different test samples, the central well shall add the corresponding specific antisera, in the surrounding wells, add test substance and positive reference substances, every well added 20 ul of sample.

6.3.4 Wet box spread of 37■ for 24 hours; fully immerse in 0.9% sodium chloride solution the agarose gel board to remove the unbound protein

6.3.5 Remove immersed agarose gel plate, dry, stain 5 minutes with coomassie brilliant blue , then use destaining solution to discolorize until the background is colorless and clear blue precipitation line appear.

6.3.6 Make gel: lay a layer of cellophane on the glass plate, put the decolorized film on the cellophane, then lay a layer of cellophane, clamp and dry it.

6.6 Selection of positive control

When a batch of products are selected as the positive control, it should be confirmed: three people independently operate (except for personnel, other operations should be consistent), and carry out serotype identification test, a total of 10 times. If the test results can show obvious precipitation line, it can be used as the positive control of identification test.

7 Flow chart

N/A

8 General considerations

8.1 Agarose should not be overheated, in order to avoid excessive moisture evaporates.

8.2 If the positive control is within the validity period

pigs 250-350g

3 Disposable syringe 4 Disposable latex gloves

5 ethanol cotton ball

6 Working procedure

6.1 Test procedure

In addition to the other regulation, the test of abnormal toxicity should include the mice test and the guinea pigs test. In the test, the same batch of animals should be set in blank control. The test is valid, if all animals survived without any abnormal reaction during the observation period, and the weight of each animal should be increased at the end of the test, slowly inject vaccine into the animal body according to the prescribed route of administration.

Abnormal toxicity test

Version 06 Page 2/3

SOP

Confidential files No copy

6.1.1 Test in mice

Five mice are used for the test on each batch of product. Weigh and number each mouse before test. Record the data. The body weight of each mouse shall be 18-22g. Each mouse was injected with 0.5ml test sample and observed for 7 days. During the observation period, all mice should be kept intact without any abnormal reaction, and the weight of each mouse should be increased at the time become due, so that the test product is in accordance with the requirements. If it does not meet the above requirements, another 10 mice weighed 19-21g should be retested, and the result shall be judged as described above.

6.1.2 Test in guinea pigs

Two guinea pigs are used for the test on each batch of product. Weigh and number each guinea pig before test. Record the data. The body weight of each guinea pig shall be 250-350g. Each guinea pig was injected intraperitoneally with 5.0ml and observed for 7 days. During the observation period, guinea pigs should be all healthy and no abnormal reaction. When the time become due, the weight of each guinea pig should be increased. If the above requirements cannot be met, 4 guinea pigs can be retested, and the result shall be judged as described above.

1 Objective

Standardize the operation of protein content test (Lowry method 2).

2 Definitions/Abbreviations

N/A

3 Scope of application

3.1 It is applicable to determine the protein content of acellular pertussis purified liquid, tetanus toxoid bulk and tetanus toxoid purified liquid other test samples manufactured by Yuxi Walvax.

4 Responsibilities

All the operators shall strictly conduct the SOP.

6 Working procedure

6.1 Principle

According to this method, the peptide bond contained in protein molecules is chelated with Cu^{2+} in alkaline solution to form a protein copper complex. The complex reduces the phosphomolybdic acid of phenol reagent to produce blue compound. At the same time, under alkaline conditions, phenol reagent is easily reduced by tyrosine, tryptophan and cysteine in protein to produce blue reaction. In a certain range, the color depth is directly proportional to the protein concentration. The protein content in the test sample was determined by colorimetry with the protein standard solution as the standard curve. Before the determination, deoxycholate trichloroacetic acid was added into the sample, and the interfering substances were removed by protein precipitation. This method can also be used to concentrate protein in dilute solution.

6.2 preparation of reagents

SOP of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-0009-0134
SOP for the protein content 3/6
Version 02 Page

test (Lowry method 2)
Confidential files No copy

6.2.1 1% sodium hydroxide solution

Weigh 1g sodium hydroxide into a beaker, dissolve it with purified water and transfer it to a 100ml volumetric flask. Add a small amount of purified water to moisten the beaker for three times and transfer it to the volumetric flask. Fix the volume to the scale line and mix well.

6.2.2 5% sodium carbonate solution

Weigh 5g anhydrous sodium carbonate into a beaker, dissolve it with purified water and transfer it to a 100ml volumetric flask. Add a small amount of purified water to moisten the beaker for three times and transfer it to the volumetric flask. Fix the volume to the scale line and mix well.

6.2.3 test solution A

Take 200ml of 1% sodium hydroxide solution and 200ml of 5% sodium carbonate solution into a 500ml volumetric flask, add purified water to the scale line, mix well, label and set aside.

6.2.4 2.98% sodium tartrate dihydrate solution

Weigh 2.98g of disodium tartrate dihydrate into a beaker, dissolve with purified water and transfer to a 100ml volumetric flask. Add a small amount of purified water to moisten the beaker for 3 times and transfer to the volumetric flask. Fix the volume to the scale line, mix well, label and reserve.

6.2.5 1.25% copper sulfate solution

Weigh 1.25g copper sulfate pentahydrate into a beaker, dissolve it with purified water and transfer it to a 100ml volumetric flask. Add a small amount of purified water to moisten the beaker for 3 times and transfer it to the volumetric flask. Fix the volume to the scale line, mix well, label and reserve.

6.2.6 test solution B (ready to use)

Take 2.98% sodium tartrate dihydrate solution, 1.25% copper sulfate solution and purified water according to the volume ratio of 2:2:1, and mix well. (according to the amount needed in the experiment, it is prepared in proportion).

6.2.7 test solution c (ready to use)

Take the test solution a and test solution B according to the volume ratio of 50:1, and mix SOP of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-0009-0134

SOP for the protein content 4/6

Version 02 Page

test (Lowry method 2)

Confidential files No copy

well. (according to the amount needed in the experiment, it is prepared in proportion).

6.2.8 Folin phenol test solution (ready to use)

Take the stock solution (2mol / L acid concentration) 1 → 2 (i.e. take 1000 μl of Folin phenol into a triangular flask, add purified water to make 2000 μl Folin phenol test solution, and mix well. According to the experimental requirement, the mixture was prepared according to 1 → 2. The prepared Folin phenol test solution should meet the following requirements: 1000 μl of test sample, 5000 μl of test solution and 500 μl of prepared Folin phenol test solution, and the pH value of the solution obtained should be 10.3 ± 0.3).

6.2.9 sodium deoxycholate test solution

Weigh 0.15g sodium deoxycholate into a beaker, dissolve it with purified water and transfer it to a 100ml volumetric flask. Add a small amount of purified water to moisten the beaker for 3 times and transfer it to the volumetric flask. Fix the volume to the scale line, mix well, label and reserve.

6.2.10 72% trichloroacetic acid solution

Weigh 7.2g trichloroacetic acid in a beaker, add purified water to dissolve it into a 10ml volumetric flask, add a small amount of purified water, repeatedly wash the beaker for three times, transfer it to the volumetric flask, and fix the volume to the scale line, mix well, then get the product, label it for use.

6.2.11 200 μg / ml protein national standard solution

Please refer to wsyx-qc-sop-0009-0801 for preparation details

6.3 test procedure

6.3.1 treatment of test articles

A pipette with a range of 100-1000 μl was used to accurately measure 1000 μl of the test sample (containing about 20-80 μg of protein) into the test tube in duplicate.

6.3.2 preparation of standard curve

0 1 2 3 4 5

200 μg / ml protein national standard solution

0 100 200 300 400 500

test (Lowry method 2)

Confidential files No copy

Purified water (μl) 1000 900 800 700 600 500

Protein content (μg/ml) 0 20 40 60 80 100

6.3.3 add 100 μL sodium deoxycholate test solution into the above tubes, mix well, and place at room temperature for 10min.

6.3.4 add 100 μl of 72% trichloroacetic acid solution into the above tubes, mix well, centrifugate at 3000g for 30min, gently pour out the supernatant, remove the remaining liquid with a pipette, and retain the protein precipitate.

6.3.5 protein precipitate: dissolve each tube with C 1000 μl of test solution, then add 5000 μl of test solution, and mix well.

6.3.6 place the above tubes in the electric constant temperature water bath at 25■ for 10 minutes, add 500 μl of Folin phenol test solution, mix one tube immediately after adding one tube, and place the electric heating constant temperature water bath at 25■ for 30 minutes.

6.3.7 read the absorbance at 750 nm.

6.4 result calculation

6.4.1 take standard 0 tube as blank, calculate the linear regression equation with the

concentration of standard solution and its corresponding absorbance, and then substitute the absorbance of the test solution into the linear regression equation to calculate the protein concentration of the test solution.

Protein concentration of test sample = average protein concentration of test sample × dilution multiple

6.4.2 Results judgment

Carry out according to corresponding quality standard.

Hydrochloric acid titration solution (0.02

mol/L)

mol/L)

6 Working procedure

6.1 Test reference substance: 5 mg/ml tryptone solution

Weigh 0.05 g tryptone (total nitrogen content 12.7%, source: Oxoid, article number: LP0042), dissolve with water, dilute to 10 ml, shake well. Prepare freshly.

6.2 The preparation of test solution: accurately weigh proper amount of the test product, the nitrogen content of the solution is 0.1 mg.

6.3 Digestion

Take a certain volume of test solution and tryptone 1.0 ml, put in the digesting and boiling tube, add about 5 g of the digestion agent, add sulfuric acid 10 ml, digestion at 420 ■ for 40 minutes, until the solution is clear, show bright green color.

6.4 Distillation

Steam the distiller for more than 15 minutes before distillation. When receiving liquid was purplish red, and digesting and boiling solution cool to room temperature. a triangle

determination of total version 07 Page 3/5

nitrogen content

Non-photocopying, confidential documents

bottle was put at the right side of the Kjeldahl nitrogen meter and insert condensing pipe and the boric acid absorbent adding pipe. Then install the digested boiling pipe on the left side of the Kjeldahl nitrogen meter and turn on the machine. The instrument begins to distillation automatically, after stopping distillation, take off the triangle bottle, wash the condensation

tube with the water for injection, collect the eluent in the triangle bottle and prepare for titration.

6.5 Titration

The distilled solution was titrated with hydrochloric acid titration solution (0.02 mol/L) until the solution turn from blue-green to grey purple, and the titration result was corrected by blank test.

6.6 Data processing

$$(VX - V0) \times c \times 14.01 \times n$$

$$\text{mg / ml} = \frac{\text{Total nitrogen content}}{V}$$

Total nitrogen content V

$$\text{Total nitrogen content (\%)} = \frac{C}{(C0 \times 12.7\%)} \times 100\%$$

where VX is volume of hydrochloric acid titration solution consumed by test solution, ml;

V0 is volume of hydrochloric acid titration solution consumed by blank control, ml;

c is concentration of hydrochloric acid titration solution, mol/L;

n is dilution multiple of test solution;

V is volume of test solution, ml;

14.01 is relative atomic mass of nitrogen;

C is total nitrogen content of test product, mg/ml;

C0 is concentration of control sample, mg/ml;

12.7% is total nitrogen content of tryptone.

7 Flow chart

N/A

8 Notes

8.1 5 mg/ml tryptone solution was used as the reference substance, and the recovery rate

Standard Operation Procedures of Yuxi Walvax Biotechnology Co., Ltd

WSYX-QC-SOP-0009-075

Code

Operation procedures 1

determination of total version 07 Page 4/5

nitrogen content

Non-photocopying, confidential documents

should be in the range of 80% - 120%.

8.2 The range of 2 blank tests shall not be greater than 0.05ml, blank value should be 0.02ml, blank value of 0 ml is also normal.

8.3 The distilled ammonia receiving liquid should be titrated as soon as possible to avoid too long storage time and affect the determination results.

8.4 The determination of total nitrogen and non-protein nitrogen can be controlled by the same blank.

8.5 If there is no black CuO precipitation in the distillation process, it shows that the addition of alkali is insufficient, so the experiment should be made up or redone.

8.6 Add 2% boric acid absorption solution to the triangle bottle should show purplish red, if it show green, indicating that the triangle bottle pollute by alkaline substance.

8.7 Operating environment should be free from ammonia and alkaline gas interference.

Type 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, 23F Pneumococcal Bulk Conjugate were stored at 2-8■, tested at 0th month, 1th month, 2nd month, 3rd month, 6th month, 9th month, 12th month■test results were all complied with specification of 13-valent pneumococcal polysaccharide conjugate vaccine (WSYX-QC-TS-06-09-0005).

This experiment was conducted by the quality control laboratory strictly sampled at each test point, could provide evidence for safety, effectiveness and validity of pneumococcal polysaccharide stored at 2-8■. In conclusion, shelf life of 13 serotypes of pneumococcal polysaccharide manufactured by Yuxi Walvax stored at 2-8■ is 12 months.

Accurately weigh 20.0 g sodium hydroxide into a beaker, dissolve it with purification,

pour it into a 100 ml volumetric flask, and then moisten the beaker with purified water for three times, then inject the moistening solution into the volumetric flask, and finally make the volume to the scale, and mix evenly.

6.1.4 5.3% anhydrous sodium carbonate solution

Accurately weigh 5.30 g anhydrous sodium carbonate in a beaker, dissolve it with purified water and fix the volume to 100ml, mix well.

6.1.5 acetylacetone reagent (ready for use)

Use a pipette gun to accurately measure 1 volume of acetylacetone and 50 volume of 5.3% anhydrous sodium carbonate solution, and mix well.

6.1.6 0.1 mol/L hydrochloric acid solution

Take a 100 ml volumetric flask, add appropriate amount of purified water, accurately measure 850 μ l hydrochloric acid, slowly pour into the volumetric flask, add purified water and fix the volume to 100 ml scale mark, mix well.

6.1.7 4-dimethylaminobenzaldehyde reagent (ready for use)

Accurately weigh 0.80g of 4-dimethylaminobenzaldehyde in a beaker, measure 15 ml of absolute ethanol and hydrochloric acid with a pipette gun to dissolve them, and then mix them evenly.

6.1.8 glucosamine standard working solution (0.5 g/L)

For details, please refer to the operation procedures for preparation of standard solution, code: WSYX-QC-SOP-00-09-0801

6.2 test procedure

6.2.1 use a 5000 μ l pipette to measure 10 ml of purified water into a plug calibrated tube, and mark the scale accurately.

6.2.2 dilute the sample with purified water to make the content of hexosamine about 100-400 μ g/ml.

6.2.3 use a pipette gun with a range of 100-1000 μ l to accurately suck the working solution of SOP of Yuxi Walvax Biotechnology Co., Ltd

8 Notes

8.1 hydrochloric acid will be used in the experiment, and safety protection measures shall be taken during operation.

8.2 pay attention to avoid scalding when using water bath.

8.3 pay more attention to the process of water bath, and the test tube with plug should be tightly covered to avoid the reagent being heated and ejected during the water bath.

6 Working procedure

6.1 Solution

6.1.1 0.6mol/L sodium hydroxide solution

Weigh 2.4g of sodium hydroxide, dissolve it with purified water and dilute it to 100ml, mix evenly.

6.1.2 0.2mol/L citric acid solution

Weigh 4.2g of citric acid, dissolve it with purified water and dilute to 100ml, mix well.

6.1.3 Protein detection solution A

Weigh 10g of sodium hydroxide and 50g of anhydrous sodium carbonate into beakers respectively, add 400ml of purified water, dissolve and mix together, pour it into plastic bottle, label as protein detection solution A, and use for standby.

6.1.4 Protein detection solution B

Weigh 0.5g of potassium tartrate into the beaker, add 50ml of purified water to dissolve it. Weigh 0.25g of copper sulfate pentahydrate into the beaker, add 30ml of purified water to dissolve it, and then mix the two solutions as protein detection solution B, label and reserve.

6.1.5 Alkaline copper test solution (Prepare the solutions immediately before use)

Before use, mix according to the volume proportion of protein detection solution A: protein detection solution B: purified water (20:4:1), and then reserve.

6.1.6 Foline-phenol test solution (Prepare the solutions immediately before use)

Take Foline-phenol (2mol/L acid concentration) 1→16 (take 1000μl foline-phenol test solution and put it into a triangular flask, add the purified water to 16ml, mix well, and prepare according to the experiment requirement)

6.1.7 0.9% sodium chloride injection (commercial purchase)

6.1.8 PBS

Take proper amount of sodium dihydrogen phosphate, disodium hydrogen phosphate and SOP of Yuxi Walvax Biotechnology Co., Ltd.

SOP of conjugate protein Code WSYX-QC-SOP-06-09-0006

content test for 13-valent 4/8

sodium chloride, dissolve them in purified water to make a solution contains 88.7μg of sodium dihydrogen phosphate, 38.0μg of disodium hydrogen phosphate and 8.5mg of sodium chloride per ml, respectively, and mix evenly.

6.1.9 200μg/ml national standard protein working solution

refer to the <operation procedures for preparation of standard solution> WSYX-QC-SOP-0009-0801

6.2 Test procedure

6.2.1 Free protein reference substance

The tetanus toxoid carrier protein was diluted with PBS to the protein content of about 2000 μg/ml, and filtered with 0.45μm needle filter to obtain the free protein reference, which was recorded as S1.

6.2.2 Desorption solution reference

Take appropriate amount of aluminum phosphate adjuvant, sodium dihydrogen phosphate, disodium hydrogen phosphate and sodium chloride, dissolve in purified water to make a solution contains 1.0mg of aluminum phosphate (adjuvant), 88.7μg of sodium dihydrogen phosphate, 38.0μg of disodium hydrogen phosphate and 8.5mg of sodium chloride per ml, to obtain the finished product diluent. Take 2000μl of finished product diluent, add 100μl of 0.6mol/L sodium hydroxide solution, and add 100μl of 0.2mol/L citric acid solution within 10s, mix well. 0.45μm needle filter is used for filtration to obtain desorption solution reference substance.

6.2.3 Test samples preparation

6.2.3.1 Take a 3K ultrafiltration cup, add 1500μl purified water into each cup, mark the concave liquid surface with a mark pen, and then discard 1500μl purified water

6.2.3.2 Take 10 vials ■syringes■ of the finished product of 13-valent pneumococcal conjugate vaccine and mix well. Take 5000μl, add 250μl of 0.6mol/L sodium hydroxide solution, quickly add 250μl of 0.2mol/L citric acid solution within 10s, mix with vortex mixer, and obtain desorption solution of finished product, which is recorded as S0.

6.2.3.3 Take 4500μl of the desorption solution of finished product and put it into the marked ultrafiltration cup, and centrifuge it at 5■, 7000rpm for 30min. After centrifugation, take out the SOP of Yuxi Walvax Biotechnology Co., Ltd.

SOP of conjugate protein Code WSYX-QC-SOP-06-09-0006

content test for 13-valent 5/8

Version 02 Page

pneumococcal conjugate

vaccine Confidential files No copy

ultrafiltration cup and add PBS to 1500μl. Fully blow wash the solution and mix well and filter it with 0.45μm needle filter to obtain the test sample.

6.2.4 Column chromatography

6.2.4.1 Take the 1ml of free protein reference to load into column (XK16/100 column filled with Sepharose CL-4B gel), eluted with 0.9% sodium chloride solution, the flow rate is 0.3ml/min, the automatic collector shall collect eluant in tubes one by one, and the 4.5ml is collected from each tube. 1.2 times of column volume is collected, the collected solution is detected at the 214nm wavelength by UV-VIS spectrophotometer, and the elution map is drawn with the tube number as the X-axis and OD214nm as the Y-axis. The number of tubes corresponding to the separation peak of free protein reference (the first tube when OD value is from less than 0.01 to greater than or equal to 0.01) is recorded as n1, at the end of chromatography, the corresponding number of tubes - (OD value is from greater than or equal to 0.01 to less than 0.01) is recorded as n2. Collect the eluant in each tube from n1 to n2, take 1000μl from each tube and mix them together then get solution S2.

6.2.4.2 Determine the protein concentration of S0 in accordance with the <SOP of protein content determination>, which multiply by the dilution multiple 1.1 in the desorption step to obtain the total protein concentration S0 in the finished product; determine the protein

concentration of S1 and S2 solutions in accordance with the same method, record s1 and s2 respectively.

6.2.4.3 Take 1ml of desorption solution reference substance and load into column, elute it with 0.9% sodium chloride solution, 0.3ml/min. Collect it tube by tube by automatic partial collector, collect 4.5ml in each tube. The volume of 1.2 column bed volumes is collected; the collected solution is detected with UV-VIS spectrophotometer at the wavelength of 214nm, take the tube number as the X-axis and OD214nm as the Y-axis. to draw the elution map. The number of tubes corresponding to the separation peak of desorption solution reference (the first tube whose OD value changed from less than 0.01 to greater than or equal to 0.01) is recorded as n3.

6.2.4.4 Take 1ml of the treated test sample to load into the column. Elute, collect, UV spectrophotometer detect with the same method, and draw the elution map.

6.3 Results calculation

6.3.1 Experimental effectiveness (%) = $4.5 \times (n2 - n1 + 1) \times s2 / s1 / V \times 100$, should be 80%-120%.

4.5: the collected volume from each tube, ml;

n1: the corresponding tube number at the beginning of the separation peak of free protein reference;

n2: the corresponding tube number at the end of the separation peak of free protein reference;

s1: the protein concentration of free protein reference, before loading into the column, µg/ml;

s2: the protein concentration of free protein reference after mixing the eluents from n1 to n2, µg/ml;

V: the volume of free protein reference loading into the column, ml.

6.3.2 Conjugate protein content of 13-valent pneumococcal conjugate vaccine:

Conjugate protein content (%) = $(1 - \Sigma OD2 \times 1.1 / 3 / \Sigma OD1 \times s1 / s0) \times 100$

If $n3 < n2$,

ΣOD1: the sum of the OD values of free protein reference from n1 to n3 tubes;

ΣOD2: the sum of OD values of the test sample from n1 to n3 tubes;

If $N3 \geq N2$,

ΣOD1: the sum of OD values of the free protein reference from n1 to n2 tubes;

ΣOD2: the sum of OD values of the test samples from n1 to n2 tubes;

s0: the protein concentration of the finished product, µg/ml;

s1: the protein concentration of free protein reference before loading column, µg/ml;

3: the concentrated multiple of the finished product desorption sample;

1.1: the multiple of the finished product desorption sample diluted by desorption dilution.

6.3.3 Results judgment

Carry out according to corresponding quality standard.

8 Matters need attention

8.1 Make sure that the joints of the gel column tightly connected without leakage before use.

8.2 Plug the liquid outlet end with a plug before plugging the liquid inlet end, and the sequence shall not be reversed.

8.3 Every month, a column volume of 0.5mol/L NaOH solution is used as the mobile phase to clean the gel. After washing, it was cleaned with the corresponding eluent to the pH of elute is less than 7 in which the gel column was calibrated.

8.4 The self-prepared eluent must be degassed by steam sterilization or appropriate methods (such as negative pressure).

8.5 The collecting tubes shall be marked by mark pen to prevent confusion.

8.6 Numbering principle of free protein reference and desorption solution reference:

The fixed number of chromatographic column is A, B, C, D and so on. The date when the column starts to be calibrated is the figure number. If the free protein reference loading into column A is on August 5, 2018, the number is column A 201808005, which is valid for 30 days and expires on September 3, 2018.

Number based on the AKTA pure25 purifier system and column starting to be calibrated. If the WYQCF0455 column is loaded the free protein reference on August 5, 2018, the number is WYQCF04155 201808005, the validity period is 30 days, and the validity period is until September 3, 2018.

8.7 Temperature and time have influence on protein content detection, which should be strictly controlled.

8.8 The free protein reference, desorption solution reference and test sample should be detected in the same column and completed within the validity period of the chromatographic column.

8.9 The calibration standard on chromatography column: calibration consistency test standard in different time periods is V0, V1 shall not exceed 1 tube, that is, the tube number of V0, V1 of SOP of Yuxi Walvax Biotechnology Co., Ltd.

6 Work procedures
6.1 Principle
Based on the fact that the amino group in ADH can react with TNBS in the presence of sodium tetraborate, the content of adipic hydrazide in derivatives is determined by UV Vis spectrophotometry.
6.2 Reagents
6.2.1 Adipic hydrazide (ADH) reference working solution (20 µg/ml)
For details, please refer to the operation procedures for preparation of standard solution, code: WSYX-QC-SOP-00-09-0801.

dihydrazide (ADH) content

Confidential documents, no copying.

6.2.2 3% TNBS solution

Accurately measure 5 ml of TNBS solution into a volumetric flask, add purified water to the volume of 50 ml, mix well, and then 3% TNBS solution is obtained. Pack it into about 7 ml/vial, label it and store it at -20℃.

6.2.3 5% sodium tetraborate solution

Weigh 47.35 g sodium tetraborate ($\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$), dissolve with purified water and fix the volume to 500 ml, mix well, transfer to 500 ml reagent bottle, label, and store at room temperature.

6.3 Test procedure

6.3.1 Treatment of test articles

Use a pipette gun with a range of 100-1000 μl to dilute the test sample with purified water until the concentration of adipic hydrazide is not higher than 20 $\mu\text{g}/\text{ml}$ as the test solution, and accurately measure 2000 μl of the test solution into the test tube in duplicate.

Original solution of pneumococcal polysaccharide conjugate: Take 8 ml-10 ml of the test sample, and evenly pack it into two 15 ml 3K ultrafiltration centrifuge tubes, 7000 g, 5℃, 30 min, take the filtrate of the lower layer of two tubes, and mix them evenly.

6.3.2 Standard curve preparation:

3 pipette tips 4 acid burette

5 powder free latex gloves 6 beaker

7 Glass rod 8 weighing scoop

9 weighing paper 10 time-meter

6 Procedures

6.1 Principle

This method is based on the reaction of bromate solution with hydrochloric acid to produce bromine and phenol to tribromophenol.. Excess bromine reacts with potassium iodide to release iodine. The precipitated iodine is titrated with sodium thiosulfate titrant. According to the consumption of sodium thiosulfate titrant, the content of phenol in the test sample can be calculated.

6.2 Reagent preparation

6.2.1 Starch indicator

Weigh Soluble starch 0.5 g, add 5 ml of water, suspend it, slowly added into 100 ml of boiling water, stir while adding, Keep boiling for 2 min, cool, take upper liquid, this solution should use immediately.

6.2.2 0.02 mol/L Bromine solution

Weigh potassium bromate 0.56 g, add potassium iodide 3 g, dissolve and dilute with water for injection to 1000 ml, shake well, that is.

6.2.3 6 mol/L Hydrochloric acid solution

Take a 100 ml volumetric flask, add proper amount of water for injection, take 50 ml of concentrated hydrochloric acid, Slowly inject into a capacity bottle, shake while adding, add water for injection to near volume, Shake and cool down to room temperature, add water for injection to volume, mix well and label, that is.

6.2.4 25% KI solution

SOP of Yuxi Walvax Biotechnology Co., Ltd

phenol content

Non-photocopying, confidential documents

Weigh 25 g of potassium iodide, dissolve with injection water and dilute volume to 100 ml, mix well, pour into brown bottle, label, that is.

6.2.5 Sodium thiosulfate titration solution (0.02 mol/L)

6.2.5.1 preparation of Sodium thiosulfate titration solution (0.1mol/L)

For details of preparation and calibration, please refer to operation procedures for

titration solution preparation (WSYX-QC-SOP-0009-0802).

6.2.5.2 preparation of Sodium thiosulfate titration solution (0.02 mol/L)
 accurately measure sodium thiosulfate titration solution (0.1 mol/L) 100 ml, dilute with water to 500 ml, shake well, that is.

6.3 test procedure
 Accurately measure test product 1 ml in a conical flask with cover, add 50 ml of water, accurately add 15 ml of 0.02 mol/L Bromine solution, add 10 ml of 6 mol/L hydrochloric acid solution along the wall of bottle, shake well, cover the conical flask, place at the dark place for 30 min, take 2 ml of 25% potassium iodide solution at the bottle-neck of the conical flask with cover, slightly open the cover a little, let the solution flow down, tight the cover, shake well. Wash the bottle neck with a little water, titrate with sodium thiosulfate(0.02 mol/L) to the end point, add about 0.5 ml of starch indicator solution until blue color disappear. The results of titration were corrected by blank test.

6.4 Result calculation

Content of phenol=

Content of phenol=average phenol content (g/L)/solid weight×1000
 V0: Volume of sodium thiosulfate titration solution consumed by blank control, ml
 V1: Volume of sodium thiosulfate titration solution consumed by test product, ml
 C: Concentration of sodium thiosulfate titration solution, mol/L
 15.69: 1/6 of Phenol molecular weight.

Blue glucan 2000 solution: preparation details see "Standard Solution Preparation
Operating Procedure" WSYX-QC-SOP-00-09-0801
6.2.4 0.5 mol/L Sodium Hydroxide solution

According to the preparation amount of 500 ml, said sodium hydroxide 10 g in the beaker, dissolved with the appropriate amount of purified water to room temperature, and transferred to 500 ml capacity bottle, and then with the appropriate amount of purified water 3 times after the washing beaker will be remixed into the capacity bottle, re-filled purity water to the scale line mixed, that is.

6.2.5 Ethanol-aqueous solution (20:80)

Take 20ml of waterless ethanol, add 80ml of purified water, mix well.

6.3 Trial steps

6.3.1 Choice of Gel:

6.3.1.1 Products with Sepharose CL-4B gel column

Haemophilus influenzae type b polysaccharides, haemophilus influenzae type b bulk conjugate, haemophilus influenzae type b conjugate vaccine, group A meningococcal polysaccharides bulk conjugate, group C meningococcal polysaccharides (bulk), group C meningococcal polysaccharides bulk conjugate, group Y meningococcal polysaccharides (bulk), group W135 meningococcal polysaccharides (bulk), group W135 meningococcal polysaccharides bulk conjugate, group A and C meningococcal polysaccharides vaccine, group ACYW135 meningococcal polysaccharides vaccine, pneumococcal polysaccharide (bulk) (stereotype 1, 2, 3, 4, 7F, 8, 9N, 12F, 14, 18C, 19A, 19F, 23F), pneumococcal polysaccharide derivative, pneumococcal polysaccharide bulk conjugate, degradation polysaccharide.

6.3.1.2 Products with Sepharose CL-2B gel column

Pneumococcal polysaccharide (bulk) (stereotype 5, 6A, 6B, 9V, 10A, 11A, 15B, 17F, 20, 22F, 33F)

6.3.2 Sepharose CL-4B (CL-2B) Calibration of gel columns

Take 1.5 ml of 2 mg/ml blue dextran 2000 solution and 1 mg/ml vitamin B12 solution

determination of molecular Version 13 Pages 6/21

size

Confidential documents, no copying.

respectively, mix them well, filter them through 0.45 μM filter membrane and use them as molecular size reference solution. Take 1 ml of test sample on the column and elute at the flow rate of 0.3 ml/min. Collect a tube every 15 min, that is, 4.5 ml/tube, and wash off at least 1.2 column volume. After elution, the absorbance of the collected solution was determined at the wavelength of 260 nm and 370 nm. The fifth and sixth tubes of the collected solution were mixed and used as blank control to mark zero. After the zero mark, the absorbance of the eighth to the 48th tubes were read to obtain the elution peaks of blue dextran 2000 solution and vitamin B12 solution. At 260 nm, the volume of blue dextran 2000 elution peak is V0 of the column. At 370nm, the volume of vitamin B12 solution eluting the peak corresponds to the Vi of the column. The post calibration period is 30 days.

According to the following formula, calculate the number of tubes in which KD0.2, KD

0.3, KD0.5 and KD0.6 are located.

Partition coefficient $KD = (V_e - V_0) / (V_i - V_0)$

0.2 $\frac{V_i - V_0}{V_i - V_0} + V_0$

Number of tubes where KD0.2 is located=

4.5

0.3 $\frac{V_i - V_0}{V_i - V_0} + V_0$

Number of tubes where KD0.3 is located=

4.5

0.5 $\frac{V_i - V_0}{V_i - V_0} + V_0$

Number of tubes where KD0.5 is located =

4.5

0.6 $\frac{V_i - V_0}{V_i - V_0} + V_0$

Number of tubes where KD0.6 is located =

4.5

6.3.3 Determination of KD values and recovery rates for each product

6.3.3.1 Haemophilus influenzae type b polysaccharides molecular size test:

a) Sampling volume and collection method: use 0.45 m membrane filtration for test products, take 1 ml of test products, wash with 0.2 mol/L sodium chlorate solution, fluid lotion amount is at least 1.2 times the volume of the column bed, automatic collector tube-by-tube collection, 4.5 ml per tube collection.

b) Mix the liquids collected by the step-by-step collector with the 5th and 6th tubes as blank controls.

c) The number of tubes in which KD is located was found out. From the number of tubes where Standard Operating Procedures of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-00-09-0104

Operating procedures

determination of molecular Version 13 Pages 7/21

size

Confidential documents, no copying.

KD0.5 is located, every two tubes are merged from the back to the front, and the seventh tube is merged. At the same time, the collected liquid after the number of KD0.5 tubes is merged in turn. When the number of tubes KD0.5 is even, tubes 7 to 48 can be combined into one tube. When the number of tubes KD0.5 is odd, tubes 7 and 48 can not be combined with the rest. At this time, tube 7 and tube 48 can not be combined with other tubes. At this time, tube 7 and tube 48 can not be combined as one tube.

d) Take 1 ml of blank control and combination tubes (when KD0.5 is in odd number, including the 7th and 48th tubes not combined), Add 5000 μ l hydrochloric acid solution of 0.1% FeCl3, mix well, add 400 μ l of 10% lichen phenol ethanol solution, mix them evenly, put them into ice water bath for 5 minutes after boiling water bath for 5 minutes, measure the absorbance at the wavelength of 670 nm of ultraviolet visible spectrophotometer, and draw the flow wash diagram.

c) Calculation method:

The sum of ribose contents in each tube (or the sum of absorbance A1) before KD value ≤ 0.5 and the sum of ribose contents (or the sum of absorbance a) of all tubes before KD value ≤ 0.5 were calculated according to the flow elution map drawn, so as to obtain the recovery rate of bulk polysaccharide with KD ≤ 0.5. Namely:

$\frac{\sum A_1}{\sum a} \leq 0.5$

$\frac{\sum A_1}{\sum a} \leq 0.5$ (1)

[illegible]

a) Sampling volume and collection method: with 0.45 μm membrane filtration for test products, for test ingenuity 1 ml column, with 0.2 mol/L sodium chloride solution flow wash, flow lot wash amount at least 1.2 times the volume of the column bed, automatic collector tube-by-tube collection, 4.5 ml per tube collection.

control to mark zero. After zero, the absorbance of tube 8 to 48 was read. The number of collecting tubes was taken as the abscissa, and the absorbance value was used as the ordinate to draw the flow elution map. The flow washing volume V_e (flow washing volume $V_e = 4.5 \text{ ml} \times \text{tube number}$) from the sample adding time to the peak was calculated.

c) Calculation method:

The area of the component peak of the KD value of 0.2 (or sum A1 of the absorbance value) is calculated according to the drawn flow map, divided by the total area of all component peaks (or sum of absorbance values A), i.e. the recovery rate of Group A meningococcal polysaccharide conjugate $KD \leq 0.2$. That is:

$$\frac{\sum_{i=1}^n A_{0.2}}{\sum_{i=1}^n A_i} \times 100 \leq 0.2$$

6.3.3.6 The determination of molecular size of group C meningococcal polysaccharides (bulk):

a) Sampling volume and collection method: with $0.45 \mu\text{m}$ membrane filtration for test products, for testing 1 ml column, with 0.2 mol/L sodium chloride solution flow wash, fluid lotion amount is at least 1.2 times the volume of the column bed, automatic collector tube-by-tube collection, each tube collection 4.5 ml.

b) Determine the absorbance of the liquid collected by the automatic collector at the wavelength of 206 nm. The fifth and sixth tubes of the collected solution were mixed and used as blank control to mark zero. After zero, the absorbance of tube 8 to 48 was read. The number of collecting tubes was taken as the abscissa, and the absorbance value was used as the ordinate to draw the flow elution map. The flow washing volume V_e (flow washing volume $V_e = 4.5 \text{ ml} \times \text{tube number}$) from the sample adding time to the peak was calculated.

c) Calculation method:

Partition coefficient $KD = (V_e - V_0) / (V_i - V_0)$

The area of the component peak of the KD value of 0.5 (or the sum of the absorbance value A1) is calculated according to the resulting flow map, divided by the total area of all component peaks (or the sum of the absorbance values A). The recovery rate of Group A meningococcal Standard Operating Procedures of Yuxi Walvax Biotechnology Co., Ltd.

as the ordinate of the flow wash map.

c) Calculation method:
Partition coefficient $KD = (V_e - V_o) / (V_i - V_o)$
 $KD \leq 0.5$ $\frac{\text{Peak area of } KD \leq 0.5}{\text{Total area of } KD \leq 0.5} \times 100$
=
 $\frac{\text{Peak area of } KD \leq 0.5}{\text{Total area of } KD \leq 0.5} \times 100$
 $\times 100$

6.3.3.12 The determination of molecular size pneumococcal polysaccharide (bulk):
a) Sampling volume and collection method: take pneumococcal polysaccharide (bulk) with 0.45 m membrane filtration, take the test 1 ml column, with 0.9% sodium chloride injection elution, fluid lotion amount at least 1.2 times the volume of the column bed, automatic collector tube-by-tube collection, 4.5 ml per tube collection.

b) The liquid collected by the automatic collector, 5th and 6th tubes, is combined and mixed and mixed to take 1 ml as blank care, from the 11th tube to the 40th tube, 1 ml per tube, 1ml. Add 4000 μ l ketone mixture in each tube, mix well, boil in the boiling water bath in the water bath for 20 minutes, remove and put in the 40 degrees C water bath for 10 minutes, measure the absorbance at 620 nm, with the number of tubes for horizontal coordinates, the corresponding absorbance for the coordinates of the polysaccharide molecular spectrum, to find the corresponding number of tubes, calculate the peak volume of the corresponding volume V_e at the peak (flow washing volume $V_e = 4.5\text{ml} \times \text{tube number}$).

c) How to calculate:
Partition coefficient $KD = (V_e - V_o) / (V_i - V_o)$
According to the different types, the recoveries were calculated according to the following requirements: stereotype 1, 2, 3, 4, 7F, 8, 9N, 12F, 14, 18C, 19F, 23F of pneumococcal polysaccharides (bulk) to calculate the recovery rate of $KD < 0.3$; stereotype 19A of pneumococcal polysaccharide (bulk) calculated $KD < 0.5$ rate of recovery; stereotype 5, 6A, 6B, 9V, 10A, 11A, 15B, 17F, 20, 22F, 33F of pneumococcal polysaccharide (bulk) calculated $KD < 0.6$ rate of recovery.
Standard Operating Procedures of Yuxi Walvax Biotechnology Co., Ltd.

Operating procedures
determination of molecular Version 13 Pages 16/21
size
Confidential documents, no copying.

0.6 rate of recovery. According to the molecular map of the polysaccharide (bulk) of this type of pneumococcus, the sum of the contents (or absorbance) of the polysaccharide with $KD < 0.3$, < 0.5 and < 0.6 was calculated and divided by the sum of the contents (or absorbance) of all the polysaccharides (or absorbance) of the type of pneumococcal polysaccharide (bulk), the recoveries of $KD < 0.3$, < 0.5 and < 0.6 were obtained. Namely:

$KD < 0.3$ $\frac{\text{Peak area of } KD < 0.3}{\text{Total area of } KD < 0.3} \times 100$
=
 $\frac{\text{Peak area of } KD < 0.3}{\text{Total area of } KD < 0.3} \times 100$
 $\times 100$

$KD < 0.5$ $\frac{\text{Peak area of } KD < 0.5}{\text{Total area of } KD < 0.5} \times 100$
=
 $\frac{\text{Peak area of } KD < 0.5}{\text{Total area of } KD < 0.5} \times 100$
 $\times 100$

$KD < 0.6$ $\frac{\text{Peak area of } KD < 0.6}{\text{Total area of } KD < 0.6} \times 100$
=
 $\frac{\text{Peak area of } KD < 0.6}{\text{Total area of } KD < 0.6} \times 100$
 $\times 100$

6.3.3.13 The determination of molecular size of pneumococcal polysaccharide derivative:
a) Sampling volume and collection method: take pneumococcal polysaccharide derivatives with 0.45 m membrane filtration, take the test 1 ml column, wash away with 0.9% sodium chloride injection, the amount of fluid lotion is at least 1.2 times the volume of the column bed, automatic collector tube collection, 4.5 ml per tube collection.

b) The liquid collected by the automatic collector, 5th and 6th tubes, is combined and mixed and mixed to take 1 ml as blank care, from the 11th tube to the 40th tube, 1 ml per tube, 1ml. Add 4000 μ l ketone mixture in each tube, mix well, boil in the boiling water bath in the water bath for 20 minutes, remove and put in the 40 degrees C water bath for 10 minutes, measure the absorbance at 620 nm, with the number of tubes for horizontal coordinates, the corresponding absorbance for the coordinates of the polysaccharide molecular spectrum, to find the corresponding number of tubes, calculate the peak volume of the corresponding V_e volume

V_e at the peak (flow washing volume $V_e = 4.5\text{ml} \times \text{tube number}$).

BioBridge Master Knowledge — Page 1303

8.3 Wash the gel with a column volume of 0.5 mol/L sodium hydroxide solution per month as a flow phase, and use phase after cleaning. The delude should be cleaned, until the pH of the outflow fluid after cleaning is less than 7 and then the gel column is demarcated.

8.4 If the self-matching eraser must be degassed by steam sterilization or suitable methods (e.g. negative pressure).

8.5 The collection pipe of the branch collector shall be marked with a marker to prevent confusion.

8.6 Tomography column standard, free protein control numbering principle:
To A, B, C, D... As a fixed number for the tomography column, the date on which the bar is marked is a numeric number, if the A-pillar is standard on August 05, 2018, the number is A-pillar 201808005, which is valid for 30 days and is valid until September 03, 2018.
The device number of the AKTA pure25 purifier system is digitized by the date of the start of the bar: if The WYQCF0455 bar is on August 05, 2018, the number is WYQCF455 201808005, which is valid for 30 days and is valid until September 03, 2018.

8.7 Each test tube used to collect eluent on the step-by-step collector needs to be numbered, and when the eluate content of each tube is determined, the test tube containing the reaction solution also needs to be numbered to ensure the accuracy of molecular size detection results.

8.8 Under 260nm, the blue glucan 2000 solution elution peak (first peak) top corresponds to the Standard Operating Procedures of Yuxi Walvax Biotechnology Co., Ltd.

determination of molecular Version 13 Pages 20/21
size
Confidential documents, no copying.

volume of the post V0. At 370 nm, the volume of the vitamin B12 solution eludes the peak (peak) top corresponding to the Vi of the post.

8.9 from the addition of samples to polysaccharide peak flow wash volume Ve flow wash volume Ve 4.5 ml, the number of tubes (if there are two peaks, take the second peak corresponding tube number).

8.10 About the standard of column chromatography calibration: V0, Vi, the judgment standard of calibration consistency in different time periods. It should be no more than 1 tube, that is, the chromatographic column V0, Vi calibrated continuously before and after two times, and the number of detection tubes should not move forward and backward more than 1 tube. If it does not meet the requirements, analyze the cause and conduct investigation.

8.11 Gel column filling: If the refill gel column, to be filled, after the completion of calibration, the last sample before the gel column filling needs to be retested, the two test results will be compared, KD shall not exceed 0.06, the recovery rate should not exceed 10%, if the requirements are not met to analyze the reasons, investigate.

6 Working procedure

6.1 Principle

6.1.1 Method one: this method uses high concentration salt and high concentration ethanol to precipitate free polysaccharide and conjugate glycoprotein in low temperature environment, and then add water to redissolve free polysaccharide. Conjugate glycoprotein cannot be redissolved due to irreversible denaturation of protein, so the purpose of separation of conjugate glycoprotein and free polysaccharide can be realized.

6.1.2 Method two: sodium deoxycholate forms protonated micelles under acidic conditions. With the increase of hydrogen ion concentration in the solution, protonated micelles gradually increase through the hydrogen bond of acid salt structure and finally form stable high-grade micelles. The micelles have the characteristics of protein adsorption, so the purpose of separation of bound glycoproteins and free polysaccharides can be realized.

6.2 Reagent preparation

6.2.1 5mol/L sodium chloride solution

Accurately weigh 14.61g of sodium chloride, put it into a 50ml volumetric flask, add a proper amount of purified water to dissolve and volume it to the scale, and mix it evenly.

6.2.2 1% sodium deoxycholate solution

b) Add 50ul of 1mol/L hydrochloric acid solution into each centrifuge tube. mix well, and

place at 2-8℃ for 30min.

c) Centrifuge the tubes at 8000g, 5min for 30min.

d) Carefully take 800μl of supernatant using a pipette respectively, which is recorded as DS and YS.

6.3.3.2 Determination of polysaccharide content

a) Take 300μl of solution D, add 900μl of diluent 1 (DIL1), mix well to obtain 4 times dilute solution, determine the polysaccharide content on the IMMAGE 800, input 4.4 (i.e. 4×1.1) of off-line dilution multiple. If the result is beyond the inspection range, adjust the dilution multiple to A, and input A×1.1 of off-line dilution multiple.

b) Take 300μl of solution Y, add 60μl of diluent 1 (DIL1), mix well to obtain 3 times dilute solution, determine the polysaccharide content on the IMMAGE 800, input 3.3 (i.e. 3×1.1) of off-line dilution multiple.

c) Take 400μl of DS solution, add 800μl of diluent 1 (DIL1), mix well to obtain 3 times dilute solution, and determine polysaccharide content on the IMMAGE 800. If the result is beyond the detection range, adjust the dilution multiple. The final result is calculated SOP of Yuxi Walvax Biotechnology Co., Ltd.

manually by the tester (i.e. test result × dilute multiple).

d) Take solution YS and directly put it on the IMMAGE 800 to determine the polysaccharide content. The final result is calculated manually by the tester (i.e. test result × dilution multiple).

6.3.3.3 Result calculation
Calculate the conjugate antigen content and test validity as following formula:

$$H = (1 - P) \times 100\%$$

$$H = \frac{A}{B} \times 100\%$$

In the formula,
H: the conjugate antigen content of test samples, %;
P: the test validity, which shall be 70-130%.

N/A

8 Matters need attention

8.1 In the process of free polysaccharide separating from 13-valent pneumococcal polysaccharide vaccine samples(except type 3), the supernatant in the centrifuge tube should be directly poured out after centrifuging at 6000g, 5min for 90min, and the supernatant in the centrifuge tube should be completely sucked by inverted on the absorbent paper.

8.2 When removing supernatant from the centrifuge tube, pay special attention that the pipette tip is not allowed to touch the tube wall, and it is not allowed to take precipitate or floating substance.

3.2 BODY OF DATA

INTRODUCTION

The Applicant has developed the 13-valent Pneumococcal Polysaccharide Conjugate Vaccine (Weuphoria), for use in infants and young children to prevent pneumococcal disease, caused by the 13 pneumococcal serotypes contained in the vaccine. Weuphoria is a sterile liquid formulation of pneumococcal capsular polysaccharides of serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F, individually conjugated to tetanus toxoid. Phosphate-buffered Saline is also included in the Weuphoria formulation to improve process control and to provide further pH control following the addition of aluminum phosphate.

Manufacturer: Yuxi Walvax Biotechnology Co., Ltd.

Common name of drug product: 13-valent Pneumococcal Polysaccharide Conjugate Vaccine.

This vaccine is produced by culture, extraction and purification of polysaccharide antigens of 13 epidemic and infectious Streptococcus pneumoniae of serotypes of 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F. After being activated and derived, the polysaccharide conjugates with tetanus toxoid carrier protein to form polysaccharide protein conjugate, which is prepared by mixing with a certain proportion and adding aluminum phosphate adjuvant. The vaccine is milky even suspension after shaking. After storage, white precipitates and supernatant can be seen due to the subsidence of adjuvant. No preservatives contained.

Table 1 Product Composition (each dose/0.5mL contains)

Active Substances	Nominal Composition	Function
Pneumococcal polysaccharide serotype 1	2.6 µg	Antigen
Pneumococcal polysaccharide serotype 3	2.5 µg	Antigen

MODULE 3 QUALITY

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Proprietary name:

Route of administration: The vaccine should be shaken well immediately prior to use, and be given intramuscularly. The preferred sites for injection are the anterolateral aspect of the thigh in infants and the deltoid muscle of the upper arm in toddlers and children. Each dose (0.5 mL) is to be injected. The vaccine should not be injected in and/or near the areas where there may be a nerve trunk and/or blood vessel.

3.2.S.2.2.2 Brief Description of Manufacturing Process

Walvax carries out production in accordance with the Drug Registration Standard for 13-valent
Pneumococcal Conjugate Vaccine (Standard No.: YBS00392019) approved by the National
Medical Products Administration.
The manufacturing process includes the following process: establishment and passage of the seed
batches, amplification of strain and large tank cultivation, sterilization of bacteria and harvest of
fermentation liquor, preparation of the crude polysaccharide and refined polysaccharide,
polysaccharide derivatization, polysaccharide conjugation with tetanus toxoid carrier protein.
After purification, sterilization and filtration, the conjugate bulk was obtained and stored at 2-8 °C.
The preparation of tetanus toxoid protein carrier includes the establishment and passage of seed
batches, amplification of bacteria and large tank fermentation, sterilization and harvest of
fermentation liquid after culture, ultrafiltration, two-stage salting out and formaldehyde
detoxification to obtain tetanus toxoid original liquid, and further purification to obtain the purified
tetanus toxoid liquid.

3.2.S.2.3 Control of Materials

2.3.S.2.3.1 Strain for Production

(1) Source of Strain

The strains used in the manufacturing are pneumococcus serotype 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F strains, which are purchased from National Centre for Medical Culture Collections of NIFDC.

Table 4 The name and CMCC code of pneumococcal strains

Serotypes Strain Name CMCC Code

1	Streptococcus pneumoniae serotype 1	31404
3	Streptococcus pneumoniae serotype 3	31441
4	Streptococcus pneumoniae serotype 4	31448
5	Streptococcus pneumoniae serotype 5	31457
6A	Streptococcus pneumoniae serotype 6A	31476
6B	Streptococcus pneumoniae serotype 6B	31492
7F	Streptococcus pneumoniae serotype 7F	31510
9V	Streptococcus pneumoniae serotype 9V	31547
14	Streptococcus pneumoniae serotype 14	31605
18C	Streptococcus pneumoniae serotype 18C	31689
19A	Streptococcus pneumoniae serotype 19A	31708
19F	Streptococcus pneumoniae serotype 19F	31696
23F	Streptococcus pneumoniae serotype 23F	31761

Clostridium tetani (CMCC 64008), which is used for producing the tetanus toxoid carrier protein, was purchased from National Centre for Medical Culture Collections of NIFDC.

(2) Establishment of Seed Lot

According to the Chinese Pharmacopoeia, Walvax established the Bacteria Management procedure (WSYX-QA-SMP-00-05-0001) for the bacteria bank establishment and the three-level seed bank management. The three-level seed bank includes original seed lot, master seed lot and working seed lot. The original seed is lyophilized after culturing two generations, as well as the working seed lot. The working seed lot is used for vaccine production. The biological characteristics of the working seed lot is consistent with the original seed lot, and each seed lot is stored below -60 °C.

(3) Strain detection

Based on Bergey's Manual of Determinative Bacteriology (the 8th Edition), Testing Methods for Streptococcus Pneumoniae on Experimental Animals (GB/T 14926.15-2001), and Vaccines (2004 Edition), Walvax established testing items and standards for the Streptococcus Pneumoniae strains and Clostridium tetani strains.

According to the test items and specifications in the Table 7, the three-level seed lot of 13 types Streptococcus Pneumoniae were tested. The results showed from the Table 8 to Table 20, which indicate that the master seed lot and working seed lot have the same biological, biochemical and serological characteristics as the original seed lot.

According to the test items and specifications in the Table 21, the three-level seed lot of Clostridium Tetani were tested. The results showed in the Table 22, which indicate that the master seed lot and working seed lot have the same biological, biochemical and serological characteristics as the original seed lot.

Table 21 Testing Items and Standards of Clostridium Tetani Strain
Test items Specifications
Obligate anaerobic, preferential temperature at 37 ■, turbid with gas produced and rotten stench in cooked
Growth Characteristic meat culture, permeated bacteria colony in blood agar medium, flagellar motility in semi-solid puncture
Cultural culture.
Characteristic
Gram negative, rod-shaped bacteria with little amount of spores at the beginning of cultivation; transformed to
Staining Microscopy
Gram positive, drumstick-shaped bacteria with round spores on the top after 48 h of cultivation.
Glucose Negative
Lactose Negative
Xylose Negative
Saccharose Negative
Biochemical Galactose Negative
Reactions Fructose Negative
Nitrate Negative
Gelatin liquefaction Positive
Hydrogen sulfide Positive
Dynamic experiment Positive

(4) Study on the heredity stability of pneumococcal strains
[Pneumococcal strain]
In order to ensure the stability of both process and product quality, Walvax carried out heredity
stability studies for strains of all 13 serotypes. Each strain is passed continuously to the 20th
generation. During the process, bacteria from the 10th, 15th, and 20th generations are
comprehensively tested. The process diagram is as follows:

Open a vial of lyophilized Working Seed Lot

Culture on solid medium for 20±4 h, then

Figure 10 The Process of Heredity Stability for Pneumococcal Strains

Testing results of strains from all generations have been constant with the Working Seed Lot.
There has been no change in biological, biochemical, or serological characteristics of the strains.
The stability of the strains used in production is proven.

[Clostridium tetani strain]
In order to ensure the stability of vaccine production process and product quality, Walvax carried
out heredity stability studies of Clostridium tetani strain. Each strain is passed and cultured in the
cooked meat semi-solid medium every year. The storage strain has been passed three times, and
the production strain has been passed five times, without any decline in virulence and
morphological variation. The test results of the strain show that its culture characteristics, staining
microscopy, biochemical reaction and specific neutralization tests are same as the seed lot, which
confirmed that the production strains of Clostridium tetani had good stability.

(5) Study on the virulence stability of pneumococcal strains
[Study Objective]

To investigate the virulence and virulence stability of pneumococcal serotype 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F production strain.

[Reference]
Manual of medical biological products, 235-241

[Experiment material]
The 3rd generation and the 20th generation of pneumococcal serotype 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F production strain.

[Experiment method]
The strain was diluted with normal saline and inoculated on solid medium containing 10% sheep blood. After incubation at 37±1 ■ and CO2 for 20±4 hours, the coating of pneumococcus was washed with normal saline and gradient diluted. The dilution was 1:10, 1:100, 1:103 until 1:108, the last three dilutions (1:106, 1:107, 1:108) were used to inject 18-22 g healthy mice (3 mice for each dilutions) into abdominal cavity at 0.5 ml/mouse.

[Criteria]
In 72 hours, if 2 of the 3 mice injected with 1:107 and 1:108 dilutions died, the strain is a strong virulent strain, otherwise it is a weak virulent strain.

[Experiment result]

From Table 23, it can be seen that the 13 strains (pneumococcus serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F) used for production are attenuated vaccine strain. After 20 generations of continuous transplanting, the strain virulence did not change and the strain was still attenuated vaccine strain. It showed that the virulence of the strain is stable and the strains are suitable for vaccine development and production.

3.2.S.2.3.2 Other Raw Materials

The company has formulated the Material Management Control Procedure (WSYX-P-05-0005) to guide and control the management and storage of the company's materials. All purchased materials are from qualified suppliers approved by the quality management director. For each kind of material, the company has established the inspection standard operating procedures according to the legal standards of the material to check whether the quality indicators of the material meet the quality requirements of the product production. At the same time, collect documents to prove whether the raw materials used in production contain ingredients of animal derived materials. If the materials contain ingredients of animal derived materials, further collect animal safety certification materials of the materials to ensure the safety of materials used in production and further ensure the safety of products. See the Table 24 and Table 25 for the composition of culture medium.

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

3.2.S.2.5 Process Validation and/or Evaluation

The process validation of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine was divided into 2 stages, (1) process design to define the commercial manufacturing process, and (2) process qualification to determine if the process is capable of reproducible commercial manufacturing. The purposes of this process validation were to find (1) whether quality of the product is built into and assured by the manufacturing process, and (2) whether the designed process parameters can produce products with sufficient safety and efficacy.

Validation Protocols

The validation and production of validation samples comply with Standard Operation Procedure of Production and Testing of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine. The validation of monovalent polysaccharide bulk production completed in 2015, and the validation of monovalent polysaccharide conjugate production as well as final product production (vial and pre-filled syringe) completed in 2017.

During monovalent polysaccharide bulk production validation and monovalent polysaccharide conjugate bulk production validation, continuous 3 batches of polysaccharide and polysaccharide conjugate were manufactured and tested to see if the manufacturing process for monovalent polysaccharide bulk and monovalent polysaccharide conjugate bulk can produce homogeneous monovalent polysaccharide and monovalent polysaccharide conjugate that complies with specifications.

In Walvax's Pneumococcal Vaccines Workshop, there are in total 2 production lines for pneumococcal polysaccharide conjugate, and in total 4 purification systems with BPG300/750 purification column. During the process validation, 1 of the 4 purification systems was used for 1 single batch.

Documented validation protocols and reports are listed as below.

Table 28 List of Process Validation Protocol and Report for Intermediate Products

Process Design

The manufacturing process is designed to consist 3 stages, which are (1) production of monovalent polysaccharide bulk, (2) production of monovalent polysaccharide conjugate bulk, and (3) production of final product of PCV13 (vial and pre-filled syringe).

Production of bulk polysaccharide

The production process of pneumococcal polysaccharides can be concluded to fit into 2 types of processes, one is the manufacturing process of serotypes 1, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F polysaccharides (Type 1 process), the other is the manufacturing process of serotype 3 polysaccharide (Type 2 process). The 2 types of processes are mostly similar with small variations.

MODULE 3 QUALITY

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Brief description of polysaccharide production Type 1

1. Strain amplification

When working seed lot is opened, it was inoculated to a kolle bottle containing Streptococcus pneumoniae comprehensive solid culturing media with 10% sheep blood. Culture for 20±4 hours under 37±1 ■ with 5 - 10% carbon dioxide.

It was then inoculated to a kolle bottle containing Streptococcus pneumoniae comprehensive solid culturing media with 10% sheep blood. Culture for 20±4 hours under 37±1 ■ with 5% - 10% carbon dioxide.

2. Fermentation

After strain amplification, inoculate to a 10 L seed tank, fermenting for 3 - 10 hours at 36.5±1 ■. Then it is transferred to a 100 L tank to ferment for no more than 6 hours at 36.5±1 ■ before being transferred to a 900 L tank to ferment for 6±2 hours at 36.0±1 ■.

3. Crude polysaccharide production

Adding 10% sodium deoxycholate solution till final concentration (w/v) reaches 1% ■ hold for 30 minutes to terminate Streptococcus pneumoniae.

3.1. Removal of culturing media

After termination of bacteria, the fermentation liquid is centrifugated at 7000 rpm for 15 minutes.

Supernatant was collected and ultrafiltrated to 10±2 times concentration. To the concentrate is added anhydrous sodium acetate till a final concentration (w/v) of 3 - 8%. pH is adjusted with glacial acetic acid to 5.6±0.3, and pre-cooled ethanol is added to a final concentration (v/v) of 14 - 50%, hold for no less than 8 hours under 2 - 8 °C. Detailed concentration of sodium acetate and ethanol is shown in the table below.

Table 29 Concentration of Sodium Acetate and Ethanol in Crude Polysaccharide Production Process

Serotypes	Sodium acetate (%)	Ethanol (%)	Serotypes	Sodium acetate (%)	Ethanol (%)
1	5±0.5	20±3	9V	6±0.5	33±3
4	6±0.5	37.5±3	14	5±0.5	20±3
5	7.5±0.5	25±3	18C	5±0.5	28.5±3
6A	5±0.5	25±3	19A	5±0.5	27±3
6B	5±0.5	25±3	19F	5±0.5	27±3
7F	7±0.5	45.7±3	23F	5±0.5	28±3

3.2. Polysaccharide precipitation
After removal of culturing media, the mixture is centrifugated at 10000 rpm for 60 minutes. Supernatant is collected and anhydrous sodium acetate is added to a final concentration of 5 - 13% (no need to add sodium acetate for serotype 5). pH is adjusted with glacial acetic acid to 5.6±0.3. Pre-cooled ethanol is added to a final concentration of 30 - 78%. Hold at 2 - 8 °C for no less than 3 hours. Detailed concentration of sodium acetate and ethanol is shown in the table below.

Table 30 Concentration of Sodium Acetate and Ethanol in Refined Polysaccharide Production Process

Serotypes	Sodium acetate (%)	Ethanol (%)	Serotypes	Sodium acetate (%)	Ethanol (%)
1	6±0.5	44±3	9V	9±0.5	55.5±3
4	12±0.5	75±3	14	10±0.5	60±3
5	70±3	18C	10±0.5	63.6±3	
6A	10±0.5	50±3	19A	10±0.5	63.5±3
6B	10±0.5	50±3	19F	10±0.5	63.5±3
7F	12±0.5	75±3	23F	10±0.5	60±3

3.3. Crude polysaccharide washing
After polysaccharide precipitation, the mixture is centrifugated at 4000 rpm for 15 minutes. Precipitate is collected and washed in turn with anhydrous ethanol, acetone and ether. The crude polysaccharide is then lyophilized and stored below -20 °C.

4. Refined polysaccharide production
4.1. Removal of protein
Crude polysaccharide is dissolved into neutral 0.3 mol/L sodium acetate solution to a final concentration of 5 - 20 mg/mL. Cold phenol solution is added at a volume ratio of 1:0.5 - 1:1, details of number of extraction times is listed in the table below. The mixture is then centrifugated at 10000 rpm for 40 minutes. Supernatant is collected and ultrafiltrated with no less than 40 times water for injection.

Table 31 Number of Extraction (Times) in Protein Removal Process

Serotypes	Number of extraction (times)	Serotypes	Number of extraction (times)
1	5±1	9V	4±1
4	6±1	14	5±1
5	4±1	18C	5±1
6A	5±1	19A	4±1
6B	5±1	19F	4±1
7F	4±1	23F	5±1

4.2. Removal of nucleic acid
To the mixture is added calcium chloride solution to a final concentration of 0.5 mol/L, then pre-cooled ethanol to a concentration of 15 - 30%. Stir for 30 - 120 minutes, hold for no less than 8 hours at 2 - 8 °C. Centrifugate at 10000 rpm for 60 minutes and collect supernatant, ultrafiltrate for no less than 10 times and collect the concentrate. To the mixture is then added sodium chloride till a final concentration of 0.3 mol/L, then ethanol till a final concentration of 40 - 80%. Stir for 30 minutes and hold for no less than 8 hours at 2 - 8 °C. Detailed ethanol concentration is shown in the table below.

Table 32 Ethanol Concentration used in the Refined Polysaccharide Production Process

Serotypes	1st ethanol (%)	2nd ethanol (%)	Serotypes	1st ethanol (%)	2nd ethanol (%)

7F	25±3	75±3	23F	25±3	60±3

4.3. Refined polysaccharide washing
After removal of nucleic acid, the mixture is centrifugated at 4000 rpm for 15 minutes. Precipitate is collected and washed in turn with anhydrous ethanol, acetone twice and ether. The refined polysaccharide is then lyophilized and stored under -20 °C.

Brief description of polysaccharide production Type 2
1. Strain amplification
When working seed lot is opened, it was inoculated to a kolle bottle containing Streptococcus

pneumoniae comprehensive solid culturing media with 10% sheep blood. Culture for 20±4 hours under 37±1 ■ with 5% - 10% carbon dioxide.
It was then inoculated to a kolle bottle containing Streptococcus pneumoniae comprehensive solid culturing media with 10% sheep blood. Culture for 20±4 hours under 37±1 ■ with 5 - 10% carbon dioxide.

2. Fermentation

After strain amplification, inoculate to 10L seed tank, fermenting for 3 - 10 hours at 36.5±1 ■. Then it is transferred to a 10 L tank to ferment for no more than 6 hours at 36.5±1 ■ before being transferred to a 900 L tank to ferment for 6±2 hours at 36.0±1 ■.

3. Crude polysaccharide production

Adding 10% sodium deoxycholate solution till final concentration (w/v) reaches 1%■ hold for 30 minutes to terminate Streptococcus pneumoniae.

3.1. Removal of culturing media

After termination of bacteria, the fermentation liquid is centrifugated at 7000 rpm for 15 minutes. Supernatant was collected and ultrafiltrated to 8±4 times concentration. To the concentrate is added anhydrous sodium acetate till a final concentration (w/v) of 5%. pH is adjusted with glacial acetic acid to 5.4±0.5, and pre-cooled ethanol is added to a final concentration (v/v) of 33.3±1%, hold for no less than 8 hours under 2 - 8 ■.

3.2. Polysaccharide precipitation

After removal of culturing media, the mixture is centrifugated at 4000 rpm for 15 minutes.

Precipitation is collected.

3.3. Crude polysaccharide washing

After collecting the precipitate. It was washed in turn with anhydrous ethanol, acetone and ether. The crude polysaccharide is then lyophilized and stored under -20 ■.

4. Refined polysaccharide production

4.1 Removal of protein

Confidential 569

MODULE 3 QUALITY

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Crude polysaccharide is dissolved into neutral 0.3 mol/L sodium acetate till a final concentration of 5 - 20 mg/mL. Cold phenol solution is added at a volume ratio of 1:0.5 - 1:1, extract for 4±1 times. The mixture is then centrifugated and supernatant is collected. the supernatant is then ultrafiltrated with no less than 40 times water for injection.

4.2. Removal of nucleic acid

pH is adjusted with sodium bicarbonate solution to 7.0 - 7.5, CTAB solution is added till a final concentration of 1 - 3%, hold for no less than 8 hours at 2 - 8 ■. The mixture is then centrifugated and precipitate is collected. to the precipitate is added 0.2 - 0.4 mol/L sodium chloride solution and stir for 3 - 6 hours. The mixture is then centrifugated at 10000 rpm for 30 minutes and supernatant is collected. Sodium acetate is added till a final concentration of 4 - 10%, and pre-cooled ethanol is added till a final concentration of 33.3±3. Stir for 30 - 120 minutes, hold for no less than 8 hours at 2 - 8 ■.

4.3. Refined polysaccharide washing

The mixture is centrifugated at 4000 rpm for 15 minutes, and precipitate is collected. the precipitate is washed in turn with anhydrous ethanol twice, acetone twice and ether. The refined polysaccharide is then lyophilized and stored at below -20 ■.

Production of monovalent polysaccharide conjugate bulk

1. Derivation of polysaccharide

Refined polysaccharide is dissolved in 0.2 mol/L sodium chloride solution to a final concentration of 3 - 8 mg/ml. If polysaccharide needs molecule degradation, then use ultrasonic method to degrade.

2. Preparation of polysaccharide-ADH derivative

2.1. Derivatives of serotypes 3, 5, 9V and 14

To the solution is added cyanogen bromide at 0.8±0.6 mg per milligram polysaccharide, keep the reaction going at pH 10.5±0.5 under 23±3■ for 12±7 minutes. To the mixture is added adipic acid dihydrazide (ADH) at 4±1 mg per milligram polysaccharide. Keep the reaction going for 20±10 minutes. The reaction is quenched and hold for no less than 8 hours under 5±3■. After ultrafiltration and sterilization filtration, polysaccharide-ADH derivative is stored under 5±3■.

2.2. Derivatives of serotypes 1, 4, 6A, 6B, 7F, 18C, 19A, 19F and 23F

To the solution is added 1-cyano-4-dimethylaminopyridinium tetrafluoroborate (CDAP) as activation agent at 0.5±0.4 mg per milligram polysaccharide. Keep the reaction going at pH 9.0±1.0 under 20±3 ■ for 5±2 minutes. To the mixture is added adipic acid dihydrazide (ADH) at 4±1 mg per milligram polysaccharide. Keep the reaction going for 20±10 minutes. The reaction is quenched and hold for no less than 8 hours under 5±3 ■. After ultrafiltration and sterilization filtration, polysaccharide-ADH derivative is stored under 5±3 ■.

2.3. Preparation of polysaccharide-protein conjugate

To the derivative is added tetanus toxoid at 0.8±0.5 mg per milligram of derivative and sodium chloride till a final concentration of 0.2 mol/L. pH is adjusted with hydrochloric acid to 5.5±0.5. To the mixture is added 1-ethyl-3-(3-dimethylaminopropyl) carbodiimide (EDAC) at 6±5 mg per milliliter of mixture. Keep the reaction going under 5±3 ■ for 4±2 hours. The reaction is quenched with pH adjustment to 7.0±0.5. Hold for no less than 5 hours and dialyze with sodium chloride solution for no less than 8 hours.

Confidential 570

MODULE 3 QUALITY

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

3. Purification of conjugate

The conjugate is purified by column chromatography with Sepharose 4FF column. Use normal saline (for serotype 3) or 0.2 mol/L sodium chloride solution (for all other serotypes) as elution solution. pH at elute side is 5.0 - 7.0, pressure is no more than 0.3 MPa, and loading size is no more than 8% of column volume.

Monovalent polysaccharide conjugate bulk is collected after sterilization filtration of elute around VO.

Production of Final Product (Vial and Pre-filled Syringe)

1. Dilution

Monovalent polysaccharide conjugate bulk, sodium chloride solution and aluminum phosphate are opened and changed to siphonages in a access-restricted isolated system. Water for injection, sodium chloride solution, aluminum phosphate and phosphate buffer are linked to the liquid preparation tank via sterilized connector. Injection water, sodium chloride solution, aluminum

phosphate and phosphate buffer are pumped into the liquid preparation tank per dilution plan. Monovalent polysaccharide conjugate bulks are linked to the bulk weighing bottle, and the weighing bottle is linked to the liquid preparation tank. The monovalent polysaccharide bulks are weighed in the weighing bottle and then pumped into the liquid preparation bottle. Dilution protocol is as below.

There should be 8.8 - 13.2 µg of serotype 6B polysaccharide conjugate, 4.4 - 6.6 µg of serotypes 1, 3, 4, 5, 6A, 7F, 9V, 14, 18C, 19A, 19F and 23F polysaccharide conjugates each, 1.0 mg aluminum phosphate as adjuvant, 88.7 µg monosodium phosphate, 38.0 µg disodium phosphate and 8.5 mg sodium chloride per milliliter final bulk.

2. Sterilized filling

Conclusion
The production process of 13-valent pneumococcal polysaccharide conjugate vaccine (vial) under pre-determined process parameters can continuously manufacture products that comply with Standard Operation Procedure for Production and Testing of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine (Vial), critical process parameters and critical quality attributes are well in control during manufacturing process and the process is stable.
The production process of 13-valent pneumococcal polysaccharide conjugate vaccine (syringe) under pre-determined process parameters can continuously manufacture products that comply with Standard Operation Procedure for Production and Testing of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine (Syringe), critical process parameters and critical quality

attributes are well in control during manufacturing process and the process is stable. During process validation of Packaging Center, manufacturing capability of vial (production line 1 and 2) is between 80000 - 150000 vials, and batch size during process validation was 80000 vials. Thus, the commercial manufacturing batch size is 100000 vials, which falls within the manufacturing capability. During process validation of Packaging Center, manufacturing capability of pre-filled syringe is between 80000 - 140000 pre-filled syringes, and the batch size during process validation was 80000 pre-filled syringes. Thus, the commercial manufacturing batch size is 100000 pre-filled syringes, which falls within the manufacturing capability.

Continued Process Verification

Walvax will continue to monitor the manufacturing process of PCV13. Based on statistical analysis of process data and critical quality attributes of the product, the manufacturing process is constantly monitored, and dynamically ensures critical quality attributes are in control in the whole life cycle of the product.

MODULE 3 QUALITY

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

3.2.S.2.6 Manufacturing process Development

1. Polysaccharide preparation process

The company has independently developed a pneumococcal synthetic medium, which is suitable for the growth of pneumococcus. Growth of bacteria is monitored by testing OD at 694nm. Systematic condition screening and optimizing are carried out for critical parameters including temperature, pH, pressure, speed of stirring, inoculation concentration, etc. Batches of fermentation and polysaccharide purification process validation for all serotypes have been completed. According to the results of validation, the process is feasible and repeatable; the yield of purified polysaccharide is stable. All the quality testing results are in compliance with registration standards, Chinese Pharmacopeia (2010 Edition), European Pharmacopeia 7.0 (2011 Edition), and WHO guidelines.

2. Production Process of Carrier Protein (Tetanus Toxoid)

The production process of Yuxi Walvax's tetanus toxoid is as follows: recovery and amplification of tetanus clostridia, fermentation, precipitation with ammonium sulfate, purification, detoxification with formaldehyde, and purification using chromatography. The purified tetanus toxoid bulk is then used as carrier proteins.

Yuxi Walvax's production process of tetanus toxoid is mature and stable; fermentation produces high yields of toxin (floc unit of ferment is over 100 lf/ml, which is much higher than Chinese Pharmacopeia specifications of 40lf/ml); the quality of the products is good and stable; all testing results comply with requirements in Chinese Pharmacopeia.

3. Conjugation Process

The company carries out comprehensive molecular structural analysis for purified polysaccharide.

Conjugation is carried out via indirect method: the polysaccharide is activated and derivated to yield polysaccharide-ADH; derivation is conjugated to the carrier protein (tetanus toxoid), with EDAC as the catalyst to yield polysaccharide-TT conjugate; conjugate is purified by gel column chromatography; collect the absorption peak near V0 to yield conjugate bulk. Stability of the process is validated.

Results of process validation demonstrate that the processes of activation, derivation, and conjugation are stable; that the yield of conjugation is stable; and that the quality of conjugate bulk complies with in-house specifications.

3.2.S.3 Characterization

3.2.S.3.1 Elucidation of Structure and other Characteristics

Walvax carried out 1H-NMR tests of the 13 serotypes of pneumococcal polysaccharides, and analyzed the corresponding spectra by comparison with ATCC standard polysaccharides. The results showed that the structures of Walvax's polysaccharides are in full accord with ATCC standard polysaccharides.

Table 62 General Information of 1H-NMR Tests of the 13 Serotypes of Pneumococcal Polysaccharides

Test information Walvax ATCC

NMR machine Varian Inova 500 Varian Inova 500

Frequency 500 MHz 500 MHz

For serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 18C,

For all 13 serotypes: D2O + 19A, 19F, 23F: D2O + 0.01%DMSO + 0.01%

Solution system 0.05%wt TSP + 0.5 mg/mL DSS-d6

maleic acid For serotype 14: D2O + 0.05%wt TSP +

0.5mg/ml maleic acid

Polysaccharide

5 mg/mL 5 mg/mL

concentration

Given the information in Table 62, test instrument and test frequency of Walvax's polysaccharides tests match those of ATCC standard polysaccharides tests. Walvax's polysaccharides used a solution system of D2O + 0.05% wt TSP + 0.5 mg/mL maleic acid, while ATCC serotypes 1, 3, 4, 5, 6A, 7F, 9V, 18C, 19A, 19F, 23F polysaccharides used a solution system of D2O + 0.01% DMSO + 0.01% DSS-d6, and serotype 14 used a solution system of D2O + 0.05% wt TSP + 0.5 mg/mL maleic acid. The two systems used maleic acid and DMSO respectively as quantitative and TSP and DSS-d6 respectively as internal standard, which has no influence on test results.

3.2.S.3.2 Impurities

3.2.S.3.2.1 Impurities and their Limits in Polysaccharide Purification Process

(1) C-polysaccharide, nucleic acid and protein are the main impurities in refined polysaccharide production.

The quality of pneumococcal polysaccharides manufactured by Walvax are controlled according to the European Pharmacopeia. Control of C-polysaccharide are implemented via various purification steps. Table x shows residual C-polysaccharide contents in 12 serotypes of polysaccharides derived from NMR spectrum analysis, which are all below 20%, indicating the purification process can effectively remove C-polysaccharide impurities.

*: Since signature peak(s) and content of C-polysaccharide cannot be analyzed in NMR spectrum of serotype 5 polysaccharide due to its structural features, no result for serotype 5 is available.

During approval process of new drug of PPSV23, Walvax completed process optimization and validation studies, including impurities removal process validation. According to the established purification process of serotypes 1, 3, 4, 5, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F, 3 continuous batches of the above serotypes are purified, sampled in each step, and impurities removal rate was calculated with nucleic acid and protein content derived from polysaccharide content, and viability, reproducibility and stability was evaluated.

Crude polysaccharide solution, concentrated phenol extraction ultrafiltration solution and concentrated solution after precipitation of nucleic acid of serotypes 1, 4, 5, 6B, 7F, 9V, 14, 18C, 19A, 19F and 21F were sampled and analyzed for nucleic acid, protein and polysaccharide content, percentages of nucleic acid and protein were calculated, and impurities removal rate of each step was evaluated by comparison of data from before/after each steps. Table X shows the removal rate of nucleic acid and protein.

Table 66 shows that the nucleic acid and protein removal rate of 3 batches of serotype 3 polysaccharide was relatively stable, which indicates the purification process is stable. Nucleic acid and protein impurity contents were monitored in the established purification process of serotypes 1, 3, 4, 5, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F, and removal rates of each step was calculated. The test results show the removal rates were high and stable, content homogeneity was well controlled, which indicates good reproducibility and stability for the purification process in pneumococcal polysaccharide vaccine manufacture.

(2) Studies on organic solvents (reagents) removal in polysaccharide production
I. Types and purposes of organic reagents used in polysaccharide manufacture
In the production process of pneumococcal polysaccharide, organic solvents (reagents) are used. According to the Chinese Pharmacopeia (2010 version), similar reagents are used in pneumococcal polysaccharide vaccine, Vi capsular polysaccharide vaccine and Hib conjugate vaccine
Confidential 617
MODULE 3 QUALITY

II. Organic solvents (reagents) removal process
Table 68 Description of Organic Solvents (Reagents) Removal Process
Organic solvent
Removal process
(reagent)
After fermentation, DOC is added for sterilization, after which several steps are done, including ultrafiltration of crude polysaccharide, ethanol precipitation, ultrafiltration of DOC refined polysaccharide and ethanol precipitation. Due to low molecular size and good water solubility, DOC can be effectively removed from capsular polysaccharide.
Phenol is used in the removal of protein, after extraction with phenol, the mixture goes through ultrafiltration to remove phenol, after which several stages of ethanol precipitation and ultrafiltration were conducted. In the ultrafiltration and ethanol Phenol precipitation process, phenol can be effectively removed due to its low molecular size and good solubility in both water and organic solution. Moreover, in the process of washing with ethanol, acetone and ether, phenol was further separated and removed. 95% ethanol is used in precipitation of crude and refined polysaccharide and can be 95% ethanol effectively removed with ultrafiltration. Vacuum drying and washing with acetone and ether of refined polysaccharide can further remove ethanol.

Anhydrous Anhydrous ethanol is used to wash refined polysaccharides, it can be removed with ethanol acetone, ether and vacuum drying.
Acetone is used to wash refined polysaccharide; it can be removed by washing with Acetone ether and vacuum drying.
Ether Ether is used to wash refined polysaccharide; it can be removed by vacuum drying.
CTAB is used for removal of nucleic acid in serotype 3 polysaccharide; freezing, CTAB centrifugation and ethanol precipitation can remove most of the CTAB used, residual CTAB can be removed with washing using anhydrous ethanol.

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Those test results show good reproducibility of ethanol, ether and acetone concentration between continuous 3 batches. There's difference between different serotypes, but residual contents remain low, the average residual ethanol is 119.22 µg/mL (polysaccharide concentration at 3.0 mg/mL), the average residual ether is 8.87 µg/mL (polysaccharide concentration at 3.0 mg/mL), the average residual acetone is 47.09 µg/mL (polysaccharide concentration at 3.0 mg/mL). According to the chemical handbook, the boiling points of ethanol, ether and acetone at 1 atm is 78.37 ■, 34.6 ■ and 56.48 ■ respectively, the lower the boiling point, the easier it is to be removed with vacuum drying, which accounted for the lowest average residual of ether and highest average residual of ethanol.

The results of residual DOC, phenol and CTAB show that no residual phenol was present in 13 serotypes of polysaccharide. No CTAB was detected in the only serotype that used CTAB in the process, serotype 3. The average residual DOC concentration was low at 0.575 µg/mL (polysaccharide concentration at 3 mg/mL). The production process can effectively remove DOC, phenol and CTAB.

According to ICH and Chinese Pharmacopeia (2010 version), ethanol, ether and acetone are low toxicity solvents (type 3 solvents) and have limited impact on human health. Acute toxicity and short-term toxicity tests show they're almost non-toxic and non-genotoxic. No discussion is needed if content intake is 50 mg/day or lower.

Walvax conducted further validation of removal of product-related and process-related impurities through planning to be listed commercial-scale process validation during clinical studies. The results showed the removal of the above impurities is effective. The results are shown in Table 70 to Table 82.

Conclusion: the results of impurities of 13 types of polysaccharide indicate the removal of product-related and process-related impurities is indeed effective.

2.3.S.3.2.2 Impurities and their Limits in Conjugation Process
Walvax uses CNBR or CDAP for activation of polysaccharide, the activated polysaccharides are derived using excessive ADH to ensure complete removal of cyanide aliphatic groups. PS-ADH and carrier protein are conjugated with EDAC to form PS-ADH-protein conjugate. The non-conjugate activation points in the conjugation process mainly come from un-conjugated hydrazide base of the PS-ADH derivative and the hydrazide base of EDAC in the bulk. Those activation points have relatively low reactivity, and can only go through conjugation with the presence of medium to strong acid and EDAC. Thus, in near neutral atmosphere in human body and without a condensation catalyst, the reactivity of hydrazine base groups is similar to that of amino and acylamino groups, theoretically it is with minimal risk.
Production of clinical samples and commercial-scale validation show good sealing of non-conjugate excitation points in Walvax's product, low residual ADH, which fall well in the range of quality control.
The test results of impurities of polysaccharide derivative and monovalent bulk conjugate are shown in the Table 83 to Table 95.

Conclusion

The pneumococcal polysaccharides of serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F produced by Walvax were stored at -20 °C for 0 months, 1 year, 2 years, 3 years and 4 years respectively. The detection values of each test item at each test time point were in accordance with the Quality Standard for 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine (WSYX-QC-TS-06-09-0005).

This stability study was conducted by the quality control laboratory in strict accordance with the stability study protocol, which can provide the basis for the safety, immunogenicity and validity of pneumococcal polysaccharide stored at -20 °C. To sum up, the pneumococcal polysaccharide produced by Walvax can meet the requirements of 4 years storage at -20 °C.

Conclusion
According to Stability Protocol of Pneumococcal Polysaccharide Derivatives (Document code: WSYX-QC-SP-0609-0099, version 00, 01), 13 serotypes of Pneumococcal Polysaccharide Derivatives were kept at 2-8 °C for 35 days, except batch SP4D202005003 at 35th day, the tests were not totally finished, all the test results of the other batches at each time point were in accordance with the Quality Standard of 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine (Document code: WSYX-QC-TS-06-09-0002).

Conclusion
Serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, 23F Pneumococcal Bulk Conjugate were stored at 2-8 °C, tested at 0th month, 1st month, 2nd month, 3rd month, 6th month, 9th month, 12th month, test results were all complied with Quality Standard of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine (Document code: WSYX-QC-TS-06-09-0005).
This stability study was conducted by the quality control laboratory strictly sampled at each test point, could provide evidence for safety, effectiveness and validity of pneumococcal bulk conjugate stored at 2-8 °C. In conclusion, shelf life of 13 serotypes of pneumococcal bulk conjugate manufactured Walvax stored at 2-8 °C is 12 months.

3.2.P DRUG PRODUCT

3.2.P.1 Description and Composition of the Drug Product

13-Valent Pneumococcal Polysaccharide Conjugate Vaccine is a sterile liquid suspension of capsular polysaccharide antigens of *Streptococcus pneumoniae* serotypes 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F, with each saccharide individually conjugated to Tetanus Toxoid protein. The vaccine contains 2.6 µg/dose of serotype 1 and 19A, 2.5 µg/dose of serotype 3, 5, 6A, 9V, 3.0 µg/dose of serotype 4 and 23F, 6 µg/dose of serotype 6B, 2.85 µg/dose of serotype 7F, 2.75 µg/dose of serotype 14 and 19F, 3.25 µg/dose of serotype 18C. The vaccine is formulated in Phosphate-buffered Saline containing 4.25 mg/dose NaCl, 44.35 µg/dose NaH₂PO₄, 19.0 µg/dose Na₂HPO₄, and contains 0.5 mg/dose of aluminum phosphate as an adjuvant. Each 1 mL syringe or vial contains a single 0.5 mL dose of vaccine for intramuscular administration, with no preservative.

3.2.P.2 Pharmaceutical Development

3.2.P.2.1 Components of the Drug Product

2.3.P.2.1.1 Drug Substances

Tetanus toxoid was chosen as the carrier protein for the 13-valent Pneumococcal Polysaccharide Vaccine based on the previous Walvax experience with tetanus toxoid in the *Haemophilus influenzae* type b conjugate vaccine.

Activation and derivation are two key steps in polysaccharide protein conjugation. After a thorough investigation on the 13 polysaccharide structures, different activation agents are used according to different structures of capsular polysaccharides, and polysaccharide-protein conjugates are prepared with indirect conjugation method. The method uses cyanide as activation agent to activate capsular polysaccharides, the activated polysaccharides are bonded with the linker, ADH, through covalent bonding to form polysaccharide-ADH derivatives. The derivatives are bonded with carrier protein through covalent bonding with condensation agent EDAC to form polysaccharide-ADH-carrier protein conjugates. The immunogenicity of the combination containing 13 polysaccharide-protein conjugates and aluminum phosphate was compared to single antigen during compatibility test in pre-clinical research. Test results showed no difference between the mitogenicity of the combination and single antigen, which proves good immunogenicity of the combination.

3.2.P.2.1.2 Excipients

The excipients in the 13-valent Pneumococcal Polysaccharide Vaccine are NaCl at 8.5 mg/mL, sodium dihydrogen at 88.7 µg/mL, disodium hydrogen phosphate at 38 µg/mL and aluminum phosphate at 0.5 mg/mL. The phosphate/saline buffer was added to the formulation to provide pH control and suitable osmolality. Aluminum phosphate was added as an adjuvant to enhance immunogenicity.

2.3.P.2.2 Drug Product
2.3.P.2.2.1 Formulation Development
(1) Adjuvant selection

Aluminium adjuvant has been used in clinic for more than 80 years, which is the first classical adjuvant approved by FDA for human vaccine. In the development of 9-valent pneumococcal conjugate vaccine preparation process, Walvax referred to the successful experience of Wyeth 7-valent pneumococcal conjugate vaccine containing aluminium phosphate adjuvant, and the requirements of European Pharmacopoeia Adsorbed Pneumococcal Conjugate Vaccine (Annex 3-6) for aluminium adjuvant, and determined to add aluminium adjuvant in the preparation of 9-valent Pneumococcal Polysaccharide Conjugate Vaccine final bulk.

Walvax used aluminium hydroxide and aluminium phosphate as adjuvants to formulate 9-valent Pneumococcal Polysaccharide Conjugate Vaccine final bulk. After visual inspection, the appearance of final bulk with aluminium hydroxide adjuvant is milky uneven suspension with coagulum after shaking, and the appearance of final bulk with aluminium phosphate adjuvant is milky homogeneous suspension after shaking. Therefore, in the preparation of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine final bulk, we choose aluminium phosphate as the adjuvant of the vaccine.

In addition, we checked the instructions of PCV10 (GSK) and PCV13 (Pfizer) which were launched in 2009 and 2010 respectively, and both of them also adopted the formula containing aluminium phosphate adjuvant. Up to now, the vaccine composition of pneumococcal conjugate vaccine approved for marketing in the world is shown in the table below:

Table 142 Vaccine Composition of PCV7, PCV13 and PCV10	
Product	PCV7 (Pfizer) PCV13 (Pfizer) PCV10 (GSK)
Composition	18C: TT, 19F: DT, other
Carrier protein	CRM197 CRM197
serotypes: PD	6B: 4.4 µg/vial
6B: 4 µg/vial 4, 18C, 19F: 3 µg/vial	
Polysaccharide 1, 3, 4, 5, 6A, 7F, 9V, 14, 4, 9V, 14, 18C, 19F 23F: 1, 5, 6B, 7F, 9V, 14, 23F: content 18C, 19A, 19F, 23F: 2.2 4µg/vial 1 µg/vial µg/vial	
0.5 mg of aluminium Aluminium phosphate, Aluminium phosphate, 0.5	
Adjuvant	phosphate 0.125 mg of aluminium mg of aluminium
100 µg of Tween-80	
Other excipients	Sodium chloride Sodium chloride
295 µg of succinate	

It can be seen from the Table 142 that all the three approved pneumococcal conjugate vaccines in the world are adsorbed with aluminium adjuvant without exception, and all of them use aluminium phosphate adjuvant, which can effectively induce the production of high-efficient protective antibodies.

(2) Specification and dose study

In the pre-clinical study of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine, Walvax referred to the actual situation that the content of each antigen in all kinds of listed conjugate vaccines was 1-10 µg, and referred to the specification of PCV7 (Pfizer) and PCV13 (Pfizer), our company designed and carried out the specification and dose research comparing to PCV7 (Pfizer), and determined the product specification and dose through the immunogenicity test.

3.2.P.2.2.2 Overages
Not Applicable

3.2.P.2.2.3 Physicochemical and Biological Properties
Appearance: should be milky uniform suspension.

3.2.P.2.3 Manufacturing Process Development
3.2.P.2.3.1 Determination of Adjuvants

According to the European Pharmacopoeia (5.0) Pneumococcal polysaccharide conjugate vaccine (adsorption) and other related literature, the characteristics (structure, charge, molecular size, etc.) of pneumococcal polysaccharide conjugate antigen, aluminium adjuvant is proposed. Aluminium hydroxide and aluminium phosphate commonly used in vaccines as adjuvant. After compounding with aluminium hydroxide and aluminium phosphate, respectively, the appropriate adjuvant can be determined through observing the appearance of complex.

Table 143 Appearance after Compounding with Adjuvant

Sample Appearance

Aluminium hydroxide milky uneven suspension with coagulum after shaking

Aluminium phosphate milky homogeneous suspension after shaking

The results in the Table 143 shows that aluminium phosphate has good compatibility with polysaccharides, while aluminium hydroxide is incompatible. Aluminium phosphate is selected as the adjuvant for this vaccine.

3.2.P.2.3.2 Determination of Buffer System

Antigenicity of an antigen is affected by its primary (molecular formula) and higher order (secondary and higher) structures. Higher order structures of antigen are dramatically affected by the solution system it's in, factors include pH, osmotic pressure, ionic strength, and so on, among which pH more drastically affects its higher order structures. Apart from controlling the osmotic

pressure the same to that of body fluid and ionic strength within bearing range of human body, a suitable buffer system should be developed as well to keep constant pH.

In reference to Chinese Pharmacopeia 2010 Version, Volume III, Manufacturing and Testing Procedure of Diphtheria, Tetanus and Acellular Pertussis Combined Vaccine, Adsorbed, and Walvax's Production Process of Final Bulk Diphtheria, Tetanus and Acellular Pertussis Combined Vaccine, adsorbed, final bulk was added to a phosphate buffer solution of pH 6.5, then filled to vials and conducted accelerated experiment at 37 °C. Appearance and pH of the sample were constantly tested to ensure a constant pH, thus evaluate the phosphate buffer system.

The test results showed that while formulating the final bulk, the NaH₂PO₄-Na₂HPO₄ buffer can stabilize the pH value effectively and ensure that the final bulk maintains a good physical appearance. The buffer system for final bulk is as follow:

NaH₂PO₄ 88.7 µg/mL
Na₂HPO₄ 38.0 µg/mL
NaCl 8.5 mg/mL

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

3.2.P.2.3.3 Establishment of Final Bulk Preparation Process

In reference to Chinese Pharmacopeia 2010 Version, Volume III, Manufacturing and Testing Procedure of Diphtheria, Tetanus and Acellular Pertussis Combined Vaccine, Adsorbed, and Walvax's Manufacturing Process of Final Bulk Diphtheria, Tetanus and Acellular Pertussis Combined Vaccine, adsorbed, and Walvax's Production and Testing Procedure of 9-valent Pneumococcal Conjugate Vaccine, Walvax established the operation procedure of final bulk. Through the detection of appearance, pH, antigen content, aluminium phosphate content, sodium chloride content, sterility, pyrogen, abnormal toxicity index, to investigate whether it meets the predetermined standard.

The preparation process of final bulk is determined as follows:

(1) Perpetration the excipients stock solution

Weigh the medicinal grade sodium chloride in the container according to the formula amount, dry heat sterilization and remove the pyrogen; weigh the medicinal grade phosphate in another container according to the formula amount, dry heat sterilization and remove the pyrogen; add the formula amount of WFI into the container, mix well, autoclave and obtain the excipients stock solution, place at 2-8 °C for use;

(2) Weigh the formula amount of each serotype polysaccharide bulk conjugate, mix well to obtain the mixture.

(3) Measure the formula amount of aluminium phosphate adjuvant, phosphate stock solution (pH 6.5), sodium chloride stock solution and WFI, mix well to obtain the excipients mixture.

(4) Pump the polysaccharide bulk conjugate mixture into the excipients mixture while stirring to obtain the final bulk.

3.2.P.2.4.2 Vial Compatibility Research

The compatibility research of vial packaging was conducted on neutral borosilicate glass vial (produced by Ningbo Zhengli Pharmaceutical Packaging Co., LTD) and halogenated butyl rubber plugs for injection (chlorinated) (produced by Jiangsu Hualan Pharmaceutical New Materials Co., Ltd).

3.2.P.2.4.2.1 Compatibility Study on Neutral Borosilicate Glass Vial

Objective:

This test is to investigate the compatibility of PCV13 and middle-boro glass injection vials (hereinafter referred to as vials) manufactured by Ningbo Zhengli as inner packing material, to evaluate the migration of the packaging material and its safety, the influence of vaccine on packing systems, and then to provide basis of selection of packaging materials and safety of drug usage.

Basis:

1 The compatibility trail guidelines between pharmaceutical packaging materials and drug substances (YBB00142002-2015)

2 The compatibility research technology guidelines of chemical pharmaceutical injection and glass pharmaceutical packaging container (trial implementation)

3 The criterion of neutral borosilicate glass vial (YBB00292005-2-2015)

accelerated test and long-term test, elements of extraction were studied with validated method, estimating possibly migration of elements to drug substance.
1.2 Migration of organics of rubber plugs: testing small molecules antioxidants content such as 2, 6-tert-butyl-4-methyl phenol (BHT) in every point. (Test results are used to evaluate compatibility and whether to continue the test.)
2 The test items of influences of pharmaceuticals on inner surface of glass containers.
2.1 The trend of packaging materials damage and erosion: 1 batch of vaccine were filled to 3 batches of neutral borosilicate glass vial placed upright or upside down to test compatibility. At the test points of accelerated test and long-term, samples were taken to study inner surface erosion and silicon, boron elements in the drug by staining, atomic absorption spectrum, etc. The influence of drug substances on vials was evaluated by analysis of trends of silicon and silicon/boron rate.

Conclusion:
Migration test results showed arsenic, antimony, lead, cadmium, calcium content of 3 batches of PCV13 samples are far lower than AET value.

3.2.P.2.4.2.1 Compatibility Study on Halogenated Butyl Rubber Plugs

Objectives:
The test is conducted to evaluate the compatibility of PCV13 with halogenated butyl rubber plugs which used to injection were made by Jiangsu Hualan Pharmaceutical New Materials Co., Ltd, and to evaluate possible migration substances and its safety, test the influence of vaccine to

package system, and then provide bases of selecting package materials and using drug safely.

Basis:

1 Compatibility test guideline for pharmaceutical packaging material and drug substance (YBB00142002-2015)

2 Compatibility research technology guidelines for chemical pharmaceutical and elastomeric seal (trial implementation)

3 Standard of halogenated rubber plugs (YBB00042005-2015)

4 Chinese pharmacopoeia, 4th edition, 2015

5 ICH Q3D, Introduction of elements and impurities, Step 4, dated 16 December 2014

6 United States Pharmacopeia <1663>

7 United States Pharmacopeia <1664>

Experimental design

1 Extraction test

1.1 Elements Extraction: Elements are the easiest extractable substances in rubber plugs.

Referencing Compatibility research technology guideline for chemical pharmaceutical and elastomeric seal (trial implementation), and ICH Q3D, we focus on detection of the following elements: magnesium, silicon, titanium, cadmium, lead, arsenic, mercury, cobalt, vanadium, nickel, antimony, lithium and copper. If high content of other elements, they shall be listed as test items for compatibility test.

1.2 Organics extraction: organics are mainly used as assistant agents during rubber plugs manufacturing process. Referencing Compatibility research technology guideline for chemical pharmaceutical and elastomeric seal (trial implementation), major assistant agents are antioxidants (BHT and its degradants), sulfides (disulfuric alkyl phenol and its degradants), volatile organic compounds (C13, C21 rubber oligomers), lubricants (dimethyl silicone oil).

2 Rubber plugs will age as time goes by, physical properties will change, and it may influence fragments for the rubber plugs, thus it was investigated.

tested simultaneously.

Safety assessment of migration test results

Confidential 711

MODULE 3 QUALITY

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

1 Based on the monitoring test results, making an initial estimation of the possibility of actual drug's

ionic migration in rubber plugs; through inspecting

pharmaceutical regular items, the categories and content of migration substances in migration test,

evaluating the influences of rubber plugs to drug and

absorption experiment, then analyzing the package system have compatibility with PCV13 or not.

2 Analytical and evaluation threshold (AET): AET value is calculated based on Compatibility research

technology guideline for chemical pharmaceutical

injection and pharmaceutical packaging container (trial implementation), Annex 6, metal catalyst or metal

agent residue approved by EMEA/CHMP the

PDE value of ICH Q3D, the safety carcinogen threshold (SCT) of 1.5 µg/day recommended by European

Medicine Agency and EPA database. The AET

values may vary for different packaging and dosage. In order to meet AET value, the test method may be adjusted.

Calculation method: AET= PDE (or SCT)/maximum dose for one day/specification of each formulation.

Conclusion:

Test results showed that no precipitate beyond threshold value hadn't been found in PCV13, and puncture exfoliation results also meet requirement of the test.

Conclusion:
Migration test results showed no precipitate beyond threshold value had not been found in PCV13, and
puncture exfoliation results also meet requirement
of the test.
Summary: In conclusion, the PCV13 manufactured by Walvax uses middle-boro glass vials for injection
manufactured by Ningbo Zhengli
Pharmaceutical Packaging Co., LTD and halogenated butyl rubber plugs of inner package injection syringes
manufactured by Jiangsu Hualan
Pharmaceutical New Materials Co., Ltd. Compatibility studies of drug substances and packaging materials
showed that no high risk extractum was
migrated to the drug substance, and no destruction to the packaging materials by the drug substance was
observed, quality and stability of PCV13 were
maintained. Walvax will follow compatibility research protocols and continue conducting research for 24
months and 36 months under 5■±3■, then
provide an objective and scientific basis for selcting halogenated butyl rubber plugs for inner package
injection syringe manufactured by Ningbo Zhengli
Pharmaceutical Packaging Co., LTD and Jiangsu Hualan Pharmaceutical New Materials Co., Ltd.

3.2.P.2.4.4 Pre-filled Syringes Compatibility

Walvax conducted compatibility studies of pre-filling syringes manufactured by Shandong
Weigao Group Medical Polymer Products Co. LTD and PCV13 to investigate the influence of
packaging materials on formulation stability and potential migration, as well as safety and
applicability in use.
So far, migration test and compatibility study of packaging material for 24 months under 5±3 and
6 months under 25±2 ■ had completed. The detailed research is shown as follows:
Objective
The test is to investigate compatibility of PCV13 and pre-filled syringes manufactured by
Shandong Weigao Group Medical Polymer Products Co. LTD to evaluate potential migration and
its safety, and the influence of vaccine on packaging systems, then to provide basis about selection
of packaging material and safety of drug usage.
Basis

- 1 guideline for compatibility for pharmaceutical packaging material and drug (YBB00142002-2015)
- 2 Compatibility research technology guideline for chemical pharmaceutical injection and pharmaceutical packaging container (trial implementation)
- 3 Compatibility research technology guideline between chemical pharmaceutical and elastomeric seal (exposure draft)
- 4 Chinese pharmacopoeia, 4th edition, 2015, <9621>: guidelines for general requirements of pharmaceutical packaging materials
- 5 Chinese pharmacopoeia, 4th edition, 2015, <9622>: guidelines for pharmaceutical packaging materials and containers
- 6 Chinese pharmacopoeia, 4th edition, 2015, <9001>: guidelines for stability tests of raw drugs and preparations
- 7 Technical guidelines for stability studies of biological products
- 8 ICH Q3D, Introduction of elements and impurities
- 9 United States Pharmacopoeia, <1660> and <1664>

MODULE 3 QUALITY

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

- 10 FDA Guidelines for Industry: Container closure systems for packaging pharmaceuticals and biologics for human use (May 1999)
 - 11 European Union: Guideline for plastic packaging material (2015)
 - 12 E/L Recommendations, safety threshold and best practice of oral inhalation and nasal substance quality (September 2006)
 - 13 ICH Q1A, Guideline for stability tests of raw drugs and formulations
 - 14 ICH Q5C, Guideline for stability studies of biological products or biotechnological products.
- Experimental design
- Migration tests were conducted with 3 batches of PCV13 and the corresponding 1 batch of packaging material, to evaluate migration of glass tubing to PCV13, and to evaluate corrosion of the surface of the pre-filled syringe glass tubing by PCV13, and to conduct safety assessment on the migration quantity. The tests used 3 batches of PCV13 and corresponding 1 batch of packaging material to evaluate the corrosion of pre-filled syringe glass tubing by PCV13. Detailed experimental design is shown in Table 188.

Safety evaluation of migration test results

- 1 Permissible daily exposure (PDE value): According to the guidelines, authorities and references, we can find permissible daily exposure (PDE value) for human of elements and organics. Permissible daily intake (ADI value) and ICH Q3D are referenced if PDE cannot be obtained, the NO(A)EL values provided by data from toxicological studies, PDE is calculated as:

$$PDE = NO(A)EL \times \text{weight(kg)} / [F1 \times F2 \times F3 \times F4 \times F5]$$
- 2 Analytical evaluation threshold (AET): AET implicates that leachates above this threshold should be qualitatively and quantitatively assessed and reported for potential toxicological assessment. AET value = PDE/maximum daily use.
- 3 Maximum dosage of PCV13 is 0.5 mL/day

Conclusion: Migration tests showed no degraded antioxidant, no antioxidant, no sulfur, no stearic acid,
no palmitic acid, no erucamide, no plasticizer,
no epoxy silane and no isobutene-isoprene oligomers in the samples, residual metal elements were well
below PDE.

Conclusion:
Migration tests showed no degraded antioxidant, no antioxidant, no sulfur, no stearic acid, no palmitic acid, no erucamide, no plasticizer, no epoxy silane and no isobutene-isoprene oligomers in the samples, residual metal elements were well below PDE.
Summary: In conclusion, the PCV13 manufactured by Walvax uses pre-filling syringes packaging manufactured by Shandong Weigao Group Medical Polymer Products Co. LTD. Compatibility studies showed no high-risk extractum in PCV13 and no destruction to the packaging material, PCV13 maintained good quality and safety. Walvax will continue conducting research following compatibility research protocols of 36 months under 5±3 ■, providing an objective and scientific basis of selecting Shangdong Weigao's pre-filling syringes packaging.

3.2.P.2.5 Microbiological Attributes
This product is sealed packages of sterile suspension. As the stability results in the "2.3.P.8 Stability" section show that during the entire period of the study, the index of all safety remains constant and qualified. It can be approved that the tightness and integrity of the packaging system of this product meet the design and quality requirements. Therefore, the packaging can fully guarantee that products will not be contaminated by microorganisms during the validity period.

3.2.P.3.3.2 Discription of Manufacturing Process

Walvax issued Standard Operation Procedures for fill and finish of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine according to Regulation of registration for 13-valent Pneumococcal Conjugate Vaccine approved by National Medical Products Administration (Standard No: YBS00392019). The product is a finished product after formulation, filling, capping, visual inspection, labelling, and packaging.

Manufacturing process steps include:

(1) Perpetration the excipients stock solution

Weigh the medicinal grade sodium chloride in the container according to the formula amount, dry heat sterilization and remove the pyrogen; weigh the medicinal grade phosphate in another container according to the formula amount, dry heat sterilization and remove the pyrogen; add the formula amount of WFI into the container, mix well, autoclave and obtain the excipients stock solution, place at 2-8 °C for use;

(2) Weigh the formula amount of each serotype polysaccharide bulk conjugate, mix well to obtain the mixture.

(3) Measure the formula amount of aluminium phosphate adjuvant, phosphate stock solution (pH 6.5), sodium chloride stock solution and WFI, mix well to obtain the excipients mixture.

(4) Pump the polysaccharide bulk conjugate mixture into the excipients mixture while stirring, sterile filtrate to obtain the final bulk.

(5) Fill the final bulk into vials or pre-filled syringes, after labelling and packaging to obtain finished products.

Warehousing Store temperature 2-8 °C

3.2.P.3.5 Process Validation and/or Evaluation

The 13-valent Pneumococcal Polysaccharide Conjugate Vaccine production process includes six process steps: final bulk formulation, filling, capping, physical appearance inspection, labelling, and packaging. Through evaluate the critical process parameters and control of each step, in 2013, a total of 6 batches of process validation were carried out for 13-valent Pneumococcal Conjugate vaccines, including 3 batches of vials packaging (G1201708001, G1201708002, G1201708001), and 3 batches of pre-filled syringe packaging (GK201709001, GK201709002, GK201709003). The validation of the production process of the batch of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine shows that the production process of 13-valent pneumococcal conjugate vaccine can continuously produce products that meet the quality standards within the specified process parameters in a controlled state, the process is stable. More detail please refer to 3.2.S.2.5.

3.2.P.4 Control of Excipients

Excipients included in the manufacturing of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine are: sodium chloride, disodium hydrogen phosphate, sodium dihydrogen phosphate,

aluminium phosphate, in which sodium chloride, disodium hydrogen phosphate, sodium dihydrogen phosphate are tested according to CP. Aluminium phosphate is not included in CP, which was tested according to Standard Operation Procedures and Specification for Aluminium Phosphate (WSYX-QC-SOP-00-09-0608) issued by Walvax. The specifications of all excipients are showed as following tables, all excipients are released after qualified.

3.2.P.4.1 Specifications

Table 218 Specification of Aluminium Phosphate

Test items Specification Analytical method

Should be a white suspension, which can

Appearance layer after long standing, back to suspension Visual detection after shaking.

pH 6.0-8.0 pH meter

Chloride NMT 0.5% Chemical reaction

Sulphate Should be less than 0.1% Chemical reaction

The color of test tube should not be deeper

Heavy metal than standard solution tube. The content of Thioacetamide method

heavy metal should not more than 0.0002%.

Arsenic salt NMT 0.00004 Gutzeit

Aluminium

Should not less than 20 mg/mL. Chemical reaction

phosphate

Sodium chloride NMT 10 g/L Chemical reaction

Bacterial endotoxin Should less than 5.0 EU/mg Gel-clot method

Sterility Should comply with the requirements Membrane filtration method

Table 219 Specification of Sodium Chloride

Item specification Analytical method

This product is colourless, transparent cubic

Appearance crystal or white crystalline powder, odorless. Physical examination

Soluble in water and almost insoluble in ethanol.

1.Sodium Salt:

(1) Take platinum wire, wet with hydrochloric acid, dip test product, burn in a colorless flame, and the flame is bright yellow.

(2) Take 100 mg the test product, put it in a 10 ml test tube, dissolve with 2 ml injection water, add 15% potassium carbonate solution 2 ml, Identify heated to boil, should not produce precipitation; Chemical reaction add 4 ml potassium pyroantimonate test solution, heated to boil; cool in ice water, if necessary, rub tube wall with glass stick, should produce dense precipitation.

2.Chloride

(1) Add silver nitrate solution, produce a white coagulate precipitate, which was dissolved by

Conclusion:
Through the analysis of the data of the above batches of products, it is shown that: appearance, volume,
pH value, aluminium content, sodium chloride
content, polysaccharide content, abnormal toxicity test, bacterial endotoxin and sterility test all met
the Quality Standard of 13-Valent Pneumococcal
Polysaccharide Conjugate Vaccine.

3.2.P.7 Container Closure System
There are two kinds of packaging forms for 13-valent Pneumococcal Polysaccharide Conjugate Vaccine, which are the packaging of vials and pre-filled syringes. The packaging materials for direct contact drugs used in vials are neutral borosilicate glass vial, halogenated butyl rubber plugs for injection (chlorination) and aluminum-plastic combined caps; the packaging materials for direct contact drugs used in pre-filled syringes are rubber plug for pre-filled syringe and pole for pre-filled syringe.

Conclusion:

According to the analysis of stability study test results, it showed that the six batches (three vials
and three pre-filled syringe) of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine were
stored at 25±2 °C for 9 months accelerated stability study met the 13-valent Pneumococcal
Polysaccharide Conjugate Vaccine registration standards (code: YBS00392019) approved by
NMPA.

The long-term stability experiment has now completed the 24th month study. The test results
showed that six batches (three vials and three pre-filled syringe) of products were stored at 5±3 °C
for long-term stability study met the 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
registration standards (code: YBS00392019) approved by NMPA.

3.2.A APPENDICES

3.2.A.1 Facilities and Equipment

Walvax has established the Plant and Facilities Management Control Procedures (document
code: WSYX-P-03-0003) specifying the maintenance cycle and scope of the plant and facilities.
The engineering supply department conducts a monthly inspection on the periphery of the clean
plant to see whether the floor, walls, ceiling, doors and windows of the plant are free of cracks
and shedding and are intact; and whether the main bearing structure is overload, corroded and so
on. Each manufacturing workshop shall inspect the inside of the clean plant every month to see
whether the ground, wall, ceiling, doors and windows of the clean plant are free of cracks and
shedding and are intact; and whether the main bearing structure is overload, corroded and so
on. During the inspection process, it shall be timely reported and handled in case of
abnormalities according to the relevant requirements. After inspection, the inspection records
shall be filed monthly to the engineering supply department, so as to know about the situations
inside the plant in a timely manner.

6 Working procedure
6.1 principle
This method is based on the formation of colored compound of sodium deoxycholate under acidic conditions, and the residual amount of sodium deoxycholate in the test sample is determined by colorimetry.
6.2 solution
6.2.1 sodium deoxycholate reference stock solution (1000ug/ml)
Accurately weigh 0.05g sodium deoxycholate dried to constant weight in a beaker, add 30ml glacial acetic acid to dissolve it, transfer it into a 50ml volumetric flask, moisten the beaker with purified water for three times, transfer the washing solution to the volumetric flask, and fix the volume to the scale with purified water.
6.2.2 sodium deoxycholate reference solution (100ug/ml)
Before use, 500 UL sodium deoxycholate reference solution (1000 UG/ml) was precisely
SOP of Yuxi Walvax Biotechnology Co., Ltd

Content of Sodium
Version 02 Page 3/5
Deoxycholate
Non-photocopying, confidential documents

measured, 4500ul purified water was added, and then 100 UG / ml sodium deoxycholate reference solution was obtained.
6.2.2 60% acetic acid solution

Measure 150ml glacial acetic acid, add 100ml purified water, and mix well.

6.2.3 43.5% sulfuric acid solution

Measure 435ml of concentrated sulfuric acid in the fume cupboard, slowly add it into the beaker containing 500ml purified water, stir while adding. After the solution is cooled, transfer it into a 1000ml volumetric flask, moisten the beaker with a small amount of purified water for three times, transfer the washing solution to the volumetric flask, add purified water to the scale, and mix well.

6.3 Test procedure

6.3.1 Test article treatment

A pipette with a range of 100-1000 ul was used to precisely transfer 1000 ul of the test sample into the test tube in duplicate.

6.3.2 preparation of standard curve

name Standard Standard Standard Standard Standard

tube No. 0 1 2 3 4

100ug/ml sodium

6 Working procedure

6.1 Principle

Phosphorus content was determined by converting the organic phosphorus into inorganic phosphorus by this method. Phosphate is formed into ammonium phosphomolybdate with ammonium molybdate in acidic solution. When there is reducing agent, blue substance (a mixture of molybdenum trioxide and molybdenum pentoxide) is produced. It is called "molybdenum blue". The content of phosphorus was determined by colorimetry Measure.

6.2 Reagent

6.2.1 Mineralizing agent (prepare freshly)

Measure equal volume of concentrated sulfuric acid and perchloric acid, mix well and obtain.

6.2.2 0.04 mol/L ammonium molybdate

Based on 100 ml preparation amount, weigh ammonium molybdate 5 g, and add water for

injection to dissolve to 100 ml, mix well and transfer into a 100 ml reagent glass. Attach label and place at room temperature for further use.

6.2.3 reducing agent (prepare freshly)

Based on 5 ml preparation amount, weigh sodium bisulfite 0.6 g, anhydrous sodium sulfite 0.12 g, 4-amino-3-naphthol-1-sulfonic acid 0.01 g, add water for injection to dissolve to 5ml, mix well.

6.2.4 20µg/ml phosphorous reference working solution

See "standard solution preparation procedure" Code: WSYX-QC-SOP-0009-0801

6.3 testing procedure

6.3.1 The standard curve was prepared by accurately measuring 20 µg/ml phosphorus standard working solution according to the table below:

Standard Operation Procedures of Yuxi Walvax Biotechnology Co.,Ltd

6.3.2 Pre-treatment of test sample

6.3.2.1 30 times dilution of haemophilus influenzae type b conjugate polysaccharide. 30 times dilution of group A meningococcal polysaccharide (bulk). 80 times dilution of group A meningococcal polysaccharide bulk derivative. 3.5 times dilution of group A meningococcal polysaccharide bulk conjugate. See "standard solution preparation procedure" Code: WSYX-QC-SOP-0009-0007

6.3.2.2 Group A and C meningococcal polysaccharide vaccine: take 6 tubes of freeze-dried vaccines reconstituted with 0.5 ml/tube diluent and mixed in 1 ultrafiltration cups, and the liquid level was marked for ultrafiltration lactose treatment and centrifuged for 30 minutes at 7000 rpm/min and 5■. After the centrifuge is finished, add water to the liquid level and blow washes, then wait to be tested.

6.3.3 Inorganic treatment

Measure diluted test sample 1.0ml, and apply parallel test. Add mineralizing agent into standard working solutions and each tube of test sample of 0.05 ml, mix well and place in the oven at 150■ for at least 1h, 180■ for at least 2 h, or 230■ for at least 30min, enabling test samples to be mineralized, inorganically treated, and leaving only a small quantity of liquid, add water for injection 2.0 ml while the test samples are still hot, mix well and place at room temperature; add 0.04 mol/L ammonium molybdate 0.4 ml, mix well, add reducing agent 0.2 ml, mix well, keep adding water for injection 3.4 ml to the final volume of 6 ml, Standard Operation Procedures of Yuxi Walvax Biotechnology Co.,Ltd

Code WSYX-QC-SOP-0009-0101

Operation procedures

determination of Version 08 Page 5/6

phosphorous content

Non-photocopying, confidential documents

place at room temperature for 15 min.

6.3.4 Measure the absorbance at the wavelength of 820 nm.

6.4 Result

6.4.1 Establish regression line using concentrations of phosphorous standard solution against absorbance, then substitute the absorbance value of test sample into the regression line, the concentration of phosphorous is determined.

Phosphorous content=mean concentration of phosphorous × dilution factor

6.4.2 The content of polysaccharide is calculated according to the content of phosphorus■

Haemophilus influenzae type b conjugate polysaccharide: phosphorus content(mg/g) = phosphorus content/total solid

Group A polysaccharide (bulk): content of group A polysaccharide(µg/ml) =phosphorus content (µg/ml)/0.08 phosphorus content of group A(mg/g) = phosphorus content (mg)/total solid

Group A meningococcal polysaccharide bulk derivative and group A meningococcal polysaccharide bulk conjugate: content of group A polysaccharide (µg/ml) =phosphorus content (µg/ml)/0.08

Group A, C meningococcal polysaccharide vaccine: Content of group A polysaccharide (µg/dose)= phosphorus content(mg)/0.075×0.5

Pneumococcal polysaccharide (bulk):

phosphorus content(%)=content of pneumococcal polysaccharide(µg/ml)/(total solid×1000)

×100
 6.4.3 result determination
 According to the corresponding sample quality standard.
 7 Flow chart

6 Working procedure

6.1 Principle
Rate nephelometry is a kinetic method. Under certain conditions, the antigen and the corresponding antibody can quickly form the antigen-antibody complex particles. Rate nephelometry is to determine the maximum reaction speed (peak value of the reaction) of antigen and antibody in a certain period. The so-called rate is the rate of the combination of antigen and antibody in a unit time. Rate nephelometry method is to determine the maximum reaction speed, that is, determine the amount of its complex formation, when the antigen antibody reaction reaches the peak, which is usually for tens of seconds. The peak value is directly proportional to the amount of antigen in the case of antibody excess. The peak time was directly related to antibody concentration and affinity. The peak velocity of different antigen content was different and the antigen content can calculate by microcomputer.

6.2 Reagent preparation
6.2.1 Pneumococcal polysaccharide standard substance stock solution (500μg/ml) (Validity period: 5 years, storage conditions: -60■ to -80■)
Accurately measure 2ml of sterile water for injection (WFI) to dissolve lyophilized pneumococcal polysaccharide standard substance, mix well and place at 2-8■ overnight (at least 8h), then dilute the polysaccharide standard substance concentration using sterile WFI to 500μg/ml in the next day. Refill it into 0.6ml centrifuge tubes in the specification of 400μl/tube. Labeling. Freeze-thaw cycles not more than 3 times.

6.2.2 Pneumococcal polysaccharide Standard working solution (50μg/ml)(Validity period:
SOP of Yuxi Watson Biotechnology Co., Ltd.

Prepare the solutions immediately before use)
6.2.2.1 Pneumococcal polysaccharide Standard working solution used for calibrating standard
curve (50µg/ml) (Validity period: Prepare the solutions immediately before use)

Accurately measure 100µl standard substance stock solution into 2ml centrifuge tube,
add defined amount Diluent 1 (according to the actual concentration of standard substance
stock solution) and mix well to obtain 50µg/ml Pneumococcal Polysaccharide Standard
substance working solution.

6.2.2.2 Pneumococcal polysaccharide Standard working solution used for preparing the

internal control reference (50µg/ml) (Validity period: Prepare the solutions

immediately before use)

a) Type 1, 3, 4, 5, 6B, 7F, 9V, 14, 18, 19A, 19F and 23F Pneumococcal polysaccharide

Standard working solution (50µg/ml) (Validity period: Prepare the solutions immediately
before use)

Accurately measure the required volume in the 45ml centrifuge tube according to the
actual concentration of the standard stock solution, add defined amount Diluent 1 (DIL1) to
obtain 15ml of 50µg/ml Pneumococcal Polysaccharide Standard working solution.

b) Type 2, 6A, 8, 9N, 10A, 11A, 12F, 15B, 17F, 20, 22F and 33F Pneumococcal

polysaccharide Standard working solution (50µg/ml) (Validity period: Prepare the

solutions immediately before use)

Accurately measure the required volume in the 45ml centrifuge tube according to the
actual concentration of the standard stock solution, add defined amount Diluent 1 (DIL1) to
obtain 9ml of 50µg/ml Pneumococcal Polysaccharide Standard working solution.

6.2.3 Internal control reference of 13-valent Pneumococcal polysaccharide
(1.0µg/ml/serotype), (Validity period: not beyond the shelf life of stock solution, storage
conditions: -60 to -80)

Accurately measure 2.0ml polysaccharide standard working solution (50µg/ml) of each
SOP of Yuxi Watson Biotechnology Co., Ltd.

13 Pneumococcal serotypes, respectively, add 74.0ml of Diluent 1 (DIL1), mix well and then
refill them into 2ml centrifuge tubes in the specification of 1ml/tube, labeling. Freeze-thaw
cycles not more than 3 times.

6.2.4 Internal control reference of 13-valent Pneumococcal polysaccharide
(2.0µg/ml/serotype), (Validity period: not beyond the shelf life of stock solution,, storage
conditions: -60 to -80)

Accurately measure 4.0ml polysaccharide standard working solution (50µg/ml) of each
13 Pneumococcal serotypes, respectively, add 48.0ml of Diluent 1(DIL1), mix well and then
refill them into 2ml centrifuge tubes in the specification of 1ml/tube, labeling. Freeze-thaw
cycles not more than 3 times.

6.2.5 Internal control reference of 23-valent Pneumococcal polysaccharide
(1.0µg/ml/serotype), (Validity period: not beyond the shelf life of stock solution,, storage
conditions: -60 to -80)

Accurately measure 2.0ml polysaccharide standard working solution (50µg/ml) of each
23 Pneumococcal serotypes, respectively, add 54.0ml of Diluent 1(DIL1), mix well and then
refill them into 2ml centrifuge tubes in the specification of 1ml/tube, labeling. Freeze-thaw
cycles not more than 3 times.

6.2.6 Internal control reference of 23-valent Pneumococcal polysaccharide
(2.0µg/ml/serotype), (Validity period: not beyond the shelf life of stock solution,, storage
conditions: -60 to -80)

Accurately measure 4.0ml polysaccharide standard working solution (50µg/ml) of each
23 Pneumococcal serotypes, respectively, add 8.0ml of Diluent 1(DIL1), mix well and then
refill them into 2ml centrifuge tubes in the specification of 1ml/tube, labeling. Freeze-thaw
cycles not more than 3 times.

6.2.7 0.6mol/L Sodium Hydroxide Solution
Measure sodium hydroxide 2.4g, dilute with purified water and fixed to 100ml, mix
SOP of Yuxi Watson Biotechnology Co., Ltd.

well.

6.2.8 0.2mol/L Citric Acid Solution

Measure Citric acid 4.2g, dilute with purified water and fixed to 100ml, mix well.

6.2.9 Anti-serum working solution of pneumococcal polysaccharide

6.2.9.1 The antiserum of pneumococcal polysaccharide was diluted appropriately. Reference
dilution multiples of antiserum are shown in the following table:

Type 1 3 4 5 6A 6B 7F 9V 14 18C 19A 19F

Dilution

2 3 4 3 3 6 1 4 2 3 6 4

multiple

Type 2 8 9N 10A 11A 12F 15B 17F 20 22F 33F 23F

Dilution

2 2 1 1.5 1 1 3 3 1 2 5 2

multiple

The antiserum dilution multiples of the above types are for reference only and can be adjusted appropriately according to different batches of antiserum. The purpose of antiserum dilution is to ensure that the value of internal control reference substance is within the specified range.

6.2.9.2 Pneumococcal antiserum working solution preparation: during the preparation of antiserum working solution, special pipette shall be used. The preparation amount shall be estimated according to the daily inspection amount before preparation.

6.2.9.3 Antiserum storage: The original antiserum shall be put back to 2-8℃ for storage in time after used, and the prepared antiserum working solution shall be stored in 2-8℃ if it is not detected in time.

6.2.9.4 Antiserum usage: Before the preparation of antiserum, check whether its appearance is clear. If there is turbidity or foreign matter, stop using. After the preparation of antiserum, test the internal control reference substance first, and test the samples after the internal control reference substance is qualified. For the same dilute multiples of antiserum working solution, the internal control test shall be carried out according to the preparation times (e.g. if the same antiserum is prepared twice in the same day, the internal control reference test shall be carried out separately, and the sample test can only be carried out after the internal control reference test is qualified).

6.2.9.5 In order to avoid confusion, two different batches of the same type of antiserum working solution should not appear at the same time.

6.3 Test steps

6.3.1 Power on: Turn on the printer, display, computer host, UPS power, instrument power successively.

6.3.2 Calibration of standard curves

6.3.2.1 Prepare polysaccharide standard solution according to the following steps, take solution B, solution C, solution D and solution E for calibrating standard curves:

1) Take 100μl of standard working solution (50μg/ml), add 900μl of diluent 1 (DIL1), mix well and obtain solution A (5μg/ml);

2) Take 300μl of solution A, add 300μl of diluent 1 (DIL1), mix well and obtain solution B

■2.5μg/ml■;

3) Take 200μl of solution A, add 300μl of diluent 1 (DIL1), mix well and obtain solution C

■2.0μg/ml■;

4) Take 200μl solution A, add 600μl of diluent 1 (DIL1), mix well and obtain solution D

■1.25μg/ml■;

5) Take 100μl solution A, add 700μl of diluent1 (DIL1), mix well and obtain solution E

■0.625μg/ml■.

6.3.2.2 Setup→<18>User defined chemistries, choose the calibration item (type) → F1

Define/Edit → F9 Save,

6.3.2.11 The original record of standard curves should be filed. And the standard curves used for sample test should be attached in the batch test record.

6.3.3 Preparation of test samples

6.3.3.1 The polysaccharide bulk solution is normally diluted 2000 times to use. Take 100μl polysaccharide bulk solution to the 100ml volumetric flask, add purified water to scale, in which dilute 1000 times. Take 1000μl of the 1000 times test sample diluent, add 1000μl of purified water to obtain 2000 times diluent (The volume of sample can be adjusted according to the proportion of testing dosage). Determine the polysaccharide content in the IMMAGE 800, enter 2000 for off-line dilution multiple. If the result is beyond the detection range, adjust the dilution ratio to A, and enter A for off-line dilution multiple.

6.3.3.2 When the test sample is conjugate bulk, directly dilute with Diluent 1 (DIL1) for appropriate dilution (record the exact dilution multiple) so that its polysaccharide content in SOP of Yuxi Watson Biotechnology Co., Ltd.

the 0.625~2.5μg/ml, mix well.

6.3.3.3 If test sample is 13-valent pneumococcal conjugate vaccine, take 5 vaccines and transfer them into a 15ml centrifuge tube, mix well and take 2000μl into another clean centrifuge tube by pipette, add 100μl of sodium hydroxide solution (0.6mol/L), mix well, then add 100μl of citric acid solution (0.2mol/L) within 10s, mix well. Take 300μl of the desorption solution, add 600μl of Diluent 1 (DIL1) and mix well to obtain 3 times diluent (The volume of sample can be adjusted according to the proportion of testing dosage), determine polysaccharide content (except for type 6B) on the IMMAGE 800, enter 3.3 (i.e. 3×1.1) for off-line dilution ratio. Take another 200μl of desorption solution, add 1000μl of Diluent 1 (DIL1) and mix well to obtain 6 times diluent (The volume of sample can be adjusted according to the proportion of testing dosage), determine polysaccharide content (type 6B) on the IMMAGE 800, enter 6.6 (i.e. 3×1.1) for off-line dilution ratio. If the result is beyond the detection range, adjust the dilution ratio to A, and enter A×1.1 for off-line dilution multiple.

6.3.3.4 If test sample is 23-valent pneumococcal polysaccharide vaccine, take 5 vaccines into 15ml centrifuge tube and mix well. Take 200μl of it, add 1800μl Diluent 1 (DIL1) and mix well to obtain 10 times test sample diluent. Take 1500μl of the above diluent and dilute with 3000μl Diluent 1 (DIL1) and mix well to obtain 30 times diluent, determine polysaccharide content on the IMMAGE 800, enter 30 for off-line dilution ratio.

6.3.4 Sample test

6.3.4.1 Enter sample display, select a test item (type) in the menu. Enter the shelf number at "Rack", enter the location number at "Pos", input samples number at "Sample ID", each sample ID number is unique in the same equipment and cannot be reused.

6.3.4.2 Enter the batch number, sample for stability test and temperature and time of storage at "Sample Comment", select a test item (type) in the menu → click F3 "Sample Options" dialog box, enter the repeat times at "Sample Replicate", enter the off-line dilution multiples at "Off-line Dilution Factor" → OK.

6.3.4.3 F10 Save/Next save and program the next sample.

6.3.4.4 Place the diluted sample (placed in the sample cup) in samples rack, then move it into the sample turn plate.

6.3.4.5 Main → Run to start testing.

6.3.5 Results view and print

6.3.5.1 Enter Results display: search the results through the any information of sample number (Sample ID), shelf number (Rack), location number (Pos), running time etc.

6.3.5.2 F1 Display Results, view the results on the computer and print the results.

6.3.6 Power-off: The instrument must be in the Standby state for system shut down.

6.3.6.1 Utils → F12 Shutdown → Shutdown Complete power off the Immage and Reboot the system. Turn off the printer, display, computer host, UPS system and instrument and so on.

7 Flow chart

N/A

8 Matters need attention

8.1 Before use, all mechanical parts of the instrument must be free of obstruction. Check remain of flushing liquid, waste liquid barrel; Check if there is any liquid leakage on syringe valve and instrument bottom etc., and clean outside surface of reagent needle/stirring needle, sample needle/agitator needle.

8.2 The pipeline should be rinsed every day before making samples. Utils → F1 Prime, enter flushing times → OK.

8.3 Any external operations in the test should be in the Standby or Pausing state of instrument.

8.4 When use the new batch antiserum, the standard curve should be calibrated again.

8.5 Concentration confirming of the pneumococcal polysaccharide standard substance stock solution

8.5.1 When preparing the new batch of pneumococcal polysaccharide standard stock solution, it is necessary to take the newly prepared pneumococcal polysaccharide standard stock solution with the concentration of 1.5μg/ml, and test its concentration with the curve

SOP of Yuxi Watson Biotechnology Co., Ltd.

Coding WSYX-QC-SOP-00-09-0141

calibrated by the previous batch of pneumococcal polysaccharide standard stock solution.

8.5.2 The same tester shall repeat the operation "8.5.1" for 10 times in different time periods (no more than 3 times in the same day), calculate the concentration of the newly prepared pneumococcal polysaccharide standard stock solution according to each test result, take the average value of the 10 test results as the final concentration of the newly prepared pneumococcal polysaccharide standard stock solution, and then subpackage the stock solution into centrifugation tubes according to 400μl/vial, paste the label.

8.5.3 For each batch, two pieces of stock solution for pneumococcal polysaccharide standard need to be reserved to confirm the concentration of stock solution for next batch.

8.6 Before each sample test, the corresponding type of internal control reference should be tested. Only when the test results of internal control reference meet the standard requirements of 1.0μg/ml (0.85-1.15μg/ml/type), 2.0μg/ml (1.70-2.30μg/ml/type), can the sample be tested. When the test results of internal control reference do not meet the standard: ① in the test of internal control reference with two concentrations, one of which does not meet the standard the same antiserum and the same internal control can be used to directly and repeatedly detect the concentration of the internal control reference that do not meet the requirements; ② when the both internal control reference of two concentrations do not meet the requirements, the antiserum working solution (or use another internal control reference of the same concentration) can be reconstituted for testing; ③ the curve need to be recalibrated, and the sample test can be conducted after the test results of the internal control reference meet the requirements.

8.6.1 When testing the content of polysaccharide in the pneumococcal polysaccharide bulk or pneumococcal polysaccharide conjugate bulk: when the polysaccharide bulk or conjugate bulk of the same batch number is less than 5 bottles, the frequency of internal control test is: before and after sample test; if the test results of two concentrations of internal control reference in the process of sample test or after sample test do not meet the requirements, then the corresponding previous stage The result of polysaccharide content in the pneumococcal SOP of Yuxi Watson Biotechnology Co., Ltd.

Coding WSYX-QC-SOP-00-09-0141
SOP of Rate nephelometry
method for detection of Version 08 Page 13/15
polysaccharide content
Confidential files No copy

polysaccharide bulk should be judged as invalid. After the internal control test results meet the requirements, carry out the original sample retest, and issue the test data based on the retest results. If there is a concentration of internal control reference whose one test result does not meet the requirements in the sample testing process or after the sample testing, the internal control reference of the corresponding concentration can be retested once. If the repeated test results of the control reference meet the requirements, then the corresponding results of the polysaccharide content in the original pneumococcal polysaccharide solution in the previous stage do not need to be retested; if the repeated test results of the internal control reference products do not meet the requirements, then the results of the polysaccharide content in the original pneumococcal polysaccharide solution in the corresponding previous stage are invalid. After the results of the internal control test meet the requirements, carry out the original retest to issue the test results Data, the original report of internal control test results after the end of sample test is attached to the verification record of the last sample.

8.7 The polysaccharide content of each type of sample shall be determined 5 times

respectively, and the RSD of the 5 results shall not be more than 15%

$RSD = SD / \text{arithmetic mean of calculation result (x)} \times 100\%$

SD = arithmetic square root of variance

8.7.1 When the relative standard deviation (RSD) of the results of 5 determinations is not more than 15%, according to the general rule 198 of the volume III of the Chinese Pharmacopoeia, the peculiar value eliminated in the peculiar reaction elimination. When the special value can be eliminated according to the rules, the peculiar value shall be eliminated, and the average value after the missing items are supplemented shall be issued with the result, and the qualified report shall be issued when the result is qualified. {The general rule 198 of the volume III of the Chinese Pharmacopoeia, the peculiar value is eliminated in the peculiar reaction elimination: 5 values, from large to small (or from small to large) Y1, Y2, Y3, Y4, Y5, $(Y2-Y1)/(Y5-Y1) > 0.73$, then Y1 can be eliminated. For example, $RSD=10\%$ of the value 66.7, 54.8, 54.2, 53.6, $(54.8-66.7)/(53.6-66.7) = 0.91$, in this case, the value 66.7 can be eliminated
SOP of Yuxi Watson Biotechnology Co., Ltd.

Coding WSYX-QC-SOP-00-09-0141
SOP of Rate nephelometry
method for detection of Version 08 Page 14/15
polysaccharide content
Confidential files No copy

under the condition that the regulations are met. At the same time, the average value 54.4 of the results 54.8, 54.8, 54.2, 53.6 can be used as the deficiency item to make up, and the report will be issued according to the average value 54.4 of 54.8, 54.8, 54.2, 53.6, 54.4.

8.7.2 When the relative standard deviation (RSD) of the 5 test results is higher than 15%, whether the test results meet the requirements or not, it shall be determined that the test results are invalid and shall be re-measured; if the relative standard deviation (RSD) of the re-measured results is not higher than 15%, and the results meet the requirements, the test data shall be issued according to the re-measured results.

8.8 For the determination of polysaccharide content in the polysaccharide bulk or the conjugate bulk, the difference between any bottles of polysaccharide content in the polysaccharide bulk or the conjugate bulk of the same batch shall not exceed 15%. The formula for calculating the difference between bottles:

■-■
Difference between bottles (%) = $|\frac{A-B}{A}| \times 100$

A: the average value of polysaccharide content in all bottles of the same batch of polysaccharide bulk or conjugate bulk;

B: the content of polysaccharide in any bottle of the same batch of polysaccharide bulk or conjugate bulk.

8.9 In the process of sample testing, if the kit batch number is used up, and the test can only be carried out after re-calibration, the shelf number of the corresponding type of sample shall be deleted, and the unfinished test shall be terminated. After the internal control test of the curve calibration is completed and meets the requirements, the unfinished sample book shall be edited again for testing.

6 Work procedures

6.1 Principle

6.1.1 Group A free polysaccharides: the protein bound polysaccharide in the original solution of the conjugate was precipitated with cold phenol, and the phosphorus content in the original solution before precipitation and the supernatant after precipitation was determined respectively. The detection of phosphorus content is to determine the content of phosphorus after transforming organic phosphorus into inorganic phosphorus. In acid solution, phosphate reacts with ammonium molybdate to form ammonium molybdate, which forms blue substance (mixture of molybdenum trioxide and molybdenum pentoxide) in the presence of reducing Standard Operating Procedure of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-00-09-0123

SOP of Free Version 09 Pages 4/11

polysaccharide content test

Confidential documents, no copying.

agent, which is called "molybdenum blue". The content of phosphorus in the test sample is determined by colorimetry.

6.1.2 Group C, Y and W135 free polysaccharides: precipitate the polysaccharide bound with protein in the original solution of conjugate with cold phenol, and determine the content of sialic acid in the original solution before precipitation and the supernatant after precipitation. Sialic acid content detection is to change the bound sialic acid into free state by acid hydrolysis method. The free sialic acid reacts with resorcinol to form colored compounds, and then extracts with organic acids to determine sialic acid content.

6.2 Reagents

6.2.1 10% saturated sodium acetate solution (pH 7.0 ± 0.02): weigh excess sodium acetate, heat and dissolve in purified water (430g → 1L), filter while hot; cool down, the solution crystallizes; mix 1 part of supernatant with 9 parts of purified water (such as 100ml of supernatant and 900 ml of purified water), adjust the pH value to 7.0 ± 0.02.

6.2.2 cold phenol solution: put phenol in water bath at 50℃ to liquefy; weigh 100 g of liquefied phenol, dissolve it in 40ml 10% saturated sodium acetate solution (pH 7.0 ± 0.02), and place it at 2-8℃ for more than 1 h.

6.3 test procedure

6.3.1 Test article treatment

6.3.1.1 Group A meningococcal polysaccharide bulk conjugate: dilute the conjugate solution and corresponding derivatives to about 20-30 µg/ml with purified water to obtain test sample P1. Take P1600 µl derivative test sample and P1600 µl conjugate test sample respectively and add them into a 2000 µl centrifuge tube. Make 6 tubes for each test sample in parallel, and then add 1200 µl cold phenol solution to each tube (the cold phenol solution must be fully mixed before each absorption), shake violently for 20 min, place in ice water bath for 10 min, centrifuge at 1500 and 10000 rpm for 15 min. After centrifugation, the liquid was divided into two layers, and obvious precipitates were observed at the boundary. Carefully absorb the centrifuged supernatant (aqueous phase) and transfer it to a clean labeled test tube to obtain P2. Standard Operating Procedure of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-00-09-0123

Mix well before use.

6.3.1.2 Group C meningococcal polysaccharide bulk conjugate: dilute the conjugate solution and corresponding derivatives with purified water. P1 was obtained when the polysaccharide content was about 40-60 µg/ml. Take P1600 µl derivative test sample and P1600 µl conjugate test sample respectively and add them into 2000 µl centrifugal tube. Each test sample is made into 12 tubes in parallel, and then each tube is added with 1200 µl cold phenol solution (the cold phenol solution must be fully mixed before each absorption), shake violently for 20 min, place in ice water bath for 10 min, centrifuge at 15000 and 10000 rpm for 15 min. After centrifugation, the liquid was divided into two layers, and obvious precipitates were observed at the boundary. Carefully absorb the centrifuged supernatant (aqueous phase) and transfer it to a clean labeled test tube to obtain P2. Mix well before use.

6.3.1.3 Group Y meningococcal polysaccharide bulk conjugate: dilute the conjugate solution and corresponding derivatives to 40-60 µg/ml with purified water to obtain P1. Take P1600 µl derivative test sample and P1600 µl conjugate test sample respectively and add them into 2000 µl centrifugal tube. Each test sample is made into 12 tubes in parallel, and then each tube is added with 1200 µl cold phenol solution (the cold phenol solution must be fully mixed before each absorption), shake violently for 20 min, place in ice water bath for 10 min, centrifuge at 15000 and 10000 rpm for 15 min. After centrifugation, the liquid was divided into two layers, and obvious precipitates were observed at the boundary. Carefully absorb the centrifuged supernatant (aqueous phase) and transfer it to a clean labeled test tube to obtain P2. Mix well before use.

6.3.1.4 Group W135 meningococcal polysaccharide bulk conjugate: dilute the original solution of conjugate to be tested and its corresponding derivatives with purified water to about 40-60 µg/ml of polysaccharide to obtain P1. Take P1600 µl derivative test sample and P1600 µl conjugate test sample respectively and add them into 2000 µl centrifugal tube. Each test sample is made into 12 tubes in parallel, and then each tube is added with 1200 µl cold phenol solution (the cold phenol solution must be fully mixed before each absorption), shake violently for 20 min, place in ice water bath for 10 min, centrifuge at 15000 and 10000 rpm for 15 min. After centrifugation, the liquid was divided into two layers, and obvious precipitates were observed at the boundary. Carefully absorb the centrifuged supernatant (aqueous phase) and transfer it to a clean labeled test tube to obtain P2. Mix well before use.

min, place in ice water bath for 10 min, centrifuge at 15000 and 10000 rpm for 15 min. After centrifugation, the liquid was divided into two layers, and obvious precipitates were observed at the boundary. Carefully absorb the centrifuged supernatant (aqueous phase) and transfer it to a clean labeled test tube to obtain P2. Mix well before use.

6.3.1.5 Group A and C meningococcal polysaccharide conjugate vaccine:

a) Group A free polysaccharides: Take the finished 14 bottles with the corresponding thinner to 0.5 ml/bottle resolvable, mixed and removed, with 2 3K ultrafiltration cups. Each take about 3.5 ml, the sample into the ultrafiltration cup, with the mark note under the liquid surface scale, balance after 500, 7000 rpm centrifugal 30min, centrifugation after taking out water to the scale line, and then in the same conditions after centrifugation to rehydrate to the tick mark, fully blow-washed evenly mixed, as a finished P1. Dilute the corresponding derivative saccharine to contain polysaccharides with purified water about 20 to 30 µg/ml, as a derivative P1. Take derivatives for test products P1600 µl and finished products P1600 µl each added to 2000 µl centrifuge tubes, each for test parallel to do 6 tubes, and then each tube to add 1200 µl cold phenol solution (cold phenol solution must be fully mixed before each absorption), severe shock 20 min, ice water bath 10 min, 15000, 10000 rpm centrifugal 20 min. After the centrifuge of the finished product for the test product, the liquid is divided into two layers, and the more obvious sediment can be seen at the demarcation boundary. Carefully absorb the centrifugal upper clear (water phase) and transfer to a clean marked test tube, as P2, mixed with the front.

b) Group C free polysaccharides: take the finished 28 bottles with the corresponding thinner with 0.5 ml / bottle resolvable, mixed and removed the combined, that is, the finished solution. P1: Take the finished solution at least 4.5 ml into a 3K ultrafiltration cup, the sample into the ultrafiltration cup, with the mark note under the liquid surface scale, balance after 500, 7000 rpm centrifugation 30 min, after centrifugation to remove the rehydration to the tick mark, and then in the same conditions after centrifugation to rehydrate to the tick mark, fully blow-out evenly for the finished product P1. Dilute the corresponding derivative to contain polysaccharides of about 40 to 60 µg/ml, as a derivative P1.

Standard Operating Procedure of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-00-09-0123

P2: The finished solution, take the derivative for the test P1600 µl and the finished solution 600 µl each added to the 2000 µl centrifuge tube, each for the test parallel to do 12 tubes, and then add 1200 µl cold phenol (cold phenol solution must be fully mixed before each absorption), violent lysing 20 min, ice bath water 10 min, 15000, 10000 rpm centrifugal 20 min. After the centrifuge of the finished product for the test product, the liquid is divided into two layers, and the more obvious sediment can be seen at the demarcation boundary. Carefully absorb the centrifugal upper clear (water phase) and transfer to a clean marked test tube, i.e. derivative P2 and finished P2 and mixed together before. Take 7 3K ultrafiltration cups, pipette to remove 750 µl purified water in ultrafiltration cups, take a marker note under the scale, add purified water 4000 µl, add the upper clear 250 µl, balance after 500, 7000 rpm centrifugation 30min, after centrifugation, add the upper clear 250 µl in 7 ultrafiltration cups, add purified water 4000 µl, continue to centrifuge in the same conditions, and then add the upper clear 250 µl to the 7 ultrafiltration cups, and add the purified water 4000 µl, continue to centrifuge in the same conditions, add purified water 4000 µl at the end, still centrifuge in the same conditions, rehydrate to 750 µl after the centrifugation, and remove the liquid from the 7 ultrafiltration cups well after the full blow-up is mixed with P2.

6.3.2 Take a clean glass test tube with a name, lot number and disposal number, where P1 represents an unprocessed test product and P2 represents a centrifugal liquid after treatment. Each sample marking and dilution can be found in the table below:

6.3.3 Group A free polysaccharides in meningococcal group A, C bivalent polysaccharide conjugate vaccine according to the "phosphorus content (micro-method) operation procedures" code encoding: WSYX-QC-SOP-00-09-0121 for phosphorus content detection, in the test tube of each tube is added mineralized reagent 150 μl, mix, aluminium-foil cover test tube, put the test tube placed in the electric heating constant temperature blower drying oven, the temperature is 150℃, the temperature reaches after drying for 1 hour, adjust the temperature to 180℃, 30 minutes after reaching the temperature, adjust the temperature to 250℃, and dry bake for 1 hour after the temperature reaches, so as to mineralize and inorganic the test sample. After taking out, add 1850 μl purified water while it is hot (this step is not required for the reference working solution). Add 2000 μl of chromogenic agent into each tube, mix well, and take water bath in 37℃ constant temperature water bath for 2 hours. The absorbance was measured at 825 nm.

6.3.4 Group A free polysaccharide in group A meningococcal polysaccharide bulk conjugate in accordance with the "phosphorus content (trace method) operating procedures" code encoding: WSYX-QC-SOP-00-09-0121 for phosphorus content detection, in the test tubes, all the Standard Operating Procedure of Yuxi Walvax Biotechnology Co., Ltd.

Code WSYX-QC-SOP-00-09-0123

mineralized reagent 150 μl, mix together, aluminium-foil covered test tube, put the test tube in the electric heating thermostat blower oven, the temperature is 150℃, after the temperature reaches, dry bake for 1 hour, adjust the temperature to 180℃, 30 minutes after reaching the temperature, adjust the temperature to 250℃, dry bake for 1 hour after reaching the temperature, make the test sample mineralized and inorganic, and add 1850 μl purified water while taking it out (this step is not required for the reference working solution). Add 2000 μl of chromogenic agent into each tube, mix well, and take water bath in 37℃ constant temperature water bath for 2 hours. The absorbance was measured at 825 nm.

6.3.5 Group C free polysaccharides in meningococcal group A, C bivalent polysaccharide conjugate vaccine, group C free polysaccharides in group C meningococcal polysaccharide bulk conjugate, group Y free polysaccharides in group Y meningococcal polysaccharide bulk conjugate, group W135 free polysaccharides in group W135 meningococcal polysaccharide bulk conjugate shall be in accordance with the document code of operation procedures for determination of sialic acid content: WSYX-QC-SOP-00-09-0122, and the content of sialic acid was detected. Add 2000 μl resorcinol chromogenic agent into each tube, mix well, place it in boiling water bath for 15 minutes, take it out and put it in ice water for 10 minutes, add 4000 μl organic phase to each tube, mix well, and let it stand for 10 minutes at room temperature. The solution is naturally stratified. Take the upper organic phase and measure the absorbance at 585 nm wavelength.

6.4 Result calculation
Experimental validity% = derivative P2 ÷ derivative P1 × 100
Free polysaccharide% = conjugate (finished product) P2 ÷ conjugate (finished product) P1 × 100

6.5 Result determination
According to the corresponding sample quality standard.
7 Flow chart
No

8 Precautions
8.1 when centrifuging, pay attention to the actual temperature of the centrifuge. If the temperature before use fails to meet the experimental requirements, the centrifuge can be idled in advance.
8.2 take the supernatant carefully, and avoid stirring the liquid and inhaling the sediment by the pipette.
8.3 pay attention to the refrigeration temperature of cold phenol solution and keep it at a low

temperature when using. If it spills, it should be treated with absolute alcohol, and gloves should be worn during operation to avoid skin injury.

8.4 the time of each step should be strictly controlled.

6.1 Experimental steps
6.1.1 Preparation of solution
6.1.1.1 0.2 mol/L sodium chloride solution
1 mg sodium hydroxide solution was mixed with 0.1 mg sodium chloride solution at pH
of 0.1 ml, and then mixed with 0.1 ml sodium chloride solution.
6.1.1.2 molecular size reference solution
For details of preparation, please refer to WSYX-QC-SOP-00-09-0801
6.1.2 calibration column
The column was calibrated with molecular size reference solution to determine the empty
flow volume V_0 and total column bed volume V_i . the column calibration period was 30 days.
6.1.3 test article treatment
6.1.3.1 free protein control (tetanus toxoid purification solution): dilute the carrier protein
tetanus toxoid purification solution with normal saline until the protein content is about 2000
Standard Operating Procedures of Yuxi Walvax Biotechnology Co., Ltd.

$\mu\text{g/ml}$ to obtain solution S1.
6.1.3.2 concentration of group A, C bivalent meningococcal polysaccharide conjugate vaccine:
a) Take a 3K ultrafiltration cup, add 2000 μl purified water, mark the concave surface with a
marking pen, and then discard 2000 μl purified water.
b) Take 10 bottles of finished products, dissolve them with 0.5 ml/bottle with corresponding
diluent, mix them well and take them out. Put 4000 μl of the above solution into the marked
ultrafiltration cup and mark the scale on the concave surface with a marking pen.
c) After balancing with a shelf plate drug balance, centrifuge for 30 min at 5000 and 7000 rpm.
After centrifugation, take out the water to make up to the sample scale line; after the second
centrifugation under the same conditions, make up water to the 2000 μl scale mark, and then
fully purge and filter with a 0.45 μm needle filter.
6.1.3.3 concentration of pneumococcal polysaccharide conjugate solution:
a) Take two 3K ultrafiltration cups, add 1000 μl purified water into each cup, mark the concave
surface with a marking pen, and then discard 1000 μl purified water.
b) Put 5000 μl test sample into 3K ultrafiltration cup, make two parallel tubes, balance with
shelf plate drug balance, centrifuge at 5000 and 7000 rpm for 30 min, and the liquid level after
centrifugation should be below 1000 μl scale mark.
c) At the end of centrifugation, take out the make-up water to 1000 μl scale mark, fully purge
and mix, and filter with 0.45 μm needle filter to obtain the test sample. 6.1.4
chromatographic column loading
6.1.4.1 Take 1 ml free protein control column, elute with 0.2 mol/l sodium chloride solution;
collect 4.5 ml each tube by automatic collector, collect 1.2 column bed volume; detect the
collected liquid at 214 nm wavelength with UV visible spectrophotometer, draw the flow
elution map with the flow washing volume as the abscissa, and take the absorbance as the
ordinate, and record the separation peak of downstream free protein control (OD value from
small to small) The number of tubes corresponding to the number of tubes at the end (OD value
changed from greater than or equal to 0.01 to less than 0.01) was N1, and the number of tubes
Standard Operating Procedures of Yuxi Walvax Biotechnology Co., Ltd.

Operation procedures of Code WSYX-QC-SOP-00-09-0114
determination free protein

corresponding to the end (OD value changed from greater than or equal to 0.01 to less than 0.01) was N2; the sum of OD of each tube from the appearance of separation peak to the end of separation peak $\sum OD1$ was calculated; the free protein control was collected from the beginning to the end of each tube, and 1000 μ l of collecting solution was mixed to obtain solution S2. The validity period of free protein control was 30 days

6.1.4.2 determine the protein concentration of S0, S1 and S2 solutions according to the operation procedures of protein content determination. According to 6.1.5.1, the validity standard should be 80% - 120%.

6.1.4.3 take 1 ml of the treated sample on the column, elute, collect and colorimetry with the same method; calculate the sum of OD values $\sum OD2$ of each tube from the appearance to the end of the corresponding free protein control separation peak.

6.1.5 Result calculation:

6.1.5.1 experimental validity $P(\%) = \text{collection volume of each tube} \times \text{number of combined tubes} \times S2 \div S1 \times 100$

6.1.5.2 meningococcal polysaccharide conjugate vaccine group A and group C:

Free protein content $P(\%) = (\sum OD2 \div \sum od1) \times S1 \div S0 \times 2 \times 100$

6.1.5.3 original solution of pneumococcal polysaccharide conjugate:

Free protein content $P(\%) = (\sum OD2 \div \sum od1) \times S1 \div S0 \times 5 \times 100$

S0: protein concentration of the test sample (μ g/ml);

S1: Pre column protein concentration of free protein control (tetanus toxoid purification solution) (μ g/ml);

S2: free protein control separation peak from the beginning to the end of each tube mixture protein concentration (μ g/ml);

6.1.6 Result judgment

According to the quality standard of corresponding samples.

Muscle Irritation Test through Single

Experiment Name: Intramuscular Injection of 13-JHYM in Japanese

Big-ear Rabbits

Experiment Number: A201118-T073-01

This experiment was completed in accordance with Non-clinical Good Laboratory Practice formulated by China Food and Drug Administration (China Food and Drug Administration rule No. 2, effective from September 1st, 2003). The experiment procedure was carried out in accordance with the experiment protocol and the relevant standard operating procedure of the research institution. No deviation that affected the reliability of experiment results and conclusions was observed. This report faithfully reflects the experiment materials, experiment methods and experiment results.

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Abstract

The 13-valent pneumococcal polysaccharide conjugate vaccine (13-JHYM) is made from pneumococcus capsule polysaccharide antigens of serotype 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F covalently combined with tetanus toxoid carrier protein and adsorbed by aluminum phosphate adjuvant. The clinical use of this vaccine is for infants and children aged 2 months to 2 years old to prevent the invasive infection caused by the above-mentioned serotype pneumococcus. The proposed dosage is 0.5 mL per person, and the proposed route of use is intramuscular injection.

In accordance with the relevant requirements of new drug declaration redefined by Provisions for Drug Registration, the irritation test of 13-JHYM provided by Yunnan Walvax Biotechnology Co., Ltd. was carried out through single intramuscular injection in rabbits by WestChina-Frontier PharmaTech Co., with a purpose to observe the irritant reactions induced by 13-JHYM to the quadriceps femoris muscle of rabbits, and to provide a reference for evaluating the safety of clinical use.

A total of 11 groups were set in this experiment, including a negative control group, a low-dose and a high-dose group for aluminum phosphate, a low-dose and a high-dose group for 7-valent pneumococcal conjugate vaccine, as well as a low-dose and a high-dose group for 13-JHYM of 3 different batches respectively (batch No. 20110304, 20110305 and 20110406), with 4 rabbits included in each group (half male and half female). The rabbits in each low-dose group were injected with sample or comparison product at corresponding concentration in the volume of 0.5 mL per side through quadriceps femoris muscle for one time, the rabbits in each high-dose group were injected with sample or comparison product at corresponding concentration in the volume of 1.5 mL per side, and the rabbits in the negative control group were given 0.9% sodium chloride through single injection in the volume of 1.5 mL/ per side. The day of administration was determined as Day 1 in this experiment. Two rabbits were taken from each group and were euthanized (CO₂ inhalation) and anatomized respectively around 48 hours after administration and on the 16th day of the experiment. The situation of the quadriceps femoris muscle at the injection site was observed and graded, and histopathology was performed. Main results are as below:

General Conditions and Gross Anatomy Results Observed by Naked Eye:

No local reactions such as swelling and ecchymosis were observed at the injection site of rabbits in each group during both the administration and recovery period.

According to the anatomy results obtained around 48 hours after administration, mild hyperaemia was observed in the right quadriceps femoris muscle at the injection site of 1 rabbit and moderate hyperaemia was observed in the left quadriceps femoris muscle at the injection site of 1 rabbit in the high-dose group of 7-valent pneumococcal conjugate vaccine; moderate hyperaemia was observed in the right quadriceps femoris muscle at the injection site of 1 rabbit in the high-dose group of 13-JHYM (batch No. 20110304); moderate hyperaemia was observed in the right quadriceps femoris muscle at the injection site of 1 rabbit in the high-dose group of 13-JHYM (batch No. 20110406). No obvious abnormalities were observed at the injection site for the rest rabbits.

On the 16th day of the experiment, no obvious abnormalities were observed at the injection site for all rabbits.

Histopathology Results:

Around 48 hours after administration, changes including mild to severe degeneration and necrosis of muscle fibers/muscular stroma, hemorrhage as well as inflammatory cell infiltration were

Confidential 794

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

observed in the high-dose group of 7-valent pneumococcal conjugate vaccine, the high-dose group of 13-JHYM of 3 batches and the low-dose group of 13-JHYM (batch No.20110406), suggesting muscle irritation at the injection site. On the 16th day of the experiment, except that mild interstitial inflammatory cell infiltration could still be observed at the injection site in the high-dose and low-dose group of aluminum phosphate as well as the high-dose group of 13-JHYM (batch No. 20110305), no obvious abnormalities were observed at the injection site for the rest groups, suggesting that the irritation could be partially recovered after the 16-day observation.

In conclusion, under the conditions of this experiment, after the low and high doses (0.5 mL/side, 1.5 mL/side, clinical dosage) of aluminum phosphate, 7-valent pneumococcal conjugate vaccine and 13-JHYM (batch No. 2011030, 20110305 and 20110406) were given to the rabbits through single injection on the quadriceps femoris muscle, the low-dose and high-dose aluminum phosphate, high-dose 7-valent pneumococcal conjugate vaccine, high-dose 13-JHYM of 3 batches, and the low-dose 13-JHYM of batch No. 20110406 had obvious irritation to the quadriceps femoris muscle of rabbits. The above mentioned muscle irritation could be partially recovered after the 16-day observation.

Animal rearing and management: Qing Liao, Yongshao Cai;

Test articles preparation and management: Qin Zhang;

Histopathology examination: Tao Chen.

2. MATERIALS

2.1 EXPERIMENT ANIMALS

2.1.1 BASIC INFORMATION

Species: Japanese big-eared rabbit;

Grade: normal;

Amount and gender of animals purchased: 46 animals in total, half male and half female;

Amount and gender of animals used: 44 animals in total, half male and half female;

Body weight: 2.135-3.300 kg;

Source: Sichuan Laboratory Animal Special Committee farm (Production License No. SCXK (Sichuan) 2008-014; Certificate of Quality No. 0024847, issuing unit: Sichuan Department of Science and Technology);

Entry date: 10/06/2011;

Environmental adaptation period after entry: Before the experiment, the rabbits adapted to the environment for 11 days (10/06/2011-20/06/2011). Healthy (female must not be pregnant) rabbits were selected as test animals. Observation measurements during adaptation period: general conditions, body weight etc.

2.1.2 ANIMAL REARING CONDITIONS

2.1.2.1 REARING SITES

The ordinary animal house of WestChina-Frontier PharmaTech Co. (laboratory animal room license No. SYXK (Sichuan) 2009-123).

2.1.2.2 REARING CONDITIONS

Rearing cage: stainless steel rabbit cage (L*W*H: 550 mm*550 mm*380 mm);

Rearing density: 1 animal per cage.

2.1.2.3 REARING ENVIRONMENT

Standard: the National Standard of the People's Republic of China GB14925-2001;

Control system: the EBI400 automatic control fresh air air conditioning system produced by Honeywell;

Temperature: room temperature 22.98-25.61°C (with a diurnal temperature range of 0.00-1.11°C);

Humidity: relative humidity 44.8-62.9%;

Illumination: artificial lighting, 12 hours of alternating light and dark (lights on at 07:30, lights off at 19:30);

Confidential 797

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Ventilation: 8-10 times per hour, 100% fresh air.

2.1.2.4 FEED

Type: complete pellet feed for rabbits;

Manufacturer: Beijing Ke'ao Xieli Feed Co., Ltd. (Feed Production Permit: SCXK (Beijing) 2009-0012, batch No.10122603 and 11044111);

Feeding method: free intake;

Nutrient analysis: provided by the feed provider, of which the routine nutritional measurements of crude protein, crude fat, crude fiber, crude ash, water, calcium and phosphorus were reported for each batch(referring to the National Standard of the People's Republic of China GB14924.5-2001); Confirmation of contaminant content in feed: provided by the feed provider, indicators for chemical contaminants including arsenic, lead, cadmium, mercury, hexachlorocyclohexane, DDT, aflatoxin B₁, total colony count, coliform group, mold and yeast count, pathogenic bacteria (Salmonella) were provided at least once a year (referring to the National Standard of the People's Republic of China GB14924.2-2001).

2.1.2.5 DRINKING

Type: drinking water for laboratory animals (reverse osmosis water);

Method of water supply: held in drinking water bottles, free intake;

Colony count detection: referring to the National Standard of the People's Republic of China GB5749-2006, sampling self-examination (once per week);

Detection of conventional indicators of water quality: referring to the National Standard of the People's Republic of China GB5749-2006, samples were sent to units with relevant qualification for testing at least 2 times per year.

2.1.3 ANIMAL GROUPING AND MARKING METHODS

2.1.3.1 ANIMAL GROUPING

Group design: a total of 11 groups, including a negative control group, a low-dose and a high-dose group for aluminum phosphate, a low-dose and a high-dose group for 7-valent pneumococcal conjugate vaccine, as well as a low-dose and a high-dose group for 13-JHYM of 3 different batches respectively (batch No. 20110304, 20110305 and 20110406);

Amount: 4 animals in each group;

Gender: half male and half female;

Grouping method: the rabbits were randomly divided into groups according to their body weight;

Disposal of surplus animals: handed over to the department of laboratory animal administration.

The specific group information is shown in Table 1.

Notes: The first digit of the animal number represents the group (e.g. 2 and 3 represent the low-dose and high-dose aluminum phosphate group respectively); the second letter stands for gender (M for male, F for female); the third and fourth digits represent cage number.

2.1.3.2 MARKING METHOD

Adaptation period: cage card was used as animal identification markers;

Post-grouping period: The cage card and ear number were used as animal identification markers;

Marking method of cage card:

Adaptation period: unified use of white cage card, with the test number, animal species, animal number, entry time and notes indicated;

Post-grouping: cage cards in different colors were used to distinguish the groups, and the cards were marked with test number, animal species, animal number, treatment factors, expected start and end time of the experiment and notes;

Colors of cage cards after grouping: white represented the negative control group as well as the high-dose and low-dose aluminum phosphate group; yellow represented the low-dose 7-valent pneumococcal conjugate vaccine group, and blue represented the high-dose 7-valent pneumococcal conjugate vaccine group; blue represented the low-dose 13-JHYM group, and red represented the high-dose 13-JHYM group.

2.2 TEST ARTICLES

2.2.1. TEST ARTICLE INFORMATION

Name: 13-valent pneumococcal polysaccharide conjugate vaccine (13-JHYM);

Source: Yunnan Walvax Biotechnology Co., Ltd.;

Character: suspension with opalescence;

Specification: 0.5 mL: 32.2µg per vial;

Batch No.: 20110304 (batch 1), 20110305 (batch 2), 20110406 (batch 3);

Preservation conditions and notes: stored under 2 - 8■;

Confidential 799

MODULE 4 NONCLINICAL STUDY REPORTS

Preservation site: the Samples Management Department of WestChina-Frontier PharmaTech Co.

2.2.2 TEST ARTICLE PREPARATION

Preparation methods: direct separation of the bulk;

Marking methods after preparation: use the original bottle label;

Preservation condition and period of validity after preparation: stored in ice box for use within 24 hours.

2.2.3 RETURN AND DISPOSAL OF REMAINING SAMPLES

The remaining samples after administration were sterilized by high temperature and collected in a waste liquid tank. The reserved samples were deposited in the sample room referring to the SOP for the preservation of test articles. The remaining samples at the end of the experiment were returned to the client.

2.3 COMPARISON PRODUCT

2.3.1 COMPARISON PRODUCT INFORMATION

Name: 0.9% sodium chloride injection (normal saline);

Source: Sichuan Kelun Pharmaceutical Co., Ltd.;

Character: colorless transparent liquid;

Specification: 100 mL per bottle;

Batch No.: C100928;

Preservation conditions and notes: sealed storage at room temperature;

Expiration date: August, 2012;

Preparation methods: direct separation of the bulk;

Marking methods after preparation: test articles were marked with white labels with experiment number, substance name and concentration used in the experiment, volume, storage condition, expiration date, responsible person and preparation date;

Preservation condition and period of validity after preparation: stored in ice box for use within 24 hours.

2.3.2 ADJUVANT CONTROL

Name: aluminum phosphate;

Source: Yunnan Walvax Biotechnology Co., Ltd.;

Character: milky suspension;

Concentration: 1 mg/mL;

Specification: 50 mL per bottle;

Batch No.: 8169402;
Preservation conditions and notes: stored under 2-8■;
Term of validity: long term;
Confidential 800
MODULE 4 NONCLINICAL STUDY REPORTS

Preservation condition and period of validity after preparation: stored in ice box for use within 24 hours.

2.3.3 SIMILAR LICENSED COMPARISON PRODUCT

Name: 7-valent pneumococcal conjugate vaccine;
Source: Wyeth Pharmaceutical Division of Wyeth Holdings Corporation;
Character: white suspension;
Specification: 0.5 mL: 16μg per vial;
Batch No.: E61516E52444, E11660D57298;
Preservation conditions and notes: stored under 2-8■;
Term of validity: December, 2011 for batch No. E61516E52444; March, 2013 for E11660D57298;
Preparation methods: direct separation of the bulk;
Marking methods after preparation: use the original bottle label;
Preservation condition and period of validity after preparation: stored in ice box for use within 24 hours.

2.3.4 RETURN AND DISPOSAL OF REMAINING COMPARISON PRODUCTS

After administration, the remaining negative control was directly discharged into the sewer, the adjuvant control was collected in the waste liquid barrel, and the licensed similar control was collected in the waste liquid barrel after sterilization.

2.4 MAIN INSTRUMENTS

Electronic platform scale, injector, etc.

3. METHODS AND OBSERVATION MEASUREMENTS

3.1 METHODS

3.1.1 DOSAGE DESIGN

Referring to the Technical Guidelines for the Study of Irritation, Hypersensitivity and Hemolysis of Chemical Drugs (March 2005), the dosage design of the irritation test should mainly consider the concentration of the sample and the overall dosage. Normally the same concentration as the clinical preparations was used and one dose group was established. Based on the information provided by the client, the clinical proposed dose of 13-JHYM was 0.5 mL per person. A single serving contained 32.2 μg of pneumococcal polysaccharide and 0.5 mg of aluminum phosphate, which meant the total amount of polysaccharide was 64.4μg/mL and that of aluminum phosphate was 1 mg/mL.

In this experiment, the clinical proposed dosage of 0.5 mL per side muscle was determined as the low-dose group of 13-JHYM (3 batches) and the high-dose group was set up using 3 times of this dosage, i.e. 1.5ml per side muscle. At the same time, the dosage of low-dose and high-dose group of aluminum phosphate and 7-valent pneumococcal conjugate vaccine were designed in the same

Confidential 801
MODULE 4 NONCLINICAL STUDY REPORTS
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

way. Animals in the negative control group were given normal saline in the volume of 1.5 mL per side muscle (Table 2).

3.1.2 ADMINISTRATION

Administration route: intramuscular injection, injected into both hind limbs at the same time;
consistent with clinical administration route;
Frequency: once;
Administration method: based on the dosage described in Table 2, rabbits in each group were given sample or comparison product at corresponding concentration through single injection on the quadriceps femoris muscle and rabbits in the negative control group were given normal saline. The day of administration was determined as Day 1 of the experiment.

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

3.2 OBSERVATION AND EXAMINATIONS

3.2.1 OBSERVATION OF GENERAL CONDITIONS

3.2.1.1 OBSERVATION TIME AND FREQUENCY

Rearing personnel: twice a day;
Experiment personnel: once a day;
Veterinarian: once a week;
Observation Period: 16 days after administration.

3.2.1.2 OBSERVATION MEASUREMENTS

Rearing personnel: death and other abnormalities of the rabbits;
Experiment personnel: including but not limited to the appearance, the general behavior activity, the mental state, the aspiration status, the excrement character, the genitals, the death and other toxic performance of the rabbits;
Veterinarian: including but not limited to the appearance, the general behavior activity, the mental state, the aspiration status, the excrement character, the genitals, the death and other toxic performance of the rabbits.

3.2.1.3 OBSERVATION OF IRRITATION AT INJECTION SITE

Observation time and frequency: the injection site was observed once 48 hours after administration;
Observation animal: all surviving animals;
Observation method: the animals were removed from the cage and the injection site was observed for irritant reactions such as redness, swelling, ecchymosis, induration, suppuration and ulceration.

3.2.2 HISTOPATHOLOGY EXAMINATION

Some animals (2 in each group, half male and half female) were euthanized (CO₂ inhalation) 48 hours after administration to observe the local muscle irritant reactions at the injection site, such as hyperemia, redness, degeneration, necrosis, etc. The quadriceps femoris was removed during anatomy and incised longitudinally. The irritant reactions of the injected muscle were observed and graded according to the standard in Table 3. The histopathological examination of local muscle tissue was performed.

The remaining animals were observed, graded and histopathologically examined on the 16th day of the experiment.

Table 3 Grading Standard for Muscle Irritant Reactions

Symptoms of reactions Grade

No obvious change 0

Mild hyperemia, with a range below 0.5*1.0 cm 1

Moderate hyperemia, with a range over 0.5*1.0 cm 2

Severe hyperemia, with degeneration of muscles 3

Necrosis with brown degeneration 4

Extensive necrosis 5

4. RESULTS

4.1 GENERAL CONDITIONS, GROSS ANATOMY OBSERVATION AND GRADING

No local reactions such as swelling and ecchymosis were observed at the injection site of rabbits in each group during both the administration and recovery period.

According to the anatomy results obtained around 48 hours after administration, mild hyperaemia was observed in the right quadriceps femoris muscle at the injection site of 1 rabbit and moderate hyperaemia was observed in the left quadriceps femoris muscle at the injection site of 1 rabbit in the high-dose group of 7-valent pneumococcal conjugate vaccine; moderate hyperaemia was observed in the right quadriceps femoris muscle at the injection site of 1 rabbit in the high-dose group of 13-JHYM (batch No. 20110304); moderate hyperaemia was observed in the right quadriceps femoris muscle at the injection site of 1 rabbit in the high-dose group of 13-JHYM (batch No. 20110406). No obvious abnormalities were observed at the injection site for the rest rabbits.

On the 16th day of the experiment, no obvious abnormalities were observed at the injection site

for all rabbits.
Please see Table 4 for specific grading.

4.2 HISTOPATHOLOGY EXAMINATION RESULTS

4.2.1 HISTOPATHOLOGIC RESULTS OBTAINED 48 HOURS AFTER ADMINISTRATION

High-dose 7-valent pneumococcal conjugate vaccine: moderate degeneration and necrosis of muscle fibers/muscle stroma, hemorrhage as well as inflammatory cell infiltration with purulent fluid formation were observed in the quadriceps femoris at the right injection site for 1 animal (5F01); slight degeneration and necrosis of muscle fibers/muscle stroma as well as inflammatory cell infiltration were observed in the quadriceps femoris at the left injection site for 1 animal (5M01);

High-dose 13-JHYM (batch 1) group: slight degeneration and necrosis of muscle fibers/muscle stroma as well as inflammatory cell infiltration were observed in the quadriceps femoris at the right injection site for 1 animal (7M01);

Confidential 805

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

High-dose 13-JHYM (batch 2) group: mild degeneration and necrosis of muscle fibers/muscle stroma, hemorrhage as well as inflammatory cell infiltration with purulent fluid formation were observed in the quadriceps femoris at the right injection site for 1 animal (9F01);

Low-dose 13-JHYM (batch 3) group: slight degeneration and necrosis of muscle fibers/muscle stroma as well as inflammatory cell infiltration were observed in the quadriceps femoris at the right injection site for 1 animal (10M01);

High-dose 13-JHYM (batch 3) group: severe degeneration and necrosis of muscle fibers/muscle stroma, hemorrhage as well as inflammatory cell infiltration with purulent fluid formation were observed in the quadriceps femoris at the right injection site for 1 animal (11F01).

No histopathologic abnormalities were observed in the quadriceps femoris of the rest rabbits.

Please see Appendix I for specific results.

4.2.2 HISTOPATHOLOGIC RESULTS OBTAINED ON THE 16TH DAY OF THE EXPERIMENT

Low-dose aluminum phosphate group: slight interstitial inflammatory cell infiltration was observed in the quadriceps femoris at the bilateral injection sites for 1 animal (2M02);

High-dose aluminum phosphate group: mild interstitial inflammatory cell infiltration was observed in the quadriceps femoris at the right injection site for 1 animal (3F02);

High-dose 13-JHYM (batch 2) group: slight interstitial inflammatory cell infiltration was observed in the quadriceps femoris at the right injection site for 1 animal (9M02).

No histopathologic abnormalities were observed in the quadriceps femoris of the rest rabbits.

Please see Appendix I for specific results.

5. DISCUSSION

5.1 IRRITATION INDUCED BY ALUMINUM PHOSPHATE

Although no obvious abnormalities were observed in the quadriceps femoris at the injection site 48 hours after aluminum phosphate administration, on the 16th day of the experiment, slight to mild interstitial inflammatory cell infiltration was observed in the quadriceps femoris at the injection site of rabbits in aluminum phosphate group. The pathological changes were dose-related, and the incidence and degree of pathological changes were significantly higher than those in the control group. Common adverse reactions of aluminum adjuvant such as sterile abscesses, erythema, subcutaneous nodules and granulomatous inflammation were often reported in clinical use. Therefore, the above mentioned pathological changes were related the injection of aluminum phosphate.

5.2 IRRITATION INDUCED BY LICENSED COMPARISON PRODUCT AND 13-JHYM

Around 48 hours after administration, changes including mild to severe degeneration and necrosis of muscle fibers/muscular stroma, hemorrhage as well as inflammatory cell infiltration were observed in the high-dose group of 7-valent pneumococcal conjugate vaccine, the high-dose group of 13-JHYM of 3 batches and the low-dose group of 13-JHYM (batch No.20110406), suggesting muscle irritation at the injection site, suggesting obvious irritation to the muscle at the injection site. Except that the muscle irritation at the injection site was relatively strong in the high-dose 13-JHYM (batch No.20110406) group, no significant difference was observed in the severity of the pathological changes among the batches.

Confidential 806

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

On the 16th day of the experiment, except that mild interstitial inflammatory cell infiltration could still be observed at the injection site in the high-dose group of 13-JHYM (batch No. 20110305), no obvious abnormalities were observed at the injection site for the rest groups, suggesting that the irritation could be partially recovered after the 16-day observation.

6. CONCLUSIONS

In conclusion, under the conditions of this experiment, after the low and high doses (0.5 mL/side, 1.5 mL/side, clinical dosage) of aluminum phosphate, 7-valent pneumococcal conjugate vaccine and 13-JHYM (batch No. 2011030, 20110305 and 20110406) were given to the rabbits through single injection on the quadriceps femoris muscle, the low-dose and high-dose aluminum phosphate, high-dose 7-valent pneumococcal conjugate vaccine, high-dose 13-JHYM of 3 batches, and the low-dose 13-JHYM of batch No. 20110406 had obvious irritation to the quadriceps femoris muscle of rabbits. The above mentioned muscle irritation could be partially recovered after the 16-day observation.

Report time 07/09/2011

1. EXPERIMENT DESIGN

The Japanese big-ear rabbits were given 13JHYM (64.4 µg/mL) through single intramuscular injection. Histopathological changes at the injection site of bilateral quadriceps femoris of 44 Japanese big-ear rabbits in the negative control group and each administration group were observed 48 hours after administration and on the 16th day of the experiment, respectively. Please see Table 1 for animal grouping and dosage design.

2. METHOD

The animals were euthanized (CO2 inhalation) 48 hours after administration and on the 16th day of the experiment respectively. The quadriceps femoris was removed and incised longitudinally. The irritant reactions of the injected muscle were observed and graded according to the standard predefined by the experiment protocol. After that, the injected quadriceps femoris muscle was fixed in 10% neutral formalin and routine paraffin section (thickness of 3-5µm) was performed. The paraffin sections were stained with HE and observed under light microscope.

3. RESULTS

3.1 GROSS ANATOMY RESULTS OBSERVED BY NAKED EYE

According to the Muscle Stimulation Response Grading Standard, 48 hours after administration, in the high-dose group of 7-valent pneumococcal conjugate vaccine, the reaction grade of quadriceps femoris muscle of 1 animal (5F01) at the right injection site was grade 1, and that of 1 animal (5M01) at the left injection site was grade 2; the reaction grade of injected quadriceps femoris muscle on the right side of 1 animal (7M01) in the high-dose group of 13-JHYM (batch 1) was grade 2; the reaction grade of injected quadriceps femoris muscle on the right side of 1 animal (11F01) in the high-dose group of 13-JHYM (batch 3) was grade 2. The reaction grades of the rest animals were all 0. Please see Table 2 for specific results. On the 16th day of the experiment, the response grade of injected quadriceps femoris muscle was 0 in all animals.

3.2 HISTOPATHOLOGICAL OBSERVATION

48 hours after administration: slight interstitial inflammatory cell infiltration was observed in the quadriceps femoris at the right injection site for 1 animal (1F01) in the negative control group; moderate degeneration and necrosis of muscle fibers/muscle stroma, hemorrhage as well as inflammatory cell infiltration with purulent fluid formation were observed in the quadriceps femoris at the right injection site for 1 animal (5F01) in the high-dose group of 7-valent pneumococcal conjugate vaccine, and mild degeneration and necrosis of muscle fibers/muscle stroma as well as inflammatory cell infiltration were observed in the quadriceps femoris at the left injection site for 1 animal (5M01); slight degeneration and necrosis of muscle fibers/muscle stroma and inflammatory cell infiltration were observed in the quadriceps femoris at the right injection site for 1 animal (7M01) in the high-dose 13-JHYM group (batch 1); mild degeneration and necrosis of muscle fibers/muscle stroma, hemorrhage as well as inflammatory cell infiltration with purulent fluid formation were observed in the quadriceps femoris at the right injection site for 1 animal (9F01) in the high-dose 13-JHYM group (batch 2); slight degeneration and necrosis of muscle fibers/muscle stroma and inflammatory cell infiltration were observed in the quadriceps femoris at the right injection site for 1 animal (10M01) in the low-dose 13-JHYM group (batch 3); sever degeneration and necrosis of muscle fibers/muscle stroma, hemorrhage as well as inflammatory cell infiltration with purulent fluid formation were observed in the quadriceps

femoris at the right injection site for 1 animal (11F01) in the high-dose13-JHYM group (batch 3). On the 16th day of the experiment: slight interstitial inflammatory cell infiltration was observed in quadriceps femoris at both injection sites for 1 animal (2M01) in the low-dose aluminum phosphate group; mild interstitial inflammatory cell infiltration was observed in quadriceps femoris at the right injection site for 1 animal (3F02) in the high-dose aluminum phosphate group; slight interstitial inflammatory cell infiltration was observed in quadriceps femoris at the right injection site for 1 animal (9M02) in the high-dose 13-JHYM group (batch 2). No abnormalities were observed for the rest animals in the histopathological observation of quadriceps femoris under microscope. The incidence and classification of reactions observed 48 hours after administration are shown in the attached Table 1. The incidence and classification of reactions observed on the 16th day of the experiment are shown in the attached Table 2. The pictures of possible drug-related pathological changes in each stage are shown in the attached pictures.

4. DISCUSSION AND CONCLUSIONS

The irritation of 13-JHYM on quadriceps femoris was observed 48 hours after a single intramuscular injection of 13-JHYM was given to the Japanese big-ear rabbits and on the 16th day of the experiment. The main pathological changes observed 48 hours after administration were degeneration and necrosis of muscle fibers/muscle stroma, hemorrhage as well as inflammatory cell infiltration with purulent fluid formation; interstitial inflammatory cell infiltration. The incidence and degree of pathological changes in each group are shown in Table 3.

(batch 3) group	
Grading: 0 = normal, 1 = slight, 2 = mild, 3 = moderate, 4 = severe, 5 = serious	

The above results showed that, 48 hours after the administration:
1) Possible vaccine-related reactions: slight to moderate degeneration and necrosis of muscle fibers/muscle stroma, hemorrhage as well as inflammatory cell infiltration with purulent fluid formation were observed in 2 inspected sites (2/4) in the high-dose 7-valent pneumococcal conjugate vaccine group; slight to severe degeneration and necrosis of muscle fibers/muscle stroma, hemorrhage as well as inflammatory cell infiltration with purulent fluid formation were observed in 1 inspected sites (1/4) in the13-JHYM (batch 1) group, the high-dose 13-JHYM group (batch 2), as well as both the high-dose and low-dose 13-JHYM (batch 3) groups respectively. The above-mentioned pathological changes only appeared in the administration groups, and the incidence was high. The degree of pathological changes was severe and showed obvious dose correlation. Therefore, the above mentioned pathological changes were probably caused by vaccine irritation. Besides, slight interstitial inflammatory cell infiltration was observed in 1 inspected site (1/4) in the negative control group, which should be probably caused by mechanical irritation.

Confidential 812
MODULE 4 NONCLINICAL STUDY REPORTS
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2) Comparison of vaccine irritation: among the three groups of 13-JHYM with different batch numbers, the high-dose 13-JHYM (batch 3) group had the strongest irritation on the muscle at the

injection site, and it was slightly stronger than that of the high-dose 7-valent pneumococcal conjugate vaccine group; the irritation of the high-dose 13-JHYM (batch 2) group was slightly weaker, but still stronger than that of the high-dose 13-JHYM (batch 1) group; the low-dose 13-JHYM (batch 3) group and high-dose 13-JHYM (batch 1) group had the similar irritation on the injected muscle.

On the 16th day of the experiment, histopathological examination under microscope showed that the main pathological change was interstitial inflammatory cell infiltration. The incidence and degree of pathological changes in each group are shown in Table 4.

Table 4 Table of Results of Histopathological Observation under Microscope on the 16th Day of the Experiment

High-dose 13-JHYM (batch 3) group 0 0

Grading: 0 = normal, 1 = slight, 2 = mild, 3 = moderate, 4 = severe, 5 = serious

The above results showed that, 48 hours after the administration:

1) Possible vaccine-related reactions: slight to mild interstitial inflammatory cell infiltration was observed respectively in 2 inspected sites (2/4) in the low-dose aluminum phosphate group and 1 inspected site in the high-dose aluminum phosphate group; slight interstitial inflammatory cell infiltration was observed respectively in 1 inspected site (1/4) in the high-dose 13-JHYM (batch 2) group. The above-mentioned pathological changes only appeared in the administration groups, and the incidence was high. The vaccine-related possibility cannot be ruled out.

2) Comparison with results obtained 48 hours after administration: Only one case of slight interstitial inflammation was observed in the high-dose 13-JHYM (batch 2) group and the pathological changes were significantly reduced compared with the previous pathological changes; degeneration and necrosis of muscle fibers/muscle stroma, hemorrhage as well as inflammatory cell infiltration with purulent fluid formation observed 48 hours after administration in the high-

Confidential 813

MODULE 4 NONCLINICAL STUDY REPORTS

dose 7-valent pneumococcal conjugate vaccine group, the high-dose 13-JHYM (batch 1) group as well as both the high-dose and low-dose 13-JHYM (batch 3) groups were no longer observed during the recovery period (on the 16th day of the experiment), which could be determined as fully recovered.

In conclusion, various degrees of degeneration and necrosis of muscle fibers/muscle stroma, hemorrhage as well as inflammatory cell infiltration with purulent fluid formation were observed in the 13-JHYM (batch 1) group, the high-dose 13-JHYM (batch 2) group, as well as both the high-dose and low-dose 13-JHYM (batch 3) groups 48 hours after Japanese big-ear rabbits were given 13-JHYM (64.4 µg/mL) through single intramuscular injection, suggesting obvious irritation to the muscle at the injection site. Among them, except for the high-dose 13-JHYM (batch 3) group, the degree of pathological changes in other groups was mainly slight to mild. On the 16th day of the experiment, pathological changes observed in the high-dose 13-JHYM (batch 2) group were significantly relieved, and the pathological changes in other administration groups were completely recovered. In addition, the possibility of the infiltration of interstitial inflammatory cells observed on the 16th day in the aluminum phosphate group was vaccine-related could not be ruled out.

Passive Cutaneous Anaphylaxis Test of 13-
Experiment Name:
JHYM in Guinea Pigs
Experiment Number: A201118-T075-01

This experiment was completed in accordance with Non-clinical Good Laboratory Practice formulated by China Food and Drug Administration (China Food and Drug Administration rule No. 2, effective from September 1st, 2003). The experiment procedure was carried out in accordance with the experiment protocol and the relevant standard operating procedure of the research institution. No deviation that affected the reliability of experiment results and conclusions was observed. This report faithfully reflects the experiment materials, experiment methods and experiment results.

MODULE 4 NONCLINICAL STUDY REPORTS
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Abstract

The 13-valent pneumococcal polysaccharide conjugate vaccine (13-JHYM) is made from pneumococcus capsule polysaccharide antigens of serotype 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14,18C, 19A, 19F and 23F covalently combined with tetanus toxoid carrier protein and adsorbed by aluminum phosphate adjuvant. The clinical use of this vaccine is for infants and children aged 2 months to 2 years old to prevent the invasive infection caused by the above-mentioned serotype pneumococcus. The proposed dosage is 0.5 mL per person, and the proposed route of use is intramuscular injection.

In accordance with the relevant requirements of new drug declaration redefined by Provisions for Drug Registration, the passive systemic anaphylaxis test of 13-JHYM provided by Yunnan Walvax Biotechnology Co., Ltd. was carried out in guinea pigs by WestChina-Frontier PharmaTech Co., with a purpose to observe whether 13-JHYM could induce passive systemic anaphylaxis in guinea pigs, and to provide a reference for evaluating the safety of clinical use.

This experiment was divided into 2 stages: (1) antiserum preparation stage; A total of 20 guinea pigs (half male and half female) were randomly divided into 10 groups, including a negative control group, a positive control group, a low-dose and a high-dose group for 7-valent pneumococcal conjugate vaccine, as well as a low-dose and a high-dose group for 13-JHYM of 3 different batches respectively (batch No. 20110304, 20110305 and 20110406). The sensitization dosage for the low-dose groups was 0.05 mL bulk/kg, which was equal to the clinical proposed dosage, and the sensitization dosage for the high-dose groups was 0.5 mL bulk/kg, which was 10 times of the clinical proposed dosage. The guinea pigs in the 7-valent pneumococcal conjugate vaccine groups and 13-JHYM groups were intramuscularly injected with sample or control at the corresponding concentration based on the above mentioned dosage, guinea pigs in the positive control group were intraperitoneally injected with 10mg/mL ovalbumin solution in the volume of 0.5 mL per animal, and guinea pigs in the negative control group were intramuscularly injected with 0.9% sodium chloride injection (normal saline) in the volume of 0.5 mL/kg. The administration was carried out every other day, and on the 10th day after the 5th consecutive administration, the antiserum was prepared using the abdominal aorta blood, which was mixed with the serum of 2 animals in the same group. The serums of two animals in the same group were mixed together and kept in reserve. (2) Locus coeruleus test: A total of 60 guinea pigs (half male and half female) were randomly divided into 10 groups at the same settings as the antiserum preparation stage. Animals in each group were intracutaneously injected with the antiserum of each group at the back (3 pre-epilated points of 3*4 cm²) after the antiserum was diluted at the ratio of 1:2, 1:8 and 1:32. Each animal was given 0.1 mL/point of antiserum in each dilution degree. The animals were intravenously injected with provoking antigen at the same dosage as phase 1 along with equivalent 1% Evans Blue dye (1 mL in total) 4 hours after being intracutaneously injected with antiserum. After 30 minutes, the guinea pigs were anesthetized (around 60 mg/kg pentobarbital sodium, intraperitoneally injection) and euthanized by abdominal aorta bloodletting. The length and diameter of the locus coeruleus were measured and the locus coeruleus were photographed.

The results showed that, in the negative control group, the diameter of intradermal locus coeruleus of each dilution degree at the injection site was all 0 mm; in the positive control group, the mean diameter of locus coeruleus was 15.24 mm at the dilution degree of 1:32, 19.17 mm at the dilution degree of 1:8 and 22.62 mm at the dilution degree of 1:2; the diameter of intradermal locus coeruleus of each dilution degree at the injection site was all 0 mm in the high-dose and low-dose groups of both 7-valent pneumococcal conjugate vaccine and 13-JHYM of 3 batches.

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

In conclusion, under the conditions of this experiment, the guinea pigs were intramuscularly injected with 13JHYM of 3 batches (batch No. 20110304, 20110305 and 20110406) at the dosage of 0.05 mL/kg and 0.5 mL/kg respectively, and the dilution degrees of the antiserum were 1:2, 1:8 and 1:32, which all obtained negative results in the passive systemic anaphylaxis in guinea pigs.

Experiment operation: Ke Mu, Xuemei Huang, Hong Yuan, Xi Wang, Quanli Xu;

Veterinarian: Lihua Duan;

Animal rearing and management: Qing Liao, Yongshao Cai;
Test articles preparation and management: Wulin Zheng.

2. MATERIALS

2.1 EXPERIMENT ANIMALS

2.1.1 BASIC INFORMATION

Species: British guinea pigs;

Grade: normal;

Amount and gender of animals purchased: 90 animals in total, half male and half female;

Amount and gender of animals used: 20 animals in total, half male and half female (stage 1); 60

animals in total, half male and half female (stage 2);

Body weight: 264.3-335.6g (stage 1); 303.2-360.7g (stage 2);

Source: Sichuan Laboratory Animal Special Committee farm (Production License No. SCXK

(Sichuan) 2008-014; Certificate of Quality No. 0024849 and 0021850, issuing unit: Sichuan

Department of Science and Technology);

Entry date: 14/06/2011 (stage 1), 05/07/2011 (stage 2);

Environmental adaptation period after entry: Before the experiment, the guinea pigs included in

stage 1 adapted to the environment for 14 days (14/06/2011-27/06/2011) and the guinea pigs

included in stage 2 adapted to the environment for 16 days (05/07/2011-20/07/2011). Healthy

guinea pigs (female must not be pregnant) were selected as formal test animals. Observation

measurements during adaptation period: general conditions, body weight etc.

2.1.2 ANIMAL REARING CONDITIONS

2.1.2.1 REARING SITES

The ordinary animal house of WestChina-Frontier PharmaTech Co. (laboratory animal room

license No. SYXK (Sichuan) 2009-123).

2.1.2.2 REARING CONDITIONS

Rearing cage: guinea pig cage (L*W*H: 515 mm*400 mm*260 mm);

Rearing density: no more than 3 animal per cage.

2.1.2.3 REARING ENVIRONMENT

Standard: the National Standard of the People's Republic of China GB14925-2001;

Control system: the EBI400 automatic control fresh air air conditioning system produced by

Honeywell;

Temperature: room temperature 22.19-26.32°C (with a diurnal temperature range of 0.07-1.66°C);

Humidity: relative humidity 37.63-74.43%;

Confidential 826

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Illumination: artificial lighting, 12 hours of alternating light and dark (lights on at 07:30, lights off at 19:30);

Ventilation: 8-10 times per hour, 100% fresh air.

2.1.2.4 FEED

Type: pellet feed for guinea pigs;

Manufacturer: Beijing Ke'ao Xieli Feed Co., Ltd. (Feed Production Permit: SCXK (Beijing) 2009-

0012);

Batch No.: 11030551;

Feeding method: free intake;

Nutrient analysis: provided by the feed provider, of which the routine nutritional measurements of

crude protein, crude fat, crude fiber, crude ash, water, calcium and phosphorus were reported for

each batch(referring to the National Standard of the People's Republic of China GB14924.5-2001);

Confirmation of contaminant content in feed: provided by the feed provider, indicators for

chemical contaminants including arsenic, lead, cadmium, mercury, hexachlorocyclohexane, DDT,

aflatoxin B₁, total colony count, coliform group, mold and yeast count, pathogenic bacteria

(Salmonella) were provided at least once a year (referring to the National Standard of the People's

Republic of China GB14924.2-2001).

2.1.2.5 DRINKING

Type: drinking water for laboratory animals (reverse osmosis water);

Method of water supply: held in drinking water bottles, free intake;

Colony count detection: referring to the National Standard of the People's Republic of China

GB5749-2006, sampling self-examination (once per week);

Detection of conventional indicators of water quality: referring to the National Standard of the

People's Republic of China GB5749-2006, samples were sent to units with relevant qualification

for testing at least 2 times per year.

2.1.3 ANIMAL GROUPING AND MARKING METHODS

2.1.3.1 ANIMAL GROUPING

Group design: a total of 10 groups, including a negative control group, a positive control group, a

low-dose and a high-dose group for 7-valent pneumococcal conjugate vaccine, as well as a low-

dose and a high-dose group for 13-JHYM of 3 different batches;

Amount: 2 animals in each group for the antiserum preparation stage and 6 animals in each group

for the passive sensitization stage;

Gender: half male and half female;

Grouping method: the guinea pigs were randomly divided into groups according to their body

weight;

Disposal of surplus animals: handed over to the department of laboratory animal administration;

The specific group information is shown in Table 1.

2.1.3.2 MARKING METHOD

Adaptation period: cage card and red mark were used as animal identification markers;
Post-grouping period: The cage card and individual ear number were used as animal identification markers;

Marking method of cage card:

Adaptation period: unified use of white cage card, with the test number, animal species, animal number, entry time and notes indicated;

Post-grouping: cage cards in different colors were used to distinguish the groups, and the cards were marked with test number, animal species, animal number, treatment factors, expected start and end time of the experiment and notes;

Colors of cage cards after grouping: white represented the negative control group; yellow represented the positive control group; blue represented the low-dose 7-valent pneumococcal conjugate vaccine group, and orange represented the high-dose 7-valent pneumococcal conjugate vaccine group; green represented the low-dose 13-JHYM group, and red represented the high-dose 13-JHYM group.

2.2 TEST ARTICLES

2.2.1 TEST ARTICLE INFORMATION

Name: 13-valent pneumococcal polysaccharide conjugate vaccine (13-JHYM);

Source: Yunnan Walvax Biotechnology Co., Ltd.;
Character: suspension with opalescence;
Specification: 0.5 mL: 32.2µg per vial;
Batch No.: 20110304 (batch 1), 20110305 (batch 2), 20110406 (batch 3);
Preservation conditions and notes: kept under 2-8■;
Expiration date: February, 2013 for batch No. 20110304 and 20110305; March, 2013 for 20110406;
Preservation site: the Samples Management Department of WestChina-Frontier PharmaTech Co.

2.2.2 TEST ARTICLE PREPARATION

Menstruum: 0.9% sodium chloride injection;
Preparation methods: samples for the low-dose groups were prepared with 0.9% sodium chloride injection under aseptic condition, and samples for the high-dose groups used direct separation of the bulk;
Marking methods after preparation: the high-dose groups were marked with red labels and the low-dose group were marked with green labels, with experiment number, substance name and concentration used in the experiment, volume, storage condition, expiration date, responsible person and preparation date;
Preservation condition and period of validity after preparation: stored in ice box for use within 24 hours.

Confidential 829

MODULE 4 NONCLINICAL STUDY REPORTS

2.2.3 RETURN AND DISPOSAL OF REMAINING SAMPLES

The remaining samples after administration were collected in the waste liquid bucket after sterilized with high temperature and high pressure. The reserved samples were deposited in the sample room referring to the SOP for the preservation of test articles. The remaining samples at the end of the experiment were returned to the client.

2.3 COMPARISON PRODUCT

2.3.1 NEGATIVE COMPARISON PRODUCT INFORMATION

Name: 0.9% sodium chloride injection;
Source: Sichuan Kelun Pharmaceutical Co., Ltd.;
Character: colorless transparent liquid;
Specification: 100 mL per bottle;
Batch No.: C100928;
Preservation conditions and notes: sealed storage at room temperature;
Expiration date: August, 2012;
Preparation methods: direct separation of the bulk on the day of use;
Marking methods after preparation: test articles were marked with white labels with experiment number, substance name used in the experiment, volume, storage condition, expiration date, responsible person and preparation date;
Preservation condition and period of validity after preparation: stored in the ice box for use within 24 hours.

2.3.2 POSITIVE COMPARISON PRODUCT INFORMATION

Name: ovalbumin;
Source: Shanghai Yuanju Bio-tech Co., Ltd.;
Character: white crystal;
Specification: 1g per bottle;
Batch No.: 091221;
Preservation conditions and notes: kept under 2-8■;
Period of validity: 2 years;
Preparation methods: prepared into 10mg/mL solution with 0.9% sodium chloride injection when use;
Preservation condition and period of validity after preparation: stored in the ice box for use within 24 hours.

2.3.3 SIMILAR LICENSED COMPARISON PRODUCT

Name: 7-valent pneumococcal conjugate vaccine;
Source: Wyeth Pharmaceutical Division of Wyeth Holdings Corporation;
Character: white suspension;

Confidential 830

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Specification: 0.5 mL: 16µg per vial;
Batch No.: E11660D57298, E19166D94429 and E61516E52444;
Preservation conditions and notes: stored under 2-8■;
Term of validity: December, 2011 for batch No.E11660D57298; April, 2012 for batch No. No. E19166D94429; March, 2013 for E61516E52444;
Preparation methods: samples for the low-dose groups were prepared with 0.9% sodium chloride injection under aseptic condition, and samples for the high-dose groups used direct separation of the bulk;
Marking methods after preparation: the high-dose groups were marked with red labels and the low-dose group were marked with green labels, with experiment number, substance name and concentration used in the experiment, volume, storage condition, expiration date, responsible person and preparation date;
Preservation condition and period of validity after preparation: stored in ice box for use within 24 hours.

2.3.4 RETURN AND DISPOSAL OF REMAINING COMPARISON PRODUCTS

After each administration, the remaining negative control was directly discharged into the sewer, the positive control was collected in the waste liquid barrel, and the licensed control was collected in the waste liquid barrel after sterilization.

2.4 MAIN REAGENT

Name: Evans Blue;
Source: Sigma;
Character: brown metallic luster powder;
Specification: 10g per bottle;
Batch No.: MKBB1167;
Preservation conditions and notes: sealed storage at room temperature;
Expiration date: March, 2013;
Preparation methods: dissolved with 0.9% sodium chloride injection to the required concentration

when use;
Marking methods: marked with blue label, with experiment number, substance name and concentration used in the experiment, volume, storage condition, expiration date, responsible person and preparation date;
Preservation condition and period of validity after preparation: sealed storage at room temperature, validate within the same day of preparation.
After use, the remaining Evans Blue solution was collected into the waste liquid bucket.

Name: pentobarbital sodium;
Source: Sigma;
Character: white powder;

Specification: 25g per bottle;
Batch No.: 127K1005;
Preservation conditions and notes: sealed storage at room temperature;
Expiration date: March, 2013 (re-inspection date);
Preparation methods: dissolved with 0.9% sodium chloride injection to the required concentration when use;
Marking methods after preparation: marked with white label;
Preservation condition and period of validity after preparation: sealed storage under 2-25 °C, validate within 14 days.
After use, the remaining pentobarbital sodium was returned to the Samples Management Department and handled according to the corresponding SOP.

2.5 MAIN INSTRUMENTS

Injector, test tube, pipette gun, hair shears, vernier scale, digital camera, electronic balance, refrigerator etc.

3. METHODS AND OBSERVATION MEASUREMENTS

3.1 METHODS

3.1.1 ANTISERUM PREPARATION STAGE

Referring to the Technical Guidelines for the Study of Irritation, Hypersensitivity and Hemolysis of Chemical Drugs (March 2005), in a passive systemic anaphylaxis test, animals in the negative control group should be given menstuum in the same volume, animals in the positive control group should be given bovine serum albumin or ovalbumin or known sensitizing positive substance in the volume of 1-5 mg per animal, animals in the low-dose groups should be given samples at the maximum clinical dosage, and animals in the high-dose groups should be given samples at a dosage which was several times of the dosage used in the low-dose group. Based on the information provided by the client, the clinical proposed dosage of 13-JHYM was 0.5 mL per person (a single serving contained 32.2 µg pneumococcal polysaccharides of various types. The dosage for infants whose weight was determined as 10 kg was converted into a clinical proposed dosage of 0.05 mL/kg, i.e. 3.22 µg/kg).

On the basis of above mentioned premises, 0.05 mL bulk/kg was determined as low dosage for 13-JHYM of 3 different batches in the antiserum preparation stage, and 0.5 mL bulk/kg was determined as high dosage, which was equal to and 10 times of the clinical proposed dosage for human beings respectively. The low-dose and high-dose 7-valent pneumococcal conjugate vaccine group were set at the same dosage as 13-JHYM groups. The dosage of 5 mg per animal was set for the positive control group (intraperitoneal injection, 10 mg/mL ovalbumin), and the normal saline was given to the animals in the negative control group in the volume of 0.5 mL/kg through intramuscular injection (Table 2).

The proposed clinical administration route for the samples used in this experiment was intramuscular injection, therefore intramuscular injection on the hind limbs was adopted in this experiment. The sensitization was carried out on the 1st, 3rd, 5th, 7th and 9th day of the experiment respectively, 5 times in total continuously. On the 10th day after the last sensitization, the animals were anesthetized using pentobarbital sodium solution (around 60 mg/kg, intraperitoneal injection) and blood samples were collected from abdominal aortic. The blood sample was centrifuged at room temperature for 10 minutes at 2000 rpm and the serum was separated. The serum of 2 animals in the same dosage group was stored together at -20 °C and kept in reserve for 2 weeks.

3.1.2 PASSIVE SENSITIZATION STAGE

Antiserum preparation: the antiserum prepared from each group was diluted to 3 proportions of 1:2, 1:8 and 1:32 respectively with 0.9% sodium chloride injection.

Depilation: after the guinea pigs in each group were anesthetized (pentobarbital sodium, around 30mg/kg, intraperitoneal injection), the back area from neck to buttocks of the guinea pigs was depilated.

Passive sensitization: animals in each group were intradermally injected at 3 injection points in the thorax-back, low back, abdomen back respectively according to the dosage design in Table 3.

Antiserum diluted in the proportion of 1:2, 1:8 and 1:32 was injected in the order from chest to abdomen (0.1 mL/point). The distance between two points was at least 1-2 cm.

Method of intradermal injection: after sterilized with 75% alcohol, the tip of the needle pressed against the skin and stabbed flatly into the skin with the pinhole up forward. The solution was injected with a great resistance during the injection process. Translucent lump bulge was observed at the injection site after injection.

3.2 OBSERVATION MEASUREMENTS

The guinea pigs in each group were anesthetized (around 60 mg/kg pentobarbital sodium, intraperitoneally injection) and euthanized by abdominal aorta bloodletting 30 minutes after provoking injection. The skin on the back was cut off, the length and diameter of the locus coeruleus were measured as well as the locus coeruleus were photographed.

3.3 RESULTS DETERMINATION

The results were determined using the method of fixed dilution ratio. The result at a certain dilution degree could be determined as positive if: the average diameter of the locus coeruleus in the positive control group was more than 5mm at that dilution degree, no locus coeruleus was observed in the negative control group at that dilution degree, and the diameter of locus coeruleus was observed to be more than 5mm in the samples' groups at that dilution degree.

4. RESULTS

4.1 PHOTOGRAPHS OF LOCUS COERULEUS

No locus coeruleus was observed at the injection site in the negative control group, the high-dose and low-dose groups of both 7-valent pneumococcal conjugate vaccine and 13-JHYM of 3 batches (batch No.20110304, 20110305 and 20110406) at all dilution degrees. Regular locus coeruleus was observed at the injection site in the positive control group at each dilution degree. The photographs of locus coeruleus were as below (the locus coeruleus in the photographs are in the order of dilution degrees, i.e. 1:2, 1:8, 1:32 from top to bottom):

4.2 DIAMETERS OF LOCUS COERULEUS

In the negative control group, as well as the high-dose and low-dose groups of both 7-valent pneumococcal conjugate vaccine and 13-JHYM of 3 batches (batch No.20110304, 20110305 and 20110406), the diameters of locus coeruleus in each group at all dilution degrees were all 0 mm. The diameters of locus coeruleus in the positive control group were all larger than 5mm at the dilution degree of 1:2, 1:8 and 1:32 (Table 5).

5. CONCLUSIONS

In conclusion, under the conditions of this experiment, the guinea pigs were intramuscularly injected with 13JHYM of 3 batches (batch No. 20110304, 20110305 and 20110406) at the dosage of 0.05 mL/kg and 0.5 mL/kg respectively, and the dilution degrees of the antiserum were 1:2, 1:8 and 1:32, which all obtained negative results in the passive systemic anaphylaxis in guinea pigs.

6. ORIGINAL DATA DEPOSITORY

Preservation site: the archives room of WestChina-Frontier PharmaTech Co.;

Preservation conditions: Standard;

Preservation period: The paper file were kept for at least 5 years after the drug got licensed, and the electronic data should be kept permanently;

Contact number: 028-85154334-511;

Contact person: Ling Chang.

7. DEVIATION

Type: experiment protocol deviation;

Description: Module 4.2.3 in the original protocol required the relative humidity to be 40-70%, while the temperature range in this experiment was 22.19-26.32°C (with a diurnal temperature range of 0.07-1.66°C) and the range of the relative humidity was 37.63-74.43%;

Processing: None;

Evaluation: the range of the relative humidity which was not within the required range from the protocol was only observed during a part of time in 3 days, which should not have impacts on the results evaluation in this experiment.

Apart from the above-mentioned deviation, no deviation which had impact on the reliability of the experiment results and conclusions as well as other abnormalities were observed in this experiment.

ABSTRACT

The 13-valent pneumococcal polysaccharide conjugate vaccine (code: 13-JHYM) is prepared by adsorption by aluminum phosphate adjuvant after covalent binding between types 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F pneumococcal capsular polysaccharides antigen and tetanus toxoid carrier protein. It is clinically intended for the prevention of invasive infections caused by the above serotypes of pneumococci in infants aged 2 months to 2 years and children. The intended clinical dose is 0.5 mL/time/person, and the intended route of administration is intramuscular injection.

WestChina-Frontier PharmaTech Co., Ltd. conducted study on in vitro hemolysis of 13-JHYM provided by Yunnan Walvax Biotechnology Co., Ltd. according to the relevant requirements for new drug application in the Provisions for Drug Registration, and observed the effect of 13-JHYM on rabbit red blood cell, providing a reference for evaluating the safety of clinical use.

The study included negative control group (0.9% sodium chloride injection), positive control group (sterile water for injection), adjuvant control group (aluminum phosphate concentration of 1 mg/mL) and 13-JHYM (clinical preparation concentration) groups from three batches (20110304, 20110305 and 20110406). Five dose groups (0.5, 0.4, 0.3, 0.2 and 0.1 mL/tube) were set up for aluminum phosphate and 13-JHYM of each batch. The 2% rabbit red blood cell suspension was mixed with aluminum phosphate adjuvant, 13-JHYM, 0.9% sodium chloride injection and sterile water for injection at a certain proportion, then placed in a $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ incubator and observed at 0, 15, 30, 45, 60 minutes and 2, 3 hours respectively. Three replicates were prepared for each dose.

The results showed that after incubation at $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ for 3 hours, no hemolysis and aggregation reaction occurred in the negative control group; hemolysis reaction occurred in the positive control group; red blood cell aggregation occurred in each tube (0.5, 0.4, 0.3, 0.2 and 0.1 mL/tube) in aluminum phosphate adjuvant group, and the degree of aggregation was significantly dose-related, but no hemolysis reaction was observed; red blood cell aggregation occurred in each tube (0.5, 0.4, 0.3, 0.2 and 0.1 mL/tube) of 13-JHYM from 3 batches, and the degree of aggregation was lower than that in the aluminum phosphate group and was not significantly dose-related, and no hemolysis reaction was observed.

In conclusion, under the conditions of this study, aluminum phosphate adjuvant (at the concentration of 1 mg/mL, the same concentration as aluminum phosphate in 13-JHYM formulation) and 13-JHYM (20110304, 20110305 and 20110406) had aggregation effect on rabbit red blood cell at different doses (0.5, 0.4, 0.3, 0.2 and 0.1 mL/tube), but no hemolysis reaction was observed.

2 MATERIALS

2.1 LABORATORY ANIMALS

2.1.1 GENERAL INFORMATION

Species: Japanese white rabbit;

Class: conventional;

Quantity and sex of animals purchased: 1, male;

Weight: 2.825 kg;

Source: Farm of Sichuan Laboratory Animal Specialized Committee, laboratory animal production

license No.: SCXK(C) 2008-014;

House entry time: August 2, 2011;

Acclimation period after entering animal house: Before the study, the rabbit was acclimated to the environment for 14 days (August 2, 2011 ~ August 15, 2011), and the study animal was a healthy

rabbit. Main inspection items during the acclimation period: General state of animals, body weight, etc.

2.1.2 ANIMAL HOUSING CONDITIONS

2.1.2.1 HOUSING PLACE

General Animal House (Building 1) of WestChina-Frontier PharmaTech Co., Ltd. (No. of license for use of laboratory animal house: SYXK (C) 2009-123).

2.1.2.2 HOUSING CONDITIONS

Type of housing cage: stainless steel rabbit cage (L × W × H: 550 mm × 550 mm × 380 mm);

Housing density: ≤1 animal/cage.

2.1.2.3 HOUSING ENVIRONMENTAL CONDITIONS

Standard for housing environmental conditions: National Standard of the People's Republic of China GB14925-2001;

Housing environmental control system: Honeywell EBI400 automatic control all-fresh air central air conditioning system;

Temperature: room temperature 23.11 ~ 24.49°C (daily range of temperature 0.53 ~ 1.15°C);

Humidity: relative humidity 52.3 ~ 61.6%;

Illumination: Artificial lighting with a 12 hour light/dark cycle (lights on at 07:30 and off at 19:30);

Ventilation rate: 8~10 times/h, 100% all fresh air.

2.1.2.4 FEED

Type: complete formula pellet feeds for rabbits

Manufacturer: Beijing Keao Xieli Feed Co., Ltd. Production license No. of feed: SCXK (J) 2009-0012;

Batch No.: 11044111;

Feeding method: Ad libitum;

Test of nutritional ingredients: Provided by the feed supplier. Test reports for conventional nutritional ingredient indicators (crude protein, crude fat, crude fiber, crude ash, moisture, calcium and

Confidential 846

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

phosphorus) were provided for each batch (refer to the national standard of the People's Republic of China GB14924.4-2001);

Confirmation of contaminant content of feed: Provided by the feed supplier. Chemical contaminant indicators such as arsenic, lead, cadmium, mercury, BHC, DDT, aflatoxin B1, total bacterial count, coliform group, mold and yeast count and pathogenic bacteria (salmonella) were provided at least once a year (refer to the national standard of the People's Republic of China GB14924.2-2001).

2.1.2.5 DRINKING WATER

Type: Drinking water for laboratory animals (reverse osmosis water)

Water supply method: Supplied in drinking bottle with water available ad libitum;

Test of total bacterial count: Refer to the national standard of the People's Republic of China GB5749-2006. Samples were taken for self-test (1 time/week).

Test of conventional indicators of water quality: Refer to the national standard of the People's Republic of China GB5749-2006. Samples were taken and sent for study.

2.1.2.6 ANIMAL IDENTIFICATION METHOD

Acclimation period and study period: Cage card was used as animal identification mark;

Marking method of cage card:

Acclimation period: White cage card was used, the study number, animal species, animal serial number, house entry time, remarks and other information were indicated.

2.2 TEST ARTICLE

2.2.1 INFORMATION OF TEST ARTICLE

Name or designation: 13-valent pneumococcal polysaccharide conjugate vaccine (code: 13-JHYM);

Source: Yunnan Walvax Biotechnology Co., Ltd.;

Description: Suspension with opalescence;

Strength: 0.5 mL: 32.2 µg/vial;

Batch No.: 20110304 (batch 1), 20110305 (batch 2), 20110406 (batch 3);

Storage conditions and precautions: Store at 2 ~ 8°C;

Shelf life: batch 20110304 and 20110305 were valid until February 2013, and batch 20110406 was valid until March 2013;

Place of storage: Test Article Management Department of WestChina-Frontier PharmaTech Co., Ltd.

2.1.2 PREPARATION OF TEST SOLUTION

Preparation method: bulk was directly used;

Method of identification after preparation: Follow the label on the original vial;

Temporary storage conditions and shelf life after preparation: Temporarily stored in the ice box and used within 24 h.

2.1.3 TREATMENT OF RETURNED AND REMAINING TEST ARTICLES

After being sterilized under high temperature and high pressure, the remaining test articles were uniformly collected into the waste liquid bucket. The retained samples were stored at the storage room of test articles in accordance with the SOP Storage of Test Articles. After completion of the test items, the remaining test articles were returned to the Client.

2.3 CONTROL ARTICLE

2.3.1 GENERAL INFORMATION

Name or designation: aluminum phosphate;

Source: Yunnan Walvax Biotechnology Co., Ltd.

Description: Suspension with opalescence;

Concentration: 1 mg/mL;

Strength: 50 mL/vial;

Batch No.: 8169402;

Storage conditions and precautions: Store at 2 ~ 8°C;

Shelf life: long term;

Preparation method: Bulk was sub-packaged and directly used;

Method of identification after preparation: Yellow label was used for identification, and the study number, name of study substance, preparation volume, storage conditions, shelf life, responsible person and preparation date were indicated.

Temporary storage conditions and shelf life after preparation: Temporarily stored in the ice box and used within 24 h.

Name or designation: Sterile water for injection
Source: Sichuan Kelun Pharmaceutical Co., Ltd.;
Description: colorless clear liquid;
Strength: 500ml/vial;
Batch No.: M10120817;
Storage condition: sealed storage at room temperature;
Valid until: November 2012;
Preparation method: Bulk was sub-packaged and directly used;
Method of identification after preparation: Yellow label was used for identification, and the study number, name and concentration of study substance, volume, storage conditions, shelf life, responsible person and preparation date were indicated.
Temporary storage conditions and shelf life after preparation: Temporarily stored in the ice box and used within 24 h.

Name or designation: 0.9% sodium chloride injection;
Source: Sichuan Kelun Pharmaceutical Co., Ltd.;
Description: colorless clear liquid;
Strength: 100 ml/vial;
Concentration: 0.9%;
Batch No.: C100928;

Confidential 848
MODULE 4 NONCLINICAL STUDY REPORTS
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Storage condition: sealed storage at room temperature;
Valid until: August, 2012;
Preparation method: bulk was directly used;
Method of identification after preparation: White label was used for identification, and the study number, name and concentration of study substance, volume, storage conditions, shelf life, responsible person and preparation date were indicated.
Temporary storage conditions and shelf life after preparation: Temporarily stored in the ice box and used within 24 h.

2.3.2 DISPOSAL OF RETURNED AND REMAINING CONTROL ARTICLES

The returned control articles were discharged directly into the sewer.

2.4 OTHER MAIN REAGENTS

Name: pentobarbital sodium
Source: Sigma;
Description: white powder;
Strength: 25 g/vial;
Batch No.: 127K1005;
Storage condition: sealed storage at room temperature;
Retest time: March 2013;
Preparation method: 0.9% sodium chloride injection was dissolved to the required concentration immediately before use;
Temporary storage condition and shelf life after preparation: Temporarily store at 2 ~ 25°C for future use, with shelf life of 14 days;
The remaining pentobarbital sodium after use was returned to the Test Article Department.

2.5 MAIN INSTRUMENTS AND DEVICES REQUIRED FOR THE STUDY

Equipment Name Manufacturer Model Authority No.

Centrifuge Eppendorf 5810R MEC-01-13

Incubator Binder BD115 MEH-08-04

Electronic platform

scale, etc.

3 EXPERIMENT METHOD

3.1 DOSE DESIGN AND BASIS

According to the information provided by the Client, the concentration of 13-JHYM for clinical use was the concentration of formulation (0.5 mL/dose, one dose containing 32.2 µg of various pneumococcal polysaccharide, 0.5 mg of aluminum phosphate, i.e. 64.4 µg/mL of various pneumococcal polysaccharide, 1 mg/mL of aluminum phosphate). In this study, the clinical preparation concentration of the test article was taken as the study concentration.

Confidential 849
MODULE 4 NONCLINICAL STUDY REPORTS
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

3.2 PREPARATION OF RBC SUSPENSION

After the rabbit was anesthetized with pentobarbital sodium (about 30mg/kg, injected intravenously into ear), collect blood from the abdominal aorta until the animal was euthanized, take appropriate amount of blood and remove fibrinogen to form defibrinated blood. Add about 10 times of 0.9% sodium chloride injection, shake well, dispense into centrifuge tubes, centrifuge at 1,000 - 2,000 rpm for 15 minutes, and discard the supernatant. Wash the precipitated red blood cells with 0.9% sodium chloride injection for at least 2 - 3 times using the above method until the supernatant did not show a red color. Prepare the obtained red blood cells into 2% suspension with 0.9% sodium chloride injection for study.

3.3 SAMPLE INJECTION AND OBSERVATION

Take clean tubes and number them: tubes No. 1 ~ 15 for test article 13-JHYM (batches 1, 2 and 3), tubes No. 16 ~ 20 for aluminum phosphate control, tube No. 21 for negative control, and tube No. 22 for positive control. Add 2% red blood cell suspension, 0.9% sodium chloride injection, 13-JHYM formulation bulk or aluminum phosphate, sterile water for injection in turn at the proportion set out in Table 1, mix well, place the mixture in an incubator at 37 ± 0.5°C for standing, and observe once at 15, 30, 45, 60, 120 and 180 minutes, respectively. Conduct 3 times of parallel determinations. See Table 1 for specific sample injection methods.

3.4 DETERMINATION OF RESULTS
3.4.1 RESULTS OBSERVATION
Complete hemolysis - The solution is clear and red, with no residual cells at the bottom of the tube;

Confidential 850
MODULE 4 NONCLINICAL STUDY REPORTS
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Partial hemolysis - The solution is red or brown, with a small amount of residual red blood cells at the bottom of the tube;
No hemolysis: All red blood cells sink to the bottom, and the supernatant is colorless and transparent;
Condensation-No hemolysis, but there is brownish red or reddish flocculent precipitates in the solution. The precipitates do not disperse after shaking. This indicates there is condensation of red blood cells.

3.4.2 RESULTS INTERPRETATION
When there are no hemolysis and condensation shown in the negative control tube and there is hemolysis in the positive control tube, if no hemolysis and condensation occur within 3 h for the solution in the test article tube, the result of test is negative; if hemolysis and (or) condensation occur within 3h for the solution in the test article tube, the result of test is positive.

4 RESULTS
After incubation at 37 °C ± 0.5 °C for 3 hours, all the red blood cells in the negative control group (saline) sank, and the supernatant was colorless ~ transparent. After appropriate shaking, the sinking red blood cells were re-dispersed, without hemolysis or aggregation; the solution in the positive control group (sterile water for injection) was clear and red, without cell residue at the bottom of tube, with hemolysis, indicating that the study system is normal and reliable.
After incubation at 37°C ± 0.5°C for 3 hours, aggregation was observed in each tube (0.1, 0.2, 0.3, 0.4 and 0.5 mL/tube) in aluminum phosphate adjuvant group. A large number of red blood cells aggregated and adsorbed on the tube wall and tube bottom, and the degree of aggregation was significantly dose-related; in each tube (0.1, 0.2, 0.3, 0.4 and 0.5 mL/tube) of 13-JHYM from batches 1, 2 and 3, only a small amount of red blood cells aggregated and adsorbed on the tube bottom. The supernatant in the above tubes was clear and colorless, and no hemolysis was observed.
See Table 2 and Figures 1, 2, 3 and 4 for specific results.

5 DISCUSSION

13-JHYM was prepared through the covalent binding of pneumococcal capsular polysaccharide antigen with tetanus toxoid carrier protein and the adsorption by aluminum phosphate adjuvant. In the study, red blood cells aggregated and attached to different degrees to the tube wall in aluminum phosphate adjuvant and 13-JHYM (three batches) groups, showing a certain dose-related relation. Aluminum phosphate has strong adsorption effect and can adsorb viruses, bacteria and toxins produced by bacteria. Therefore, it is speculated that the above phenomenon may be caused by the adsorption effect of aluminum phosphate.

6 CONCLUSION

In conclusion, under the conditions of this study, aluminum phosphate adjuvant (at the concentration of 1 mg/mL, the same concentration as aluminum phosphate in 13-JHYM formulation) and 13-JHYM (20110304, 20110305 and 20110406, clinical preparation concentration) had aggregation effect on rabbit red blood cell at different doses (0.5, 0.4, 0.3, 0.2 and 0.1 mL/tube), but no hemolysis reaction was observed.

7 LOCATION FOR STORING INITIAL DATA

Place of storage: Archives Room, WestChina-Frontier PharmaTech Co., Ltd.;

Storage conditions: Conventional conditions;

Retention period: Paper archives should be kept at least 5 years after the drug is marketed, and electronic files should be permanently kept;

Tel.: 028-85154334-511;

Contact: Chang Ling.

8 DEVIATION

This study has no deviations or other abnormalities affecting the reliability of study results and conclusions.

Acute Toxicity Test of 13-JHYM Through

Experiment Name:

Intramuscular Injection in Kunming Mice

Experiment Number: A201118-T001-01

This experiment was completed in accordance with Non-clinical Good Laboratory Practice formulated by China Food and Drug Administration (China Food and Drug Administration rule No. 2, effective from September 1st, 2003). The experiment procedure was carried out in accordance with the experiment protocol and the relevant standard operating procedure of the research institution (please see Module 7 for relevant deviation in this experiment). No deviation that affected the reliability of experiment results and conclusions was observed. This report faithfully reflects the experiment materials, experiment methods and experiment results.

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Abstract

The 13-valent pneumococcal polysaccharide conjugate vaccine (13-JHYM) is made from pneumococcus capsule polysaccharide antigens of serotype 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F covalently combined with tetanus toxoid carrier protein and adsorbed by aluminum phosphate adjuvant. The clinical use of this vaccine is for infants and children aged 2 months to 2 years old to prevent the invasive infection caused by the above-mentioned serotype pneumococcus. The proposed dosage is 0.5 mL per person, and the proposed route of use is intramuscular injection.

In accordance with the relevant requirements of new drug declaration, the acute toxicity test of JHYM provided by Yunnan Walvax Biotechnology Co., Ltd. was carried out through

intramuscular injection in Kunming mice by WestChina-Frontier PharmaTech Co., with a purpose to evaluate the nature, degree, time-effect relationship and reversibility of the possible toxic reaction, to determine the toxic target organ or target tissue, and to provide a reference for the safe range of clinical use.

A total of 3 groups were set for the test article 13-JHYM in this experiment, including test articles of Batch No.20110304, 20110305 and 20110406 respectively. The 13-JHYM of the corresponding batch number for each group was injected in the concentration of 64.4 µg/mL (in terms of the total amount of pneumococcal polysaccharide contained) in the volume of 10 mL/kg. A negative control group was set and mice in the control group were given 0.9% sodium chloride injection in the volume of 10 mL/kg. Each group included 10 mice (half male and half female). The mice in each group were given a single intramuscular injection with the corresponding sample or control in the maximum volume of 10 mL/kg (simultaneous injection into both hind limb muscles). The day of administration was determined as the first day in this experiment.

After administration, the general conditions of mice in each group was observed daily, meanwhile the body weight and food intake were measured twice a week. On the 15th day of the experiment, all the surviving mice were anesthetized (about 60 mg/kg pentobarbital sodium was injected intraperitoneally) and blood samples were collected from abdominal aorta for examination of hematology and blood biochemical measurements. A systematic autopsy was also performed to observe the appearance and internal organs of the animals. The main results are as below:

General Conditions

During the 14-day observation after administration, the mice in each group showed normal physical, mental and motor state. The natural pores were clean, and no abnormal symptoms were observed. No irritant reactions such as redness, swelling, ecchymosis, induration, suppuration and ulceration were observed at the injection site.

Body Weight and Food Intake

No abnormalities were observed in food intake and body weight for mice in each group at each detection time points during the 14-day observation after administration.

Hematology and Blood Biochemical Examination

On the 15th day of the experiment, no abnormalities were observed in hematology and blood biochemical measurements for mice in each group.

Gross Anatomy Results

On the 15th day of the experiment, no abnormal changes were observed with naked eyes in the size, shape, color and texture of the major organs such as heart, liver, spleen, lung and kidney for the

Confidential 864

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

mice in each group. No irritant reactions such as redness, swelling, and induration were observed at the injection site.

In conclusion, under the conditions of this experiment, the mice were in good condition and no toxic reactions were observed during the 14-day observation after the mice were given 13-JHYM (Batch No. 20110304, 20110305 and 20110406) through single muscular injection in the maximum volume of 10mL/kg.

1 BASIC INFORMATION

1.1 EXPERIMENT NAME AND NUMBER

Experiment name: Acute Toxicity Test of 13-JHYM through Intramuscular Injection in Kunming Mice

Experiment number: A201118-T001-01

1.2 OBJECTIVES

The Kunming mice in this experiment were intramuscularly injected with 13-JHYM for acute toxicity test, with a purpose to evaluate the nature, degree, time-effect relationship and reversibility of the possible toxic reaction, to determine the toxic target organ or target tissue, and to provide a reference for the safe range of clinical use.

2 MATERIALS

2.1 EXPERIMENT ANIMALS

2.1.1 BASIC INFORMATION

Species: Kunming mice;
Grade: SPF;
Amount and gender of animals purchased: 46 animals in total, half male and half female;
Amount and gender of animals used: 40 animals in total, half male and half female;
Body weight (at the time of grouping): 25.0-27.9g for females, 25.3-29.1g for males;
Source: Shanghai SLAC Laboratory Animal Co., Ltd. (Production License No. SCXK (Shanghai) 2007-0005; Certificate of Quality No. 2007000521239, Serial number 0049180, issuing unit: Shanghai Laboratory Animal Administration Office);
Entry date: 14/06/2011;
Environmental adaptation period after entry: Before the experiment, the Kunming mice adapted to the environment for 7 days (14/06/2011-20/06/2011) and went through relevant examinations. The healthy mice were selected to enter the formal experiment. Observation measurements during adaptation period: Is it consistent with the quality measurements required at the time of ordering? Is the animal in general condition? Is the body weight within the range required by the experiment?

2.1.2 ANIMAL REARING CONDITIONS

2.1.2.1 REARING SITES

SPF small animal house of WestChina-Frontier PharmaTech Co. (laboratory animal room license No. SYXK (Sichuan) 2009-123).

2.1.2.2 REARING CONDITIONS

Rearing cage: plastic mouse cage (Upper L*W: 295 mm*175 mm, Lower L*W: 270 mm*155 mm, H: 140mm);
Padding material: corncob, provided by Beijing Ke'ao Xieli Feed Co., Ltd.;
Rearing density: 55 animals per cage.

2.1.2.3 REARING ENVIRONMENT

Standard: the National Standard of the People's Republic of China GB14925-2001;
Control system: the EBI400 automatic control fresh air air conditioning system produced by Honeywell;

Confidential 867

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Temperature: room temperature 21.24-24.14°C (with a diurnal temperature range of 0.55-1.78°C);
Humidity: relative humidity 48.9-69.5%;
Illumination: artificial lighting, 12 hours of alternating light and dark (lights on at 07:30, lights off at 19:30);
Ventilation: 10-20 times per hour, 100% fresh air.

2.1.2.4 FEED

Type: Cobalt 60 irradiation sterilized complete feed for mice;
Manufacturer: Shanghai SLAC Laboratory Animal Co., Ltd. (Feed Production Permit: Shanghai Feed Audit (2008)04002);
Batch No.: M02-F-20110316003;
Feeding method: free intake;
Nutrient analysis: provided by the feed provider, of which the routine nutritional measurements of crude protein, crude fat, crude fiber, crude ash, water, calcium and phosphorus were reported for each batch; amino acid measurements of threonine, cysteine + methionine, satin, L-Isoleucine, leucine, tyrosine, L-Phenylalanine, histidine, lysine and arginine were reported at least once a year (referring to the National Standard of the People's Republic of China GB14924.5-2001);
Confirmation of contaminant content in feed: provided by the feed provider, indicators for chemical contaminants including arsenic, lead, cadmium, mercury, hexachlorocyclohexane, DDT, aflatoxin B1, total colony count, coliform group, mold and yeast count, pathogenic bacteria (Salmonella) were provided at least once a year (referring to the National Standard of the People's Republic of China GB14924.2-2001).

2.1.2.5 DRINKING

Type: drinking water for laboratory animals (reverse osmosis water);
Method of water supply: held in drinking water bottles, free intake;
Colony count detection: referring to the National Standard of the People's Republic of China GB5749-2006, sampling self-examination (once per week);
Detection of conventional indicators of water quality: referring to the National Standard of the People's Republic of China GB5749-2006, samples were sent to units with relevant qualification for testing at least 2 times per year.

2.1.3 ANIMAL GROUPING AND MARKING METHODS

2.1.3.1 ANIMAL GROUPING

Group design: a total of 4 groups, including a negative control group and three 13-JHYM groups with batch No. 20110304, 20110305 and 20110406 respectively;
Amount: 10 animals in each group;
Gender: half male and half female;
Grouping method: Kunming mice were randomly divided into groups according to their body weight;
Disposal of surplus animals: handed over to the department of laboratory animal administration. The specific group information is shown in Table 1.

Confidential 868

Notes: The first digit of the animal number represents the group (1 represented the control group; 2, 3 and

4 represent 13-JHYM group 1, 2 and 3); the second letter stands for gender (M for male, F for female); the

third and fourth digits represent cage number; the fifth and sixth digits represent animal serial number.

2.1.3.2 MARKING METHOD

Adaptation period: cage card and tail mark were used as animal identification markers;

Post-grouping period: The cage card, ear number and tail mark were used as animal identification markers;

Experiment period: the cage card and ear markers were used as animal identification marks;

Marking method of cage card:

Adaptation period: unified use of white cage card, with the test number, animal species, animal number, entry time and notes indicated;

Post-grouping: cage cards in different colors were used to distinguish the groups, and the cards were marked with test number, animal species, animal number, treatment factors, expected start and end time of the experiment and notes;

Colors of cage cards after grouping: white represented the negative control group, green represented 13-JHYM group 1, blue represented 13-JHYM group 2 and red represented 13-JHYM group 3.

2.2 TEST ARTICLES

2.2.1 TEST ARTICLE INFORMATION

Name: 13-valent pneumococcal polysaccharide conjugate vaccine (13-JHYM);

Source: Yunnan Walvax Biotechnology Co., Ltd.;

Character: suspension with opalescence;

Specification: 0.5 mL: 32.2μg per vial;

Batch No.: 20110304, 20110305, 20110406;

Preservation conditions and notes: kept under 2-8■;

Expiration date: February, 2012 for batch No. 20110304 and 20110305; March, 2013 for 20110406;

Preservation site: the Samples Management Department of WestChina-Frontier PharmaTech Co.

2.2.2 TEST ARTICLE PREPARATION

Preparation methods: direct separation of the bulk;

Confidential 869

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Marking methods after preparation: use the original bottle label;

Preservation condition and period of validity after preparation: stored in ice box for use within 24 hours.

2.2.3 RETURN AND DISPOSAL OF REMAINING SAMPLES

The remaining samples after administration were sterilized by high temperature and high pressure and diluted with a large amount of water before being discharged into the sewer. The reserved samples were deposited in the sample room referring to the SOP for the preservation of test articles. The remaining samples at the end of the experiment were returned to the client.

2.3 COMPARISON PRODUCT

2.3.1 COMPARISON PRODUCT INFORMATION

Name: 0.9% sodium chloride injection (normal saline);

Source: Sichuan Kelun Pharmaceutical Co., Ltd.;

Character: colorless transparent liquid;

Specification: 100 mL per bottle;

Batch No.: C100928;

Preservation conditions and notes: sealed storage at room temperature;

Expiration date: August, 2012.

2.3.2 COMPARISON PRODUCT PREPARATION

Preparation methods: direct separation of the bulk;

Marking methods after preparation: test articles were marked with red labels with experiment number, substance name and concentration used in the experiment, volume, storage condition, expiration date, responsible person and preparation date;

Preservation condition and period of validity after preparation: sealed storage under 2■8°C, use within the same day.

2.2.3 RETURN AND DISPOSAL OF REMAINING COMPARISON PRODUCTS

After administration, the remaining negative control was directly discharged into the sewer, the adjuvant control was collected in the waste liquid barrel, and the listed control was collected in the waste liquid barrel after sterilization.

Character: white powder;
Specification: 25g per bottle;
Batch No.: 127K1005;
Preservation conditions and notes: sealed storage at room temperature;
Expiration date: March, 2013 (re-inspection date);
Preparation methods: dissolved with 0.9% sodium chloride injection to the required concentration when use;
Marking methods: marked with white label;
Preservation condition and period of validity after preparation: sealed storage under 2-25 °C, validate within 14 days.
After use, the remaining pentobarbital sodium was returned to the Samples Management Department.

3. METHODS AND OBSERVATION MEASUREMENTS

3.1 METHODS

3.1.1 DOSAGE DESIGN

Referring to the General Principles for the Technical Review of the Preclinical Safety Evaluation of Prophylactic Biological Products (December 2005) and Technical Guidelines for Acute Toxicity Testing of Chemicals (March 2005), the dosage in acute toxicity test can be determined according to the maximum administration capacity of different animals and routes of administration. Based on the anatomical characteristics of the mice, the site for intramuscular injection should be on bilateral hind limbs and the total volume of the injection should not exceed 10 mL/kg.

In this experiment, test articles prepared using 13-JHYM of the 3 different batch numbers were given to mice in the maximum volume of 10 mL/kg through intramuscular injection (weight of baby mice was determined as 10kg, which meant 200 times of the clinical proposed dosage for human). Mice in the negative control group were injected intramuscularly with normal saline of equal volume.

The specific dosage information is shown in Table 2.

Table 2 Table of Dosage Design

3.1.2 ADMINISTRATION

Administration route: intramuscular injection;

Volume: 10 mL/kg;

Confidential 871

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Frequency: all groups of mice were injected with sample or control into the muscle of both hind limbs at one time. The single injection amount was about 1/2 of the total amount. The day of administration was defined as the first day in this experiment.

3.2 OBSERVATION MEASUREMENTS

3.2.1 GENERAL CONDITIONS

3.2.1.1 OBSERVATION TIME AND FREQUENCY

Rearing personnel: twice a day;

Experiment personnel: once a day;

Veterinarian: once a week;

Observation Period: 14 days after administration.

3.2.1.2 OBSERVATION MEASUREMENTS

Rearing personnel: death and near-death situation of the mice;

Experiment personnel: including but not limited to the appearance, the general behavior activity, the mental state, the aspiration status, the excrement character, the genitals, the death and other toxic performance of the mice;

Veterinarian: including but not limited to the appearance, the general behavior activity, the mental state, the aspiration status, the excrement character, the genitals, the death and other toxic performance of the mice.

3.2.2 OBSERVATION OF IRRITATION AT INJECTION SITE

Observation time and frequency: once a day within 1 week after administration (i.e. Day 1 to Day 7 of the experiment);

Observation animal: all surviving animals;

Observation method: the animals were removed from the cage and the injection site was observed for irritant reactions such as redness, swelling, ecchymosis, induration, suppuration and ulceration.

3.2.3 BODY WEIGHT

Measurement time: once before administration and twice a week thereafter;

Measurement animal: all surviving mice in each group.

3.2.4 FOOD INTAKE

Measurement time: once a week;

Measurement animal: all mice in each group;

Measurement method: the feed quantity of each cage was determined on the first day, and the remaining feed was measured at approximately the same time on Day 2. The difference between the two measurements was the total food intake of the animals in each cage in 24 hours, and the total food intake for each cage was divided by the number of animals in each cage to calculate the average food intake for each animal.

3.2.5 HEMATOLOGY EXAMINATION

Measurement time: on the 15th day of the experiment;

Measurement animal: all surviving mice to be anatomized in each group;

Confidential 872

MODULE 4 NONCLINICAL STUDY REPORTS

Method of blood collection: the mice were fasting for at least 12 hours before blood collection but were not deprived of water. The mice to be anatomized were anesthetized with pentobarbital sodium (about 60 mg/kg, intraperitoneal injection), and blood samples were collected from the abdominal aorta (about 0.5 mL);
Blood sample preparation: blood samples (about 0.5 mL) for hematologic examination used EDTA as anticoagulant, and the whole blood samples were used for direct examination.

Measurement item: please see Table 3.

3.2.6 BLOOD BIOCHEMICAL EXAMINATION

Measurement time: on the 15th day of the experiment;

Measurement animal: all surviving mice to be anatomized in each group;

Method of blood collection: the mice were fasting for at least 12 hours before blood collection but were not deprived of water. The mice to be anatomized were anesthetized with pentobarbital sodium (about 60 mg/kg, intraperitoneal injection), and blood samples were collected from the abdominal aorta (about 0.5 mL);

Blood sample preparation: the blood sample (not anticoagulated) was centrifuged for 10 minutes at 3000RP (centrifugal force about 1800g). The serum was separated and examined. The remaining serum was stored at -20 °C.

Measurement item: please see Table 4.

3.2.7 SYSTEMATIC AUTOPSY (GROSS ANATOMY)

Autopsy time: on the 15th day of the experiment;

Autopsy animal: all surviving mice in each group;

Methods of anesthesia and autopsy: before autopsy, the mice were fasting for at least 12 hours.

The mice were anesthetized with pentobarbital sodium depending on their weight (about 60mg/kg, intraperitoneal injection), and mice were taken in parallel in each group. After observing the appearance of mice, the mice were euthanized by bleeding from the abdominal aorta, and the systematic autopsy (gross anatomy) was performed.

3.3 STATISTICAL ANALYSIS AND RESULTS DETERMINATION

Mean $\pm$ standard deviation ($\bar{X} \pm SD$) was used to describe quantitative indices including weight, hematology and blood biochemical measurements. Raw data was presented directly for food intake. When the sample size was less than 3, raw data was presented directly and the data in that group was not included in statistical analysis.

ONE-WAY ANOVA was used to test the group differences in the mean of quantitative indices of Kunming mice. When the mean difference was statistically significant ($p \leq 0.05$), LSD method was used to compare the difference between the 13-JHYM group of different batch and the negative control group. The KRUSKAL-H rank sum test (K-W test) was used to test the group differences of the above indices when the homogeneity of variance ($p \leq 0.05$) was indicated by the Levene test. MANN-WHITNEY U rank sum test (m-w method) was used to compare the mean of 13-JHYM group of different batch and that of negative control group when the mean difference was statistically significant ($p \leq 0.05$).

All tests were bilateral tests with $\alpha = 0.05$. All statistical analyses were performed in SPSS (Window s 13.0).

4. RESULTS

4.1 GENERAL CONDITIONS

During the 14-day observation after administration, each mouse was in normal physical and mental state, and the natural holes were clean. No obvious abnormalities were observed. No local reactions

at the injection site such as redness, swelling, ecchymosis, induration, suppuration and suppuration were observed.

4.2 BODY WEIGHT

No obvious abnormalities were observed in the body weight of the mice in each 13-JHYM group at each detection time point during the 14-day observation after administration.

Please see Table 1 in Appendix I for specific results.

4.3 FOOD INTAKE

No obvious abnormalities were observed in the food intake of the mice in each 13-JHYM group at each detection time point during the 14-day observation after administration.

Please see Table 2 in Appendix I for specific results.

4.4 HEMATOLOGY EXAMINATION

On the 15th day of the experiment, EOS of 13-JHYM batch No. 20110305 and 20110406 groups were significantly higher than those of the control group ($p \leq 0.05$). Apart from that, no abnormal changes were observed in hematological measurement for 13-JHYM batch no. 20110304, 20110305 and 20110406 groups.

In terms of the individual data, the above changes were mainly caused by the abnormal rise of EOS values (EOS values of 0.25 and 0.6) in certain individual animals (animal No.3M0103 and 3M0105). The abnormal rise of EOS values (EOS value of 0.24) was also observed in certain individual animal (animal No.1F0101) in the control group. Moreover, no obvious consistency was observed between the changes of EOS values among the three batches. Therefore, the changes of EOS values were not related to the injected samples.

Please see Table 3 in Appendix I for specific results.

4.5 BLOOD BIOCHEMICAL EXAMINATION

On the 15th day of the experiment, abnormal rise of ALT value (ALT value of 419.7) was observed for certain individual animal (animal No.3M0104) in 13-JHYM batch No.20110305 group. Apart from that, no abnormal changes in blood biochemical measurements were observed for 13-JHYM batch 20110304, 20110305 and 20110406 groups. These changes were only seen in individual animals in 13-JHYM batch No.20110305 group, while no similar changes were observed in the other groups. Therefore, the above change was individual difference and was not related to the injected samples.

Please see Table 4 in Appendix I for specific results.

4.6 GROSS ANATOMY OBSERVATION

On the 15th day of the experiment, the mice in each 13-JHYM group were anatomized. No abnormalities were observed with naked eyes in the size, shape, color and texture of main organs including heart, liver, spleen, lung and kidney. No irritant reactions such as redness, swelling and induration were observed in the muscles at the injection site.

5. CONCLUSIONS

In conclusion, under the experimental conditions, the Kunming mice were in good condition and no obvious toxic reactions were observed in the 14-day observation after the mice were injected with 13-JHYM (batch no. 20110304, 20110305 and 20110406) through a single intramuscular injection in the maximum volume of 10 mL/kg.

6. ORIGINAL DATA DEPOSITORY

Preservation site: the archives room of WestChina-Frontier PharmaTech Co.

Preservation conditions: Standard;

Preservation period: The paper file were kept for at least 5 years after the drug got licensed, and the electronic data should be kept permanently;

Contact number: 028-85154334-511;

Contact person: Ling Chang.

7. DEVIATIONS

Type: experiment protocol deviation;

Description: The Hematology Examination (Module 8.4) and Blood Biochemical Examination (Module 8.5) in the original protocol required hematology and blood biochemical examination for all surviving mice to be anatomized in each group. At the time of blood collection, no biochemical sample for animal No.1F0101 and hematologic sample for animal No.2F0104 were collected. Blood coagulation was detected in samples of animal No.1F0103, 2F0103 and 4M0102, which resulted in the failure of hematological and biochemical examination for these animals;

Processing: None;

Evaluation: Due to the restriction of mouse blood volume and blood sample collection method, resampling and reexamination were not possible. Besides, only a certain part of the measurements for certain individual animals could not be detected, which had no obvious influence on statistical analysis and therefore had no impact on the experiment results.

Apart from the above-mentioned deviation, no deviation which had impact on the reliability of the experiment results and conclusions as well as other abnormalities were observed in this experiment.

Notes:
1) Due to the fail in collecting blood sample from animal 1F0103, the sample size of the negative control group was 9;
2) Due to the fail in collecting blood sample from animal 2F0103 and 2F0104, the sample size of 13-JHYM group 1 was 8;
3) Due to the fail in collecting blood sample from animal 4M0102, the sample size of 13-JHYM group 3 was 9;
* The difference in the mean was significant (p≤0.05) when compared with the negative control group.

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Abstract

The 13-valent pneumococcal polysaccharide conjugate vaccine (code: 13-JHYM) is prepared by adsorption by aluminum phosphate adjuvant after covalent binding between types 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F pneumococcal capsular polysaccharides antigen and tetanus toxoid carrier protein. It is clinically intended for the prevention of invasive infections caused by the above serotypes of pneumococci in infants aged 2 months to 2 years and children. The intended clinical dose is 0.5 mL/time/person, and the intended route of administration is intramuscular injection.

WestChina-Frontier PharmaTech Co., Ltd. has carried out a study on abnormal toxicity of 13-JHYM provided by Yunnan Walvax Biotechnology Co., Ltd. via intraperitoneal injection in mice in accordance with the relevant requirements for new drug application, so as to check whether the test article is contaminated by exogenous substances and whether there is any unexpected risk factor about safety, and to provide a reference for safety assessment on clinical application. In this study, 1 dose group (0.5 mL/animal) was set up based on the intended clinical concentration for the test article 13-JHYM, with 5 male mice in total. Each mouse was intraperitoneally injected with 0.5 mL of the test article at one time, and the appearance and signs, general behavior and activity, mental status, respiration, genitalia and crissum, feces and urine, moribundity or death, and other conditions of the animals were observed and recorded once a day after administration for a total of 7 days. Then the body weight was measured at the end of the observation on day 7.

Study results:

General Conditions

During the period from post-administration to the end of observation, each mouse was normal in terms of the appearance and signs, mental and motor status with natural holes all clean and no obvious abnormal reaction symptoms.

Body Weight

On Day 7 after administration, the body weight of each mouse increased compared with that before administration.

In conclusion, under the conditions of this study, the study on abnormal toxicity of 13-JHYM by single intraperitoneal injection of 0.5 mL/animal (1 dose) in Kunming mice is qualified.

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Animal feeding and management: Gou Xiankui

Management and preparation of test article: Zheng Wulin

2 MATERIALS

2.1 LABORATORY ANIMALS

2.1.1 GENERAL INFORMATION

Species: Kunming mice;

Grade: SPF;

Quantity and sex of animals purchased: 16, male;

Quantity and sex of animals used: 5, male;
Body weight: 21.1~23.8 g;
Source: Beijing Vital River Lab Animal Technology Co., Ltd., production license No.: SCXK (J) 2006-0005. Quality certificate No.: 0226898, issued by: Beijing Laboratory Animal Management Office;
Animal house entry time: August 10, 2011;
Acclimation period after entering animal house: Kunming mice that entered the animal house were acclimatized to the environment for 7 days (August 10, 2011-August 16, 2011) before the study and were examined accordingly. All the mice that entered the animal house were healthy animals and were included in the formal study. Main examination items during the acclimation period: if the quality indicators are consistent with that required upon ordering; general status of animals: if the body weight reaches the weight range required by the study.

2.1.2 ANIMAL HOUSING CONDITIONS

2.1.2.1 HOUSING PLACE

SPF Animal House (Building 1) of WestChina-Frontier PharmaTech Co., Ltd. (No. of license for use of laboratory animal house: SYXK (C) 2009-123).

2.1.2.2 HOUSING CONDITIONS

Type of housing cage: Plastic mouse cage (top L x W: 295 mm x 175 mm, bottom: L x W: 270 mm x 155 mm, H: 140 mm);

Padding: Corncob, supplied by Beijing Keao Xieli Feed Co., Ltd.;

Housing density: ≤5 animals/cage

2.1.2.3 HOUSING ENVIRONMENTAL CONDITIONS

Standard for housing environmental conditions: National Standard of the People's Republic of China GB14925-2001;

Housing environmental control system: Honeywell EBI400 automatic control all-fresh air central air conditioning system;

Temperature: room temperature 21.84 ~ 23.63 °C (daily temperature difference 0.55 ~ 1.18 °C);

Humidity: relative humidity 47.28 ~ 61.92%;

Illumination: Artificial lighting with a 12 hour light/dark cycle (lights on at 07:30 and off at 19:30);

Ventilation rate: 10~20 times/h, 100% all fresh air.

Confidential 891

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.1.2.4 FEED

Type: Rat complete pellet feed sterilized by cobalt-60 irradiation;

Manufacturer: Shanghai SLAC Laboratory Animal Co., Ltd. No. of certificate for inspection of feed production enterprise: HSS (2008) 04002;

Batch No.: M02-F-20110506005, M02-F-20110713006;

Feeding method: Ad libitum;

Test of nutritional ingredients: Nutritional ingredient test result: Provided by the feed supplier.

Test reports for conventional nutritional ingredient indicators (crude protein, crude fat, crude fiber, crude ash, moisture, calcium and phosphorus) were provided for each batch; test reports for amino acid indicators (threonine, cystine + methionine, valine, isoleucine, leucine, tyrosine, phenylalanine, histidine, lysine and arginine) were provided at least once a year (refer to the national standard of the People's Republic of China GB14924.3-2001);

Confirmation of contaminant content of feed: Provided by the feed supplier. Chemical contaminant indicators such as arsenic, lead, cadmium, mercury, BHC, DDT, aflatoxin B1, total bacterial count, coliform group, mold and yeast count and pathogenic bacteria (salmonella) were provided at least once a year (refer to the national standard of the People's Republic of China GB14924.2-2001).

2.1.2.5 DRINKING WATER

Type: Drinking water for laboratory animals (reverse osmosis water)

Water supply method: Supplied in drinking bottle with water available ad libitum;

Test of total bacterial count: Refer to the national standard of the People's Republic of China GB5749-2006. Samples were taken for self-test (1 time/week).

Test of conventional indexes of water quality: Refer to the national standard of the People's Republic of China GB5749-2006. Samples should be taken and sent to the unit with relevant qualifications for test at least twice a year.

2.1.3 ANIMAL IDENTIFICATION METHOD

Acclimation period and study period: Cage card and tail mark were used as animal identification marks;

Marking method of cage card:

Acclimation period: White cage cards were uniformly used, and the study number, animal species, cage number, number of animals, animal house entry time, remark information and other information were indicated;

After grouping: Red cage cards were used for 13-JHYM group, with the study number, animal species, cage number, treatment factors, number of animals, expected starting and ending time of the study, remark information and other information indicated on the cage cards.

2.2 TEST ARTICLE

Source: Yunnan Walvax Biotechnology Co., Ltd.;

Confidential 892

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Description: Suspension with opalescence;

Strength: 0.5 mL: 32.2 µg/vial;

Batch No.: 20110304;

Storage conditions and precautions: Store at 2 ~ 8°C;

Shelf life: Expired in February 2013;

Place of storage: Test Article Management Department of WestChina-Frontier PharmaTech Co., Ltd.

2.2.2 PREPARATION OF TEST SOLUTION

Preparation method: The bulk can be directly used.

Identification method after preparation: Red label was used for identification, and the study number, name and concentration of test substance, volume, storage condition, shelf life, responsible person and preparation date were indicated.

Temporary storage conditions and shelf life after preparation: Temporarily stored in the ice box

and used within 24 h.

2.2.3 TREATMENT OF RETURNED AND REMAINING TEST ARTICLES

The test articles returned after administration were autoclaved and then poured into the waste liquid bucket. The retained samples were stored at the storage room of test articles in accordance with the SOP Storage of Test Articles. After completion of the test items, the remaining test articles were returned to the Client.

2.3 MAIN INSTRUMENTS AND DEVICES REQUIRED FOR THE STUDY

Electronic balance, syringe, etc.

3 STUDY METHOD AND OBSERVATION INDICATORS

3.1 ADMINISTRATION

Five mice weighing 21 ~ 24 g were used. Each mouse was intraperitoneally injected with 0.5 mL (1 dose) of the test article at one time.

3.2 OBSERVATION

The appearance and signs, general behavior and activities, mental status, respiration, genitalia and crissum, feces and urine, moribundity or death and other conditions of the animals were observed and recorded once a day after administration for a total of 7 days.

3.3 BODY WEIGHT

Body weight was measured once before administration, and once on Day 7 after administration.

4 DETERMINATION OF RESULTS

The study can be judged as qualified if no abnormal reaction is observed during the observation period, and the body weight at the end of the observation period is higher than that before administration for each animal.

The test articles returned after administration were autoclaved and then poured into the waste liquid bucket. The retained samples were stored at the storage room of test articles in accordance with the SOP Storage of Test Articles. After completion of the test items, the remaining test articles were returned to the Client.

2.3 MAIN INSTRUMENTS AND DEVICES REQUIRED FOR THE STUDY

Syringe, electronic balance, etc.

3 STUDY METHOD AND OBSERVATION INDICATORS

3.1 ADMINISTRATION

6 guinea pigs weighing 274.5–355.4 g were selected (4 guinea pigs were used to repeat the test once again since the results for 2 guinea pigs used in the 1st test were unqualified at the end of observation period), and each guinea pig was intraperitoneally injected with 5 mL (10 doses) of the test article at one time.

3.2 OBSERVATION

The appearance and signs, general behavior and activities, mental status, respiration, genitalia and crissum, feces and urine, moribundity or death and other conditions of the animals were observed and recorded once a day after administration for a total of 7 days.

3.3 WEIGHT

Body weight was measured once before administration, and once on Day 7 after administration.

4 DETERMINATION OF RESULTS

The study can be judged as qualified if no abnormal reaction is observed during the observation period, and the body weight at the end of the observation period is higher than that before administration for each animal.

5 RESULTS

5.1 GENERAL CONDITIONS

During the period from post-administration to the end of observation, each guinea pig was normal in terms of the appearance and signs, mental and motor status with natural holes all clean and without obvious abnormal reaction symptoms.

Remarks: The first number of the animal number represents the group (1 represents 13-JHYM group). The second letter represents sex (M indicates male, F indicates female), the third and fourth numbers represent animal cage number, and the fifth and sixth numbers represent animal serial number.

6 CONCLUSION

In conclusion, under the conditions of this study, the study on abnormal toxicity of 13-JHYM by single intraperitoneal injection of 5 mL/animal (10 doses) in guinea pig is qualified.

7 LOCATION FOR STORING INITIAL DATA

Place of storage: Archives Room, WestChina-Frontier PharmaTech Co., Ltd.;

Storage conditions: Conventional conditions;

Retention period: Paper archives should be kept at least 5 years after the drug is marketed, and electronic files should be permanently kept;

Tel.: 028-85154334-511;

Contact: Chang Ling.

Specific Toxicity Test of JHYM Through Subcutaneous Injection in
Experiment Name:
Guinea Pigs
Test Article: JHYM

Experiment Director: Wei Guo

This experiment was completed in accordance with Non-clinical Good Laboratory Practice formulated by China Food and Drug Administration (August 2003). The experiment procedure was carried out in accordance with the experiment protocol and the relevant standard operating procedure of the research institution. No deviation that affected the reliability of experiment results and conclusions was observed. This report faithfully reflects the experiment materials, experiment methods and experiment results.

Signature of Experiment Director: Date: 17/03/2010

MODULE 4 NONCLINICAL STUDY REPORTS
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Abstract

JHYM is a prophylactic vaccine manufactured by Yunnan Walvax Biotechnology Co., Ltd. It is used to prevent pneumonia, meningitis, otitis media and other diseases in infants and children aged 2 months to 2 years old and 2 to 9 years old. The clinical proposed dosage is 0.5 mL per person and is injected intramuscularly.

In accordance with the relevant requirements of new drug declaration, the specific toxicity test of JHYM provided by Yunnan Walvax Biotechnology Co., Ltd. was carried out through subcutaneous injection in guinea pigs by WestChina-Frontier PharmaTech Co., with a purpose to observe whether the animals have tetanus symptoms or local reactions at the injection site such as suppuration and necrosis, and to provide a reference for evaluating the safety of clinical use.

A total of 9 groups were set in this experiment and each group included 4 guinea pigs (half male and half female). The guinea pigs in each group were injected with the corresponding serotypes of JHYM (pneumococcus bulk of serotype 1, 4, 5, 6B, 9V, 14, 18C, 19F, and 23F). Each guinea pig was subcutaneously injected with 2 ml of the corresponding sample at multiple points. The animals were observed for a total of 21 days, and the appearance of tetanus symptoms or local reactions at the injection site such as suppuration and necrosis were observed on the 7th, 14th and 21st day after administration. The body weight was measured 7, 14, and 21 days before and after administration. The results are described below:

General Conditions

Each Guinea pig was in normal physical and mental state, and the natural holes were clean. No tetanus symptoms such as muscle spasm, convulsion, and opisthotonos were observed. No local reactions at the injection site such as suppuration and necrosis were observed.

Body Weight

On the 21st day after administration, the body weight of each guinea pig increased normally compared with that obtained before administration.

In conclusion, the specific toxicity test of JHYM (pneumococcus bulk of serotype 1, 4, 5, 6B, 9V, 14, 18C, 19F and 23F) through single subcutaneous injection in guinea pigs was up to standard.

In conclusion, the specific toxicity test of JHYM (pneumococcus bulk of serotype 1, 4, 5, 6B, 9V, 14, 18C, 19F and 23F) through single subcutaneous injection in guinea pigs was up to standard.

MODULE 4 NONCLINICAL STUDY REPORTS
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

1. OBJECTIVES

In accordance with the relevant requirements for new drug declaration predefined by the Provisions for Drug Registration, referring to the General Principles for Technical Review of Non-Clinical Safety of Biological Products for Preventive use (December 2005) and Pharmacopoeia of the People's Republic of China (2005), the specific toxicity test of carrier protein (tetanus toxoid) through subcutaneous injection in guinea pigs was carried out, with a purpose to observe whether the animals have tetanus symptoms or local reactions at the injection site such as suppuration and necrosis, and to provide a reference for evaluating the safety of clinical use.

2. MATERIALS

2.1 TEST ARTICLES

Pneumococcus serotype 1 polysaccharide conjugate bulk, suspension with opalescence, batch No. 20090501, 10 mL per vial, valid for 5 years;

Pneumococcus serotype 4 polysaccharide conjugate bulk, suspension with opalescence, batch No. 20090501, 10 mL per vial, valid for 5 years;

Pneumococcus serotype 5 polysaccharide conjugate bulk, suspension with opalescence, batch No. 20090501, 10 mL per vial, valid for 5 years;

Pneumococcus serotype 6B polysaccharide conjugate bulk, suspension with opalescence, batch No. 20090501, 10 mL per vial, valid for 5 years;

Pneumococcus serotype 9V polysaccharide conjugate bulk, suspension with opalescence, batch No. 20090501, 10 mL per vial, valid for 5 years;

Pneumococcus serotype 14 polysaccharide conjugate bulk, suspension with opalescence, batch No. 20090501, 10 mL per vial, valid for 5 years;

Pneumococcus serotype 18C polysaccharide conjugate bulk, suspension with opalescence, batch No. 20090501, 10 mL per vial, valid for 5 years;

Pneumococcus serotype 19F polysaccharide conjugate bulk, suspension with opalescence, batch No. 20090501, 10 mL per vial, valid for 5 years;

Pneumococcus serotype 23F polysaccharide conjugate bulk, suspension with opalescence, batch No. 20090501, 10 mL per vial, valid for 5 years.

The above test articles were provided by Yunnan Walvax Biotechnology Co., Ltd.

Sample preparation: Immediate access when use. Test articles were kept in ice box and out of light until the end of administration.

The reserved samples were deposited in the Samples Management Department of WestChina-Frontier PharmaTech Co. The remaining samples after administration were sterilized by high temperature and high pressure and diluted with a large amount of water before being discharged into the sewer. The remaining samples at the end of the experiment were handled according to the client's opinions.

2.2 EXPERIMENT ANIMALS

A total of 36 normal healthy British guinea pigs were included in this experiment (half male and

half female, 268.0-348.9g), provided by Sichuan Laboratory Animal Special Committee farm (Production License No. SCXK (Sichuan) 2008-014). Entry Date: December 1st, 2009. The guinea pigs were reared in the ordinary animal house of WestChina-Frontier PharmaTech Co. (Laboratory

Confidential 909
MODULE 4 NONCLINICAL STUDY REPORTS
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Animal Room License No. SYXK (Sichuan) 2009-123). The animals were mated and reared in stainless steel cages for guinea pigs (rearing density: 3 animals per cage). The EBI400 automatic control fresh air conditioning system produced by Honeywell was adopted to ensure that the feeding conditions in line with the National Standard of the People's Republic of China GB14925-2001: room temperature 21±5℃ (with a diurnal temperature range within 4℃), relative humidity 55±15%, 12 hours of alternating light and dark, and ventilate 8-10 times per hour. The guinea pigs were fed with pellet feed provided by Beijing Ke'ao Xieli Feed Co., Ltd. (Batch No. 091016, 091202). The animals were allowed to ingest food and drink water freely with 0.1g Vitamin C per 500 mL per day adding in the drinking water. The animals were fed with fresh vegetables in the meantime.

The animals were distinguished from each other by cage number and individual number (ear number method).

3. METHODS AND OBSERVATION MEASUREMENTS

3.1 ADMINISTRATION

A total of 36 guinea pigs were included (250-350g). Each guinea pig was subcutaneously injected with 2 mL sample at multiple points (no more than 1 mL per points).

3.2 OBSERVATION

The animals were observed for a total of 21 days. The appearance of tetanus symptoms or local reactions at the injection site such as suppuration and necrosis were observed once respectively on the 7th, 14th and 21st day after administration.

3.3 BODY WEIGHT

The body weight of guinea pigs was measured once before administration and once respectively 7, 13, 21 days after administration.

4. RESULTS DETERMINATION

At the end of observation, animals with no tetanus symptoms, no suppuration or necrosis at the injection site and whose body weight increased compared with that obtained before administration were determined as qualified.

5. DEVIATIONS

No deviation that could affect the results of this experiment was observed.

6. RESULTS

6.1 GENERAL CONDITIONS

Each Guinea pig was in normal physical and mental state, and the natural holes were clean. No tetanus symptoms such as muscle spasm, convulsion, and opisthotonos were observed. No local reactions at the injection site such as suppuration and necrosis were observed.

6.2 EFFECTS ON BODY WEIGHT

On the 21st day after administration, the body weight of each guinea pig increased normally compared with that obtained before administration.

7. CONCLUSIONS
In conclusion, the specific toxicity test of JHYM (pneumococcus bulk of serotype 1, 4, 5, 6B, 9V, 14, 18C, 19F and 23F) through single subcutaneous injection in guinea pigs was up to standard.
8. ORIGINAL DATA DEPOSITORY
All data related to this experiment (including written data, electronic data, etc.) were kept in the archives room of WestChina-Frontier PharmaTech Co. The data would be kept for at least five years after the vaccine got licensed and electronic data would be eternally retained. Standard archive preservation conditions were adopted for data storage.

Abstract

The 13-valent pneumococcal polysaccharide conjugate vaccine (13-JHYM) is made from pneumococcus capsule polysaccharide antigens of serotype 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14,18C, 19A, 19F and 23F covalently combined with tetanus toxoid carrier protein and adsorbed by aluminum phosphate adjuvant. The clinical use of this vaccine is for infants and children aged 2 months to 2 years old to prevent the invasive infection caused by the above-mentioned serotype pneumococcus. The proposed dosage is 0.5 mL per person, and the proposed route of use is intramuscular injection.

In accordance with the relevant requirements of new drug declaration, the specific toxicity test of JHYM provided by Yunnan Walvax Biotechnology Co., Ltd. was carried out through subcutaneous injection in guinea pigs by WestChina-Frontier PharmaTech Co., with a purpose to observe whether the animals have tetanus symptoms or local reactions at the injection site such as suppuration and necrosis, and to provide a reference for evaluating the safety of clinical use.

A total of 4 groups were set for the test article 13-JHYM in this experiment, including serotype 3 pneumococcus polysaccharide conjugate group, serotype 6A pneumococcus polysaccharide conjugate group, serotype 7F pneumococcus polysaccharide conjugate group and serotype 19A pneumococcus polysaccharide conjugate group. Each group included 4 guinea pigs (half male and half female). Each guinea pig was subcutaneously injected with 2 ml of the corresponding sample at multiple points. The animals were observed for a total of 21 days, and the appearance of tetanus symptoms or local reactions at the injection site such as suppuration and necrosis were observed

on the 7th, 14th and 21st day after administration. The body weight was measured 7, 14, and 21 days before and after administration. The results are described below:

General Conditions

Each Guinea pig was in normal physical and mental state, and the natural holes were clean. No tetanus symptoms such as muscle spasm, convulsion, and opisthotonos were observed. No local reactions at the injection site such as suppuration and necrosis were observed.

Body Weight

On the 21st day after administration, the body weight of each guinea pig increased normally compared with that obtained before administration.

In conclusion, the specific toxicity test of 13-JHYM (pneumococcus bulk of serotype3, 6A, 7F and 19A) through single subcutaneous injection in guinea pigs was up to standard.

2.1.2.4 FEED
Type: pellet feed for guinea pigs provided by Beijing Ke'ao Xieli Feed Co., Ltd. (Feed Production Permit: SCKK (Beijing) 2009-0012);
Batch No.: 11030551;
Feeding method: free intake;
Nutrient analysis: provided by the feed provider, of which the routine nutritional indexes of crude protein, crude fat, crude fiber, crude ash, water, calcium and phosphorus were reported for each batch (referring to the National Standard of the People's Republic of China GB14924.5-2001);
Confirmation of contaminant content in feed: provided by the feed provider, indicators for chemical contaminants including arsenic, lead, cadmium, mercury, hexachlorocyclohexane, DDT, aflatoxin B₁, total colony count, coliform group, mold and yeast count, pathogenic bacteria (Salmonella) were provided at least once a year (referring to the National Standard of the People's Republic of China GB14924.2-2001).

2.1.2.5 DRINKING
Type: drinking Water for laboratory animals (reverse osmosis water);
Method of water supply: held in drinking water bottles, free intake;
Colony count detection: referring to the National Standard of the People's Republic of China GB5749-2006, sampling self-examination (once per week);
Detection of conventional indicators of water quality: referring to the National Standard of the People's Republic of China GB5749-2006, samples were sent to units with relevant qualification for testing at least 2 times per year.

2.1.3 ANIMAL GROUPING AND MARKING METHODS
2.1.3.1 ANIMAL GROUPING
Group design: the guinea pigs were randomly divided into pneumococcus serotype 3, 6A, 7F and 19A polysaccharide conjugate group respectively, a total of 4 groups, with 4 animals in each group (half male and half female);
Amount: 16 animals in total;
Gender: half male and half female;
Grouping method: Guinea pigs were randomly divided into groups according to their body weight. The specific group information is shown in Table 1.

Table 1 Grouping Table

Animal amount	Animal number

Pneumococcus serotype 7F
polysaccharide 2 2 3F0101, 3F0102 3M0101, 3M0102
conjugate bulk group
Pneumococcus serotype 19A
polysaccharide 2 2 4F0101, 4F0102 4M0101, 4M0102
conjugate bulk group
Notes: The first digit of the animal number represents the group (1, 2, 3 and 4 represent the pneumococcus serotype 3, 6A, 7f and 19A polysaccharide conjugate bulk group respectively); the second letter stands for gender (M for male, F for female); the third and fourth digits represent cage number; the fifth and sixth digits represent animal serial number.

2.1.3.2 MARKING METHOD
Adaptation period: cage cards and red mark were used as animal identification markers;
Experiment period: the cage card and ear mark were used as animal identification markers;
Marking method of cage card:
Adaptation period: unified use of white cage card, with the test number, animal species, animal number, entry time and notes indicated;
Post-grouping: cage cards in different colors were used to distinguish the groups, and the cards were marked with test number, animal species, animal number, treatment factors, expected start and end time of the experiment and notes;
Colors of cage cards after grouping: white represented pneumococcus serotype 3 polysaccharide conjugate bulk group, green represented pneumococcus serotype 6A polysaccharide conjugate bulk group, blue represented pneumococcus serotype 7F polysaccharide conjugate bulk group and red represented pneumococcus serotype 19A polysaccharide conjugate bulk group.

Preservation site: the Samples Management Department of WestChina-Frontier PharmaTech Co.

2.2.2 TEST ARTICLE PREPARATION

Preparation methods: direct separation of the bulk;
Marking methods after preparation: test articles were marked with red labels with experiment number, substance name and concentration used in the experiment, volume, storage condition, expiration date, responsible person and preparation date;
Preservation condition and period of validity after preparation: stored in ice box for use within 24 hours.

2.2.3 RETURN AND DISPOSAL OF REMAINING SAMPLES

The remaining samples after administration were sterilized by high temperature and high pressure and diluted with a large amount of water before being discharged into the sewer. The reserved samples were deposited in the sample room referring to the SOP for the preservation of test articles. The remaining samples at the end of the experiment were returned to the client.

3. METHODS AND OBSERVATION MEASUREMENTS

3.1 ADMINISTRATION

A total of 36 guinea pigs were included (243.2-307.2g). Each guinea pig was subcutaneously injected with 2 mL sample.

3.2 OBSERVATION

The animals were observed for a total of 21 days. The appearance of tetanus symptoms or local reactions at the injection site such as suppuration and necrosis were observed once respectively on the 7th, 14th and 21st day after administration.

3.3 BODY WEIGHT

The body weight of guinea pigs was measured once before administration and once respectively 7, 13, 21 days after administration.

4. RESULTS DETERMINATION

At the end of observation, animals with no tetanus symptoms, no suppuration or necrosis at the injection site and whose body weight increased compared with that obtained before administration were determined as qualified.

5. RESULTS

5.1 GENERAL CONDITIONS

Each Guinea pig was in normal physical and mental state, and the natural holes were clean. No tetanus symptoms were observed. No local reactions at the injection site such as suppuration and necrosis were observed.

5.2 EFFECTS ON BODY WEIGHT

On the 21st day after administration, the body weight of each guinea pig increased normally compared with that obtained before administration.

Compliance Statement
Study No.: A200932-O004
Study Name: Study on Toxicity Reversal of JHYM Related Carrier Protein (Tetanus Toxoid)
Name of Test Article: JHYM
Study Director: Guo Wei

The study was carried out in accordance with the Good Laboratory Practice (August 2003) issued by the State Food and Drug Administration. The study was carried out in accordance with the study protocol and relevant standard operating procedures of the study facility, with no deviation affecting the reliability of the test results and conclusions. This report truthfully reflected the test materials, test methods and test results.

MODULE 4 NONCLINICAL STUDY REPORTS

Abstract

JHYM is a preventive vaccine provided by Yunnan Walvax Biotechnology Co., Ltd. It is used for preventing pneumonia, meningitis, otitis media and other diseases in infants aged 2 months to 2 years and children aged 2 to 9 years. The intended clinical dose is 0.5 mL/time/person, and the intended route of administration is intramuscular injection.

WestChina-Frontier PharmaTech Co., Ltd. carried out the study on toxicity reversal of JHYM related carrier protein (tetanus toxoid) provided by Yunnan Walvax Biotechnology Co., Ltd. (subcutaneous injection of test article in guinea pigs) in accordance with the relevant requirements for new drug application to observe if the animals had tetanus symptoms and if there are suppuration, necrosis and other local reactions at the injection site, and to provide a reference for evaluating the safety of clinical application.

There were 9 groups in the study, with 4 guinea pigs in each group, 50% males and 50% females. Guinea pigs in each group were respectively injected with the corresponding types of JHYM (pneumococcus types 1, 4, 5, 6B, 9V, 14, 18C, 19F and 23F, respectively). After the bulk of the test article was diluted with PBS to the required concentration, the solution was stored at 37 °C for 42 days, each guinea pig was subcutaneously injected with 5 mL of the corresponding test article at one time at multiple sites. On Days 7, 14 and 21 after administration, animals were observed for muscle spasm, convulsion, opisthotonos and other tetanus symptoms, as well as local reactions such as suppuration and necrosis at the injection site for a total of 21 days. Body weights were measured before administration and on Days 7, 14, and 21 after administration. Study results were as follows:

During the period from post-administration to the end of observation, each guinea pig was normal in terms of the appearance and signs, mental and motor status with natural holes all clean and no tetanus symptoms; no local reactions such as suppuration and necrosis were observed at the injection site.

On Days 7, 14 and 21 after administration, the body weight of guinea pigs in all groups increased normally compared with that before administration.

In conclusion, under the conditions of the study, the study on toxicity reversal of JHYM (pneumococcus types 1, 4, 5, 6B, 9V, 14, 18C, 19F and 23F) related carrier protein (tetanus toxoid) by single subcutaneous injection of 5 mL/guinea pig is qualified.

Confidential 927

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

1 OBJECTIVE

To carry out the study on toxicity reversal of JHYM by subcutaneous injection of related carrier protein (tetanus toxoid) in guinea pigs in accordance with the relevant requirements for new drug application in the Provisions for Drug Registration with reference to the General Principles for Non-clinical Safety Technical Review of Preventive Biological Products (December 2005) and Chinese Pharmacopoeia Volume III (2005), to observe if the animals have tetanus symptoms and if there are local reactions such as suppuration and necrosis at the injection site, and to provide a reference for evaluating the safety of clinical application.

2 MATERIALS

2.1 TEST ARTICLE

Bulk of pneumococcal type 1 polysaccharide conjugate, suspension with opalescence, batch number 20090501, 25 mL/vial, shelf life: 5 years.

Bulk of pneumococcal type 4 polysaccharide conjugate, suspension with opalescence, batch number 20090201, 25 mL/vial, shelf life: 5 years.

Bulk of pneumococcal type 5 polysaccharide conjugate, suspension with opalescence, batch number 20090401, 25 mL/vial, shelf life: 5 years.

Bulk of pneumococcal type 6B polysaccharide conjugate, suspension with opalescence, batch number 20090301, 25 mL/vial, shelf life: 5 years.

Bulk of pneumococcal type 9V polysaccharide conjugate, suspension with opalescence, batch number 20090301, 25 mL/vial, shelf life: 5 years.

Bulk of pneumococcal type 14 polysaccharide conjugate, suspension with opalescence, batch number 20090301, 25 mL/vial, shelf life: 5 years.

Bulk of pneumococcal type 18C polysaccharide conjugate, suspension with opalescence, batch number 20090301, 25 mL/vial, shelf life: 5 years.

Bulk of pneumococcal type 19F polysaccharide conjugate, suspension with opalescence, batch number 20090401, 25 mL/vial, shelf life: 5 years.

Bulk of pneumococcal type 23F polysaccharide conjugate, suspension with opalescence, batch number 20090401, 25 mL/vial, shelf life: 5 years.

The above test articles were diluted to the required concentration of the study with PBS and stored at 37°C for 42 days, and were provided by Yunnan Walvax Biotechnology Co., Ltd. after treatment. Preparation of test articles: test articles were treated by the Client, and were taken and used directly. Test articles were stored in ice box, protected from light, till the end of administration.

Retained samples were stored at the Test Article Management Department of WestChina-Frontier PharmaTech Co., Ltd., and the remaining test articles of administration were diluted with a large amount of water and then discharged into the sewer after high temperature and high pressure sterilization. The remaining test articles after completion of the study were treated in accordance with the opinion of the Client.

2.2 LABORATORY ANIMALS

36 ordinary healthy British guinea pigs, 50% males and 50% females, weighing 250.2 ~ 337.4 g, supplied by the Farm of Sichuan Laboratory Animal Specialized Committee (Production License No.: SCXK (C) 2008-014), and entered animal house on December 1, 2009.

Confidential 928

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Guinea pigs were housed in the General Animal House (Building 1) of WestChina-Frontier PharmaTech Co., Ltd. (No. of license for use of laboratory animal house: SYXK (C) 2009-123). Guinea pigs were housed in stainless steel cages (housing density: 3 animals/cage). Honeywell EBI400 automatic control all-fresh air central air conditioning system was used to ensure that the housing conditions met the national standard GB14925-2001: room temperature of 21 ±5°C (daily temperature difference ≤ 4°C), relative humidity of 55 ± 15%, 12-hour light-dark cycle, and ventilation rate of 8 ~ 10 times/h. Pellet feed for guinea pigs (supplied by Beijing Keao Xieli Feed Co., Ltd., batch number: 091016, 091202) was fed. The animals could eat and drink free (Vc, 0.1

g/500 mL H₂O/day was added to the drinking water), while fresh vegetables were fed. Cage number and individual number (ear number method) were used to distinguish laboratory animals

3 STUDY METHOD AND OBSERVATION INDICATORS

3.1 PREPROCESSING OF TEST ARTICLE

Bulk of test article was diluted to the required concentration with PBS, and stored at 37°C for 42 days (treatment had been completed by the Client).

3.2 ADMINISTRATION

36 guinea pigs (250 ~ 350 g) were selected. Each guinea pig received a single subcutaneous injection of 5 mL of test article by multiple injection sites, with not more than 1 mL at each site.

3.3 OBSERVATION

On Days 7, 14 and 21 after administration, animals were observed once for muscle spasm, convulsion, opisthotonos and other tetanus symptoms, as well as local reactions such as suppuration and necrosis at the injection site for a total of 21 days.

3.4 BODY WEIGHT

Body weight was determined once before administration, and once on Days 7, 14 and 21 respectively after administration.

4 DETERMINATION OF RESULTS

At the end of the observation period, the animals did not show tetanus symptoms, with no suppuration or necrosis at the injection site, with normal weight gain compared with that before administration.

5 DEVIATION FROM STUDY

During the study, no deviation affecting the study results was observed.

6 RESULTS

6.1 GENERAL CONDITIONS

During the period from post-administration to the end of observation, each guinea pig was normal in terms of the appearance and signs, mental and motor status with natural holes all clean and no tetanus symptoms such as muscle spasm, convulsion and opisthotonos; no local reactions such as suppuration and necrosis were observed at the injection site.

6.2 EFFECT OF JHYM ON THE BODY WEIGHT OF GUINEA PIG

On Day 21 after administration, the body weight of each guinea pig increased normally compared with that before administration (Table 1).

Table 1 Effect of JHYM on the Body Weight of Guinea Pig (g)

MODULE 4 NONCLINICAL STUDY REPORTS
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Abstract

The 13-valent pneumococcal polysaccharide conjugate vaccine (code: 13-JHYM) is prepared by adsorption by aluminum phosphate adjuvant after covalent binding between types 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F pneumococcal capsular polysaccharides antigen and tetanus toxoid carrier protein. It is clinically intended for the prevention of invasive infections caused by the above serotypes of pneumococci in infants aged 2 months to 2 years and children. The intended clinical dose is 0.5 mL/time/person, and the intended route of administration is intramuscular injection.

WestChina-Frontier PharmaTech Co., Ltd. carried out the study on toxicity reversal of 13-JHYM related carrier protein (tetanus toxoid) provided by Yunnan Walvax Biotechnology Co., Ltd. (subcutaneous injection of test article in guinea pigs) in accordance with the relevant requirements for new drug application to observe if the animals had tetanus symptoms and if there are suppuration, necrosis and other local reactions at the injection site, and to provide a reference for evaluating the safety of clinical application.

In the study, 4 groups were set for the test article 13-JHYM: bulk groups of streptococcus pneumoniae types 3, 6A, 7F and 19A polysaccharide conjugates, with 4 guinea pigs in each group, 50% males and 50% females. After the bulk of the test article was diluted to the required concentration with PBS, the solution was stored at 37 °C for 42 days. Each guinea pig was subcutaneously injected with 5 mL at one time at multiple sites, respectively. On Days 7, 14 and 21 after administration, the animals were observed once for tetanus symptoms, suppuration, necrosis and other local reactions at the injection site for a total of 21 days. The body weight was measured before administration and on Days 7, 14 and 21 after administration. Study results:

General Conditions

During the period from post-administration to the end of observation, each guinea pig was normal in terms of the appearance and signs, mental and motor status with natural holes all clean and no tetanus symptoms; no local reactions such as suppuration and necrosis were observed at the injection site.

Body Weight

On Day 21 after administration, the body weight of each guinea pig increased compared with that before administration.

In conclusion, under the conditions of the study, the study on toxicity reversal of 13-JHYM (bulk of streptococcus pneumoniae types 3, 6A, 7F and 19A polysaccharide conjugates) related carrier protein (tetanus toxoid) by single subcutaneous injection of 5 mL/guinea pig is qualified.

2 MATERIALS

2.1 LABORATORY ANIMALS

2.1.1 GENERAL INFORMATION

Species: British guinea pig;

Class: conventional;

Quantity and sex of animals used: 16, 50% males and 50% females;

Body weight: 241.7~310g;

Source: Farm of Sichuan Laboratory Animal Specialized Committee, laboratory animal production license No.: SCXK(C)2008-014. Quality certificate No.: No.0024564, issued by:

Science & Technology Department of Sichuan Province;

Entry time: August 16, 2011;

Acclimation period after entering animal house: Guinea pigs were acclimated to the environment for 14 days before the study (August 16, 2011~August 29, 2011), and healthy guinea pigs were selected for the formal study. Main inspection items during the acclimation period: General state of animals, body weight, etc.

2.1.2 ANIMAL HOUSING CONDITIONS

2.1.2.1 HOUSING PLACE

General Animal House (Building 1) of WestChina-Frontier PharmaTech Co., Ltd. (No. of license for use of laboratory animal house: SYXK (C) 2009-123).

2.1.2.2 HOUSING CONDITIONS

Type of housing cage: guinea pig cage (L×W×H: 515mm×400mm×260mm)

Housing density: ≤3 animals/cage

2.1.2.3 HOUSING ENVIRONMENTAL CONDITIONS

Standard for housing environmental conditions: National Standard of the People's Republic of China GB14925-2001;

Housing environmental control system: Honeywell EBI400 automatic control all-fresh air central air conditioning system;

Temperature: Room temperature: 21.04~25.95°C (daily temperature difference: 0.14~2.3°C);

Humidity: Relative humidity: 43.07~61.7%;

Lighting: Artificial lighting, 12-hour light-dark cycle (lights on at 07:30 and off at 19:30);

Ventilation rate: 8~10 times/h, 100% all fresh air.

2.1.2.4 FEED

Type: pellet feeds for guinea pigs

Manufacturer: Beijing Keao Xieli Feed Co., Ltd. Production license No. of feed: SCXK (J) 2009-0012;

Batch No.: 11030551;

Confidential 937

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Feeding method: Ad libitum;

Test of nutritional ingredients: Provided by the feed supplier. Test reports for conventional nutritional ingredient indicators (crude protein, crude fat, crude fiber, crude ash, moisture, calcium and phosphorus) were provided for each batch (refer to the national standard of the People's Republic of China GB14924.5-2001);

Confirmation of contaminant content of feed: Provided by the feed supplier, chemical contaminant indexes such as arsenic, lead, cadmium, mercury, BHC, DDT, aflatoxin B1, total bacterial count, coliform group, mold and yeast count and pathogenic bacteria (salmonella) should be provided at least once a year (refer to the national standard of the People's Republic of China GB14924.2-2001)

2.1.2.6 DRINKING WATER

Type: Drinking water for laboratory animals (reverse osmosis water)

Water supply method: Supplied in drinking bottle with water available ad libitum;

Test of total bacterial count: Refer to the national standard of the People's Republic of China

GB5749-2006. Samples were taken for self-test (1 time/week).

Test of conventional indexes of water quality: Refer to the national standard of the People's Republic of China GB5749-2006. Samples should be taken and sent to the unit with relevant qualifications for test at least twice a year.

2.1.3 ANIMAL GROUPING AND IDENTIFICATION METHOD

2.1.3.1 ANIMAL GROUPING

Group design: Guinea pigs were randomized according to the SOP Grouping of Laboratory Animals, including 4 groups, namely streptococcus pneumoniae types 3, 6A, 7F and 19A polysaccharide conjugate groups, with 4 animals in each group, 50% males and 50% females.

Number of animals: 16;

Sex ratio: 50% males and 50% females;

Grouping method: Randomized by body weight of guinea pigs.

See Table 1 for the specific grouping information.

sex (M indicates male, F indicates female), the third and fourth numbers represent animal cage number, and the

fifth and sixth numbers represent animal serial number.

2.1.3.2 IDENTIFICATION METHOD

Acclimation period: Cage cards and marks of red marker were used as animal identification marks;

Study period: Cage cards and ear marks were used as the animal identification marks;

Marking method of cage card:

Acclimation period: White cage cards were uniformly used, and the study number, animal species, animal serial number, animal house entry time, remark information and other information were indicated;

After grouping: Cage cards of different colors were used for group differentiation. The study number, animal species, animal number, treatment factor, expected starting and ending time of the study, remark information and other information were indicated on the cage cards.

Color of cage card after grouping: White for streptococcus pneumoniae type 3 polysaccharide conjugate group, green for streptococcus pneumoniae type 6A polysaccharide conjugate group, blue for streptococcus pneumoniae type 7F polysaccharide conjugate group, and red for streptococcus pneumoniae type 19A polysaccharide conjugate group.

2.2 TEST ARTICLE

2.2.1 INFORMATION OF TEST ARTICLE

Name or designation: Bulk of streptococcus pneumoniae type 3 polysaccharide conjugate;

Source: Yunnan Walvax Biotechnology Co., Ltd.;

Description: Suspension with opalescence;

Strength: 25 ml/vial;

Batch No.: 20100903;

Storage conditions and precautions: Store at 2 ~ 8°C;

Valid until: August, 2012;

Name or designation: Bulk of streptococcus pneumoniae type 6A polysaccharide conjugate;

Place of storage: Test Article Management Department of WestChina-Frontier PharmaTech Co., Ltd.

2.2.2 PREPARATION OF TEST SOLUTION

Preparation method: Bulk was filled and used directly. Bulk of test article was diluted to the required concentration with PBS, and stored at 37°C for 42 days (treatment had been completed by the Client).

Identification method: Red label was used for identification, and the study number, name and concentration of test substance, volume, storage conditions, shelf life, responsible person and preparation date were indicated.

Temporary storage conditions and shelf life: Temporarily stored in the ice box and used within 24 h.

2.2.3 TREATMENT OF RETURNED AND REMAINING TEST ARTICLES

The test articles returned after administration were autoclaved and then poured into the waste liquid bucket. The retained samples were stored at the storage room of test articles in accordance with the SOP Storage of Test Articles. After completion of the test items, the remaining test articles were returned to the Client.

2.3 MAIN INSTRUMENTS AND DEVICES REQUIRED FOR THE STUDY

Syringe, electronic balance, etc.

3 STUDY METHOD AND OBSERVATION INDICATORS

3.1 PREPROCESSING OF TEST ARTICLE

Bulk of test article was diluted to the required concentration with PBS, and stored at 37°C for 42 days (treatment had been completed by the Client).

3.2 ADMINISTRATION

16 guinea pigs (241.7 ~ 310g) were selected, and each guinea pig was subcutaneously injected with 5 mL of the test article at one time.

Confidential 940

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

3.3 OBSERVATION

On Days 7, 14 and 21 after administration, animals were observed once for tetanus symptoms, as well as local reactions such as suppuration and necrosis at the injection site for a total of 21 days.

3.4 BODY WEIGHT

Body weight was determined once before administration, and once on Days 7, 14 and 21 respectively after administration.

4 DETERMINATION OF RESULTS

At the end of the observation period, the animals did not show tetanus symptoms, with no suppuration or necrosis at the injection site, with normal weight gain compared with that before administration.

5 RESULTS

5.1 GENERAL CONDITIONS

During the period from post-administration to the end of observation, each guinea pig was normal in terms of the appearance and signs, mental and motor status with natural holes all clean and no tetanus symptoms; no local reactions such as suppuration and necrosis were observed at the injection site.

5.2 EFFECT OF 13-JHYM ON THE BODY WEIGHT OF GUINEA PIG

On Day 21 after administration, the body weight of each guinea pig increased compared with that before administration (Table 2).

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Abstract

The 13-valent pneumococcal polysaccharide conjugate vaccine (13-JHYM) is made from pneumococcus capsule polysaccharide antigens of serotype 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F and 23F covalently combined with tetanus toxoid carrier protein and adsorbed by aluminum phosphate adjuvant. The clinical use of this vaccine is for infants and children aged 2 months to 2 years old to prevent the invasive infection caused by the above-mentioned serotype pneumococcus. The proposed dosage is 0.5 mL per person, and the proposed route of use is intramuscular injection.

In accordance with the relevant requirements of new drug declaration redefined by Provisions for Drug Registration, the active systemic anaphylaxis test of 13-JHYM provided by Yunnan Walvax Biotechnology Co., Ltd. was carried out in guinea pigs by WestChina-Frontier PharmaTech Co., with a purpose to observe whether 13-JHYM could induce active systemic anaphylaxis in guinea pigs, and to provide a reference for evaluating the safety of clinical use.

A total of 10 groups were set in this experiment, including a negative control group, a positive control group, a low-dose and a high-dose group for 7-valent pneumococcal conjugate vaccine, as well as a low-dose and a high-dose group for 13-JHYM of 3 different batches respectively (batch No. 20110304, 20110305 and 20110406), with 6 guinea pigs included in each group (half male and half female). The sensitized dosage of low-dose group was 0.05 mL bulk/kg, which was equal the clinical proposed dosage, and the sensitized dosage of high-dose group was 0.5 mL bulk/kg, which was equal to 10 times of the clinical proposed dosage.

When sensitizing, the guinea pigs in the 7-valent pneumococcal conjugate vaccine groups and 13-JHYM groups were given sample or comparison product at corresponding concentration based on the above mentioned dosage design. Guinea pigs in the positive control group were given 10 mg/mL ovalbumin solution through intraperitoneal injection in the volume of 0.5 mL/kg, while guinea pigs in the negative control group were given 0.9% sodium chloride (normal saline) through intramuscular injection in the volume of 0.5 mL/kg. Sensitization was done once every other day and 5 times in total continuously. On the 10th day after the last sensitization, guinea pigs in each group were provoked by single injection of 2 times sensitized dosage through dorsalis pedis vein. The systemic reactions and death of guinea pigs were observed at least 30 minutes after provocation injection. Main results are as below:

No anaphylaxis was observed in the negative control group, 7-valent pneumococcal conjugate vaccine groups and the low-dose 13-JHYM groups of 3 batches within 30 minutes after provocation injection. Anaphylaxes observed in the positive control group were all strong positive and guinea pigs with anaphylaxis all died within 4 minutes. Three Guinea pigs in the high-dose 13-JHYM (batch No.20110304) group showed strong positive anaphylaxis and the duration of the reaction was about 6-21 minutes; one guinea pig showed extremely positive anaphylaxis and died about 7 minutes after being provoked. One guinea pig in the high-dose 13-JHYM group (batch No.20110305) showed positive anaphylaxis and another showed strong positive anaphylaxis with a duration of 4-6 minutes; one guinea pig showed extremely positive anaphylaxis and died about 7 minutes after being provoked. Three guinea pigs in the high-dose 13-JHYM group (batch No.20110406) showed positive anaphylaxis and one showed strong positive anaphylaxis with a duration of 23-30 minutes.

In conclusion, under the conditions of this experiment, the guinea pigs were intramuscularly injected with 3 batches of 13-JHYM (batch No.20110304, 20110305 and 20110406) in the volume of 0.05 mL/kg and 0.5 mL/kg respectively. At the dosage of 0.5 mL/kg, the active systemic

1. BASIC INFORMATION

1.1 EXPERIMENT NAME AND NUMBER

Experiment name: Active Systemic Anaphylaxis Test of 13-JHYM in Guinea Pigs
Experiment number: A201118-T074-01

1.2 OBJECTIVES

The active systemic anaphylaxis test of 13-valent pneumococcal polysaccharide conjugate vaccine (13-JHYM) was carried out in guinea pigs, with a purpose to observe whether 13-JHYM could induce active systemic anaphylaxis in guinea pigs, and to provide a reference for evaluating the safety of clinical use.

2. MATERIALS

2.1 EXPERIMENT ANIMALS

2.1.1 BASIC INFORMATION

Species: British guinea pigs;
Grade: normal;
Amount and gender of animals purchased: 66 animals in total, half male and half female;
Amount and gender of animals used: 60 animals in total, half male and half female;
Body weight: female 269.6-389.6g, male 289.5-398.2g;
Source: Sichuan Laboratory Animal Special Committee farm (Production License No. SCXK (Sichuan) 2008-014; Certificate of Quality No. 0024848, issuing unit: Sichuan Department of Science and Technology);
Entry date: 14/06/2011;
Environmental adaptation period after entry: Before the experiment, the guinea pigs adapted to the environment for 21 days (14/06/2011-04/07/2011). Healthy guinea pigs were selected as formal test animals. Observation measurements during adaptation period: general conditions, body weight etc.

2.1.2 ANIMAL REARING CONDITIONS

2.1.2.1 REARING SITES

The ordinary animal house of WestChina-Frontier PharmaTech Co. (laboratory animal room license No. SYXK (Sichuan) 2009-123).

2.1.2.2 REARING CONDITIONS

Rearing cage: guinea pig cage (L*W*H: 515 mm*400 mm*260 mm);
Rearing density: no more than 3 animal per cage.

2.1.2.3 REARING ENVIRONMENT

Standard: the National Standard of the People's Republic of China GB14925-2001;
Control system: the EBI400 automatic control fresh air air conditioning system produced by Honeywell;
Temperature: room temperature 19.75-25.08°C (with a diurnal temperature range of 0.07 - 2.98°C);
Humidity: relative humidity 42.00-59.13%;
Illumination: artificial lighting, 12 hours of alternating light and dark (lights on at 07:30, lights off at 19:30);
Ventilation: 8-10 times per hour, 100% fresh air.

Confidential 950

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

2.1.2.4 FEED

Type: pellet feed for guinea pigs;
Manufacturer: Beijing Ke'ao Xieli Feed Co., Ltd. (Feed Production Permit: SCXK (Beijing) 2009-0012);
Batch No.: 11030551;
Feeding method: free intake;
Nutrient analysis: provided by the feed provider, of which the routine nutritional measurements of crude protein, crude fat, crude fiber, crude ash, water, calcium and phosphorus were reported for each batch(referring to the National Standard of the People's Republic of China GB14924.5-2001);
Confirmation of contaminant content in feed: provided by the feed provider, indicators for

chemical contaminants including arsenic, lead, cadmium, mercury, hexachlorocyclohexane, DDT, aflatoxin B₁, total colony count, coliform group, mold and yeast count, pathogenic bacteria (Salmonella) were provided at least once a year (referring to the National Standard of the People's Republic of China GB14924.2-2001).

2.1.2.5 DRINKING

Type: drinking water for laboratory animals (reverse osmosis water);

Method of water supply: held in drinking water bottles, free intake;

Colony count detection: referring to the National Standard of the People's Republic of China

GB5749-2006, sampling self-examination (once per week);

Detection of conventional indicators of water quality: referring to the National Standard of the People's Republic of China GB5749-2006, samples were sent to units with relevant qualification for testing at least 2 times per year.

2.1.3 ANIMAL GROUPING AND MARKING METHODS

2.1.3.1 ANIMAL GROUPING

Group design: a total of 10 groups, including a negative control group, a positive control group, a low-dose and a high-dose group for 7-valent pneumococcal conjugate vaccine, as well as a low-dose and a high-dose group for 13-JHYM of 3 different batches;

Amount: 6 animals in each group;

Gender: half male and half female;

Grouping method: the guinea pigs were randomly divided into groups according to their body weight;

Disposal of surplus animals: handed over to the department of laboratory animal administration.

The specific group information is shown in Table 1.

Notes: The first digit of the animal number represents the group (e.g. 1 and 2 represent the negative control

group and positive control group respectively); the second letter stands for gender (M for male, F for female);

the third and fourth digits represent cage number, and the fifth and sixth digits represent animal serial number.

2.1.3.2 MARKING METHOD

Adaptation period: cage card and marks were used as animal identification markers;

Post-grouping period: The cage card and individual ear number were used as animal identification markers.

Marking method of cage card:

Adaptation period: unified use of white cage card, with the test number, animal species, animal number, entry time and notes indicated;

Post-grouping: cage cards in different colors were used to distinguish the groups, and the cards were marked with test number, animal species, animal number, treatment factors, expected start and end time of the experiment and notes;

Colors of cage cards after grouping: white represented the negative control group; yellow represented the positive control group; blue represented the low-dose 7-valent pneumococcal conjugate vaccine group, and orange represented the high-dose 7-valent pneumococcal conjugate vaccine group; green represented the low-dose 13-JHYM group, and red represented the high-dose 13-JHYM group.

2.2 TEST ARTICLES

2.2.1 TEST ARTICLE INFORMATION

Name: 13-valent pneumococcal polysaccharide conjugate vaccine (13-JHYM);

Source: Yunnan Walvax Biotechnology Co., Ltd.;

Character: suspension with opalescence;

Specification: 0.5 mL: 32.2μg per vial;

Batch No.: 20110304 (batch 1), 20110305 (batch 2), 20110406 (batch 3);

Preservation conditions and notes: kept under 2-8℃;

Expiration date: February, 2012 for batch No. 20110304 and 20110305; March, 2013 for 20110406;
Confidential 952
MODULE 4 NONCLINICAL STUDY REPORTS
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Preservation site: the Samples Management Department of WestChina-Frontier PharmaTech Co.
2.2.2 TEST ARTICLE PREPARATION

Menstruum: 0.9% sodium chloride injection;
Preparation methods: samples for the low-dose groups were prepared with 0.9% sodium chloride injection under aseptic condition, and samples for the high-dose groups used direct separation of the bulk;
Marking methods after preparation: the high-dose groups were marked with red labels and the low-dose group were marked with green labels, with experiment number, substance name and concentration used in the experiment, volume, storage condition, expiration date, responsible person and preparation date;
Preservation condition and period of validity after preparation: stored in ice box for use within 24 hours.

2.2.3 RETURN AND DISPOSAL OF REMAINING SAMPLES

The remaining samples after administration were collected in the waste liquid bucket after sterilized with high temperature and high pressure. The reserved samples were deposited in the sample room referring to the SOP for the preservation of test articles. The remaining samples at the end of the experiment were returned to the client.

2.3 COMPARISON PRODUCT

2.3.1 NEGATIVE COMPARISON PRODUCT INFORMATION

Name: 0.9% sodium chloride injection;
Source: Sichuan Kelun Pharmaceutical Co., Ltd.;
Character: colorless transparent liquid;
Specification: 100 mL per bottle;
Batch No.: C100928;
Preservation conditions and notes: sealed storage at room temperature;
Expiration date: August, 2012;
Preparation methods: direct separation of the bulk on the day of use;
Marking methods after preparation: test articles were marked with white labels with experiment number, substance name used in the experiment, volume, storage condition, expiration date, responsible person and preparation date;
Preservation condition and period of validity after preparation: stored in the ice box for use within 24 hours.

2.3.2 POSITIVE COMPARISON PRODUCT INFORMATION

Name: ovalbumin;
Source: Shanghai Yuanju Bio-tech Co., Ltd.;
Character: white crystal;
Specification: 1g per bottle;
Batch No.: 091221;

Confidential 953
MODULE 4 NONCLINICAL STUDY REPORTS
Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Preservation conditions and notes: kept under 2-8℃;
Period of validity: 2 years;
Preparation methods: prepared into 10mg/mL solution with 0.9% sodium chloride injection when use;
Preservation condition and period of validity after preparation: stored in the ice box for use within 24 hours.

2.3.3 SIMILAR LICENSED COMPARISON PRODUCT

Name: 7-valent pneumococcal conjugate vaccine;
Source: Wyeth Pharmaceutical Division of Wyeth Holdings Corporation;
Character: white suspension;
Specification: 0.5 mL: 16µg per vial;
Batch No.: E19166D94429, E35571D94426 and E61516E52444;
Preservation conditions and notes: stored under 2-8℃;
Term of validity: February, 2012 for batch No. E19166D94429 and E35571D94426; March, 2013 for E61516E52444;
Preparation methods: samples for the low-dose groups were prepared with 0.9% sodium chloride injection under aseptic condition, and samples for the high-dose groups used direct separation of the bulk;
Marking methods after preparation: the high-dose groups were marked with red labels and the low-dose group were marked with green labels, with experiment number, substance name and concentration used in the experiment, volume, storage condition, expiration date, responsible person and preparation date;
Preservation condition and period of validity after preparation: stored in ice box for use within 24 hours.

2.3.4 RETURN AND DISPOSAL OF REMAINING COMPARISON PRODUCTS

After each administration, the remaining negative control was directly discharged into the sewer, the positive control was collected in the waste liquid barrel, and the licensed control was collected in the waste liquid barrel after sterilization.

3. METHODS AND OBSERVATION MEASUREMENTS

3.1 METHODS

Referring to the Technical Guidelines for the Study of Irritation, Hypersensitivity and Hemolysis of Chemical Drugs (March 2005), in an active systemic anaphylaxis test, animals in the negative control group should be given menstruum in the same volume, animals in the positive control group should be given bovine serum albumin or ovalbumin or known sensitizing positive substance in the volume of 1-5 mg per animal, animals in the low-dose groups should be given samples at the maximum clinical dosage, and animals in the high-dose groups should be given samples at a dosage which was several times of the dosage used in the low-dose group. Based on the information provided by the client, the clinical proposed dosage of 13-JHYM was 0.5 mL per person (a single serving contained 32.2 µg pneumococcal polysaccharides of various types. The dosage for infants whose weight was determined as 10 kg was converted into a clinical proposed dosage of 0.05 mL/kg, i.e. 3.22 µg/kg).

Confidential 954
MODULE 4 NONCLINICAL STUDY REPORTS

On the basis of above mentioned premises, 0.05 mL bulk/kg was determined as low dosage for 13-JHYM of 3 different batches when sensitizing, and 0.5 mL bulk/kg was determined as high dosage, which was equal to and 10 times of the clinical proposed dosage for human beings respectively. The low-dose and high-dose 7-valent pneumococcal conjugate vaccine group were set at the same dosage as 13-JHYM groups. The dosage of 5 mg per animal was set for the positive control group (intraperitoneal injection, 10 mg/mL ovalbumin), and the normal saline was given to the animals in the negative control group in the volume of 0.5 mL/kg through intramuscular injection.

Guinea pigs in each group were intramuscularly injected with corresponding sample or control for sensitization through hind limbs at the above dosage on the 1st, 3rd, 5th, 7th and 9th day of the experiment respectively, and guinea pigs in the positive control group were intraperitoneally injected with 10 mg/mL ovalbumin in the volume of 0.5 mL per animal. On the 10th day after the last sensitization (i.e. the 19th day of the experiment), guinea pigs in each group were all provoked through intravenous injection at a twice sensitizing dosage.

Please see Table 2 and Table 3 for the specific dosage design.

Table 2 Table of Sensitizing Dosage Design

Dosage	Animal	Administration	Volume	Group (mL)	Concentration	amount	route (mL/kg)	bulk/kg)	Male	Female

3.2 OBSERVATION MEASUREMENTS

3.2.1 OBSERVATION MEASUREMENTS DURING SENSITIZATION

3.2.1.1 OBSERVATION TIME AND FREQUENCY

Observation period: from the 1st sensitization to provocation;

Observation frequency:

Rearing personnel: twice a day;

Experiment personnel: at least once around 2 hours after each administration, and at least once a day for the rest time;

Veterinarian: at least once a week.

3.2.1.2 OBSERVATION MEASUREMENTS AND CONTENTS

Rearing personnel: death and other abnormalities of guinea pigs;

Experiment personnel: including but not limited to the appearance, the general behavior activity, the mental state, the aspiration status, the excrement character, the genitals, the death and other toxic performance of guinea pigs;
Veterinarian: including but not limited to the appearance, the general behavior activity, the mental state, the aspiration status, the excrement character, the genitals, the death and other toxic performance of guinea pigs.

3.2.2 OBSERVATION AFTER PROVOCATION

The response of each guinea pig as well as the time of occurrence and disappearance of symptoms was observed and recorded immediately to 30 minutes after intravenous provocation according to the symptoms specified in Table 4. The maximum observation time was 3 hours.

Table 4 Table of Anaphylaxis Symptoms

No. Symptom	No. Symptom	No. Symptom	No. Symptom
No Shortness of breath	7 14		
symptom	breath	Gait

3.2.3 BODY WEIGHT

Measurement time: once respectively on the day of sensitization and provocation;

Confidential 956

MODULE 4 NONCLINICAL STUDY REPORTS

Version No. Walvax-202007-00 Yuxi Walvax Biotechnology Co., Ltd.

Measurement animal: all surviving guinea pigs.

3.3 RESULTS DETERMINATION

The degree of the anaphylaxes were determined based on the criteria specified in Table 5, and a comprehensive judgment was made according to the incidence and degree of the anaphylaxes.

Table 5 Table of Standards for Evaluation of Systemic Sensitization in Guinea Pigs

Symptom No. Symbol Results Determination

- 0 - Solvent of anaphylaxis
- 1-4 + The anaphylaxis was weakly positive.
- 5-10 ++ The anaphylaxis was positive.
- 11-19 +++ The anaphylaxis was strong positive.
- 20 ++++ The anaphylaxis was extremely strong positive.

4. RESULTS

4.1 GENERAL CONDITIONS

The guinea pigs in each group were in good conditions before provocation, with normal activities, normal weight gain and no other abnormal reactions.

4.2 SYSTEMIC ANAPHYLAXIS

Within 30 minutes after provocation injection, no anaphylaxis was observed for the guinea pigs in the negative control group. The anaphylaxes of guinea pigs in the positive control group were all extremely strong positive and the guinea pigs all died within 4 minutes. No anaphylaxis was observed for guinea pigs in the high-dose and low-dose 7-valent pneumococcal conjugate vaccine group, as well as the low-dose 13-JHYM groups of 3 different batches. The anaphylaxes of 3 guinea pigs in the high-dose 13-JHYM group (batch 1) were strong positive with a duration of 6-21 minutes; the anaphylaxis of 1 guinea pig was extremely strong positive and the guinea pig died around 7 minutes after provocation; the positive rate was 50%. The anaphylaxes of 3 guinea pigs in the high-dose 13-JHYM group (batch 3) were positive; the anaphylaxis of 1 guinea pig was strong positive with a duration of 23-30 minutes; the positive rate was 83.3%.

Another 6 guinea pigs in the negative control group were intravenously injected with 13-JHYM in the volume of 1.0 mL bulk/kg (3 batches, 2 animals each batch, half male and half female) and observed for 30 minutes. No anaphylaxis symptoms were observed.

Please see Table 6 for the observation results of the anaphylaxes.

5. CONCLUSIONS

In conclusion, under the conditions of this experiment, the guinea pigs were intramuscularly injected with 13-JHYM of 3 batches (batch No.20110304, 20110305 and 20110406) in the volume of 0.05 mL bulk/kg and 0.5 mL bulk/kg. When injected in the volume of 0.5 mL bulk/kg, the results of active systemic anaphylaxis test for guinea pigs were all positive, and when injected in the volume of 0.05 mL bulk/kg, the results of active systemic anaphylaxis test for guinea pigs were all negative.

Pivotal trial
Phase/Study No. Phase III PCV13-TT 002
Country China
Status Completed
Objective Primary To assess the immunogenicity of Walvax PCV13-TT in healthy children aged 3 months and above. The proposed regimen consists of four

doses, with a single intramuscular injection at 0, 1, 2 month for primary immunisation schedule and a single intramuscular injection at 12 to 15 months for booster immunisation schedule. To assess the non-inferiority of 7 common pneumococcal serotypes compared to Pnevfromnar 7® and the efficacy of 6 additional pneumococcal serotypes with same immunization schedule.

Secondary (1) To assess the immunogenicity of Walvax PCV13-TT in healthy children aged 2 months (≥6 weeks). The proposed regimen consists of four doses, with a single intramuscular injection at 0, 1 and 2 month for primary immunisation schedule and a single intramuscular injection at 12 to 15 months for booster immunisation schedule.

(2) To assess the non-inferiority of 7 common pneumococcal serotypes compared to Pnevfromnar 7® and the efficacy of 6 additional pneumococcal serotypes with same immunization schedule.

(3) To assess antibody opsono-phagocytosis activity (OPA) Walvax PCV13-TT in healthy children aged 2 months (≥6 weeks) to 71months by different immunization procedures.

(4) To assess the safety of Walvax PCV13-TT in healthy children aged 2 months (≥6 weeks) to 71months. Evaluate safety of PCV13 in 6 weeks - 5 years old children

5.3.5 Reports of Efficacy and Safety Studies

5.3.5.1 Study Reports of Controlled Clinical Studies Pertinent to the Claimed Indication

In China, the pivotal phase III clinical trial of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine (Tetanus Toxoid Protein) (PCV13-TT) was a randomized and blinded non-inferiority study comparing to Pevnar. This study evaluated the immunogenicity and safety of PCV13-TT and Pevnar in 2760 subjects 2 through 71 months of age (at least 6 weeks of age). A total of 1040 infants aged 3 months were randomized in a 1:1 ratio as study group and control group, with PCV13-TT or Pevnar given at 3, 4, 5 and 12-15 months of age, respectively; for 520 infants aged 2 months (at least 6 weeks of age), PCV13-TT were vaccinated at 2, 4, 6 and 12-15 months of age. 1200 Children of 7 through 71 months of age, including children 7 months through 11 months of age, 12 months through 23 months of age and 24 months through 5 years of age (prior to the 6th birthday) who were naïve to pneumococcal conjugate vaccine, were split into three age groups with each containing 400 subjects randomized in a 1:1 ratio given 3, 2 or 1 dose of PCV13-TT or Pevnar, respectively, according to the age-appropriate schedules. Enzyme-linked immunosorbent assay (ELISA) was utilized to detect the IgG antibody concentration in all serum samples collected

from each group; additionally, a subsets of sera randomly obtained from 100 subjects in each age group for PCV13-TT and Prevnar, totaling 900, were tested by opsonophagocytic assay (OPA) to measure the ability of serotype-specific functional antibodies to eliminate corresponding pneumococci by promoting complement-mediated phagocytosis.

The details of phase III clinical trial of PCV13-TT please refer to Annex 5-1Phase III clinical study report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine (Tetanus Toxoid Protein)

5.3.5.2 Study Reports of Uncontrolled Clinical Studies

Phase I clinical trial of the PCV13-TT was conducted in China, including 120 subjects, to evaluate the safety of 13-valent pneumococcal polysaccharide conjugate vaccine (PCV13-TT) in healthy population aged 2-3 months (minimum age: 6 weeks), 2-5 years and 18 years and above and to explore the IgG immune responses of PCV13-TT vaccinated in subjects aged 2-3 months (minimum age: 6 weeks), 2-5 years and 18 years and older. For subjects have been vaccinated with at least one dose of PCV13-TT were observed for 30 minutes after each dose of PCV13-TT, and were under active observation for adverse events (AEs) within 0-7 days post vaccination, while for 8-30 days post vaccination, AEs were spontaneously reported and collected by subjects. Serious adverse events (SAEs) were monitored for 6 months after full immunization of PCV13-TT which was administered in accordance with the immunization procedure prescribed in the protocol.

The details of phase I clinical trial please refer to Annex 5-2 Phase I clinical study report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine (Tetanus Toxoid Protein)

5.3.6 Reports of Post-Marketing Experience

The 13-valent Pneumococcal Polysaccharide Conjugate Vaccine (Tetanus Toxoid Protein) licensed on 30th 12 2019, the post-marketing data will be reported at the fourth quarter by Walvax in Dec. 2020. This is because there is only one major source for AEFI in China. Firstly, the Chinese CDC, which is the only allowed point of vaccination, collects the original AEFI and then reported to National Medical Products Administration (NMPA). Subsequently, NMPA will sort out the reported AEFI by province and distribute to Provincial MPA (PMPA). Finally, the PMPA will send the AEFIs of last year to each company according to the vaccine batch number in every July or August. The AEFI data for 2019 will only be issued by Chinese regulatory agency in July or August in 2020.

Safety evaluation measures:
 Local reactions: administration site pain, itching, redness, swelling, induration, rash (injection site) size and severity, and body movement disorders.
 Systemic reactions: observation of fever, allergy, headache, tiredness/fatigue, nausea/vomiting, diarrhea, myalgia, Cough and other discomfort or clinical adverse
 Efficacy reactions.
 measures Laboratory tests: hematology and urinalysis, hepatic and renal function correlates in blood biochemistry.
 Immunogenicity evaluation measures:
 Proportion of subjects with specific pneumococcal IgG antibody concentration ≥ 0.35 µg/mL (positive rate)
 Specific pneumococcal IgG geometric mean concentration (GMC).
 Safety:

The incidence of vaccine-related adverse events was 80.00%, 53.33%, 66.67% and 70.00% in adults, children, 2-month-old and PCV13-TT (3 months) group, respectively. A total of 6 cases in the adult group experienced grade 3 local adverse reactions, corresponding to an incidence rate of 20% (6 / 30), including 1 case of local redness, 1 case of induration, 2 cases of swelling, 2 cases of redness combined with swelling. The incidence rate of adverse reactions with grade 3 severity in other age groups was less than 15%.

The most common symptoms of systemic adverse reactions were fever in adults and children aged 2-5 years, and were fever and diarrhea in 2-month-old and 3-month-old infants. Common local adverse reactions in adults included redness, pain and swelling at the vaccination site, and were pain and redness in children aged 2-5 years, as compared to redness in infants 2 and 3 months of age.

Adverse events mainly occurred on Day 0-7. No adverse events related to the study vaccine were collected on Day 8-30, and no serious adverse events were collected during the observation period.

Clinical trial
 Immunogenicity:
 evaluation

High IgG antibody positive rates and antibody levels were observed in adults and children aged 2-5 years before immunization for all 13 serotypes. The IgG antibody positive rates of all serotypes reached 100% or over 80% after immunization, the antibody level increased more than 2 folds after immunization. In 2-month-old and PCV13-TT (3 months) group, all the 13 serotypes were with lower IgG antibody positive rates and antibody levels than those in the adult and children groups before immunization, while after immunization, the antibody positive rates all reached 100% except for serotype 3, 5, 6A and 6B, and the fold increase of antibody was significantly higher in the two infants groups compared to adult group and children group.

The positive rates and antibody levels of OPA were lower than that of IgG in each age PCV7 before immunization, while the level of OPA antibody after immunization significantly increased with a higher fold increase compared with IgG. The OPA positive rate of each serotype was $\geq 90\%$ in subjects aged 3 months after immunization.

The correlation analysis between IgG and OPA indicated high consistency between post-

immunization antibody positive rates of the two measures, while some bias might exist due to the small sample size.

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 002152015002

1. INTRODUCTION

The 13-valent pneumococcal polysaccharide conjugate vaccine, jointly developed by the Yunnan Walvax Biotechnology Co., Ltd. and the Yuxi Walvax Biotechnology Co., Ltd., is consistent with the marketed 13-valent pneumococcal conjugate vaccine with respect to serotypes, and is used for the prevention of related diseases caused by infections of the 13 pneumococcal serotypes contained in this vaccine (types 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F). Upon review and approval by the National Medical Products Administration (NMPA) in accordance with the Drug Administration Law of the P.R.C and Provisions for Drug Registration, this vaccine met the relevant provisions for drug registration, and therefore, the "Drug Clinical Trial Approval" was issued in Apr. 2015 (Approval No.: 2015L00591) for conduct of clinical trials.

Entrusted by the Yunnan Walvax Biotechnology Co., Ltd. and the Yuxi Walvax Biotechnology Co., Ltd., the Beijing Chaoyang Center for Disease Control and Prevention (CDC) was responsible for the clinical trial of this vaccine, with a view to evaluating its safety in healthy population aged 2 months and above. The Beijing Chaoyang CDC, based on the relevant requirements in the "Drug Clinical Trial Approval" by NMPA (Approval No.: 2015L00591) and the Provisions for Drug Registration and as per the protocol, conducted a phase I clinical trial on the 13-valent pneumococcal polysaccharide conjugate vaccine jointly developed by the Yunnan Walvax Biotechnology Co., Ltd. and Yuxi Walvax Biotechnology Co., Ltd., and issued this clinical trial report.

2. OBJECTIVES

2.1. PRIMARY OBJECTIVES

To evaluate the safety of 13-valent pneumococcal polysaccharide conjugate vaccine (PCV13-TT) in healthy population aged 2-3 months (minimum age: 6 weeks), 2-5 years and 18 years and above.

2.2. SECONDARY OBJECTIVES

To explore the IgG immune responses of PCV13-TT vaccinated in subjects aged 2-3 months (minimum age: 6 weeks), 2-5 years and 18 years and older.

3. CLINICAL TRIAL MANAGEMENT

3.1. MAIN UNITS AND COLLABORATORS OF CLINICAL STUDY

3.1.1. Main responsible units

This clinical study was undertaken by the Beijing Chaoyang CDC. This research institution obtained the CFDA (now NMPA) approval as "One-Time Certification for Vaccine Clinical Trial Institution" after review, and the clinical trial protocol, the informed consent form, and related forms were reviewed and approved by the ethics committee.

The Beijing Chaoyang CDC has carried out multiple clinical studies on preventive biological products successfully. The principle investigator has experience in clinical studies on preventive biological products, all staff in the Institute of Vaccine Clinical Study that participated in this study have attended GCP training and examinations organized by the national government or this institution, and after training and authorization, all the research participants had been aware of the responsibilities and obligations of clinical investigators and familiar with the nature, effects, efficacy, and safety of the investigational drugs to be used in the clinical trial. Effective measures and conditions were available to ensure the safety of subjects and the timely, accurate, and truthful recording of clinical research data. They were mainly responsible for:

- ✓ Formulating the vaccine clinical trial protocol, and organizing the implementation of such a protocol;

Confidential 7 / 56

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 002152015002

- ✓ Preparing and printing such on-site application forms as informed consent forms, diary cards, and case report forms;
- ✓ Submitting ethical review materials to the ethics committee for approval;
- ✓ Choosing the clinical trial site meeting the requirements set forth in the protocol, and recruiting trial subjects;
- ✓ Organizing the implementation of on-site vaccination and on-site work related to clinical observations;
- ✓ Organizing the follow-up of subjects in the clinical trial site and the collection of adverse events, and reporting, investigating and handling abnormal vaccine reactions;
- ✓ Completing the collection of blood samples, laboratory processing and delivery to the designated laboratory as per the protocol;
- ✓ Completing all the forms and case report forms on the clinical trial site;
- ✓ Issuing a clinical trial report.

3.1.2. Technical collaboration unit

National Institutes for Food and Drug Control, which was responsible for laboratory testing of serum samples and issuing a testing report.

3.1.3. Research institutions on the trial site

The research institutions on this trial site included Heizhuanghu Community Health Service Center Affiliated to Shuangqiao Hospital in Chaoyang District of Beijing, Xiaohongmen Community Health Service Center in Chaoyang District of Beijing, and Nanmofang Community Health Service Center. The number of trained investigators, technical strengths, and environmental facilities on these clinical trial sites met the needs of the clinical trial, so were the resources of subjects. The direct reporting network system operated normally, and the monitoring system for side reactions arising from vaccination was complete. All the laboratories passed the metrological certification. The institutions on the trial site were responsible for subject recruitment, organization on the site, and handling and reporting of adverse events.

3.1.3.1. Beijing Chaoyang Center for Disease Control and Prevention

The Beijing Chaoyang CDC, which is located in the east of Beijing, covers a total area of 470.8 square kilometers, and has an actual resident population of near 5.1 million. Currently, the Beijing Chaoyang CDC has a total of 199 professional technical personnel, which account for 86% of the actual number of employees, and the personnel have an average age of 35.9 years. Specifically, there are 35 personnel with senior titles, 11 with Ph.D degrees, 86 with master's degrees, and 74 with bachelor's degrees. Since 2007, the center has undertaken scientific research projects from the Chinese Preventive Medicine Association, the NMPA 12th Five-Year Major Project, etc., and the phase III clinical trial of the EV71 vaccine. Since the promulgation of "Good Clinical Practice on Vaccine Clinical Trials (Pilot Edition)" by NMPA in 2013, it has undertaken the phase III clinical study involving the freeze-dried rabies vaccine (MRC-5 cells) for human use from Beijing

Minhai Biological Technology Co., Ltd., the randomized, blinded, parallel, controlled phase II clinical study involving the recombinant humanized rabies virus monoclonal antibody injection from the NCPIC, and the phase III clinical trial involving the recombinant human papillomavirus bivalent (types 16/18) vaccine (yeast) from the Shanghai Zerun Biotechnology Co., Ltd. The employees from the CDC have published more than 10 papers at home and abroad, including 6 papers in foreign languages, and published 5 monographs on vaccines. All staff in the Institute of

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 002152015002

Vaccine Clinical Study that participated in this study have attended GCP training and examinations organized by the national government or this institution.

(1) Heizhuanghu Community Health Service Center Affiliated to Shuangqiao Hospital in Chaoyang District of Beijing

Established in 1958, the Shuangqiao Hospital in Chaoyang District of Beijing, is affiliated to the Health Bureau of Chaoyang District, and has been approved by the Beijing Municipal Human Resources and Social Security Bureau as a designated medical institution for medical insurance in Beijing. Located in the southeast of the Chaoyang District, the hospital covers an area of 26 square kilometers and a building area of 3512 square meters. The hospital has 72 personnel of various professional and technical levels, including 3 with senior titles, 9 with intermediate titles, 2 with master's degrees, 30 with bachelor's degrees, and 20 with associated college degrees. There are altogether 9 community health service stations under the hospital, including Daludian, Xiaoludian, Wanzhiyong, Dingxinzhuan, Langgezhuang, Langxinzhuan, Shuangshu, Dongxu, and Yijingcheng, undertaking the six-in-one medical and health work for the 80,000 population in the Heizhuanghu area with respect to prevention, health care, medical treatment, rehabilitation, family planning, and health education. The hospital has such clinical departments as general practice, Traditional Chinese medicine (TCM), gynecology, stomatology, rehabilitation, and health care. The hospital undertakes the related work in the emergency work station in the southern area according to the "regionalization" and "gridding" goal as set by the Chaoyang District Health Bureau, and it has carried out the Sanofi Pasteur's HAF87 clinical trial study.

(2) Beijing Chaoyang Xiaohongmen Community Health Service Center

Established in 1953, the Beijing Chaoyang Xiaohongmen Community Health Service Center is affiliated to the Health Bureau of Chaoyang District, and has been approved by the Beijing Municipal Human Resources and Social Security Bureau as a designated medical institution for medical insurance in Beijing. Located at No. 1 Xiaohongmen Middle Street, Chaoyang District, the Xiaohongmen Community Health Service Center covers an area of 12.47 square kilometers and a building area of 3037 square meters. The hospital has 70 personnel of various professional and technical levels, including 2 with senior titles, 8 with intermediate titles, 8 with bachelor's degrees and 24 with associated college degrees. There are altogether 4 community health service stations under the hospital, including Paifang, Xiaohongmen, Xiaocun, and Longzhaoshu, undertaking the six-in-one medical and health work for the 80,000 population in the Xiaohongmen area with respect to prevention, health care, medical treatment, rehabilitation, family planning, and health education. The center has such clinical departments as internal medicine, surgery, TCM, gynecology, stomatology, ophthalmology, and health care. The phase III clinical study on the H1N1 influenza vaccine, the phase III clinical study on the EV71 vaccine, the phase III clinical study on the meningococcal polysaccharide ACYW135 vaccine, and the phase III clinical study on the lyophilized human rabies vaccine (MRC-5 cells) have been carried out here.

(3) Beijing Chaoyang District Nanmofang Community Health Service Center

The Beijing Chaoyang Nanmofang Community Health Service Center is affiliated to the Chaoyang Health and Family Planning Commission, representing a designated medical institution for medical insurance in Beijing. Located at No. 29 West Dawang Road, Chaoyang District and with a service area of 9.64 square kilometers, it serves a population of 160,000. The center has such departments as general medicine, stomatology, surgery, gynecology, TCM, orthopedic massage, physiotherapy, and preventive health care, and five community health service stations under it: Nanxinyuan, Shuanglongnanli, Huanlegu, Zinanjiayuan, and Baiziwan, with experts on TCM, endocrinology, gynecology, and surgery from the Chuiyangliu medical consortium (tertiary hospital) for specialist clinic service of the center on a regular basis. The center is equipped with

Confidential 9 / 56

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 002152015002

such examination and treatment equipment as Color Ultrasound Doppler Apparatus, CR, Automatic Biochemical Analyzer, Fluorescent Immunoassay Analyzer, Lumbar and Cervical Spine Treatment Instrument, Infrared Polarized Light Treatment Instrument, and TCM Meridian Flow Injection Treatment Instrument. With these pieces of equipment, vascular ultrasonography, cardiac ultrasound examinations, testing of tumor markers, Helicobacter pylori testing, high and low frequency and infrared pain treatment and other physical therapy items are available. The center has 134 employees, including 105 professional technicians with associate college degrees or above and 6 with professional titles as associated chief physicians or above, and is open to an average of over 1000 outpatients per day. In areas under its jurisdiction, the health care department serves 4000 children 0–3 of age, and manages over 4000 children from 15 nursery schools, and 8 primary and secondary schools.

3.2. SPONSOR

Yunnan Walvax Biotechnology Co., Ltd. and Yuxi Walvax Biotechnology Co., Ltd., which were mainly responsible for:

(1) Providing the preliminary clinical trial protocol and finally confirming the clinical trial protocol;

(2) Providing such application documents on the site as the Clinical Trial Approval, the Investigator's Brochure for the clinical trial (pre-clinical product safety information), and the product implementation standards;

(3) Providing vaccines used in the clinical study and issuing test control reports;

(4) Dispatching monitors to assess and recognize the clinical trial site, perform the monitoring duty as per the GCP requirements, and verify the research data during the trial;

(5) Participating in the investigation and handling of cases of abnormal reactions arising from the vaccine, and providing medical and related compensation fees for cases of abnormal reactions which are clinically proven related to the vaccine as per relevant regulations;

(6) Providing the fund for the clinical study.

3.3. STUDY TEAM

Principal investigator, Shi Nianmin (Beijing Chaoyang District Center for Disease Control and prevention)

Medical Monitor, Wang Meng (Beijing Simoon Record Pharma Information Consulting Co., Ltd.)

Director of Statistics, Jiang Zhiwei (Beijing Key Tech Statistical Consulting Co., Ltd.)
Clinical Report Writer, Li Yanping (Center for Disease Control and prevention of Guangxi Zhuang Autonomous Region)
Clinical Report Reviewer, Shi Nianmin

3.4. ETHICS

This study complied with the "Technical Guidelines for Vaccine Clinical Trials" by NMPA and the ethical principles of medical study in humans set forth in the World Medical Association's "Helsinki Declaration", "Good Clinical Practice" (GCP), and all applicable regulatory requirements. Prior to this study, this clinical research protocol and the informed consent form had been approved by the Ethics Review Committees of the Beijing Chaoyang CDC. The subjects for the clinical trial were recruited in accordance with the principle of informed consent and voluntariness. All subjects/legal guardians were informed of matters related to the vaccine clinical Confidential 10 / 56

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 002152015002

trial in detail in order to obtain their voluntary signed informed consent forms. The subjects were screened in strict accordance with the inclusion criteria.

3.5 DATA MANAGEMENT

The study records and reports were managed in accordance with Articles 48–52 of the GCP issued by NMPA. All operations were performed as per the SOPs, and the clinical trial records and report data will be stored in the on-site CDC as required until five years after the clinical trial.

3.6 OBSERVATION AND REPORTING OF ADVERSE EVENTS

In strict accordance with the GCP principles, each subject was observed closely for local and systemic adverse reactions and adverse events. All adverse reactions and adverse events were recorded in the CRF fully, including the symptoms, time of occurrence, severity, duration, measures adopted and the status of recovery; the investigator was responsible for judging the relevance of the adverse events to the test vaccine.

If serious adverse events occurred during the study, appropriate treatment measures were taken immediately, whether they were associated with the test vaccine, and the events were reported to the sponsor, the ethics committee, and the local food and drug administration for the responsible institutions of each sub-center by telephone or fax within 24 hours after learning about such information.

4. STUDY DESIGN AND PROCEDURES

4.1. DESCRIPTION OF STUDY DESIGN AND PROTOCOL

This clinical trial was designed as a single center, open, non-controlled trial.

Healthy subjects aged 2 months and above were included. The planned sample size was 120, and subjects were recruited in three stages in the order of: adults (18 years and above), children (2-5 years) and infant and toddlers (2-3 months, minimum 6 weeks).

A total of 30 subjects were enrolled in the first stage. Each subject was administered with 1 dose of 13-valent pneumococcal polysaccharide conjugate vaccine (PCV13-TT). Blood samples were collected 3 times from all subjects before vaccination, on Day 3 post vaccination (interval 2 days, same below) and Day 30 post vaccination, respectively. The blood samples collected before vaccination and on Day 3 post vaccination were assessed by hematology, liver and kidney function tests, meanwhile, the serum IgG antibody concentration was measured using the blood sample taken before vaccination and on Day 30 post vaccination. Subjects who had no abnormal results of hematology, liver and kidney function tests before vaccination and met other inclusion criteria could proceed to get vaccinated. If no SAE related to study vaccine was identified by the investigators after 7 days' observation and no grade 4 vaccine-related abnormalities determined by the investigators as measured by hematology, liver and kidney function tests were detected on Day 3 after vaccination, then the study proceeded to the next stage.

A total of 30 subjects were enrolled in the second stage. Each subject was administered with 1 dose of PCV13-TT. Blood samples were collected 3 times from all subjects respectively before the vaccination, on Day 3 post vaccination (interval 2 days, same below) and Day 30 days post vaccination. The blood samples collected before vaccination and on Day 3 post vaccination were assessed by hematology, liver and kidney function tests, meanwhile, the serum IgG antibody concentration was measured using the blood sample taken before vaccination and on Day 30 post vaccination. Subjects with testing results within the normal range predefined in the protocol or not within the normal range but were determined by site investigators to be normal and in compliance with other inclusion criteria could be administered with the vaccine. If no SAE related to study

Confidential 11 / 56

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 002152015002

vaccine was identified by the investigators after 7 days' observation and no grade 4 vaccine-related abnormalities determined by the investigators as measured by hematology, liver and kidney function tests were detected on Day 3 after vaccination, then the study proceeded to the next stage.

A total of 60 subjects were enrolled in the third stage and subjects were divided into 2 months (minimum age: 6 weeks) group and 3 months group with 30 subjects in each arm. Subjects in the 2 months group were administered with 3 doses of PCV13-TT according to the procedure of one dose each vaccinated at 0, 2 and 4 months and subjects in the 3 months group were administered with 3 doses of PCV13-TT following the procedure of one dose each at 0, 1 and 2 months. Blood samples were collected from all subjects twice respectively before the first dose and 30 days after the third dose. The serum was separated and the IgG antibody concentration was measured. All subjects were observed for 30 minutes after each dose of PCV13-TT, and were under active observation for adverse events (AEs) within 0-7 days post vaccination, while for 8-30 days post vaccination, AEs were spontaneously reported and collected by subjects. Serious adverse events (SAEs) were monitored for 6 months after full immunization of PCV13-TT which was administered in accordance with the immunization procedure prescribed in the protocol.
Flow chart of Phase I clinical trial of 13-valent pneumococcal conjugate vaccine

▲: No abnormal findings for measures associated with hematology, hepatic and renal functions

Confidential 12 / 56

■: No grade 4 and vaccine-related abnormal findings for measures associated with hematology, hepatic and renal functions as adjudicated by the investigator

●: No investigational vaccine-related SAE at Day 7 as adjudicated by the investigator

4.2. ENDPOINTS

4.2.1. Primary Endpoints

(1) The incidence of adverse reactions / events, and the incidence of adverse reactions of grade 3 and above at 30 days after vaccination of 13-valent pneumococcal conjugate vaccine in first, second and third stage following respective vaccination schedule.

(2) If death occurs during the clinical trial, then the clinical trial shall be interrupted / terminated.

4.2.2. Secondary Endpoint

The changes of hematology, hepatic and renal function were observed in the first and second stages after vaccination.

4.2.3. Exploratory Endpoints

(1) The proportion of subjects with vaccine serotypes-specific pneumococcal IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ (positive rate) at 30 days after vaccination of 13-valent pneumococcal conjugate vaccine in the first, second and third stage following respective vaccination schedule.

(2) The geometric mean concentration (GMC) of vaccine serotypes-specific pneumococcal IgG antibody at 30 days after vaccination of 13-valent pneumococcal conjugate vaccine in the first, second and third stage following respective vaccination schedule.

4.3. STUDY DURATION

Enrollment and study period for clinical trial subjects: a total of 18 months.

The first subject was enrolled in June 2015.

The study was completed in December 2017.

4.4. PROPOSED INDICATIONS AND RATIONALES

Indications: for the prevention of related diseases caused by infections of the 13 pneumococcal serotypes contained in this vaccine (types 1, 3, 4, 5, 7A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F).

Justification: "Pneumococcal polysaccharide vaccine" in the European Pharmacopoeia (version 5.0), and the instructions of use for similar vaccines that have been marketed abroad.

4.5. SELECTION OF SUBJECTS

4.5.1. Study Population

The eligible subjects were population 2 months of age (minimum age: 6 weeks) and above, without contraindications and no history of pneumococcal vaccination, and there were no gender and ethnicity restrictions. Subjects might participate in the study voluntarily, and the informed consent form must be signed by the subject or the guardian of the subject (for subjects aged 12-17 years, the signature from the recipient and the guardians should all be collected).

4.5.2. Inclusion Criteria:

- Healthy infants (aged 2-3 months [at least 6 weeks of age], 2-5 years, and 18 years and above), children or adults as evidenced by medical history, physical examination, and investigators' judgement;

Confidential 13 / 56

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 002152015002

- Subjects and or legal guardians of subjects voluntarily participate in the study and must sign the informed consent;
- Subjects / legal guardians of subjects are able to follow requirements of the trial;
- No abnormal findings for pre-immunization hematology, hepatic and renal function-related measures for subjects aged 2-5 years and 18 years or above;
- Subjects who have not been vaccinated with pneumococcal vaccines, and have not been administered any other preventive products within 7 days;
- Axillary temperature $\leq 37^{\circ}\text{C}$.

4.5.3. Exclusion Criteria:

4.5.3.1. Exclusion Criteria for First Vaccination

- Previously vaccination listed or vaccinated with trial pneumococcal vaccine
- History of invasive disease caused by *Streptococcus pneumoniae*, which was confirmed by bacterial culture
- Prior history of allergic reactions to any drug, vaccine, or vaccine-related serotype
- Vaccination-related fever of 39°C or more has occurred with biological products used for vaccination
- Birth weight $< 2.5 \text{ kg}$
- There is a history or family history of allergies, convulsions, seizures, encephalopathy, and psychosis
- Abnormal births of infants (difficult labors, aided by instruments) or a history of asphyxia, neurological organ damage
- History of diagnosed thrombocytopenia or other coagulation disorders
- Infants with diagnosed pathological jaundice
- Known or suspected to suffer from diseases, including: respiratory system disease, acute infection or chronic disease, serious cardiovascular disease, kidney disease, malignant tumor, skin diseases, mothers with HIV infection (as evidenced by test report)
- Known serious congenital malformations or severe chronic disease; congenital deformities, developmental disorder, or a clinical diagnosis of severe chronic diseases (such as Down's syndrome, diabetes, sickle cell anemia, or neurological disorders, Guillain-Barre Syndrome)
- Known or suspected co-morbidities including: respiratory disorders, acute infections or active attack of chronic disease, serious cardiovascular disorders, liver and kidney disorders, malignant neoplasms, skin diseases.
- Received blood products or globulin. Hepatitis B hyper-immune globulin can be used
- Participating in other clinical trials
- Any condition that the investigator considered to have the potential to affect the evaluation of the study

4.5.3.2. Exclusion Criteria for 2nd, 3rd Vaccination

- Subjects who had severe allergic reactions during the first or second vaccination
- Subjects who experienced serious adverse reactions from the previous vaccination with causal relationship demonstrated
- After the first vaccination, the newly discovered or newly occurred conditions not conforming to the first dose of the inclusion criteria or to the exclusion criteria for the first dose
- Any other conditions that may affect the study evaluations as assessed by investigators

4.5.4. Criteria for Early Termination of the Trial

Early termination means that the subject terminates the study visit prior to the time set forth in clinical study protocol, and no more study procedures would be performed, the subject would not

Confidential 14 / 56

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 002152015002

be followed and no more information should be collected from the subject. In case of any of the

following conditions, the study will be terminated in advance:

- The subject or the guardians may withdraw from the trial at any time at their own disposal;
- Subjects who leave the region and fail to complete the study procedures are deemed to have voluntarily withdrawn from the test;
- Occurrence of intolerable adverse events, whether or not related to the investigational vaccine;
- The health status restricts their ability to participate in the study, and the observation should be terminated according to the investigator's judgment;
- Any other reason considered by the investigators.

Any adverse event observed in subjects are adjudicated by the investigator to determine the relevance with investigational vaccine, and the investigator shall decide whether the clinical trial shall be terminated in advance; if the early-terminated subject has been vaccinated with the investigational vaccine, the clinical trial data of the subject will still be used for safety analysis; the subjects cannot be replaced during the conduct of the trial; the subjects who have been vaccinated with the vaccine used in the clinical trial shall be followed by investigator to monitor the adverse events occurred in the subject and related to the study after withdrawing or terminating the study.

4.5.5 Criteria for interruption or termination of the clinical trial

The clinical trial shall be interrupted or terminated under any of the following circumstances:

- ✓ Occurrence of subject deaths related to vaccination;
- ✓ Occurrence of collective serious adverse reactions;
- ✓ Interruption or termination of the clinical trial as required by the sponsor due to such reasons as the investigational vaccine; and
- ✓ Interruption or termination as required by the NMPA.

4.6. GROUPS

The total number of patients in phase I clinical trial was 120, and the study is divided into three stages in sequence as follows:

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine

Protocol No.: 002152015002

4.7. INVESTIGATIONAL DRUG

4.7.1. Investigational Vaccine

Product Name: 13-valent pneumococcal polysaccharide conjugate vaccine

Manufacturer: Yuxi Walvax Biotechnology Co., Ltd

Strength and components: 0.5 mL/syringe, containing 30.8 µg of pneumococcal polysaccharides (total amount of polysaccharides), including 2.2 µg each of serotype 1, 3, 4, 5, 6A, 7F, 9V, 14, 18C, 19A, 19F and 23F, and 4.4 µg of serotype 6B polysaccharide.

Dosage form: injection (suspension for injection)

Batch No.: 201511003

Expiration date: November 23, 2017

4.7.2. Packaging

Yuxi Walvax is responsible for the preparation of the investigational vaccine, and Beijing Simoon Record Pharma Information Consulting Co., Ltd. (CRO) is responsible for printing the vaccine repackaging label. The Registration and Clinical Management Department of Yunnan Walvax is responsible for reviewing and grouping vaccine labels. Based on the "PCV13 Phase I Clinical Study Investigational Vaccine Repackaging Plan" and the clinical study protocol, the Registration and Clinical Management Department of Yunan Walvax completed the operation training, introduced in detail the repackaging process and related considerations for the personnel participating in the repackaging program before the implementation of the repackaging procedures, and organized to complete the repackaging of investigational vaccine.

4.7.3 Storage and transportation of the vaccine

The vaccine shall be stored and transported at 2–8 °C, away from light. The storage temperature needed to be monitored daily and recorded. If the storage and transportation conditions exceeded the specified ranges, the investigator on the site shall contact the staff of the unit responsible for the clinical study and the sponsor immediately, and the vaccine shall not be used until obtaining the permission of the sponsor.

4.7.4. Route of administration and dose

Route of administration: intramuscular injection. The lateral skin of the deltoid muscle of the upper arm or the anterolateral skin of the thigh was sterilized with 75% medical alcohol, the vaccine was shaken well, and 0.5 mL of vaccine was intramuscularly injected after the skin had become slightly dry; for infants under 12 months of age, the preferred vaccination site is the anterolateral thigh.

4.7.5 Concomitant medication

Allowed medication: If adverse events occurred in a subject during the trial, the subject shall be allowed to have access to necessary medications and medical treatment.

Allowed vaccines: The interval between other vaccines and the investigational vaccine shall not be less than 7 days, and that between the live attenuated vaccine and the investigational vaccine shall not be less than 14 days; emergency vaccination can be conducted at any time according to the need of vaccination (e.g., rabies or tetanus vaccine). If the concomitant vaccine vaccination led to the violation of the interval between the vaccination and the investigational vaccine vaccination against the requirements of this protocol, such a circumstance was handled as protocol violation and there was no need to terminate the trial. The investigator shall record any information on

concomitant medication, including the drug name, dosage form, dosage and administration, and time of administration.

Medication records: In order to learn about the impact of drug use on the safety and immunogenicity of the vaccine during the trial or to collect adverse events that may be related to vaccination without omission, the investigator needed to collect the medications of subjects during the observation period by taking measures, and guide the subjects or their guardians in recording their visits and medication in the diary cards as much as possible. The following drugs shall be transcribed into the Electronic Data Capture (EDC) system:

- (1) Oral or injectable hormones/steroids (e.g., dexamethasone);
- (2) Anti-allergic drugs (e.g., chlorpheniramine);
- (3) Antipyretic/analgesic/non-steroidal anti-inflammatory drugs (e.g., aspirin, ibuprofen, fenbid);
- (4) Any vaccines or biological products;
- (5) Immunosuppressants;
- (6) Antibiotics
- (7) Anti-viral drugs;
- (8) Other drugs

4.8 STUDY PROCEDURES

4.8.1 Recruitment of subjects

After the research site had been determined and approval had been secured from the ethics committee, the recruitment notices were issued to those meeting the requirements on age, vaccination history, and health status as per the protocol.

4.8.2 Informed consent

Prior to the enrollment, the investigator informed fully the subject or his guardian of information related to the clinical protocol, and the subject, his guardian, and the research doctor signed the informed consent form jointly in duplicate, with the subject keeping the copy.

4.8.3 Screening via physical examinations

The investigator carried out physical examinations on all subjects, including the height, body weight, body temperature, skin examinations, and hematology and indicators related to liver and kidney functions. The investigator carried out inquiries as per the "inclusion and exclusion criteria", observed the general state of subjects, examined the throat, heart, and lungs, and measured the blood pressure of subjects at 18 years old and above, thereby excluding subjects with a serious medical history, e.g., serious diseases, infectious diseases, and organ removal. The subjects were assigned to groups in accordance with the inclusion and exclusion criteria. The basic information of all the subjects was filled in the "Physical Examination Form". The "Source Document Book" was filled in.

4.8.4. Assignment of study numbers

Subjects were assigned with unique random numbers according to the order of their enrollment, and the study number were recorded in the "Source Document Book", the name abbreviations of the subjects were filled in the "Vaccine Allocation Form", which was then signed and dated by the investigator.

4.8.5. Blood collection before immunization

Subjects in the first and second stage were subjected to the collection of whole blood not less than 5.0 mL in volume by means of venipuncture before the first vaccination, and the blood samples were divided in two parts, the first part was on the same day sent to hospital of Grade A Level 2 and above for hematology, hepatic and renal function-related testing; another part was separated through centrifugation and then stored at -20 °C or below, and was intended for pre-immunization IgG antibody concentration testing.

Subjects in the third stage was subjected to the collection of whole blood not less than 3.0 mL, which was then centrifuged to separate the serum, and then stored at -20°C or below, to test the pre-immunization IgG antibody concentration.

4.8.6. Vaccination

Subjects in the first and second stage of clinical study may receive vaccination only when their hematology, hepatic and renal function measures are within the normal range specified in the protocol, or not within the normal range but are judged to be normal after comprehensive evaluation by the on-site investigators, and met other inclusion criteria, subjects in the third stage may receive vaccination only when they meet the inclusion criteria and have completed the pre-immunization blood collection. The corresponding vaccine number is obtained according to the study number, and number on the source document book is also checked to confirm the consistency, and then the name abbreviation of the subject is filled on the label of the outer package of the vaccine, the internal label of the vaccine is then filled and pasted at the designated position of the source document book. Double check the information of the subjects before vaccination. The vaccine should be shaken well before injection, 0.5 ml vaccine is injected into the lateral deltoid muscle of upper arm or anterolateral thigh. The preferred vaccination site for infants under 1 year old is anterolateral thigh.

4.8.7. Medical observation

After each dose of vaccination, a 30-min observation was required on the trial site, the "Diary Card", the thermometer, and the scale were issued, and the legal guardians of the subjects or the were trained to use the thermometer, observe the adverse events, and fill out the "Diary Card", and an appointment was made for the time to return the "Diary Card" (the "Diary Card" was returned at day 8 after the vaccination, and the "Contact Card" was received in the meantime).

4.8.8. Blood Collection at Day 3 Post Dose 1

For subjects in stage 1 and 2, no less than 3.5 mL of whole blood was collected through venipuncture at Day 3 post vaccination (with an interval of 2 days), the blood samples were sent to hospitals of Grade A Level Two or above on the same day for hematology and hepatic and renal function tests. The time window for blood collection was +1 day.

4.8.9. Vaccinations of the Dose 2 and Dose 3

For subjects in stage 3, the second and third doses were given as per corresponding vaccination schedule after the first dose, with a time window of 15 days. The contact card was collected and reviewed before of each dose. The contact card for the last dose of vaccination was collected and reviewed one month after the last dose.

4.8.10. Blood Collection after Complete Series

When the subjects in the three stages had completed the full series following the vaccination schedule specified in the clinical study protocol, no less than 3.0 mL whole blood was collected

Confidential 18 / 56

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 002152015002

from each subject, and then the serum was separated, and serum IgG antibody concentration was detected. The time window for blood collection was + 10 days.

4.8.11. End of the Trial

The serum was sent to a designated laboratory for testing, the review for the entry of EDC data was completed, and after review of all materials and data clarification, the report on site closure was issued.

4.9. OBSERVATIONS

4.9.1. Safety Observations

Safety observations included all the expected and unexpected medical events related or unrelated to vaccination occurred during the observation period of clinical trial in subjects.

Local reactions: pain, itching, redness, swelling, induration, rash (injection site) and their size and severity at injection site, and disturbance of body activity.

Systemic reactions: observe fever, allergic reactions, headache, fatigue / weakness, nausea / vomiting, diarrhea, muscle pain, cough, other discomfort or clinical adverse reactions.

Other events: any medical event other than the above stated reactions, such as acute diseases, accidental injury, etc.

Hematology, hepatic and renal function observations: hemoglobin content (HGB), white blood cell count (WBC), platelet count (PLT), alanine aminotransferase (ALT), aspartate aminotransferase (AST), total bilirubin (TBIL), creatinine (CR), urea nitrogen (BUN).

Grading standard: the systemic and local reactions following vaccination were classified according to the Guideline for Classification of Adverse Reactions in Clinical Trials of Preventive Vaccines promulgated and implemented by the National Medicinal Product Administration.

Confidential 19 / 56

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 002152015002

4.9.2. Immunogenicity Observations

Blood samples were collected from all subject before immunization and 30 days post complete series to detect the vaccine serotype-specific pneumococcal IgG and opsonophagocytic antibody (OPA):

(1) The proportion of subjects with vaccine serotype-specific pneumococcal IgG antibody concentration $\geq 0.35 \mu\text{g/ml}$ (positive conversion rate).

(2) The geometric mean concentrations (GMCs) of pneumococcal IgG antibody were determined.

(3) The proportion of subjects with antibody titer of vaccine serotype-specific pneumococcal OPA $\geq 1:8$ (positive rate) in adults, children and 3-month-old infants.

(4) The geometric mean titers (GMTs) of the vaccine serotype-specific pneumococcal OPA antibody were detected in adults, children and 3-month-old infant.

4.10. LABORATORY TESTS

4.10.1. Clinical laboratory indicators

The hematology, liver and kidney function detection in this clinical trial were entrusted to the Laboratory of Shuangqiao Hospital in Chaoyang District, Beijing. See the tables below for methods used and the normal value reference range for each measurement.

(1) Detection method and reference range for hematology

Measurement Method Reference range

Male: 110-175 g/L

Hemoglobin (HGB) Automatic Blood Cell Analyzer

Female: 110-150 g/L

White blood cell count (WBC) Automatic Blood Cell Analyzer (3.5-9.5) $\times 10^9/\text{L}$

Platelet count (PLT) Automatic Blood Cell Analyzer (125-350) $\times 10^9/\text{L}$

(2) Detection method and reference range for liver function

Measurement Method Reference range

Male: 9.0-50.0 U/L

Alanine aminotransferase (ALT) Velocity method

Female: 7.0-40.0 U/L

Male: 15.0-40.0 U/L

Aspartate aminotransferase (AST) Velocity method

Female: 13.0-35.0 U/L
Total bilirubin (TBIL) Modified diazonium method 3.44-25.40 $\mu\text{mol/L}$

(3) Detection method and reference range for kidney function

Measurement Method Reference range

Male: 44.0-97.0 $\mu\text{mol/L}$

Creatinine (cr) Jaffe reaction

Female: 35.0-80.0 $\mu\text{mol/L}$

Blood urea nitrogen (BUN) Enzymatic method 2.9-8.2 mmol/L

4.10.2. Serum antibody detection

Serum samples detection was entrusted to National Institutes for Food and Drug Control.

The antibody concentration of IgG in serum samples was detected using enzyme-linked immunosorbent assay (ELISA), the subjects achieving IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ and the geometric mean concentration (GMCs) were calculated.

Opsonophagocytic Assay (OPA) was used to detect the antibody opsonophagocytic activity of serum samples, meanwhile the subjects achieving an OPA antibody $\geq 1:8$ and the geometric mean titers (GMTs) were calculated.

Confidential 20 / 56

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 002152015002

Testing standard samples and quality control standards were provided by the laboratory. The method and quality control of ELISA and OPA can be found in the standard procedure of laboratory.

4.11. STATISTICAL ANALYSIS PLAN AND STATISTICAL ANALYSIS

4.11.1. Data management and Statistical Software

Establishment of Database: professional team of Medidata and data administrator of Sponsor constructed the clinical research database using Medidata Rave EDC system according to the study protocol. In the meantime, the logic verification program was set to verify the quality of data input in real time.

Data Entry: all safety data were entered into EDC system directly by investigators in real time; immunogenicity data were entered by two operators from data management team in duplicate.

Data Audit: the project data were managed and reviewed by data administrator according to the Data Management Plan of the project, and the data cleaning was performed through the process of "online query and online answer".

Database Locking: the databases was lock after the data were reviewed and approved by principal investigators, biostatisticians, data administrator and sponsor.

Statistical analysis was performed using SAS 9.13 software.

4.11.2. Statistical Analysis of Clinical Safety

The evaluation of the data mainly included the summary of clinical response endpoints, local and systemic clinical reactions during the observation period for all subjects, and the incidence rates of related adverse reactions / events.

Subjects with at least one adverse reaction (Day 0-7, Day 8-30, Day 0-30):

The percentages of adverse events / reactions of all subject populations were statistically analyzed;

The percentages of adverse events / reactions after each dose were statistically analyzed;

The percentages of local or systemic adverse reactions of subject populations were statistically analyzed;

The percentages of adverse reactions with different severity were statistically analyzed.

Analysis of symptoms of adverse reactions:

The percentages of any systemic and local abnormal symptoms after vaccination were statistically analyzed;

The percentages and severity of body temperature reactions after vaccination were statistically analyzed.

Events and serious adverse events resulted in withdrawal of subjects:

The cases that discontinued study due to severe or serious adverse events were identified, and the inter-group differences for frequency of occurrence were statistically compared between groups.

4.11.3. Statistical Analysis of Immunogenicity (based on FAS and PPS sets, respectively)

IgG concentration $\geq 0.35 \mu\text{g/mL}$ was considered as the positive level for vaccine serotype-specific pneumococcal IgG antibody. For different types of IgG antibody, the post-immunization positive rate and the positive conversion rate of IgG antibody in subjects with negative pre-

Confidential 21 / 56

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 002152015002

immunization antibody level were calculated respectively, with the 95% confidence interval (CI) given by Clopper Pearson method.

For different types of IgG antibodies, the geometric mean and 95% CI were calculated to describe the post-immunization GMC and GMC fold increase of all groups, groups with negative pre-immunization antibody, and groups with positive pre-immunization antibody.

OPA titer $\geq 1:8$ was considered as the positive antibody level for vaccine serotype-specific pneumococcal OPA antibodies. For different types of OPA antibody, the post-immunization positive rate and the positive conversion rate of IgG antibody in subjects with negative pre-immunization antibody level, post-immunization 4-fold increase rates of antibody in subjects with pre-immunization positive antibody, as well as the post-immunization positive conversion rates (4-fold increase) in all subjects were calculated respectively.

For different types of OPA antibodies, the geometric mean and 95% confidence interval were calculated to describe the post-GMT and GMT growth multiple after immunization in all the population composed of 18 years old and above, 2-5 years old and 3 months old, negative before immunization and positive before immunization.

For different types of OPA antibodies, the geometric mean and 95% CI were calculated to statistically describe the post-immunization GMT and GMT fold increase in subjects aged 18 years and above, 2-5 years and 3 months, GMC and GMC fold increase of all groups.

4.11.4. Statistical Analysis Plan

4.11.4.1 Project plan

The personnel undertaking the statistical analysis task participated in the whole process, from trial design, implementation, formulation of the statistical analysis plan to the analyses and summary, established a database and carried out statistical analysis, wrote the statistical analysis plan and completed the clinical statistical report.

4.11.4.2 Selection of analysis sets

(1) Full Analysis Set (FAS) refers to all subjects who complied with the intention-to-treat (ITT) analysis principle, who have undergone randomization, and have received at least one dose of

vaccine and have finished pre-immunization blood collection with antibody detection result. Subjects with missing data of serum testing results were imputed using Last Observation Carried Forward (LOCF) method. Subjects with incorrect vaccinations were evaluated for immunogenicity by randomized groups following ITT rule.

(2) Per Protocol Set (PPS) refers to all subjects who met the inclusion/exclusion criteria, entered randomization, completed vaccinations, undergone pre- and post-immunization immunogenicity evaluations, and with valid titer values. Additionally, subjects should be excluded from PPS if the following criteria were met:

- Study protocol violation;
- Vaccination with wrong number;
- Use of vaccines or medications inhibited by the study protocol;
- Other conditions violating the study protocol.

FAS and PPS were mainly intended for evaluating the immunogenicity of vaccines. This clinical trial defined specific FAS and PPS for the IgG antibody and OPA antibody analysis of 13 individual serotypes.

Confidential 22 / 56
Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 002152015002

(3) Safety Analysis Set (SS): All subjects who received vaccination after randomization. Subjects vaccinated with wrong number were included in specific safety evaluation as per actual vaccine group following All Subjects As Treated (ASST) rules.

Safety population is mainly used for safety evaluations. The safety population included in this trial includes overall safety population, safety population of dose 1, safety population of dose 2, and safety population of dose 3.

4.11.4.3. Statistical methods

General principle:

Statistical description: Quantitative indicators were listed out with the mean $\pm$ standard deviation, median, maximum and minimum values; qualitative indicators or grade indicators were listed out with the frequency distribution table. The antibody titer and antibody concentration of the immunogenicity indicators in this trial were expressed as geometric mean, standard deviation, median, maximum and minimum values, and 95% confidence interval, and the antibody titer and antibody concentration should be logarithmically transformed.

Drop-out analysis: The case number of enrollment, drop-out, exclusion and completers were listed, as well as the number of cases in each analysis set, the total drop-out rate and the drop-out rate caused by adverse events.

Safety analysis: The safety analysis was based on the SS. The frequency and case number of adverse events and adverse reactions in each group were listed out for calculation of the incidence and corresponding severity; the detailed list of various adverse events was given.

4.12. MODIFICATION AND INTERIM ANALYSIS DURING THE STUDY

Not applicable.

5. STUDY RESULTS

5.1. ALLOCATION, DROPOUT AND EXCLUSION OF SUBJECTS

A total of 200 subjects were screened in this study, eventually 120 subjects were enrolled, including 30 subjects each in age groups of ≥ 18 years old, 2-5 years old, 2 months old and 3 months old.

Among the enrolled subjects, 117 cases (97.50%) completed the trial, and 3 cases (1 case in 2-5 years old group and 2 cases in 3-month-old group) dropped out. All age groups were analyzed for IgG immunogenicity, including 113 cases (94.17%) entering FAS and 103 cases (85.83%) entering PPS; immunogenicity OPA analysis was conducted for subjects aged ≥ 18 years, 2-5 years and 3 months, including 83 cases (92.22%) entering FAS and 78 cases (86.67%) entering PPS.

See Table 1 for the allocation, dropouts and exclusion of subjects.

3 months	30	0.28 $\pm$ 0.02	0.28 0.25,0.33

5.3. SAFETY ANALYSIS

5.3.1. Observation Method

Safety observations were performed in the sequence of adults, children and target population, the adults and children groups were vaccinated with one dose of investigational vaccine, and the subjects aged 2 or 3 months were vaccinated with 3 doses of investigational vaccines, while the vaccinations for 2 month olds were given at 2, 4, 6 months of age, and at 3, 4, 5 months of age for those aged 3 months.

In the adult group, one dose of vaccine was given before blood samples collection, subsequently at Day 3, hematology, urinalysis, and blood chemistry tests were performed, at Day 8, the diary cards were collected for preliminary 7-day safety evaluation after immunization, and the subjects continued to complete the safety observation of Day 8-30.

After the preliminary safety evaluation in adults, children subjects were then enrolled, after blood collection, one dose of investigational vaccine was inoculated. At Day 3, hematology, urinalysis, and blood chemistry tests were performed, at Day 8, the diary cards were collected for preliminary 7-day safety evaluation after immunization, and the subjects continued to complete the safety observation of Day 8-30.

After the preliminary safety evaluation in children, subjects aged 2 months and 3 months were enrolled, and were vaccinated with 3 doses as per prespecified immunization schedules, all adverse events within 30 days post each dose were observed.

5.3.2. Overall Incidence Rate of Adverse Events

Solicited adverse events in phase I clinical trials are by default associated with the study vaccine, and the relatedness of unsolicited adverse reactions was adjudicated by investigators. The overall adverse events in each stage is summarized in Table 3.

A total of 24 (80.00%) subjects in adults group experienced adverse events related to the study vaccine, of which 10 cases (33.33%) experienced systemic adverse reactions, but no grade 3 systemic adverse reaction was reported; 23 cases (76.67%) experienced local reactions, of which the severity of the reaction for 6 cases (20.00%) reached grade 3.

Confidential 24 / 56
Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 002152015002

A total of 16 (53.33%) subjects in children group experienced adverse events related to the study vaccine, of which 7 cases (23.33%) experienced systemic adverse reactions, and the severity of 2 cases (6.67%) reached grade 3; 8 cases (26.67%) experienced local reactions, of which the severity of the reaction for 1 case (3.33%) reached grade 3.

A total of 20 (66.67%) subjects in the 2-month age group experienced adverse events related to the study vaccine, of which 18 cases (60.00%) experienced systemic adverse reactions, and the severity of 2 cases (6.67%) reached grade 3; 12 cases (40.00%) experienced local reactions, of which the severity of the reaction for 2 cases (6.67%) reached grade 3. Another case of adverse event which was unrelated to the study vaccine was reported as herpangina and the severity reached grade 3.

A total of 21 (70.00%) subjects in the 3-month age group experienced adverse events related to the study vaccine, of which 17 cases (56.67%) experienced systemic adverse reactions, but no grade 3 systemic adverse reaction was reported; 11 cases (36.67%) experienced local reactions, of which the severity of the reaction for 1 case (3.33%) reached grade 3. Another case of adverse event which was unrelated to the study vaccine was reported as upper respiratory tract infection and the severity reached grade 3.

No serious adverse event was collected during the observation period, and no drop-outs due to adverse events were noted.

5.3.3. Adverse Events Occurred within 30 minutes, Day 0-7 and Day 8-30 after vaccination
Most adverse reactions were observed within Day 0-7 after vaccination in all groups, with local pain and redness being the most common symptoms, while the incidence rate of pain in adults was higher compared to that in children and infants. No adverse events related to the study vaccine were observed during Day 8-30.
The incidence of adverse events in 30 minutes, Day 0-7 and Day 8-30 after vaccination in each age group is shown in Table 4.

5.3.4. Adverse reactions after each vaccination in 2 months old group and 3 months old group
The incidence of adverse events in the 2 months old group (vaccinations were given at 0, 2, 4 months) and the 3 months old group (vaccinations were given at month 0, 1, 2) are shown in Table 5 to Table 6.

No growing tendency was observed for adverse reaction as the doses of vaccination increased in subjects administered with either immunization procedure. No significant difference was observed in the incidences of adverse events among each dose in the schedule of vaccination at 0, 2, 4 months, and a downward trend was noted as the doses increased in the schedule of vaccination at 0, 1, 2 months.

5.3.5. Solicited adverse events – systemic and local reactions
See Table 7 to Table 10 for the incidences of systemic and local reactions.
The most common systemic reaction was fever in all age groups, the incidence of fever in infants and toddlers was higher than that in adults and children aged 2-5 years. The severity of fever was mainly grade 1, while 2 cases in 2-5 years old group and 1 case in 2 months old group reach grade 3. The incidences of vomiting, diarrhea, abnormal crying and other symptoms were also higher in subjects aged 2 and 3 months. Except for fever, one case in the 2 months old group had grade 3 fatigue / somnolence. The severity of other systemic reactions was mainly grade 1, and no grade 3 reaction was reported.
Common local reactions in adults and children aged 2-5 years were pain, redness and swelling. The severity of local pain for 1 case in the children group reached grade 3; the severity of local redness for 3 adults and 1 child reached grade 3; the severity of local swelling for 4 cases in the adults group reached grade 3; the severity of local induration for 1 case in the adults group reached grade 3. Other local adverse reactions were mainly grade 1. The most common symptoms were local tenderness, redness and induration in 2 months old group; tenderness, redness and swelling

were more common in 3 months old group. The severity of local redness and local induration for 1 case in 2 months old group reached grade 3, and the severity of swelling for 1 case in 3-month group reached grade 3.

Within 30 minutes after vaccination, the primarily observed adverse reactions were fever, fatigue (mainly observed among adults) and local redness, including 1 case of fever, one case of fatigue and 7 cases of local redness in the adults group who received 1 dose of vaccine; one case of fever was observed in the children group who received 1 dose of vaccine; eight cases of fever and 7 cases of local redness were observed in the 2 months old group who received three-dose series given at 0, 2, 4 months; four cases of fever and 4 cases of local redness were observed in the 3 months old group who received three-dose series at 0, 1, 2 months.

5.3.6. Unsolicited adverse events
A total of 70 unsolicited adverse events including laboratory tests were observed in 44 cases, including 13 vaccine-related cases (16 events) and 35 vaccine-independent cases (54 events). In the adult and 2-5-year-old children group, 9 cases (11 events) were observed with abnormal laboratory findings related to vaccination. The severity of abnormal laboratory results related to vaccine was grade 1, and were determined as clinically irrelevant events by investigators. Five other unsolicited adverse events, other than laboratory tests, were determined as "probably related to study vaccine" by the investigators, including one case of lymphadenopathy in adult group, one case of rhinorrhea (runny nose) in children group, 1 case of decreased appetite in 2 months old group, 1 case of dyspepsia and 1 case of vomiting in 3-month group. See Table 11-Table 14 for analysis of unsolicited events.

5.3.8. Serious Adverse Events and Important Events
Fourteen subjects experienced grade 3 adverse events, including 1 case of local redness, 1 case of induration, 2 cases of swelling, 2 cases of redness with swelling after one dose of vaccine in adults $\geq$ 18 years old; 1 case of fever and 1 case of fever with local reaction in children group aged 2-5 years; 1 case of local redness (2 episodes), 1 case of local induration, 1 case of somnolence, 1 case of herpangina with fever (herpangina was not related to vaccination, while fever was determined to be probably related to vaccination) in subjects of 2 months old; 1 case of local reaction and 1 case of upper respiratory tract infection in the 3 months olds. Except for 3 cases receiving outpatient treatment, most of the patients recovered spontaneously. No serious adverse events were observed in this trial.

5.4. IMMUNOGENICITY ANALYSIS
5.4.1. Pre- and Post-Immunization Antibody Test Results in Adults Group
5.4.1.1. Immunogenicity Results of IgG Antibody
The positive rate of PCV13-TT IgG antibody was higher in adult group before immunization, the antibody positive rate was 100% for 13 serotypes after immunization except for serotype 3 and 6A (96% for both). The IgG antibody level post immunization were with at least 2-fold increase from baseline, with the lowest fold as 2.23 for serotype 3 and the highest fold as 10.92 for serotype 6B (Table 17 to Table 18).

5.4.1.2. Immunogenicity Results of OPA Antibody
The positive rate of OPA antibody in adult group was 100% for serotype 9V, 18C, 19A, 19F, and 23F after immunization, and was $\geq 80\%$ for serotype 1 and 5, while it was $\geq 90\%$ for other serotypes. The OPA antibody titer in all serotypes increased by more than 3 folds compared with that before immunization. Except for the fold increase of GMT of serotypes 1, 3 and 9V OPA antibody being <10 , the fold increases of other serotypes were > 10 (Table 19 to Table 21).

5.4.2. Results of Antibody Detection Pre- and Post-Immunization in Subjects Aged 2-5 years

5.4.2.1. Immunogenicity Results of IgG Antibody

The antibody positive rates of 13 serotypes in children aged 2-5 years reached 100% except for serotype 3 and 6A, which were 88.89% and 96.30%, respectively. The IgG antibody levels post immunization increased by more than 3 folds compared with those before immunization. Except for the fold increase of GMT of serotypes 1, 3, 5, 6A, 6B, 14, and 19F being <10, the fold increases of other serotypes were > 10 (Table 22 to Table 23).

5.4.3. Results of IgG Antibody Detection Pre- and Post-Immunization in Subjects Aged 2 months

In subjects aged 2 months, the serum positive rate reached 100% for most serotypes, except for an IgG antibody positive rate of 84.62% for serotype 5, and 92.31% and 96.00% for serotype 3 and 6B, respectively; among those with pre-immunization negative antibody levels, all but serotype 3 and 5 reached 100% as seroconversion. Post-immunization fold increase of IgG antibody was ≥ 5, and it was <10 for serotypes 3, 5, 6B, 14, and 19A, while was >10 folds for other serotypes (Table 27 to Table 29).

5.4.4. Results of Antibody Detection Pre- and Post-Immunization in Subjects Aged 3 Months

5.4.4.1. Immunogenicity Results of IgG Antibody

In subjects aged 3 months, the IgG antibody positive rate and antibody seroconversion rate (for those with pre-immunization negative antibody) reached 100% except serotype 6A and 6B, the post-immunization fold increase of IgG antibody level was >10 except for 6B with 6 fold increase, and the highest fold was 469 for serotype 4 (Table 30 to Table 32).

Since the antibody levels detected with the two methods were expressed as concentration and titer respectively, no comparison was made on the consistency rate for IgG antibody and OPA antibody level.

The comparison for the consistency of post-immunization IgG and OPA antibody positive rates in subjects 3 months of age after immunization is shown in Table 36.

6. DISCUSSIONS AND CONCLUSIONS

6.1. SAFETY

The incidence of adverse events related to the study vaccine in adults, children, 2 months and 3 months group was 80.00%, 53.33%, 66.67% and 70.00%, respectively. A total of 6 subjects in the adults group experienced local adverse reactions with severity reaching grade 3, including 1 case of local redness, 1 case of induration, 2 cases of swelling and 2 cases of redness with swelling, corresponding to an incidence of 20% (6/30) in the adults group. The incidence of adverse reactions with grade 3 severity in other age groups was less than 15%.

Confidential 54 / 56

Phase I Clinical Study Report of 13-valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 002152015002

The most common symptom of systemic adverse reactions was fever in adults and children aged 2-5 years, while fever and diarrhea were more common in 2 months and 3 months group. Local adverse reactions in adults were mainly redness, pain and swelling at the vaccination site; pain and redness were common local reactions in children aged 2-5 years, and redness was the most common local symptom in 2 months and 3 months group.

Adverse events mainly occurred within 0-7 days post vaccination and no adverse events related to the study vaccine were collected during 8-30 days post vaccination. No serious adverse events were reported during the extended observation period.

6.2. IMMUNOGENICITY

The IgG positive rates and antibody levels of 13 serotypes in adults and children 2-5 years of age were relatively high before immunization, and most of the IgG antibody positive rates of all serotypes in these groups reached 100% or > 80% post immunization, accompanied by more than 2 fold increases in post-immunization antibody level compared to those before vaccination. The IgG positive rates and antibody levels of 13 serotypes in subjects aged 2 or 3 months were lower than those in adults and children groups before immunization, and the positive rate of most IgG antibody reached 100% except for serotypes 3, 5, 6A and 6B, besides, the fold increase of antibody was significantly higher compared to adults and children groups.

The positive rates of OPA antibody and antibody levels were lower than that of IgG antibody before immunization in all age groups. After immunization, OPA antibody level increased significantly, with higher fold the increase compared to IgG antibody, and in 3 months age group, the OPA positive antibody rates in subjects aged 3 months were ≥ 90%.

The correlation analysis of IgG and OPA results demonstrated rather high consistency of the

positive rates of IgG and OPA after immunization, while bias might exist due to the small sample size.

7. STATEMENTS ON OF NOTEWORTHY FINDINGS IN THE STUDY

In the observation period for adults, 6 subjects developed grade 3 adverse events, corresponding to an incidence rate of 20%, which was higher than the study interruption criteria (15%) set forth in the protocol. The adverse reactions of grade 3 were tolerable local symptoms such as redness and swelling, and no severe reactions such as abscess, death or serious reactions of limb movement disorder (reaching grade 4). After consulting the experts, it was analyzed that the syringe for vaccination was equipped with small needles specific for children, which did not meet the requirements specified in the protocol for deep injection, and the investigators might have not fully mixed the vaccine before vaccination, so it was suggested to improve the operating procedure. The preliminary summary of adverse events in adult group was reported to the ethics committee and then the next stage of observation initiated. After another round of training, the incidents never occurred in the following stage involving subjects 2 and 3 months of age.

8. SUMMARY OF ALL UNITS PARTICIPATING IN THE CLINICAL TRIAL

This clinical trial involves a single center, no available data for other sites.

Investigational13-valent pneumococcal polysaccharide conjugate Batch No.: 201511003
vaccine vaccine, manufactured by Yuxi Walvax Expiration date: November, 2017
Biotechnology Co., Ltd, for injection, 0.5 mL/vial,
each dose contains 2.2 µg of polysaccharide from
pneumococcal serotype 1, 3, 4, 5, 6A, 7F, 9V, 14,
18C, 19A, 19F, and 23F, and 4.4 µg polysaccharide
for 6B.
Comparator 7-valent pneumococcal conjugate vaccine, Batch No.: H29315H13880
vaccine manufactured by Pfizer (Wyeth) Pharmaceutical Inc., Expiration date: May, 2017
for injection, 0.5 mL/vial, each dose contains 2 µg of
polysaccharide from pneumococcal serotypes 4, 9V,
14, 18C, 19F, 23F and 4 µg polysaccharide for 6B.

 Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
 Protocol No.: 022152015003

■ The percentage of subjects with vaccine-type specific IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ and ≥ 1.0 $\mu\text{g/mL}$ as well as the IgG geometric mean concentration (GMC) measured 30 days after primary series.

■ The percentage of subjects with IgG vaccine-type specific IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ and ≥ 1.0 $\mu\text{g/mL}$, as well as the IgG geometric mean concentration (GMC) measured before and 30 days after booster dose.

■ The percentage of subjects with vaccine-type specific anti-pneumococcal OPA titer $\geq 1:8$ and the geometric mean titer (GMT) measured 30 days after primary series and 30 days after booster dose.

Safety:

■ Adverse events within 30 days after full primary immunizations and within 30 days after booster dose.

Clinical trial In the main target population (3 months of age)
 evaluation The common serotypes achieved noninferiority criteria for comparison between PCV13-TT and PCV7 group except for serotype 6B during primary series, meanwhile all common serotypes in PCV13-TT group were noninferior to that in PCV7 group after the booster dose; for additional serotypes, superiority criteria were met for PCV13-TT group vs PCV7 group after primary series; the common serotypes in PCV13-TT group aged 3-71 months were all noninferior to those in PCV7 group during primary series, besides, the additional serotypes in PCV13-TT group were all superior as compared to PCV7 group.

For PCV13-TT (2 months) group vs PCV7 (3 months) group
 Both common and additional serotypes had achieved noninferiority or superiority criteria post primary series. For PCV13-TT (2 months) group vs PCV13-TT (3 months) group, 12 serotypes reached noninferiority criteria during primary series except for additional serotype 5; and all 13 serotypes were noninferior to those in PCV13-TT (3 months) group post booster dose.

In PCV13-TT recipients aged 7-11 months, 12-23 months, and 24-71 months
 The proportions of subjects with IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ for common serotypes were all noninferior to those in PCV7 group. The additional serotypes in PCV13-TT group of 7-11 months had reached superiority criteria after primary series; for PCV13-TT groups of 12-23 months and 24-71 months, superiority criteria were generally met after immunization.

The results before and after booster dose indicated decrease in the antibody levels of several serotypes in the 13 serotypes either in PCV13-TT group or PCV7 group to some extent, while the percentage of subjects with IgG antibody concentration ≥ 3.5 $\mu\text{g/mL}$ and antibody GMC after 1 dose of booster immunization both reached or exceeded the levels observed after primary series, demonstrating significant effect of the booster dose, reflecting the immunological memory effect of the conjugate vaccine adequately. The antibody GMC post booster dose had more than 3-fold increase in the 2-6 months olds, and greater than 1-fold increase in subjects aged 7-11 months as compared with the GMC before booster dose.

The overall incidence of adverse events in PCV13-TT group was lower than that in PCV7 group. No significant intergroup difference was observed in the incidence of vaccine-related adverse events. The main symptom of systemic adverse reaction was fever. The incidence of systemic reactions in PCV13-TT group was lower than that in PCV7 group. Local adverse reactions were primarily redness, swelling and pain at the injection site. No significant difference was observed in the incidence of local reactions between PCV13-TT group and PCV7 group.

The incidence of vaccine-related grade 3 adverse events in PCV13-TT group and PCV7 group was 4.21% and 2.41%, respectively. The incidence of local adverse reactions with severity reaching grade 3 in PCV13-TT group was higher than that in PCV7 group, while no significant intergroup difference was observed in subjects aged 3 months.
 A total of 80 cases (105 events) of SAEs were observed during primary series and 8 cases (10

events) of SAEs were noted during booster dose. No significant intergroup difference was
Confidential 8 / 310
Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

observed in the incidence of SAEs. SAEs were not related to the study vaccine except for one case in PCV13-TT (3 months) group with fever determined to be probably related to the study vaccine.

To sum up, the immunogenicity of 7 common serotypes in main target population aged 3 months met the non-inferiority criteria after booster dose, and that of 6 new serotypes had already achieved the standard of superiority after primary immunizations in this clinical trial. The common and additional serotypes had fulfilled the non-inferiority or superiority standard in subjects 3-71 months of age after primary immunizations. The common and additional serotypes in PCV13-TT group (2 months) were noninferior and/or superior to that in PCV7 (3 months) group. In PCV13-TT (2 months) group, all 13 serotypes were noninferior to those in the PCV13-TT (3 months) group post booster dose. The incidence of adverse events/reactions in PCV13-TT group was not higher than that in PCV7 group. The results of immunogenicity and safety evaluation in this clinical trial had achieved the study objectives predefined in the protocol.

Confidential 9 / 310
Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

Overview of the Clinical Study

1. INTRODUCTION

The 13-valent pneumococcal polysaccharide conjugate vaccine, jointly developed by the Yunnan Walvax Biotechnology Co., Ltd. and the Yuxi Walvax Biotechnology Co., Ltd., is consistent with the marketed 13-valent pneumococcal conjugate vaccine with respect to serotypes, and is used for the prevention of related diseases caused by infections of the 13 pneumococcal serotypes contained in this vaccine (types 1, 3, 4, 5, 6A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F). Upon review and approval by the National Medical Products Administration (NMPA) in accordance with the Drug Administration Law of the P.R.C and Provisions for Drug Registration, this vaccine met the relevant provisions for drug registration, and therefore, the "Drug Clinical Trial Approval" was issued in Apr. 2015 (Approval No.: 2015L00591) for conduct of clinical trials.

Entrusted by the Yunnan Walvax Biotechnology Co., Ltd. and the Yuxi Walvax Biotechnology Co., Ltd., the Beijing Chaoyang Center for Disease Control and Prevention (CDC), the Hebei Provincial CDC, the Henan Provincial CDC, and the Shanxi Provincial CDC were responsible for the clinical trial of this vaccine, with a view to evaluating its immunogenicity and safety in healthy children at 2–71 months of age (minimum, 6 weeks). The Beijing Chaoyang CDC, the Hebei Provincial CDC, the Henan Provincial CDC, and the Shanxi Provincial CDC, based on the relevant requirements in the "Drug Clinical Trial Approval" by NMPA (Approval No.: 2015L00591) and the Provisions for Drug Registration and as per the protocol, conducted a phase III clinical trial on the 13-valent pneumococcal polysaccharide conjugate vaccine jointly developed by the Yunnan Walvax Biotechnology Co., Ltd. and Yuxi Walvax Biotechnology Co., Ltd., and issued this clinical trial report.

2. OBJECTIVE

2.1. PRIMARY OBJECTIVE

To evaluate the safety of 13-valent pneumococcal polysaccharide conjugate vaccine (PCV13-TT) in healthy population aged 2-3 months (minimum age: 6 weeks), 2-5 years and 18 years and above. To demonstrate the IgG immune response to 13-valent pneumococcal polysaccharide conjugate vaccine in healthy children who were enrolled in the study group at the age of 3 months and were injected with the study vaccine in the schedule that one dose was administered in Month 0, 1, and 2 respectively and the booster dose was administered during Month 12-15. The results were compared with 7-valent pneumococcal conjugate vaccine in the same immunization schedule. The non-inferiority test of 7 common serotypes and the effectiveness evaluation of 6 additional serotypes were performed.

2.2. SECONDARY OBJECTIVE

(1) To observe the IgG immune response to 13-valent pneumococcal polysaccharide conjugate vaccine in healthy children who were enrolled in the study group at the age of 2 months (minimum age: 6 weeks) and were injected with the study vaccine in the schedule that one dose was administered in Month 0, 2, and 4 respectively and the booster dose was administered during Month 12-15. The results were compared with those obtained the control group where healthy children who were enrolled in the group at the age of 3 months and were injected with 7-valent

Confidential 10 / 310
Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

pneumococcal conjugate vaccine in the schedule that one dose was administered in Month 0, 1, and 2 respectively and the booster dose was administered during Month 12-15. The non-inferiority test of 7 common serotypes and the effectiveness evaluation of 6 additional serotypes were performed.

(2) To observe and evaluate the serotype-specific opsonophagocytic activity (OPA) of pneumococcal antibodies in healthy children aged 2-71 months (minimum age: 6 weeks) vaccinated with 13-valent pneumococcal polysaccharide conjugate vaccine in different immunization schedules.

(3) To observe and evaluate the safety of vaccinating healthy children aged 2-71 months (minimum age: 6 weeks) with 13-valent pneumococcal polysaccharide conjugate vaccine.

3. STUDY MANAGEMENT

3.1. MAIN RESPONSIBLE UNITS AND TECHNICAL COLLABORATION UNIT

3.1.1. Main responsible units

This clinical study was undertaken by the Beijing Chaoyang CDC, the Hebei Provincial CDC, the Henan Provincial CDC, and the Shanxi Provincial CDC. These research institutions obtained the CFDA (now NMPA) approval as "One-Time Certification for Vaccine Clinical Trial Institution" after review, and the clinical trial protocol, the informed consent form, and related forms were reviewed and approved by the ethics committee.

The Beijing Chaoyang CDC, Hebei Provincial CDC, Henan Provincial CDC, and Shanxi Provincial CDC have carried out multiple clinical studies on preventive biological products

successfully. The principle investigator has experience in clinical studies on preventive biological products, all staff in the Institute of Vaccine Clinical Study that participated in this study have attended GCP training and examinations organized by the national government or this institution, and after training and authorization, all the research participants had been aware of the responsibilities and obligations of clinical investigators and familiar with the nature, effects, efficacy, and safety of the investigational drugs to be used in the clinical trial. Effective measures and conditions were available to ensure the safety of subjects and the timely, accurate, and truthful recording of clinical research data. They were mainly responsible for:

- Formulating the vaccine clinical trial protocol, and organizing the implementation of such a protocol;
- Preparing and printing such on-site application forms as informed consent forms, diary cards, and case report forms;
- Submitting ethical review materials to the ethics committee for approval;
- Choosing the clinical trial site meeting the requirements set forth in the protocol, and recruiting trial subjects;
- Organizing the implementation of on-site vaccination and on-site work related to clinical observations;
- Organizing the follow-up of subjects in the clinical trial site and the collection of adverse events, and reporting, investigating and handling abnormal vaccine reactions;
- Completing the collection of blood samples, laboratory processing and delivery to the designated laboratory as per the protocol;
- Completing all the forms and case report forms on the clinical trial site;
- Issuing a clinical trial report.

3.1.2. Technical collaboration unit

National Institutes for Food and Drug Control, which was responsible for laboratory testing of

Confidential 11 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

serum samples and issuing a testing report.

3.1.3. Research institutions on the trial site

The research institutions on this trial site included the Zhengding County Center for Disease Control and Prevention and the Dingxing County Center for Disease Control and Prevention in Hebei Province, the Puyang County Center for Disease Control and Prevention and the Wen County Center for Disease Control and Prevention in Henan Province, and the Xiangfen County Center for Disease Control and Prevention and the Wanrong County Center for Disease Control and Prevention in Shanxi Province. In addition, the Xiaohongmen Community Health Service Center from Chaoyang District, Beijing, the Heizhuanghu Community Health Service Center under the Shuangqiao Hospital, and the Nanmofang Community Health Service Center were used as standby clinical trial sites (not in operation). The number of trained investigators, technical strengths, and environmental facilities on this clinical trial site met the needs of the clinical trial, so were the resources of subjects. The direct reporting network system operated normally, and the monitoring system for side reactions arising from vaccination was complete. All the laboratories passed the metrological certification. The institutions on the trial site were responsible for subject recruitment, organization on the site, and handling and reporting of adverse events.

3.1.3.1. Beijing Chaoyang Center for Disease Control and Prevention

The Beijing Chaoyang CDC, which is located in the east of Beijing, covers a total area of 470.8 square kilometers, and has an actual resident population of near 5.1 million. Currently, the Beijing Chaoyang CDC has a total of 199 professional technical personnel, which account for 86% of the actual number of employees, and the personnel have an average age of 35.9 years. Specifically, there are 35 personnel with senior titles, 11 with Ph.D degrees, 86 with master's degrees, and 74 with bachelor's degrees. Since 2007, the center has undertaken scientific research projects from the Chinese Preventive Medicine Association, the NMPA 12th Five-Year Major Project, etc., and the phase III clinical trial of the EV71 vaccine. Since the promulgation of "Good Clinical Practice on Vaccine Clinical Trials (Pilot Edition)" by NMPA in 2013, it has undertaken the phase III clinical study involving the freeze-dried rabies vaccine (MRC-5 cells) for human use from Beijing Minhai Biological Technology Co., Ltd., the randomized, blinded, parallel, controlled phase II clinical study involving the recombinant humanized rabies virus monoclonal antibody injection from the NCPC, and the phase III clinical trial involving the recombinant human papillomavirus bivalent (types 16/18) vaccine (yeast) from the Shanghai Zerun Biotechnology Co., Ltd. The employees from the CDC have published more than 10 papers at home and abroad, including 6 papers in foreign languages, and published 5 monographs on vaccines. All staff in the Institute of Vaccine Clinical Study that participated in this study have attended GCP training and examinations organized by the national government or this institution.

(1) Heizhuanghu Community Health Service Center under the Shuangqiao Hospital in Chaoyang District, Beijing

Established in 1958, the Shuangqiao Hospital in Chaoyang District, Beijing, is affiliated to the Health Bureau of Chaoyang District, and has been approved by the Beijing Municipal Human Resources and Social Security Bureau as a designated medical institution for medical insurance in Beijing. Located in the southeast of the Chaoyang District, the hospital covers an area of 26 square kilometers and a building area of 3512 square meters. The hospital has 72 personnel of various professional and technical levels, including 3 with senior titles, 9 with intermediate titles, 2 with master's degrees, 30 with bachelor's degrees, and 20 with associated college degrees. There are altogether 9 community health service stations under the hospital, including Daludian, Xiaoludian, Wanziyang, Dingxinzhuang, Langgezhuang, Langxinzhuang, Shuangshu, Dongxu, and Yijingcheng, undertaking the six-in-one medical and health work for the 80,000 population in the Heizhuanghu area with respect to prevention, health care, medical treatment, rehabilitation, family

Confidential 12 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

planning, and health education. The hospital has such clinical departments as general practice, Traditional Chinese medicine (TCM), gynecology, stomatology, rehabilitation, and health care. The hospital undertakes the related work in the emergency work station in the southern area according to the "regionalization" and "gridding" goal as set by the Chaoyang District Health Bureau, and it has carried out the Sanofi Pasteur's HAF87 clinical trial study.

(2) Beijing Chaoyang Xiaohongmen Community Health Service Center

Established in 1953, the Beijing Chaoyang Xiaohongmen Community Health Service Center is affiliated to the Health Bureau of Chaoyang District, and has been approved by the Beijing Municipal Human Resources and Social Security Bureau as a designated medical institution for medical insurance in Beijing. Located at No. 1 Xiaohongmen Middle Street, Chaoyang District,

the Xiaohongmen Community Health Service Center covers an area of 12.47 square kilometers and a building area of 3037 square meters. The hospital has 70 personnel of various professional and technical levels, including 2 with senior titles, 8 with intermediate titles, 8 with bachelor's degrees and 24 with associated college degrees. There are altogether 4 community health service stations under the hospital, including Paifang, Xiaohongmen, Xiaocun, and Longzhaoshu, undertaking the six-in-one medical and health work for the 80,000 population in the Xiaohongmen area with respect to prevention, health care, medical treatment, rehabilitation, family planning, and health education. The center has such clinical departments as internal medicine, surgery, TCM, gynecology, stomatology, ophthalmology, and health care. The phase III clinical study on the H1N1 influenza vaccine, the phase III clinical study on the EV71 vaccine, the phase III clinical study on the meningococcal polysaccharide ACYW135 vaccine, and the phase III clinical study on the lyophilized human rabies vaccine (MRC-5 cells) have been carried out here.

(3) Beijing Chaoyang District Nanmofang Community Health Service Center

The Beijing Chaoyang District Nanmofang Community Health Service Center is affiliated to the Chaoyang Health and Family Planning Commission, representing a designated medical institution for medical insurance in Beijing. Located at No. 29 West Dawang Road, Chaoyang District and with a service area of 9.64 square kilometers, it serves a population of 160,000. The center has such departments as general medicine, stomatology, surgery, gynecology, TCM, orthopedic massage, physiotherapy, and preventive health care, and five community health service stations under it: Nanxinyuan, Shuanglongnanli, Huanlegu, Zinanjiayuan, and Baiziwan, with experts on TCM, endocrinology, gynecology, and surgery from the Chuiyangliu medical consortium (tertiary hospital) for specialist clinic service of the center on a regular basis. The center is equipped with such examination and treatment equipment as Color Ultrasound Doppler Apparatus, CR, Automatic Biochemical Analyzer, Fluorescent Immunoassay Analyzer, Lumbar and Cervical Spine Treatment Instrument, Infrared Polarized Light Treatment Instrument, and TCM Meridian Flow Injection Treatment Instrument. With these pieces of equipment, vascular ultrasonography, cardiac ultrasound examinations, testing of tumor markers, Helicobacter pylori testing, high and low frequency and infrared pain treatment and other physical therapy items are available. The center has 134 employees, including 105 professional technicians with associate college degrees or above and 6 with professional titles as associated chief physicians or above, and is open to an average of over 1000 outpatients per day. In areas under its jurisdiction, the health care department serves 4000 children 0–3 of age, and manages over 4000 children from 15 nursery schools, and 8 primary and secondary schools.

3.1.3.2. Hebei Provincial Center for Disease Control and Prevention

Based on the overall deployment of the country and Hebei on health system reforms, the Hebei Provincial CDC is a public institution directly under the provincial Health Department after disbanding and merging of the 6 former units, namely the Hebei Provincial Health and Epidemic Prevention Station, the Provincial Endemic Disease Control Center, the Provincial Center for

Confidential 13 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

Occupational Disease Control, the Provincial Institute of Radiological Hygiene, the Provincial Center for Tuberculosis Prevention, and the Provincial Medical Science Academy, and was officially established in Aug. 2001. The CDC is mainly responsible for the following 7 tasks: (1) disease prevention and control; (2) emergency handling of public health emergencies; (3) epidemic reporting and management of health related factors information; (4) monitoring and intervention of health hazards; (5) laboratory testing, analysis and evaluation; (6) health education and health promotion; and (7) technical management and guidance on application research. It is a center offering business technical guidance for disease prevention and control within the province.

At present, the center has 40 offices, and is attached to 6 provincial-level associations, such as the Hebei Provincial anti-Tuberculosis Association, the Endemic Disease Association, and those related to TCM, integrated TCM and western medicine, acupuncture, and nursing; the center has a total of 507 employees, including 171 senior professional technical employees, 108 employees with master's degrees and Ph.D degrees, 21 provincially-administered experts, middle-aged and young experts, experts on special government allowances, and 2 national and provincial model workers.

The Hebei Provincial CDC has a tertiary laboratory for biosafety, and over 10 laboratories for poliomyelitis, AIDS confirmation, virological testing, disinfection, and toxicological testing, etc. The CDC has three province-level key medical disciplines, including medical virology, food safety risk monitoring laboratories, and cardiovascular and cerebrovascular disease prevention and treatment. The center boasts a total of 587 large and high-precision instruments and pieces of equipment, including the Ultra-high Performance Liquid Chromatograph-Quadrupole Mass Spectrometer/Mass Spectrometer, Ultra-high Performance Liquid Chromatograph, ICP-MS, DNA Synthesizer, Quantitative PCR Instrument, Liquid-mass Spectrometer, Gas-mass Spectrometer, Atomic Absorption Spectrophotometer, Gas Chromatograph, Ion Chromatograph, Amino Acid Analyzer, and Automatic Microbe Identification/Drug Sensitivity Analysis System. The center has 17 department certifications at the national and provincial levels, which are represented by national laboratory accreditation and metrological certification, and these make it the testing institution with the widest testing items within the province's public health field. There are a total of 737 sanitary inspection and testing items that involve food, health food, cosmetics, water and water-related products, pesticides, and various pathogenic microorganisms, etc., and the inspection and testing results have been recognized by a total of over 50 countries and regions across the globe.

(1) Dingxing County Center for Disease Control and Prevention

Located in the middle of Baoding, Hebei Province, the Dingxing County covers a total area of 714 square kilometers. It has 5 towns, 11 townships, and 274 administrative villages under its jurisdiction, with a total population of 580,000; the number of urban populations reaches 95,927, and the average annual birth rate stands at about 14.8‰. With an area of 8867 square meters and a total construction area of 2822 square meters, the Dingxing County CDC has a three-story laboratory building which was put into use in 2004 with a construction area of 2054 square meters, a 2–8 °C room-temperature freezer with an area of 15.3 square meters, and 20 types of instruments and pieces of equipment. It has 85 employees, including 62 professional technical employees, 3 employees with deputy senior titles, 36 employees with junior titles, and 14 other medical technicians. The CDC has 14 departments, and its laboratory passed the metrological certification review by the Hebei Provincial Bureau of Quality and Technical Supervision in Apr. 2011. There are 26 sites for planned immunization and spot inoculation. The direct reporting network systems at the county, township, and town levels are operating normally, EPI is conducted in the form of centralized vaccination in the vaccination clinics of township health centers, and the center's cold

Confidential 14 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

chains are operating all year round. Both planned immunization and vaccination rate exceed 97%. A total of 6 employees from the CDC have currently attended the training by NMPA and obtained the GCP qualification certificates, and 29 employees have obtained the GCP qualification certificates issued by the Hebei Food and Drug Administration; they have undertaken and completed the Novartis's M37P2, M37P2E1, V37_06, V37_07, and V37_07E1, the influenza vaccine project by the Yunnan Kunming Institute, and the phase I clinical trial involving mumps, etc., gaining a wealth of experience and a good mass foundation.

(2) By Zhengding County Center for Disease Control and Prevention

Located in the north of Shijiazhuang, Hebei Province, the Zhengding County lies to the urban area by a river, and covers a total area of 468 square kilometers. It has jurisdiction over 1 street, 4 towns, 5 townships, and 174 administrative villages, with a total population of 480,000, of which the urban population is 113,778 and the average annual birth rate stands at about 14.13‰. The Zhengding County CDC is a business unit under the Hebei Provincial CDC. There are a total of 63 employees in the center, including 51 professional technical personnel, 3 with senior titles, 17 with intermediate titles, 44 majoring in health, and 38 with associate college degree. The CDC has 14 departments, is equipped with a central laboratory and testing laboratories which are 1142 square meters in area, and has 19 sites for both planned and spot immunizations. The direct reporting network systems at the county, township, and town levels are operating normally, EPI is conducted in the form of centralized vaccination in the vaccination clinics of township health centers, and the center's cold chains are operating all year round. Both planned immunization and vaccination rate exceed 98%. At present, a total of 13 employees from the CDC have attended the training by the NMPA and obtained the GCP qualification certificates, and 41 employees have obtained the GCP qualification certificates issued by the Hebei Food and Drug Administration. The Zhengding County has been established as a national research base on viral hepatitis since the 1980s, and has been undertaking national scientific and technological research projects or major projects since the beginning of the 7th "Five-Year Plan". So far, the center has completed a total of 7 national scientific and technological research projects or major projects involving hepatitis and another 6 scientific research projects, and has won 4 provincial awards for scientific and technological progresses. The center has undertaken and completed such clinical trials as Novartis's M37P2 and M37P2E1, gaining a wealth of experience and a good mass foundation.

3.1.3.3. Henan Provincial Center for Disease Control and Prevention

The Henan provincial CDC is a public welfare health institution with the qualifications for administering preventive biological products and immunization planning and vaccination, and its administrative and business fall under the jurisdiction of the Henan Provincial Health and Family Planning Commission. The center has 9 business institutes, including the Institute for the Prevention and Control of Infectious Diseases, the Institute for the Prevention and Control of Parasitic Diseases, the Institute for Immunization Prevention and Planning, the Center for Health Detection and Testing, the Institute for STD & AIDS Prevention and Research, the Institute for the Prevention and Control of Endemic Diseases, the Institute for the Prevention and Control of Tuberculosis, the Institute for the Prevention and Control of Health Education and Chronic Non-infectious Diseases, and the Institute for Research on Public Health. There are a total of 439 in-service employees and 375 professional technicians on health, including 27 chief physicians (technicians), 94 deputy chief physicians (technicians or superintendent nurses), 14 with Ph.D degrees, and 94 with master's degrees. There are 5 excellent experts at the provincial level, 1 expert on special government allowances, and over 20 employees assuming positions in the national professional academic groups. More than 30 business technical backbones have been abroad for research and studies since 2006. Specifically, the Vaccine Clinical Research Center is a dedicated department for the evaluation of vaccine safety and efficacy, and with the assistance of other

Confidential 15 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

departments in the center, it can carry out immunological, etiological, molecular biological, biochemical, and routine tests.

Composition of technical personnel: 3 with senior titles, 1 with associate senior titles, 6 with intermediate titles, and 1 for administrative affairs. Composition of technical personnel by educational background: 4 with master degrees, 4 with bachelor degrees, and 3 with associate college degrees. Composition of technical employees by profession: 4 epidemiologists, 2 clinicians, 4 testers, and 1 for other affairs. A total of 10 employees have obtained the national GCP training certificates. The management personnel and technicians from the Vaccine Clinical Research Center are familiar with the procedures of drug clinical trials, and there is a reasonable composition of management personnel and technicians and clear division of labor, meeting the corresponding job responsibilities. The Vaccine Clinical Research Center formulates and implements the systems for relevant regulations and technical training. The Vaccine Clinical Research Center has established the clinical trial quality control and quality assurance systems and various SOPs which are complete in content and operable and which run throughout the clinical trial process, ensuring the implementation of the quality control and quality assurance systems of clinical trials. Quality control can be carried out during various stages of data processing, to ensure the completeness, accuracy, truthfulness, and reliability of data. For many times, the center has obtained the qualifications for one-time vaccine clinical trial institutions by NMPA.

Experience in clinical trials: In recent years, the center has carried out clinical trials on over 10 vaccines, including the influenza vaccine, the H1N1 influenza vaccine, the rotavirus vaccine, the group A and C meningococcal polysaccharide vaccine, the 10MG recombinant hepatitis B vaccine, the ACYW135 meningococcal conjugate vaccine, the freeze-dried rabies vaccine for human use (VERO cells), the freeze-dried Haemophilus influenza type b conjugate vaccine, the 23-valent pneumonia vaccine, and the HPV cervical cancer vaccine, gaining a wealth of experience in clinical trials of vaccines.

(1) Puyang County Center for Disease Control and Prevention

Located in the northeast of Henan Province, Puyang County falls under the jurisdiction of Puyang City. Covering a total area of 1441.6 square kilometers, the County has jurisdiction over 14 townships, 6 towns, and 1005 administrative villages, with a population of 1.089 million. Specifically, the resident population in the urban area is 150,000. The Puyang County CDC has the qualifications for administering preventive biological products and the immunization planning, and vaccination. Among the 11 internal departments in the center, there are a total of 137 cadres, 104 of which are in service, and 75 professional technicians, 1 employee with senior title, 18 with intermediate titles, and 56 with junior titles. The HPV office is composed of three employees. With Ma Zihé, deputy director, as the director of the Project Office, a total of 14 professional technical personnel were transferred to attend the pre-clinical research project (2 personnel on clinical medicine and 4 laboratory employees). The laboratory passed the Henan metrological certification/metrological certification re-review in Oct. 2002. There are a total of 22 immunization

and vaccination clinics within the county, all of which belong to the provincial-level demonstration vaccination clinics. The vaccination rate exceeds 98%. In 2013, the Puyang County CDC participated in the work on the sites of such clinical trials as the Hualan Bio's phase III clinical study involving 10 µg recombinant hepatitis B vaccine (Hansenula polymorpha) for the maternal-neonatal hepatitis B blockage, and HPV cervical cancer vaccine, gaining work experience in clinical trials.

(2) Wen County Center for Disease Control and Prevention

Located in the northwest of Henan and closed to the Yellow River in the south and to the Qin River in the north, the Wen County is a typical agricultural county and an authentic production place of the "great four Huai medicines", e.g., yam, Rehmannia glutinosa, chrysanthemum, and achyranthes. The Wen county has a long development history and rich cultural origins. It is home to Sima Yi, a

Confidential 16 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

famous military strategist during the period of the Three Kingdoms, and the birthplace of Taijiquan, which is well-known both domestically and internationally. The whole county covers a total area of 462 square kilometers, and has jurisdiction over 10 townships and 262 administrative villages, with a total population of 460,000 and an annual birth rate of 12.5‰. Specifically, the urban area has a resident population of over 80,000. The county has a total of 16 clinics for immunization and vaccination, of which there are 7 provincial-level demonstration vaccination clinics, with a vaccination rate of more than 98%.

The Wen County CDC has the qualifications for administering preventive biological products and immunization planning, and vaccination. Among the 15 internal departments in the center, there are a total of 84 cadres, 68 of which are in service, and 54 professional technicians, 3 employee with senior title, 17 with intermediate titles, and 34 with junior titles. The HPV office is composed of three employees. A total of 15 professional technical personnel were transferred to attend the pre-clinical research project (3 personnel on clinical medicine and 5 laboratory employees). The center has a laboratory which covers an area of over 1500 square meters. The laboratory has a total of 53 (in 32 categories) instruments or pieces of equipment, including the Gas Chromatograph, High-performance Liquid Chromatograph, and Atomic Absorption Spectrophotometer, with which 393 monitoring items can be carried out, including microbiology, physical and chemical testing, clinical testing, and disease control. The laboratory passed the metrological certification review by the Henan Provincial Bureau of Quality and Technical Supervision in Jul. 2013. In 2012, the Wen County CDC undertook the phase III clinical research project of the III-valent rotavirus gene reassortment vaccine, which is about to complete now. In 2013, it undertook the work on the site of such clinical trials as the Hualan Bio's "Phase III clinical study involving 10 µg recombinant hepatitis B vaccine (Hansenula polymorpha) for the maternal-neonatal hepatitis B blockage", and HPV cervical cancer vaccine, gaining the work experience in carrying out vaccine clinical trials.

3.1.3.4. Shanxi Provincial Center for Disease Control and Prevention

The Shanxi Provincial CDC was established in Jun. 2001 based on the adjustment, optimization, and combination of the former Shanxi Provincial Health and Epidemic Prevention Station, the Shanxi Provincial Institute of Occupational Disease Control, and the Shanxi Provincial Institute for Tuberculosis Control. The center covers a total area of 17.17 Mu and a work housing area of 18,393 square meters, of which the laboratory housing area stands at 7794 square meters. In the laboratory housing, the areas of microbiology laboratory, physical and chemical laboratory, and toxicology laboratory are 5109, 1881, and 804 square meters, respectively. There are a total of 18 business departments, 12 functional departments, and 1 training center in the center. There are 262 formal employees in the center, and currently, there are 233 in-service employees, including 173 professional health technicians (accounting for 74.25% of the in-service employees) and 77 assuming senior professional technical positions (accounting for 44.51% of the in-service employees). Among the health professionals, there is 1 with Ph.D degree (0.57%), 41 with master degrees (23.70%), and 87 with bachelor degrees (50.29%).

The center's Vaccine Clinical Evaluation Room was established on Jun. 10, 2014 through the merging of two related business offices under the Department of Infectious Disease Prevention and Control and the Center for Biological Product Distribution, and is responsible for the organization, management, and implementation of vaccine clinical trials. There are 9 researchers in the Vaccine Clinical Evaluation Room, and by technical title, they are composed of 3 chief physicians, 1 deputy chief physician, 3 head physicians, 1 physician, and 1 chief technician. Composition of technical personnel by educational background: 7 with master degrees, 1 with bachelor degree, and 1 with other educational background. The center is headed by Li Guohua,

Confidential 17 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

chief of the Department of Infectious Disease Prevention and Control and chief physician. He has certain experience in vaccine clinical trials because he went to Canada for studies in the late 1990s as a visiting scholar, and attended training related to the national GCP and ethics review and obtained the training certificate. The Vaccine Clinical Evaluation Room now has 6 active management systems, 73 standard operating procedures (SOPs), 28 SOPs related to clinical institutions, 45 SOPs related to the trial site, 2 emergency plans, and 2 job responsibilities (1 on the institution, and 1 on the trial site). A total of 8 employees have received the national GCP trainings, and the institution has carried out such regulatory and technical trainings for internal GCP, SOPs, and clinical trial protocols according to the conduct of clinical trials.

The Vaccine Clinical Evaluation Room has a fixed office venue and necessary facilities and equipment for clinical trials, e.g., computers, printers, telephones, fax machines, scanners, and paper shredders. In addition, there is a relatively independent archive room which is equipped with fire-proof, anti-theft, moisture-proof, insect-proof, and rodent-proof facilities, and dedicated personnel are in place for archiving and management of the archives.

(1) Xiangfen County Center for Disease Control and Prevention

Located in the south of Shanxi Province, the Xiangfen County covers a total area of 1034 square kilometers. The county has jurisdiction over 7 towns and 6 townships (mainly Han nationality), with a population of over 500,000 and an average annual birth rate of about 11.23‰. The Xiangfen County CDC has 13 departments which are composed of 38 professional technicians, including 1 with senior professional title, 19 with intermediate professional titles, and 18 medical technicians. There are 8 employees in the Department of Epidemiology Prevention and Treatment and the Department of Planned Immunology Department, and 10 employees in the laboratory. The center's laboratory passed the metrological certification review by the Provincial Bureau of Quality and Technical Supervision in Jul. 2006, and passed the metrological certification re-review by the Bureau in Oct. 2009 and Apr. 2013. There are 346 sites for planned immunization and spot inoculation. The direct reporting network systems at the county, township, and town levels are operating normally, and EPI is carried out in the form of spot vaccination, with the center operating

in the cold chain mode once a month. Both planned immunization and vaccination rate exceed 95%.

(2) Wanrong County Center for Disease Control and Prevention

Located in the southwest of Shanxi Province and at the junction of the Yellow River and the Fenhe River, the Wanrong County covers a total area of 1082 square kilometers and a cultivated area of 1.02 million Mu. It administers 14 townships and towns and 281 administrative villages, with a total population of 440,000. The Wanrong County CDC has 35 formal employees, including 10 with bachelor degrees, 14 with college degrees, and 11 with other academic degrees. The center has over 10 departments, including Central Office, Finance, Business/Food, Information/Biological Products, Immunization Program/Infectious Diseases, Tuberculosis, STD/AIDS, Chronic Diseases/Disinfection and Sterilization, Vaccination Clinic, Clinical Laboratory, and Physical Examination. The county administers 14 townships and towns and 281 administrative villages. All the 14 townships and towns have established the department of prevention and protection. The chief of the department is administered by both the township/town health center (for administrative assessment) and the county CDC (for business assessment). The 281 administrative villages have established a total of 282 village health centers; all of the departments of the prevention and protection of health hospitals in 14 townships and towns and

Confidential 18 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

282 village health centers undertake vaccination, and all of them have the qualifications as vaccination clinics granted by the county health bureau. From Jul. 2013 to Feb. 2014, the center, in collaboration with the Beijing Chaoyang CDC and the Shanxi Provincial CDC, carried out the clinical trial site work on the "Research Project on Protective Effects of the 2-injection Varicella Vaccine Immunization Procedures". From Dec. 2014 to Mar. 2015, the center carried out the "Phase III Clinical Study on Lyophilized Rabies Vaccine for Human Use (MRC-5 cells)" as a trial site.

3.2 SPONSOR

Yunnan Walvax Biotechnology Co., Ltd. and Yuxi Walvax Biotechnology Co., Ltd., which were mainly responsible for:

- 1■ Providing the preliminary clinical trial protocol and finally confirming the clinical trial protocol;
- 2■ Providing such application documents on the site as the Clinical Trial Approval, the Investigator's Brochure for the clinical trial (pre-clinical product safety information), and the product implementation standards;
- 3■ Providing vaccines used in the clinical study and issuing test control reports;
- 4■ Dispatching monitors to assess and recognize the clinical trial site, perform the monitoring duty as per the GCP requirements, and verify the research data during the trial;
- 5■ Participating in the investigation and handling of cases of abnormal reactions arising from the vaccine, and providing medical and related compensation fees for cases of abnormal reactions which are clinically proven related to the vaccine as per relevant regulations;
- 6■ Providing the fund for the clinical study.

3.4. ETHICS

This study complied with the "Technical Guidelines for Vaccine Clinical Trials" by NMPA and the ethical principles of medical study in humans set forth in the World Medical Association's "Helsinki Declaration", "Good Clinical Practice" (GCP), and all applicable regulatory requirements. Prior to this study, this clinical research protocol and the informed consent form had been approved by the Ethics Review Committees of the Beijing Chaoyang CDC, the Hebei Provincial CDC, the Henan Provincial CDC, and the Shanxi Provincial CDC. The subjects for the clinical trial were recruited in accordance with the principle of informed consent and voluntariness. All subjects/legal guardians were informed of matters related to the vaccine clinical trial in detail in order to obtain their voluntary signed informed consent forms. The subjects were screened in strict accordance with the inclusion criteria.

3.5. DATA MANAGEMENT

The study records and reports were managed in accordance with Articles 48–52 of the GCP issued by NMPA. All operations were performed as per the SOPs, and the clinical trial records and report data will be stored in the on-site CDC as required until five years after the clinical trial.

3.6. OBSERVATION AND REPORTING OF ADVERSE EVENTS

In strict accordance with the GCP principles, each subject was observed closely for local and systemic adverse reactions and adverse events. All adverse reactions and adverse events were recorded in the CRF fully, including the symptoms, time of occurrence, severity, duration, measures adopted and the status of recovery; the investigator was responsible for judging the relevance of the adverse events to the test vaccine.

If serious adverse events occurred during the study, appropriate treatment measures were taken immediately, whether they were associated with the test vaccine, and the events were reported to

the sponsor, the ethics committee, and the local food and drug administration for the responsible institutions of each sub-center by telephone or fax within 24 hours after learning about such information.

Confidential 20 / 310
Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

4. STUDY DESIGN AND PROCEDURE

This clinical trial was designed as a randomized, blinded, comparable vaccine-controlled, multicenter, non-inferiority clinical trial.

The subjects were healthy children aged 2-71 months (minimum of 6 weeks), stratified into four age groups: 2-6 months (minimum of 6 weeks), 7-11 months, 12-23 months and 24-71 months. Subjects were divided into PCV13-TTs and PCV7 group, with the PCV13-TT receiving the 13-valent pneumococcal conjugate vaccine (PCV-13) from Yuxi Walvax Biotechnology Co., Ltd. and the control group receiving the Prevenar7 (PCV-7) from Pfizer (Wyeth), Inc.

Accordance to the 'Technical Guidelines for Clinical Trials of Vaccine' and 'Regulation of Drug Registration', the sample size of phase III clinical trial should not less than 500, a total of 2,760 subjects were recruited in this trial. The sponsor entrusted the Beijing Chaoyang District CDC, Hebei Province CDC, Henan Province CDC and Shanxi Province CDC to complete this clinical study. The enrolled subjects were completed by the business cooperation units or subordinate units of Zhengding County CDC, Dingxing County CDC, Puyang County CDC and Wenxian County CDC, Xiangfen County CDC and Wanrong County CDC. The Xiaohongmen Community Health Service Centre, the Heizhuang Family Community Health Service Centre of Shuangqiao Hospital, and the Nanmoufang Community Health Service Centre were used as alternate sites for the clinical trial. There was no alternative plan for the subjects who were dropped out during the study.

The study consisted of 4 subgroups enrolling total of 2760 healthy subjects of 2-71months old.

Subgroup one inclusion of 1560 subjects aged 2-6 months (minimum 6 weeks of age), divided into PCV13-TT 1 (520 subjects, aged 3 months), PCV13-TT 2 (520 subjects, aged 2 months) and control group (520 subjects, aged 3 months).The proposed regimen for PCV13-TT 1 consists of four doses of PCV-13, with a single intramuscular injection at months 0, 1 and 2 (3, 4 and 5 months of age) for primary series and at ages12-15months for booster dose. The proposed regimen for PCV13-TT 2 consists of four doses of PCV-13, with a single intramuscular injection at months 0, 2 and 4 (2, 4 and 6 months of age) for primary series and at ages12-15months for booster dose. The proposed regimen for control group consists of four doses of PCV-7, with a single intramuscular injection at months 0, 1 and 2 (3, 4 and 5 months of age) for primary series and at ages12-15months for booster dose.

Subgroup two inclusion of 400 subjects aged 7-11 months, divided into PCV13-TT (200 subjects) and control group (200 subjects). The proposed regimen for PCV13-TT and control group consists of three doses of PCV-13 and PCV-7 separately, with a single intramuscular injection at months 0 and 2 for primary series and at ages12-15months for booster dose. The vaccination interval between the 2nd dose for primary series and booster dose was at least 2 months.

Subgroup three inclusion of 400 subjects aged 12-23 months, divided into PCV13-TT (200 subjects) and control group (200 subjects). The proposed regimen for PCV13-TT and control group consists of two doses of PCV-13 and PCV-7 separately, with a single intramuscular injection at months 0 and 2.

Subgroup four inclusion of 400 subjects aged 24-71 months, divided into PCV13-TT (200 subjects) and control group (200 subjects).

The proposed regimen for PCV13-TT and control group inoculated with PCV-13 and PCV-7 at 0 months. separately.

Safety observations were performed after each dose of vaccination. The immunogenicity was evaluated before the first dose of vaccination and 30 days after primary series. Subjects with booster dose were also required to observe immunogenicity before and 30 days after booster dose. After the on-site blood sampling, the data collation, verification and clarification should be complete. The results of the blood tests were returned for statistical analysis, and a statistical analysis report was issued to write the clinical trial report.

Protocol No.: 022152015003

4.2. SAMPLE SIZE ESTIMATION

4.2.1. Sample Size Consideration

4.2.1.1. Consideration based on 7 common serotypes

(1) It was assumed that for each vaccine serotype, the proportion of subjects achieving serum IgG antibody concentrations $\geq 0.35 \mu\text{g/mL}$ was not less than 85% in both PCV13-TT and control group. Set: $\alpha/2 = 0.0125$ (One side),

$\delta = 0.1$ (Threshold of Non-inferiority),

$1-\beta = 0.80$ (Power of test)■

To ensure that the total power of test is not less than 80%, the adjusted value is $1-0.2/7=0.97$.

Sample distribution ratio was 1:1 for the PCV13-TT and control group. The PASS11 was used to calculate the minimum number of subjects to be enrolled in each of the test and PCV7 group was 434 separately.

(2) It was assumed that after the GMC ratio logarithmically transformed (with 10 as the base), the covariance was not greater than 1.0 for each vaccine serotype,

Set: $\alpha/2 = 0.0125$ (One side)■

$\delta = 0.3$ (Threshold of Non-inferiority)

$1-\beta = 0.80$ (Power of test)

To ensure that the total power of test is not less than 80%, the adjusted value is $1-0.2/7=0.97$.

Sample distribution ratio was 1:1 for the PCV13-TT and control group. The PASS11 was used to calculate the minimum number of subjects to be enrolled in each of the test and PCV7 group was 379 separately.

4.2.1.2. Consideration based on the 6 additional serotypes after the immunogenicity non-inferiority test of 7 common serotypes confirmed

It was assumed that each vaccine serotype, the proportion of subjects achieving serum IgG antibody concentrations $\geq 0.35 \mu\text{g/mL}$ was not less than 80%. For the 6 additional vaccine serotype, the proportion of subjects achieving serum IgG antibody concentrations $\geq 0.35 \mu\text{g/mL}$ was lower than 50%

Set: $\alpha = 0.025$ (One side)

It was assumed that each target vaccine serotype, the proportion of subjects achieving serum IgG antibody concentrations $\geq 0.35 \mu\text{g/mL}$ was not less than 70%. The Lower limit of the one-sided 97.5% CI for the IgG seroresponse rates $\geq 0.35 \mu\text{g/mL}$ was $\geq 70\%$.

$1-\beta = 0.80$ (Power of test)

To ensure that the total power of test is not less than 80%, the adjusted value is $1-0.2/6=0.97$.

Sample distribution ratio was 1:1 for the PCV13-TT and control group. The PASS11 was used to calculate the minimum number of subjects to be enrolled in each of the test and PCV7 group was 274 separately.

Considering the cross-protective effects of 19F and 6B in 7 common serotypes on 19A and 6A in 6 additional serotypes, respectively, the effectiveness evaluation of 19A and 6A needs to be combined with the results of OPA.

4.2.1.3. Final consideration of sample size

According to the above situation, the PCV13-TT and the control group should be enrolled 434 subjects at least,

Considering the drop-out during the study, 520 subjects were enrolled in the main subgroup which aged 2-6 months in both PCV13-TT and control group separately.

At the same time, another three subgroups including 7-11 months old, 12-23 months old and 24-5 years old were investigated. Sample distribution ratio was 1:1 for the PCV13-TT and control group

Confidential 23 / 310
Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

in these three subgroups. 200 subjects were enrolled in each age group for both PCV13-TT and control group.

Sample size allocation and immunogenicity test subgroup

Table 2. Sample size allocation
Age (Month) PCV13-TT group PCV13-TT group
PCV7 group Total
(3-71M) (2M)
2-6
520 520 520 1560
(Minimum age of 6 weeks)
7-11 200 / 200 400
12-23 200 / 200 400
24-71 200 / 200 400

4.2.2. Criterion for immunogenicity hypothesis testing

Common 7 serotypes: non-inferiority test

The evaluation of non-inferiority criterion for comparison of common 7 serotypes in PCV13-TT group and PCV7 group includes:

- (1) The lower limit of the 2-sided 97.5% CI for the rate difference of percentage of subjects with IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ (PCV13-TT – PCV7) was greater than -10%
- (2) The lower limit of the 2-sided 97.5% CI for IgG antibody GMC ratio (GMR, PCV13-TT relative to PCV7) is greater than 0.5.

Any common serotype that meets the evaluation criteria 1) or 2) will be judged to be immunogenically non-inferior.

Additional 6 serotypes: superiority test

The evaluation of superiority criterion for comparison of additional 6 serotypes in PCV13-TT group and PCV7 group includes:

- (1) The lower limit of the 2-sided 95% CI for the rate difference of percentage of subjects with IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ (PCV13-TT – PCV7 seroresponse or PCV7 reference) was greater than 0.
- (2) The lower limit of the 2-sided 95% CI for IgG antibody GMC ratio (GMR, PCV13-TT relative to PCV7 seroresponse or PCV7 reference) is greater than 1.
- (3) The lower limit of the 2-sided 95% CI for percentage of subjects with IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ was greater than 70% in PCV13-TT group.

Any additional serotype, which simultaneously meets the evaluation criterion (1), (2) and (3), is judged to be superior.

PCV7 reference is referred to as the lowest response among the 7 common serotypes contained in PCV7 achieved by subjects who received PCV7.

The evaluation of non-inferiority criterion for secondary endpoints, including percentage of subjects with IgG antibody concentration ≥ 1.0 $\mu\text{g/mL}$, OPA titer $\geq 1:8$, GMT and GMT ratio were same as the above described evaluation criterion.

Sequential tests

In the hypothesis test, if the non-inferiority of PCV13-TT (3 months) group vs PCV7 group was established and additional 6 serotypes met the pre-specified superiority criterion, the non-inferiority test of PCV13-TT group (2 months) vs PCV7 group was performed. Then, if all the serotypes met the pre-specified evaluation criterion in PCV13-TT (2 months) group, the non-inferiority test of PCV13-TT group (2 months) vs PCV13-TT group (3 months) was performed.

Confidential 24 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

Strict statistical analysis was performed for the comparison of PCV13-TT (3 months) vs PCV7 (3 months), PCV13-TT (2 months) vs PCV7 (3 months), and PCV13-TT (2 months) vs PCV13-TT (3 months) in a sequential fashion, while other comparisons for non-primary populations (including age groups of 7-11, 12-23, 24-71 months) were statistically analyzed while without strict statistical inference.

The immunogenicity analysis would be performed in all eligible subjects with evaluable serum for testing as per the study protocol. Immunogenicity analysis was performed with the PPS data set as the primary analysis set.

4.3. STUDY ENDPOINTS

4.3.1. Immunogenicity Endpoints

4.3.1.1. Primary immunogenicity endpoints

- (1) Percentage of subjects with pneumococcal serotype-specific IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ 30 days post-dose 3 in PCV13-TT group and PCV7 group
- (2) Pneumococcal serotype-specific IgG geometric mean concentration (GMC) 30 days post-dose 3 in PCV13-TT group and PCV7 group

4.3.1.2. Secondary immunogenicity endpoints

- (1) Percentage of subjects with pneumococcal serotype-specific OPA antibody titer $\geq 1:8$ one month post-dose 3 in PCV13-TT group and PCV7 group
- (2) Percentage of subjects with pneumococcal serotype-specific OPA GMT one month post-dose 3 in PCV13-TT group and PCV7 group
- (3) Percentage of subjects with pneumococcal serotype-specific IgG antibody concentration ≥ 1.0 $\mu\text{g/mL}$ 30 days post-dose 3 in PCV13-TT group and PCV7 group
- (4) Percentage of subjects with pneumococcal serotype-specific IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ 30 days post-dose 4 in PCV13-TT group and PCV7 group
- (5) Pneumococcal serotype-specific IgG GMC 30 days post-dose 4 in PCV13-TT group and PCV7 group
- (6) Percentage of subjects with pneumococcal serotype-specific OPA antibody titer $\geq 1:8$ one month post-dose 4 in PCV13-TT group and PCV7 group
- (7) Percentage of subjects with pneumococcal serotype-specific OPA GMT one month post-dose 4 in PCV13-TT group and PCV7 group
- (8) Percentage of subjects with pneumococcal serotype-specific IgG antibody concentration ≥ 1.0 $\mu\text{g/mL}$ 30 days post-dose 4 in PCV13-TT group and PCV7 group.

4.3.2. Endpoint of Safety

The incidence of local and systemic adverse reactions 30 days after primary series and booster days was chosen as the primary endpoints for safety evaluation.

If there is an unexpected serious abnormal reaction during the study, or after any dose vaccination, if the proportion of subjects who had level 3 and above local or systemic reactions achieve 15% of the total subjects on the same day, the trial should be suspended. The sponsor should report to the Ethics Committee and National Medical Products Administration and other related NRA where necessary. Experts meeting would be held to demonstrate vaccine safety. Perform unblinding procedure to determine whether to continue the study where necessary.

4.4. RANDOM AND CODED BLINDING

In this clinical trial, randomized blindness was through the method of vaccine blinding.

4.5. PACKAGING AND LABEL

Packaging: Uniform outer packaging will be used for packaging the vaccines used in the clinical trial so that their appearance looks the same.

Confidential 25 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

Label on the vaccine vial: The label shall contain the number and name abbreviation. The pattern is as follows:

Dose 1

Phase III Clinical Study of PCV13-TT Dose 1

Dose 1

Vaccine No.:

Initials:

Walvax For Clinical Use Only Store at 2-8°C, protected from light

■■■■■■■■■■

The "number" was the study number from the random allocation table. Besides the labels of the same number attached to the outer packaging and inner packaging on the test vaccine, a pre-printed sticker label with the same number was placed on the original records book of subjects.

Vaccine's medium box label: The label shall contain such basic information as the number segment of the vaccine, name of the sponsor, and storage conditions, and specify "for use in clinical trials only". The pattern is as follows:

Phase III Clinical Study of PCV13-TT

Dose 1

Number of vaccines in this box (xxxx-1—xxxx-1)

Walvax For Clinical Use Only Store at 2-8°C, protected from light

Blood sample label: The blood sample label was the study number plus the suffix of the number of blood collections, and blinded submission for testing was performed:

Study No. -1 denotes the blood collection before immunization.

Study No. -2 denotes the second blood collection.

Study No. -3 denotes the third blood collection.

Study No. -4 denotes the forth blood collection.

For a study number requiring IgG testing only, three copies of the label were prepared, with the larger label attached to the blood collection tube, and two smaller labels attached to the separated serum 1 pending testing/standby serum, respectively, and priority was given to serum 1 pending testing. For a study number requiring IgG and OPA testing, four copies of the label were prepared, with the larger label attached to the blood collection tube, and three smaller labels attached to the separated serum 1 pending testing/serum 2 pending testing/standby serum; the serums were collected in the order of serum 1 pending testing, serum 2 pending testing, and the standby serum.

The style of the serum label was as follows:

Study No.: 0001-1

Initials:

Confidential 26 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

4.6. CONTROL VACCINE

In this clinical study, 7-valent pneumococcal conjugate vaccine (PCV7) manufactured by Pfizer (Wyeth) was used as the control vaccine. The route of administration, dosage and precautions were carried out according to the instructions of the vaccine.

4.7. STUDY PERIOD

The study period was 26 months.

The first subject was enrolled in April 2016.

Site closing time: March 2018

Clinical study report issued in January 2018

4.8 PROPOSED INDICATIONS AND RATIONALES

Indications: for the prevention of related diseases caused by infections of the 13 pneumococcal serotypes contained in this vaccine (types 1, 3, 4, 5, 7A, 6B, 7F, 9V, 14, 18C, 19A, 19F, and 23F). Justification: "Pneumococcal polysaccharide vaccine" in the European Pharmacopoeia (version 5.0), and the instructions of use for similar vaccines that have been marketed abroad.

4.9. SUBJECT CRITERIA

4.9.1. Populations

Subjects were healthy children aged 2-71 months (minimum 6 weeks of age). No contraindications to vaccination or history of pneumonia vaccination, no gender or ethnicity stipulations. On the principle of voluntary participation, the informed consent form (signed by the recipient and guardian for the recipients aged 12-17 years) should be signed by themselves or their guardians.

4.9.2. Inclusion Criteria

- Healthy infants (aged 2-71 months) as evidenced by medical history, physical examination, and investigators' judgement
- Subjects are in compliance with age requirements for this clinical trial (children from 6 weeks to 5 years old or adults over 18 years old)
- Parents / legal guardians of subjects must sign and date the informed consent in person
- Parents / legal guardians of subjects have been informed of all information related to the trial
- Subjects / legal guardians of subjects are able to follow requirements of the trial
- Subjects who have not been vaccinated with pneumococcal vaccines, and have not been administered any other preventive products within 7 days
- Axillary temperature $\leq 37^{\circ}\text{C}$

4.9.3. Exclusion Criteria

4.9.3.1. Exclusion Criteria for First Vaccination

- Previously vaccination listed or vaccinated with trial pneumococcal vaccine
- History of invasive disease caused by *Streptococcus pneumoniae*, which was confirmed by bacterial culture
- Prior history of allergic reactions to any drug, vaccine, or vaccine-related serotype
- Vaccination-related fever of 39°C or more has occurred with biological products used for vaccination
- Birth weight < 2.5 kg
- There is a history or family history of allergies, convulsions, seizures, encephalopathy, and psychosis
- Abnormal births of infants (difficult labors, aided by instruments) or a history of asphyxia, neurological organ damage
- History of diagnosed thrombocytopenia or other coagulation disorders
- Infants with diagnosed pathological jaundice

- Known or suspected to suffer from diseases, including: respiratory system disease, acute infection or chronic disease, serious cardiovascular disease, kidney disease, malignant tumor, skin diseases, mothers with HIV infection (as evidenced by test report)
- Known serious congenital malformations or severe chronic disease; congenital deformities, developmental disorder, or a clinical diagnosis of severe chronic diseases (such as Down's syndrome, diabetes, sickle cell anemia, or neurological disorders, Guillain-Barre Syndrome)
- Known or suspected co-morbidities including: respiratory disorders, acute infections or active attack of chronic disease, serious cardiovascular disorders, liver and kidney disorders, malignant neoplasms, skin diseases.
- Received blood products or globulin. Hepatitis B hyper-immune globulin can be used
- Participating in other clinical trials
- Any condition that the investigator considered to have the potential to affect the evaluation of the study

4.9.3.2. Exclusion Criteria for 2nd, 3rd Vaccination or Booster Dose

- Subjects who had severe allergic reactions during the first or second vaccination
- Subjects who experienced serious adverse effects from the previous vaccination with causal relationship demonstrated
- After the first vaccination, the newly discovered or newly occurred conditions not conforming to the first dose of the inclusion criteria or to the exclusion criteria for the first dose
- Other exclusion criteria affirmed by investigators

4.9.4. Criteria for Termination of the Study

4.9.5. Criteria for suspension or termination of the clinical trial

The clinical trial shall be suspended or terminated by the sponsor and the investigator jointly under any of the following circumstances:

- Occurrence of subject deaths related to vaccination;
- Occurrence of collective serious adverse reactions;
- Suspension or termination of the clinical trial as required by the sponsor due to such reasons as the test vaccine; and
- Suspension or termination as required by the NMPA.

4.10. PCV13-TT

A total of 2760 subjects were enrolled in the phase III clinical trial of PCV13-TT, including 1560 subjects in the age group of 2-6 months (the minimum age of 6 weeks), 1040 subjects in the PCV13-TT group and 520 subjects in the PCV7 group, 400 subjects in the 7-11 month age group, 12-23 months age group and 24-71 months age group. There were 200 cases in the PCV13-TT group and the PCV7 group respectively.

4.11. GENERAL INFORMATION FOR VACCINE

4.11.1. Study Vaccine

4.11.2. Control Vaccine

4.11.3. Storage and Transportation of the Vaccine

The vaccine shall be stored and transported at 2–8 °C, away from light. The storage temperature needed to be monitored daily and recorded. If the storage and transportation conditions exceeded the specified ranges, the investigator on the site shall contact the staff of the unit responsible for the clinical study and the sponsor immediately, and the vaccine shall not be used until obtaining the permission of the sponsor.

4.11.4. Route of administration and dose

The lateral skin of the deltoid muscle of the upper arm or the anterolateral skin of the thigh was sterilized with 75% medical alcohol, the vaccine was shaken thoroughly, and 0.5 mL of vaccine was intramuscularly injected after the skin had become slightly dry; for infants under 12 months of age, the preferred vaccination site is the anterolateral thigh. The control vaccine was administered in the same way.

4.11.5 Concomitant medication

Allowed medication: If adverse events occurred in a subject during the trial, the subject shall be allowed to have access to necessary medications and medical treatment.

Allowed vaccines: The interval between other vaccines and the test vaccine shall not be less than 10 days, and that between the live attenuated vaccine and the test vaccine shall not be less than 14 days; emergency vaccination can be conducted at any time according to the need of vaccination (e.g., rabies or tetanus vaccine), and as for this, each sub-center shall implement as per the immunization program policies in local province. If the concomitant vaccine inoculation led to the violation of the interval between the vaccination and the test vaccine inoculation against the requirements of this protocol, such a circumstance was handled as violation of the protocol and there was no need to terminate the trial. The investigator shall record any information on concomitant medication, including the drug name, dosage form, dosage and administration, and time of administration.

Medication records: In order to learn about the impact of drug use on the safety and immunogenicity of the vaccine during the trial or to collect adverse events that may be related to vaccination without omission, the investigator needed to collect the medications of subjects during the observation period by taking measures, and guide the subjects or their guardians in recording their visits and medication in the diary cards as much as possible. The following drugs shall be transcribed into the case report form (CRF):

- (1) Oral or injectable hormones/steroids (e.g., dexamethasone);
- (2) Anti-allergic drugs (e.g., chlorpheniramine);
- (3) Antipyretic/analgesic/non-steroidal anti-inflammatory drugs (e.g., aspirin, ibuprofen, fenbid);
- (4) Any vaccines or biological products;
- (5) Immunosuppressants;
- (6) Antibiotics
- (7) Anti-viral drugs;
- (8) Other drugs

4.12 TRIAL PROCEDURES

4.12.1 Recruitment of subjects

After the research site had been determined and approval had been secured from the ethics

Confidential 30 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

committee, the recruitment notices were issued to those meeting the requirements on age, vaccination history, and health status as per the protocol.

4.12.2 Informed consent

Prior to the enrollment, the investigator informed fully the subject or his guardian of information related to the clinical protocol, and the subject, his guardian, and the research doctor signed the informed consent form jointly in duplicate, with the subject keeping the copy.

4.12.3 Screening via physical examinations

The investigator carried out physical examinations on all subjects, including the height, body weight, body temperature, skin examinations, and routine blood test and indicators related to liver and kidney functions. The investigator carried out inquiries as per the "inclusion and exclusion criteria", observed the general state of subjects, examined the throat, heart, and lungs, and measured the blood pressure of subjects at 18 years old and above, thereby excluding subjects with a serious medical history, e.g., serious diseases, infectious diseases, and organ removal. The subjects were assigned to groups in accordance with the inclusion and exclusion criteria. The basic information of all the subjects was filled in the "Physical Examination Form". The "Original Record Book" was filled in.

4.12.4 Assignment of study numbers

After the subjects had provided their informed consent, and underwent the inclusion and exclusion criteria and physical examinations, those who met the enrollment criteria were assigned unique random numbers (vaccine number/study number) each in the order of their enrollment, and the "Original Record Book" was filled in. The name abbreviations of the subjects were filled in the "Random Assignment Form", and the signature of the investigator and date were filled in, too.

4.12.5 Blood collection before immunization

Subjects requiring IgG and OPA testing simultaneously prior to immunization were subjected to the collection of whole blood not less than 5.0 mL in volume by means of venipuncture before the first vaccination, and the other subjects were subjected to collection of whole blood not less than 3.0 mL in volume by venipuncture. Failure of the volume of blood collection to reach that required by the protocol while which did not affect the testing shall not be regarded as a violation of the protocol. The serum was separated and stored at –20 °C or below.

4.12.6 Inoculation of the vaccine

The vaccines with the corresponding numbers were obtained according to the assigned random numbers. After the numbers on the original record book had been verified, the name abbreviation of the subject was filled in on the outer packaging label of the vaccine, the inner label of the vaccine was filled in and pasted in the designated place of the original record book, and the subject information was verified again before the vaccination. A total of 0.5 mL of vaccine was injected into the deltoid muscle in the lateral aspect of the upper arm or the muscle in the anterolateral aspect of the thigh after full shaking of the vaccine; for infants under 12 months of age, the preferred vaccination site was the anterolateral thigh.

4.12.7 Medical observation

After each dose of vaccination, a 30-min observation was required on the trial site, the "Diary Card", the thermometer, and the scale were issued, and the legal guardians of the subjects or the clients were trained to use the thermometer, observe the adverse events, and fill out the "Diary Card", and an appointment was made for the time to return the "Diary Card" (the "Diary Card" was returned at day 8 after the vaccination, and the "Contact Card" was received in the meantime).

Confidential 31 / 310

4.12.8 Inoculation of second and third doses of vaccines and the enhanced vaccine

The subjects were given the second and third doses of vaccines and/or the enhanced vaccines as per the corresponding immunization procedures in the protocol, with a time range of +15 days. The contact card was recovered and reviewed before each dose. The contact card for the last dose of vaccination was recovered and reviewed during the blood collection 30 days after the full immunization.

4.12.9 Blood collection after immunization

Subjects requiring IgG and OPA testing simultaneously after the immunization were subjected to whole blood not less than 5.0 mL in volume via venipuncture 30 days after the basic immunization procedure, before the enhanced immunization (for subjects requiring enhanced immunization) and 30 days after the enhanced immunization (for subjects requiring enhanced immunization); the remaining subjects were subjected to whole blood not less than 3.0 mL in volume via venipuncture 30 days after the basic immunization procedure, before the enhanced immunization (for subjects requiring enhanced immunization) and 30 days after the enhanced immunization (for subjects requiring enhanced immunization). Failure of the volume of blood collection to reach that required by the protocol while which did not affect the testing shall not be regarded as a violation of the protocol. The serum was separated and stored at -20 °C or below. The time range for blood collection was +10 days.

4.12.10 Termination of the trial

The serum was sent to a designated laboratory for testing, the review for the entry of EDC data was completed, and after review of all materials and data clarification, the report on site closure was issued.

Protocol No.: 022152015003

4.13. SAFETY FOLLOW-UP

4.13.1 Definition of adverse reaction / time

Adverse events (AE): An unintended medical event observed in the subjects in a clinical trial that is not necessarily causally related to the vaccine or the administration process of the study vaccine. Adverse reaction: An unintended or damaging reaction during the process of vaccination according to the prescribed dosages and schedules, usually associated with vaccination.

Serious adverse reaction (SAE): Events such as hospitalization, prolonged hospitalization, disability, impairment of working ability, life-threatening or death, and congenital malformations occurred in clinical trials.

4.13.2 Timing and method for safety observation

All the subjects shall be observed for immediate reactions at the vaccination site for 30 min following each vaccination. The trained investigator conducted systematic observations and physical examinations on each subject, and recorded in detail both the local and systemic reactions in the subjects that occurred within 30 min. At 0-7 days after each dose of vaccination, the adverse reactions were systematically observed through the "Diary Card" filled in by the subject's legal guardian or his client; at 8-30 days, adverse events were collected through the "Contact Card" filled in by the subject's legal guardian or his client; at 6 months after the full basic immunization and at 6 months after the full enhanced immunization, serious adverse events were collected by active reporting in combination with regular follow-ups.

After each vaccination and before the next vaccination, the investigator shall transcribe the information on adverse reactions and other original information on the "Diary Card" and the "Contact Card" to the "Original Record Book" in a timely manner, and enter it into the Medidata Rave electronic data collection and management system after review and confirmation.

The duration, seriousness, and severity of any adverse event and its causal relationship with the test vaccine shall be evaluated. In the meantime, the measures taken for the test vaccine, the possible concomitant treatment and the results, and whether the event leads to the termination of the study shall be recorded.

4.13.3 Content and indicators for the follow-ups

Safety observations included all expectations and unexpectations, any medical events related or unrelated to vaccination during clinical trial observation.

Local reactions: Vaccination site's pains, itching, redness, swelling, induration, and rashes (vaccination site) and their degrees, and the body movement disorders.

Systemic reactions: The subjects were observed for fever, allergy, headache, fatigue/weakness, nausea/vomiting, diarrhea, muscle pains, cough, other discomfort or clinical adverse reactions.

Other events: Any medical event other than the above-mentioned ones, e.g., acute illness and accidental injury.

Criteria for grading: The systemic and local reactions after vaccination were judged in accordance with the "Guidelines for Criteria of Grading of Adverse Reactions in Clinical Trials of Preventive Vaccines" issued by the NMPA.

4.13.4 Correlation between adverse events and the vaccine

Definitely irrelevant: Other factors lead to the adverse events, and therefore, there is sufficient evidence to show that the adverse reactions/events occur as a result of other reasons while are irrelevant to vaccination.

Possibly irrelevant: Adverse events may occur as a result of other factors, such as the clinical conditions, other treatments, or concomitant medications in the subject, and are inconsistent with the known adverse reactions to vaccination.

Possibly relevant: Adverse events are consistent with the known information on the test vaccine,

Confidential 33 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

occur in a reasonable time sequence compared with vaccination, and/or are adverse events that arose before vaccination. The adverse event shows a causal relationship with the test vaccine, but it may also be related to other factors.

Very likely relevant: Adverse events are consistent with the known information on the test vaccine, there is a causal relationship between it and the test vaccine, and the events cannot be explained by other factors, e.g., the clinical conditions, other treatments, or concomitant medication in the subject.

Definitely relevant: The adverse events are consistent with the known information on the test vaccine, there is a causal relationship between it and the test vaccine, and such a relationship cannot be explained by other factors, e.g., the clinical conditions, other treatments, or concomitant medication in the subject. In addition, the adverse event appears again when the subject resumes the use of the test vaccine.

4.14 Immunogenicity observation

The venous blood was collected from the subject before the first dose of immunization and 30 days after the basic immunization; for subjects requiring enhanced immunization, it was necessary to collect the venous blood before the enhanced immunization and 30 days after the enhanced immunization. By testing the 13 pneumococcal serotype-specific IgG antibodies in all subjects before the first dose of immunization, 30 days after the basic immunization, before the enhanced immunization, and 30 days after the enhanced immunization, the proportions of subjects with the concentration of the specific IgG antibody $\geq 0.35 \mu\text{g/mL}$ in the various serotypes and the geometric mean concentrations of the specific antibody after the immunization with the test vaccine vs. the control vaccine were compared.

There were 100 subjects in each of the PCV13-TT group and the PCV7 group by age stratification. A total of 900 subjects were subjected to testing of serum specific antibody opsonization phagocytic activity (OPA), of whom a total of 300 subjects at the 2–6 months of age (minimum, 6 weeks) were tested for the serum specific antibody OPA 30 days after the basic immunization, before the enhanced immunization and 30 days after the enhanced immunization, a total of 200 subjects at the 7–11 months of age were tested for serum specific antibody OPA before the first dose, 30 days after the basic immunization, before the enhanced immunization and 30 days after the enhanced immunization, and a total of 400 subjects at the 12–71 months of age were tested for the serum specific antibody OPA before the first dose, and 30 days after the full immunization. As per the proportion of the sample size of the enrolled subjects 2 months of age in each clinical trial site to the total sample size of enrolled subjects 2 months of age, the subjects 2 months of age enrolled who required OPA testing were allocated to each trial site. For the other subjects whose age on enrollment required OPA testing, references shall be made to the proportion of sample sizes of various clinical trials, and the requirements on randomization shall be met. The distribution of study numbers for subjects requiring OPA testing at different ages across different clinical trial sites is shown in Table 7.

For subjects to undergo the testing of pneumococcal serotype-specific IgG antibody only, the venous blood not less than 3.0 mL in volume was collected each time; for subjects to undergo testing of pneumococcal serotype-specific IgG antibody and serum-specific antibody OPA, venous blood not less than 5.0 mL in volume was collected each time. Failure of the volume of blood collection to reach that required by the protocol while which did not affect the testing shall not be regarded as a violation of the protocol.

4.15. SAMPLE PROCESSING AND TESTING IN CLINICAL TRIALS

4.15.1 Processing, aliquoting, storage, and transportation of the blood samples

After collection, the venous blood was allowed to stand at room temperature for at least 2 h or coagulate fully using other measures, and then the serum was separated within 24 h. If the blood sample collected could not be centrifuged on that day, it shall be stored in a refrigerator at 2–8 °C. For a study number requiring IgG testing only, the separated serum was aliquoted into 2 tubes: tube 1 pending testing and the standby tube, and for serum aliquoting, priority was given to tube 1 pending testing. For a study number requiring IgG and OPA testing, the separated serum was aliquoted into 3 tubes: tube 1 pending testing, tube 2 pending testing, and the standby tube, and the serum was collected in the order of tube 1, tube 2, and the standby tube.

All the aliquoted serums were frozen at –20 °C or below, and the serum samples shall be kept under the frozen state when being transported.

4.15.2 Rules for number assignment to the serum samples

In principle, the study numbers should be used for the serum samples of subjects, and preceded by different sampling time points. For specific number assignment, see the "SOPs for Number Assignment to Biological Samples in Clinical Trials".

Test standards and quality control standards were provided by the testing laboratory.

4.15.3. Serum antibody detection

All serum samples detection were entrusted to National Institutes for Food and Drug Control.

The antibody concentration of IgG in serum samples was detected using enzyme-linked immunosorbent assay (ELISA), the subjects achieving IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ and the geometric mean concentration (GMCs) were calculated.

Opsonophagocytic Assay (OPA) was used to detect the antibody opsonophagocytic activity of serum samples, meanwhile the subjects achieving an OPA antibody $\geq 1:8$ and the geometric mean titers (GMTs) were calculated.

Testing standard samples and quality control standards were provided by the laboratory. The method and quality control of ELISA and OPA can be found in the standard procedure of laboratory.

4.16. STATISTICAL ANALYSIS

4.16.1. Statistical Project plan

4.16.1.1 Project plan

The personnel undertaking the statistical analysis task participated in the whole process, from trial design, implementation, formulation of the statistical analysis plan to the analyses and summary, established a database and carried out statistical analysis, wrote the statistical analysis plan and completed the clinical statistical report.

4.16.1.2 Selection of analysis sets

Full Analysis Set (FAS) refers to all subjects who complied with the intention-to-treat (ITT) analysis principle, who met the inclusion/exclusion criteria, and who have undergone randomization, and have received at least one dose of vaccine and at least one follow-up record.

Confidential 35 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

Completed Full Basic Immunization Per Protocol Set (PPS) refers to all subjects who met the inclusion/exclusion criteria, and who have undergone the full basic immunization and planned follow-up as per the protocol.

Completed Full Enhanced Immunization Per Protocol Set (PPS) refers to all subjects who met the inclusion/exclusion criteria and who have undergone full enhanced immunization and planned follow-up as per the protocol.

PPS exclusion cases: those who did not meet the inclusion criteria; those who failed to be followed up the data and information after vaccination; those who seriously missed information and data after randomization; those who met the criteria for suspension or withdrawal but did not withdraw; those who received the wrong vaccination or incorrect dosage.

If there was any inconsistency between the FAS and PPS analysis results, it should be discussed in the report.

Safety Set (SS): All subjects who received vaccination after randomization experienced the safety evaluation, and data that violated the protocol should not be excluded.

> Safety Set (SS)

All subjects who received at least one vaccination after randomization and had at least one information on safety evaluation should experience the safety evaluation. The SS was summarized according to overall situation, severity, and number of doses; and data that violated the protocol should not be excluded.

The safety analysis of each dose was based on the actual number of people vaccinated each time, that is, the population of the safety analysis of the first dose was subjects who were randomly assigned to receive the first dose of test vaccine; the population of the safety analysis of the second dose was subjects who were randomly assigned to receive the second dose of test vaccine; the population of the safety analysis of the third dose was subjects who were randomly assigned to receive the third dose of test vaccine; the population of the safety analysis of the enhanced dose was subjects who were randomly assigned to receive the enhanced dose of test vaccine.

Safety analysis PPS: subjects who were randomized and completed full immunization.

The safety analysis was mainly based on the results of the FAS and took the analysis results of the PPS as a reference.

> Immunogenicity Set

Completed Full Basic Immunization Immunogenicity PPS: All subjects who met the inclusion/exclusion criteria entered randomization, completed the full basic immunization and corresponding blood collection as per the protocol, and had the test results of serum immunogenicity. The investigator and laboratory testers should discuss and decide to accept or reject the subject whose serum antibody concentration was inverted before and after immunization.

Completed Full Enhanced Immunization Immunogenicity PPS: All subjects who met the inclusion/exclusion criteria entered randomization, completed the full enhanced immunization and corresponding blood collection as per the protocol, and had the test results of serum immunogenicity. The investigator and laboratory testers should discuss and decide to accept or reject the subject whose serum antibody concentration was inverted before and after immunization.

4.16.2 Statistical methods

General principle:

Statistical description: Quantitative indicators were listed out with the mean $\pm$ standard deviation, median, maximum and minimum values; qualitative indicators or grade indicators were listed out with the frequency distribution table. The antibody titer and antibody concentration of the

Confidential 36 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

immunogenicity indicators in this trial were expressed as geometric mean, standard deviation, median, maximum and minimum values, and 95% confidence interval, and the antibody titer and antibody concentration should be logarithmic transformed.

Statistical inference: Appropriate statistical analysis methods were used for inter-group comparison according to different applicable conditions. All statistical tests gave the test statistics and corresponding P values, and the P value was directly given when using the Fisher's exact probability test; all statistical tests were two-sided, and the P value less than or equal to 0.05 would be considered that the difference of the test was statistically significant (except for special instructions).

Drop-out analysis: The case number of enrollment, drop-out, and exclusion were listed out, as well as the number of completed case and the number of cases in each analysis set. The Fisher's exact probability test was used for inter-group comparison of the total drop-out rate and the drop-out rate caused by adverse events.

Homogeneity analysis: Appropriate statistical analysis methods were used for comparison between groups for the demographics of the selected vaccine recipients in each group and the characteristics of the relevant baselines, so as to investigate the equilibrium comparability between groups. Immunogenicity analysis: X2 test or Fisher's exact probability test was used to compare the differences of antibody positive seroconversion rates between the PCV13-TT group and the PCV7 group; the t test was used to compare the ratios of geometric mean concentration (GMC) of antibodies between the PCV13-TT group and the PCV7 group, and the test statistics and their corresponding P values were given. The P values were calculated directly by the Fisher's exact probability test, and $P \leq 0.05$ was taken as the standard with statistical significance. Safety analysis: The safety analysis was based on the SS. The frequency and case number of adverse events and adverse reactions in each group were listed out for calculation of the incidence and corresponding severity; the inter-group comparison of the adverse event (reaction) rates was performed using the Fisher's exact probability test, and the detailed list of various adverse events was given.

4.16.3 Statistical content

4.16.3.1 Demographic feature description

■ Numbers and reasons of enrollment, completion, and drop-out;

■ Demographic balance.

4.16.3.2 Statistical analysis of immunogenicity

■ The analysis was based on that all subjects met the requirements of the trial protocol and had a series of effective serums before and after immunization.

■ For a total of 7 serotypes, the proportion of samples with specific pneumococcal IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ of each serotype was counted in the PCV13-TT group and the PCV7 group, respectively, and chi-square test was used to statistically compare the difference between groups in each serotype, while the binomial distribution method was used to calculate the two-sided 97.5% (one-sided 98.75%) confidence interval of the difference of positive seroconversion rates (test group – control group), and a non-inferiority judgment of interval estimation was performed;

■ For a total of 7 serotypes, the GMC proportion (test group/control group) of specific pneumococcal IgG antibody of each serotype was calculated in the PCV13-TT group and the PCV7 group, respectively. After performing logarithmic conversion (based on 10), t test was used to statistically compare the difference between groups in each serotype, and the two-
 $X_1 - X_2$ ■ t df, 0.025S $X_1 - X_2$

sided 97.5% (one-sided 98.75%) confidence interval () of the

Confidential 37 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

difference of means was calculated after conversion (ratio after anti-logarithm), and a non-inferior judgment of interval estimation was performed;

■ For the newly added 6 serotypes, the proportion of samples with specific pneumococcal IgG antibody concentration $\geq 0.35 \mu\text{g/mL}$ of each serotype, and their two-sided 95% confidence intervals were calculated; chi-square test was used to statistically compare the differences between groups in each serotype, and to calculate the two-sided 95% confidence interval of the difference of positive seroconversion rates (test group – control group) (determination of the immunogenicity of the newly added 6 serotypes);

■ Subjects who were 2–6 months of age were the core target population of the study. Statistical comparisons were made for other age groups, and statistical descriptions but no statistical conclusions were given, and other age groups were incorporated into the 2- to 6-month-old PCV13-TT group for non-inferiority judgment between groups;

■ After a total of 7 serotypes of the test vaccine and the control vaccine passed the non-inferiority test, and if the newly added 6 serotypes of the test vaccine were better than the blank serotype of the control vaccine, then the positive seroconversion rate test of the specific pneumococcal IgG antibody of the newly added 6 serotypes was performed.

■ When the non-inferiority test of the test group 1 and the control group was established and the immunogenicity of the newly added 6 serotypes was determined, the non-inferiority test of the test group 2 and the control group was carried out; when the non-inferiority test of the test group 2 and the control group was established, the non-inferiority tests (sequential tests) of the test group 2 and the test group 1 were further performed.

4.16.3.3 Statistical analysis of clinical safety

The evaluation of the data would include a summary of the clinical response endpoints, the incidence of local and systemic clinical responses in all subjects during the observation period. Subjects with at least one adverse reaction in the test group and the control group within day 0–7, days 8–30, and days 0–30:

■ Statistical analysis of the percentage of adverse reactions in subjects;

■ Statistical analysis of the percentage of adverse reactions in each dose;

■ Statistical analysis of the percentage of local or systemic adverse reactions in subjects;

■ Statistical analysis of the percentage of adverse reactions of different severity levels in subjects;

■ The Fisher's exact probability test was used to statistically compare the incidence of various adverse events between the PCV13-TT group and the PCV7 group.

Analysis of adverse reaction symptoms in the PCV13-TT group and the PCV7 group:

■ Percent of occurrence of any systemic and local abnormal symptoms after vaccination of the subjects;

■ Percentage and intensity of body temperature reaction after each vaccination of the subjects;

■ The Fisher's exact probability test was used to statistically compare the incidence of various adverse events between the PCV13-TT group and the PCV7 group.

Adverse events leading to withdrawal and serious adverse events:

The cases with suspension in this study due to adverse events and occurrence of severe or serious adverse events were especially marked, and the incidence was statistically compared between groups.

Confidential 38 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

Usage of concomitant medication:

The frequency of concomitant medications was described in the PCV13-TT group and the PCV7 group, respectively, and the Fisher's exact probability test was used for statistical comparison.

4.17 MODIFICATION AND INTERIM ANALYSIS DURING THE TRIAL

This trial did not carry out modifications and interim analysis.

5 TRIAL COMPLETION AND BASELINE CONDITIONS

5.1 ALLOCATION OF SUBJECTS

This clinical trial was a multi-center study in three provinces. The phase I clinical trial was conducted in the Chaoyang District of Beijing Center for Disease Prevention and Control, and phase III clinical trial was completed in Hebei, Henan, and Shanxi provinces, respectively. A total of 2760 subjects were enrolled, 2753 of which completed at least one dose of vaccination. The number of subjects enrolled in each center is shown in Table 1.

5.2 TRIAL COMPLETION

In this study, a total of 3240 subjects were screened, and 2760 subjects were enrolled in this study, 1640 of which were in the PCV13-TT group (including subjects at 2 months of age in 0, 2, 4 program groups and no control) and 1120 of which were in the PCV7 group. Among the 2760 subjects enrolled in the study, 7 subjects voluntarily withdrew without the first dose of vaccination, and it was not due to adverse events, so a total of 2753 (99.75%) subjects completed at least one dose of vaccination, 1634 (99.57%) of which were in the PCV13-TT group and 1119 (99.91%) of which in the PCV7 group. Among the 2760 subjects enrolled in the study, 94 subjects dropped out (including the above 7 enrolled subjects who voluntarily withdrew without the first dose of vaccination), 62 (3.78%) of which were in the PCV13-TT group and 32(2.86%) of which were in the PCV7 group, and there was no difference between groups in the drop-out rate, $p = 0.2010$; 2666 (96.59%) subjects completed the trial, 1578 (96.22%) of which were in the PCV13-TT group and 1088 (97.14%) of which were in the PCV7 group. Among the 2760 subjects enrolled in the study, 2753 subjects were included in the SS, 1634 (99.57%) of which were in the PCV13-TT group and 1119 (99.91%) of which were in the PCV7 group; except for the type 9V, 2753 subjects were included in the FAS for the other serotypes, 1634 (99.63%) of which were in the PCV13-TT group and 1119 (99.91%) of which were in the PCV7 group; because one patient in the PCV13-TT group had insufficient pre-immunization Confidential 39 / 310 Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

serum samples, there was no pre-immunization serum test result of type 9V, and because the second dose of this subject dropped out, there was no post-immunization serum test result, therefore, 2752 subjects were included in the FAS for the type 9V, 1633 (99.63%) of which were in the PCV13-TT group and 1119 (99.91%) of which were in the PCV7 group; 2589 subjects were included in the PPS, 1525 (92.99%) of which were in the PCV13-TT group and 1064 (95.00%) of which were in the PCV7 group. The enrollment and completion of all subjects and subjects of each age group are shown in Tables 2-1 to 2-6 and the trial flow chart. Table 2-1 Completers of Enrolled Subjects

Protocol No.: 022152015003

5.4 DEVIATION OF THE TRIAL PROTOCOL
There was no serious deviation of the protocol in this trial. A total of 312 cases of individual protocol violations/deviations occurred in the trial, including 91 cases in the 2-month-old test group, 83 cases in the 3-month-old test group and 55 cases in the control group, 34 cases in the 7- to 11-month-old PCV13-TT group and 28 cases in the PCV7 group, 10 cases in the 12- to 23-month-old PCV13-TT group and 7 cases in the PCV7 group, 1 case in the 24- to 71-month-old PCV13-TT group and 3 cases in the PCV7 group. Four subjects with protocol violations/deviations withdrew the trial because they met the "Termination and Withdrawal Criteria". The protocol

violations/deviations were mainly due to the time of vaccination or blood collection exceeding the window period, followed by the lack of enough interval for other vaccinations. Infants under 12 months of age had a higher incidence.

5.5. DEMOGRAPHIC BASELINE OF SUBJECTS

The proportions of age and sex of subjects aged 2 months (minimum age: 6 weeks) and above are shown in Table 3 to

Table 7. Considering the age at which the comparator vaccine was approved for use in China, no PCV7 group was set up for 2 months old group (minimum age: 6 weeks). No statistical intergroup difference was observed in the mean age and sex distribution of SS and FAS data sets between the PCV13-TT and PCV7 groups in subjects aged 3-71 months. The baseline demographics were balanced and comparable.

5.6. PRE-IMMUNE ANTIBODY POSITIVE RATE AND ANTIBODY LEVEL BASELINE OF 13-VALENT PNEUMONIA SEROTYPES IN SUBJECTS

5.6.1. Pre-immune IgG Antibody Positive Rate of 13-valent Pneumonia Serotypes in Subjects (≥0.35 µg/mL)

The pre-immune antibody positive rates of subjects aged 2 months, 3 months, 7-11 months, 12-23 months and 24-71 months are shown in Table 6-1 to 6-6.

The pre-immune antibody positive rates of all 13-valent pneumonia serotypes in the 2-month study group were higher than those in the 3-month study group and control group.

No significant difference was observed in the antibody positive rates of all 13-valent pneumonia serotypes between the PCV13-TT group and PCV7 group of subjects aged 3 months, 7-11 months and 12-23 months.

The antibody positive rates in the study group of subjects aged 24-71 months were all higher than those in the control group. Except for serotypes 3, 6b, 7F and 14, the difference of antibody positive rate between the study group and the control group of other serotypes was statistically significant. The pre-immune antibody positive rates of 4 serotypes (6B, 14, 19A and 19F) in the study and control group of each age group were relatively higher than those of other serotypes.

5.6.2. Pre-immune IgG Antibody Level (GMC) of 13-valent Pneumonia Serotypes in Subjects
 The analysis of pre-immune antibody levels of subjects aged 2 months, 3 months, 7-11 months, 12-23 months and 24-71 months are shown in Table 7-1 to 7-6.
 The pre-immune GMCs of all 13-valent pneumonia serotypes in the 2-month study group were higher than those in the 3-month study group and control group.
 No significant difference was observed in GMCs of all 13-valent pneumonia serotypes between the PCV13-TT group and PCV7 group of subjects aged 3 months, 7-11 months and 12-23 months.
 GMC in the study group of subjects aged 24-71 months were all higher than those in the control

group. Except for serotypes 7F, 9V and 14, the difference of GMC between the study group and the control group of other serotypes was statistically significant.
The pre-immune GMC of 4 serotypes (6B, 14, 19A and 19F) in the study and control group of each age group were relatively higher than those of other serotypes.

5.7 CONCOMITANT MEDICATIONS

During the observation period of basic immunization phase, among subjects at the 3–71 months of age, 812 subjects (3753 cases) in the PCV13-TT group and 840 subjects (3728 cases) in the PCV7 group recorded concomitant medications, and among subjects at the 2 months of age, 495 subjects (3418 cases) recorded concomitant medications. The most commonly used drugs were vaccines and biological products, especially EPI vaccines for subjects who were at the 2–23 months of age, followed by antipyretic/analgesic/non-steroidal anti-inflammatory drugs, antibiotics and antiallergic drugs. The incidence of concomitant medications was the highest in subjects at the 2 and 3 months of age, and the lowest in subjects at the 24–71 months of age. There were no statistical differences between the PCV13-TT group and the PCV7 group in the incidence of various concomitant medications. During the observation period, the concomitant medications of the subjects are shown in Tables 8-1 to 8-6.

Study Results

6. IMMUNOGENICITY ANALYSIS

According to the protocol, the primary end point measurements of immunogenicity were the proportion of subjects whose serotype-specific pneumonia IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ (positive rate) and the geometric mean concentration (GMC) of IgG obtained 30 days after subjects in the study and control group completed the primary immunization series.

The positive conversion rate was defined as the proportion of subjects whose serotype-specific IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ after immunization in the original protocol. Since the pre-immune blood samples were examined before immunization in this clinical trial, and considering that the report would evaluate the antibody positive rate in the pre-immune antibody negative population, in order to distinguish the two descriptions, in this report, the proportion of subjects with serotype-specific IgG antibody concentration $\geq 0.35\mu\text{g/mL}$ after vaccination was described as "positive rate" in this report; the proportion of subjects whose pre-immune antibody concentration $< 0.35\mu\text{g/mL}$ while the post-immune antibody concentration was higher than 0.35 g/ml was described as "positive conversion rate" .

The 7 common serotypes in the study and control group all reached the standard of non-inferiority, which meant that the lower limit of bilateral 97.5% confidence interval (CI) of the positive rate difference (the study group minus the control group) was greater than -10%, or the lower limit of bilateral 97.5% confidence interval (CI) of the ratio of antibody GMC (the study group divided by the control group) was greater than 0.5.

The 6 additional serotypes were superior to the 7-valent vaccine, which meant that the lower limit of bilateral 95% confidence interval of antibody positive rate was greater than 0, the lower limit of bilateral 95% confidence interval of the ratio of antibody GMC was greater than 1, and the lower limit of bilateral 95% confidence interval of IgG antibody positive rate was no less than 70%.

The analysis would be based on the premise that all subjects met the requirements of the protocol, and effective serum samples needed to be collected from the subjects before and after immunization. Therefore, the PPS data set was used as the main analysis set in immunogenicity analysis.

Protocol No.: 022152015003

6.1. PRIMARY ENDPOINTS ANALYSIS

6.1.1. Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects aged 3-71 months after immunization in PCV13-TT and control group

6.1.1.1. Comparison of percentage of subjects achieving IgG antibody concentration ≥ 0.35 $\mu\text{g/mL}$ and the IgG antibody geometric mean concentrations (GMCs)

According to the protocol, the subjects aged 7-11 months, 12-23 months and 24-71 months were incorporate into the subjects aged 3 months for non-inferiority analysis (hereinafter referred to as "3-71 months").

Among the 7 common serotypes the proportion of responders at ≥ 0.35 $\mu\text{g/mL}$ in the PCV13-TT was more than 95%. The lower limit of 2-sided, 97.5% CI for the differences of positive rate between PCV13-TT and control group was greater than -10% (refer to table 9-1) in primary series. The GMCs for 6 of the 7 common serotypes (except serotype 6B) were greater than 3.0 $\mu\text{g/mL}$ in PCV13-TT and met the GMC ratio non-inferiority criterion (lower limit of 2-sided, 97.5% CI for the GMR>0.5) (refer to table 9-3). For serotype 6B, the GMC was 2.68 $\mu\text{g/mL}$. Therefore, the positive rate and GMC of 7 common serotype in the PCV13-TT were noninferior to the control group.

Among the 6 additional serotypes the proportion of responders at ≥ 0.35 $\mu\text{g/mL}$ in the PCV13-TT was at least 96%. The lower limit of 2-sided, 95% CI for the positive rate in PCV13-TT was greater than 70%. The lower limit of 2-sided, 95% CI differences of positive rate was greater than 0 and the GMC ratio (test group/control group) was greater than 1 between PCV13-TT and control group. Therefore, the positive rate and GMC of each additional serotype in the PCV13-TT were superiority to the control group.

The statistical analysis of positive rate of IgG antibody and the IgG antibody concentrations (GMCs) for subjects aged 3-71 months after immunization in PCV13-TT and control group was shown in tables 9-1 to 9-4.

6.1.2. Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects aged 2-6 months after immunization in PCV13-TT and control group

6.1.2.1. Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects aged 3 months after immunization in PCV13-TT and control group
Among the 7 common serotypes, the proportion of responders at ≥0.35 µg/mL in the PCV13-TT (except serotype 6B, the the proportion of responders at ≥0.35 µg/mL of 6B was 90.45%) was more than 97%. The positive rate and GMCs for 6 of the 7 common serotypes (except serotype 6B) were noninferior to the control group after primary series. The results were shown in tables 11-1 and 11-3.
Among the 6 additional serotypes the proportion of responders at ≥0.35 µg/mL in the PCV13-TT was at least 96%. The lower limit of 2-sided, 95% CI for the positive rate in PCV13-TT was greater than 70%. The lower limit of 2-sided, 95% CI differences of positive rate was greater than 0 and the GMC ratio (testgroup/control group) was greater than 1 between PCV13-TT and control group. Therefore, the positive rate and GMC of each additional serotype in the PCV13-TT were superiority to the control group.

The statistical analysis of positive rate of IgG antibody and the IgG antibody concentrations (GMCs) for subjects aged 3-71 months after immunization in PCV13-TT and control group was shown in tables 11-1 to 11-4.

 Protocol No.: 022152015003

6.1.2.2. Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects aged 2 months (minimum age of 6 weeks) in PCV13-TT and control group aged 3 months

Among the 7 common serotypes the proportion of responders at $\geq 0.35 \mu\text{g/mL}$ in the PCV13-TT aged 2 months was more than 97% using 0, 2, and 4 month dosing schedule. The positive rate of 7 common serotype in the PCV13-TT aged 2 month was noninferior to the control group aged 3 months using 0, 1, and 2 month dosing schedule, the result was shown in Table 12-1. The GMCs for 5 of the 7 common serotypes (except serotype 4 and 18C) in the PCV13-TT aged 2 month were noninferior to the control group aged 3 months. For serotype 4 and 18C, the GMC was $2.43 \mu\text{g/mL}$ and $2.04 \mu\text{g/mL}$ separately, the result was shown in Table 12-3.

Among the 6 additional serotypes (except serotype 5) the proportion of responders at $\geq 0.35 \mu\text{g/mL}$ in the PCV13-TT aged 2 months was at least 96% and the lower limit of 2-sided, 95% CI for the positive rate in PCV13-TT was greater than 70%. For serotype 5, the proportion of responders at $\geq 0.35 \mu\text{g/mL}$ was 90.87%. The lower limit of 2-sided, 95% CI differences of positive rate was greater than 0 and the GMC ratio (PCV13-TT/control group) was greater than 1 between PCV13-TT aged 2 months and control group aged 3 months. Therefore, the positive rate and GMCs of each additional serotype in the PCV13-TT aged 2 months were superiority to the control group.

The statistical analysis of positive rate of IgG antibody and the IgG antibody concentrations (GMCs) for subjects in PCV13-TT aged 2 months n and control group aged 3 months after immunization was shown in tables 12-1 to 12-4.

6.1.2.3. Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects aged 2 months (minimum age of 6 weeks) in PCV13-TT and control group aged 3months

The proportion of responders at ≥ 0.35 $\mu\text{g/mL}$ for 11 of 13 serotypes (except serotype 3 and 5) was more than 97% in PCV13-TT aged 2 months using 0, 2, and 4 month dosing schedule. For serotype 3 and 5, the proportion of responders at ≥ 0.35 $\mu\text{g/mL}$ was 96.06% and 90.87% separately. The lower limit of 2-sided, 97.5% CI differences of positive rate for 12 of 13 serotypes (except serotype 5) in PCV13-TT aged 2 months using 0, 2, and 4 month dosing schedule was less than -10%. For serotype 5, the lower limit of 2-sided, 97.5% CI differences of positive rate was -10.84%. And the positive rate of 12 serotype (except serotype 5) in the PCV13-TT aged 2 month using 0, 2, and 4 month dosing schedule was non-inferior to the PCV13-TT aged 3 months using 0, 1, and 2 month dosing schedule, the result was shown in Table 13-1. The lower limit of 2-sided, 97.5% CI of GMC ratio for 11 of 13 serotypes (except serotype 4 and 5) was greater than 0.5 in PCV13-TT aged 2 months.and PCV13-TT aged 3 months. For serotype 4 and 5, the lower limit of 2-sided, 97.5% CI differences of GMC ratio was 0.48 and 0.37 separately. The GMCs of 11 serotypes in PCV13-TT aged 2 months were non-inferior to the PCV13-TT aged 3 months, the result was shown in Table 13-3.

The statistical analysis of positive rate of IgG antibody and the IgG antibody concentrations (GMCs) for subjects in PCV13-TT aged 2 months and PCV13-TT aged 3 months after immunization was shown in tables 13-1 to 13-4.

6.1.2.4. Pneumococcal Serotype Antibody Concentrations in the Subjects in PCV13-TT (2 months) group, PCV13-TT (3 months) group and PCV7 (3 months) group
The results of pneumococcal serotype antibody concentrations for subjects in PCV13-TT (2 months) group, PCV13-TT (3 months) group and PCV7 (3 months) group post primary series were shown in Table 8 to Table 20. The reverse cumulative distribution curves were shown in Figure 1 to 13.

Figure 25 Reverse cumulative distribution curves, pneumococcal serotype 19A, IgG antibody

concentrations for subjects in PCV13-TT (2 months) group, PCV13-TT (3 months) group and PCV7 (3 months) group - post primary series.

6.1.3 Summary of primary endpoints

For major subjects (aged 2-6 month, minimum 6 weeks old), the positive rate and GMCs for 6 of the 7 common serotypes (except serotype 6B) in the PCV13-TT aged 3 month were noninferior to the control group aged 3 months using 0, 1, and 2 month dosing schedule. Among the 6 additional serotypes the lower limit of 2-sided, 95% CI for the positive rate in PCV13-TT was greater than 70%, and the positive rate and GMCs of each additional serotype in the PCV13-TT were superiority to the control group.

For subjects aged 3-71 months, among the 7 common serotypes, the positive rate and GMC of 7 common serotype in the PCV13-TT were noninferior to the control group. Among the 6 additional serotypes, the lower limit of 2-sided, 95% CI for the positive rate in PCV13-TT was greater than 70%. And the positive rate and GMC of each additional serotype in the PCV13-TT were superiority to the control group. The immunogenicity of the PCV13-TT aged 3-71 months was non-inferior to the control group aged 3-71months.

The positive rate of 7 common serotype in the PCV13-TT aged 2 month(minimun age of 6 weeks) was noninferior to the control group aged 3 months using 0, 2, and 4 month dosing schedule. The GMCs for 5 of the 7 common serotypes (except serotype 4 and 18C) in the PCV13-TT aged 2 month were noninferior to the control group aged 3 months.

Among the 6 additional serotypes, the lower limit of 2-sided, 95% CI for the positive rate in PCV13-TT aged 2 months was greater than 70%. The positive rate and GMCs of each additional serotype in the PCV13-TT aged 2 months were superiority to the control group aged 3 months.

Confidential 89 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

And the positive rate of 12 serotype (except serotype 5) in the PCV13-TT aged 2 month (minimun age of 6 weeks) using 0, 2, and 4 month dosing schedule was non-inferior to the PCV13-TT aged 3 months using 0, 1, and 2 month dosing schedule.

The positive rate of the subjects aged 3-71 months and major subjects (aged 2-6 month, minimum 6 weeks old) was greater than 90%. For the 6 additional serotypes, the lower limit of 2-sided, 95% CI for the positive rate was greater than 70%. The GMCs of most serotypes was greater than 2.0 µg/mL, except serotype 3 and 5, 6B and 6A in PCV13-TT aged 3 months.

6.2. SECONDARY ENDPOINT ANALYSIS

6.2.1. Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects aged 7-11months, 12-23 months and 24-71 months after immunization in PCV13-TT and control group

6.2.1.1 Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects aged 7-11 months after immunization in PCV13-TT and control group

(1)Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects aged 7-11 months

Among the 7 common serotypes the proportion of responders at ≥0.35 µg/mL in the PCV13-TT was more than 96%. The lower limit of 2-sided, 97.5% CI for the differences of positive rate between PCV13-TT and control group was greater than -10% (refer to table 15-1) in primary series.

The GMCs for the 7 common serotypes were greater than 2.0 µg/mL. The lower limit of 2-sided, 97.5% CI for the GMC ratio for 6 of the 7 common serotypes (except serotype 14) was greater than 0.5. For serotype 14, the lower limit of 2-sided, 97.5% CI for the GMC ratio was 0.45 and the GMC ration was 0.53.The result was shown in table 15-3

Among the 6 additional serotypes the lower limit of 2-sided, 95% CI for the positive rate in PCV13-TT was greater than 70%. The lower limit of 2-sided 95% CI differences of positive rate was greater than 0 and the GMC ratio (testgroup/control group) was greater than 1.

The statistical analysis of positive rate of IgG antibody and the IgG antibody concentrations (GMCs) for subjects aged 7-71 months after immunization in PCV13-TT and control group was shown in tables 15-1 to 15-4.

6.2.1.2. Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects aged 12-23 months after immunization in PCV13-TT and control group
(1) Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects aged 12-23 months
Among the 7 common serotypes the proportion of responders at ≥0.35 µg/mL in the PCV13-TT was more than 99%. The lower limit of 2-sided, 95% CI for the differences of positive rate between PCV13-TT and control group was greater than -10% (refer to table 17-1) after Complete immunization. The GMCs for 12 of 13 serotypes (except serotype 9V) were greater than 4.0 µg/mL in PCV13-TT. For serotype 9V, the GMC was 2.97 µg/mL. The lower limit of 2-sided, 95% CI for the GMC ratio was great than > 0.5 (refer to table 17-3).
Among the 6 additional serotypes the proportion of responders at ≥0.35 µg/mL in the PCV13-TT was at least 96%. The lower limit of 2-sided, 95% CI for the positive rate in PCV13-TT was greater than 70%.
The lower limit of 2-sided, 95% CI differences of positive rate for 5 of 6 serotypes (except serotype 19) was greater than 0 and the GMC ratio (testgroup/control group) was greater than 1 between PCV13-TT and control group. For serotype 19, the lower limit of 2-sided, 95% CI differences of positive rate was -0.51 and the differences of positive rate was 0.53.
The statistical analysis of positive rate of IgG antibody and the IgG antibody concentrations (GMCs) for subjects aged 12-23 months after immunization in PCV13-TT and control group was shown in tables 17-1 to 17-4.

(2). Pneumococcal Serotype antibody concentrations in the subjects aged 12-23 months in PCV13-TT group and PCV7 group
The results of pneumococcal serotype antibody concentrations for subjects aged 12-23 months after full immunizations in PCV13-TT group and PCV7 group were shown in Table 34. to Table 46 The reverse cumulative distribution curves were shown in Figure 53 to 65.

6.2.1.3 Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects aged 24-71 months after immunization in PCV13-TT and control group
(1)Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects aged 24-71 months
Among the 7 common serotypes the proportion of responders at $\geq 0.35 \mu\text{g/mL}$ in the PCV13-TT was more than 98%. The lower limit of 2-sided, 95% CI for the differences of positive rate between PCV13-TT and control group was greater than -10% (refer to table 19-1) after complete immunization. The GMCs for 13 serotypes was great than or equal to $3.84 \mu\text{g/mL}$. The lower limit of 2-sided, 95% CI for the GMC ratio for 12 of 13 serotypes (except serotype 14) was great than 0.5 (refer to table 19-3). For serotype 14, the lower limit of 2-sided, 95% CI for the GMC ratio was 0.49.
Among the 5 of 6 additional serotypes (except serotype 3) the proportion of responders at $\geq 0.35 \mu\text{g/mL}$ in the PCV13-TT was at least 96%. The lower limit of 2-sided, 95% CI for the positive rate in PCV13-TT was greater than 70%.
The lower limit of 2-sided, 95% CI differences of positive rate for 4 of 6 serotypes (except serotype 6A and 19A) was greater than 0 and the GMC ratio (test group/control group) was greater than 1 between PCV13-TT and control group. For serotype 6A and 19A, the lower limit of 2-sided, 95% CI differences of positive rate was -0.07 and 0.48 separately.
The statistical analysis of positive rate of IgG antibody and the IgG antibody concentrations (GMCs) for subjects aged 24-71 months after immunization in PCV13-TT and control group was shown in tables 19-1 to 19-4.

6.2.2 Analysis of antibody positive seroconversion rate and antibody level in the pre-immunization antibody negative population
6.2.2.1 Antibody positive seroconversion rate and antibody level in the pre-immunization antibody negative population at the 3–71 months of age
After basic immunization, among the pre-immunization antibody negative population at 3–71 months of age, 7 common serotypes in the PCV13-TT group had antibody positive seroconversion rates greater than 91%. Compared with the PCV7 group, the lower limits of the two-sided 97.5% confidence interval of the differences in antibody positive seroconversion rates were all greater than –10%, except for type 6B (–10.40%) (as shown in Table 21-1); the GMC ratios of post-immune antibodies of 7 common serotypes were all greater than 0.5, and the lower limits of 97.5% confidence interval of antibody GMC ratios were all greater than 0.5, except for the type 14 (0.45) (as shown in Table 21-3).
For the newly added 6 serotypes, the antibody positive seroconversion rates in the PCV13-TT group were all greater than 95%, and the lower limits of the two-sided 95% confidence interval were all greater than 70%. Compared with the PCV7 group, the lower limits of the two-sided 95% confidence interval of the differences in antibody positive seroconversion rates in the PCV13-TT group were all greater than 0, and the lower limits of the two-sided 95% confidence interval of the antibody GMC ratios were all greater than 1.
Statistical analyses of post-immunization IgG antibody positive seroconversion rate and antibody level in the PCV13-TT group and PCV7 group of the pre-immunization IgG antibody negative population at the 3–71 months of age are shown in Tables 21-1 to 21-4.

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

6.2.2.2 Antibody positive seroconversion rate and antibody level in the pre-immunization antibody negative population at the 2–6 months of age

(1) Antibody positive seroconversion rate and antibody level in the test group and control group of the pre-immunization antibody negative population at the 3 months of age
After basic immunization, among the pre-immunization antibody negative population at the 3 months of age, 7 common serotypes in the test group had relatively low antibody positive seroconversion rates, except for type 6B (88.58%), and the antibody positive seroconversion rates of other common serotypes were all greater than 96%. Compared with the control group, the lower limits of the two-sided 97.5% confidence interval of the differences in positive seroconversion rates were all greater than –10% (as shown in Table 22-1); the GMC ratios of antibodies were all greater than 0.5, except for type 6B (0.33), and the lower limits of 97.5% confidence interval of GMC ratios were all greater than 0.5, except for type 6B (0.26) and type 14 (0.46). (as shown in Table 22-3)

For the newly added 6 serotypes, the antibody positive seroconversion rates in the PCV13-TT group were all greater than 96%, and the lower limits of the two-sided 95% confidence interval of the positive seroconversion rates were all greater than 70%; compared with the PCV7 group, the lower limits of the two-sided 95% confidence interval of the differences in antibody positive seroconversion rates in the PCV13-TT group were all greater than 0, and the lower limits of the two-sided 95% confidence interval of the antibody GMC ratios were all greater than 1.

Statistical analyses of post-immunization IgG antibody positive seroconversion rate and antibody

level in the test group and control group of pre-immunization IgG antibody negative population at the 3 months of age are shown in Tables 22-1 to 22-4.

(2) Antibody positive seroconversion rate and antibody level of the pre-immunization antibody negative population in the test group at the 2 months of age and the control group at the 3 months of age

After basic immunization, among the pre-immunization negative population, 7 common serotypes in the test group at the 2 months of age (minimum, 6 weeks) had post-immunization antibody positive seroconversion rates greater than 98%. Compared with the control group at the 3 months of age, the lower limits of the two-sided 97.5% confidence interval of the differences in antibody positive seroconversion rates were all greater than -10% (as shown in Table 23-1); the GMC ratios of post-immunization antibodies were all greater than 2 µg/mL, the antibody GMC ratios were all greater than 0.5, except for type 4 and type 18C, and the lower limits of 97.5% confidence interval of antibody GMC ratios were greater than 0.5, except for type 4, type 14, type 18C, and type 19F (as shown in Table 23-3).

For the newly added 6 serotypes, the post-immunization antibody positive seroconversion rates in

Confidential 131 / 310

(3) Post-immunization antibody positive seroconversion rate and antibody level of pre-immunization antibody negative population in the test group at the 2 months of age and the test group at the 3 months of age

After basic immunization, among the pre-immunization negative population, except for type 5 (89.73%), the post-immunization antibody positive seroconversion rates of the remaining 12 serotypes in the test group at the 2 months of age (minimum, 6 weeks) were all greater than 96%. Compared with the test group at the 3 months of age, except for type 5, the lower limits of the two-sided 97.5% confidence interval of the differences in antibody positive seroconversion rates of the other serotypes were greater than -10% (as shown in Table 24-1); except for type 5 (0.41), the antibody GMC ratios were all greater than 0.5, and the lower limits of 97.5% confidence interval of antibody GMC ratios were all greater than 0.5, except for type 4 (0.48) and type 5 (0.36) (as shown in Table 24-3).

Statistical analyses of post-immunization antibody positive seroconversion rate and antibody level of pre-immunization IgG antibody negative population in the test group at the 2 months of age and the test group at the 3 months of age are shown in Tables 24-1 to 24-4.

6.2.2.3 Antibody positive seroconversion rate and antibody level in the pre-immunization
 antibody negative population at the 7–11 months of age
 After basic immunization, among the pre-immunization antibody negative population at 7–11
 months of age, 7 common serotypes in the PCV13-TT group had post-immunization antibody
 positive seroconversion rates greater than 94%. Compared with the PCV7 group, except for type
 Confidential 136 / 310

 Protocol No.: 022152015003

6B (–10.55%), the lower limits of the two-sided 95% confidence interval of the differences in
 antibody positive seroconversion rates of the other common serotypes were all greater than –10%
 (as shown in Table 25-1); except for type 14, the lower limits of the two-sided 95% confidence
 interval of post-immunization antibody GMC ratios of the other common serotypes were greater
 than 0.5 (as shown in Table 25-3).
 For the newly added 6 serotypes, the post-immunization antibody positive seroconversion rates in
 the PCV13-TT group were all greater than 90%, and the lower limits of the two-sided 95%
 confidence interval were all greater than 70%; compared with the PCV7 group, the lower limits of
 the two-sided 95% confidence interval of the differences in post-immunization antibody positive
 seroconversion rates in the PCV13-TT group were all greater than 0, and the lower limits of the
 two-sided 95% confidence interval of the post-immunization antibody GMC ratios were all greater
 than 1.
 Statistical analyses of post-immunization IgG antibody positive seroconversion rate and antibody
 level of the pre-immunization antibody negative population at the 7–11 months of age are shown
 in Tables 25-1 to 25-4.

6.2.2.4 Antibody positive seroconversion rate and antibody level in the pre-immunization antibody negative population at the 12–23 months of age
 After full immunization, among the pre-immunization antibody negative population at the 12–23 months of age, 7 common serotypes in the PCV13-TT group had post-immune antibody positive seroconversion rates greater than 98%. Compared with the PCV7 group, except for type 14 and type 19F (100 % of the positive seroconversion rate), the lower limits of the two-sided 95% confidence interval of the differences in post-immunization antibody positive seroconversion rates of the other common serotypes in the PCV13-TT group were all greater than –10% (as shown in Table 26-1); except for type 14, the GMC ratios of post-immunization antibodies were all greater than 0.5, and the lower limits of the two-sided 95% confidence interval of post-immunization antibody GMC ratios of the other common serotypes were all greater than 0.5 (as shown in Table 26-3).
 For the newly added 6 serotypes, the post-immunization antibody positive seroconversion rates in the PCV13-TT group were all greater than 95%, and the lower limits of the two-sided 95% confidence interval of the antibody positive seroconversion rates were all greater than 70%; compared with the PCV7 group, the antibody positive seroconversion rates of the newly added 6 serotypes were all greater than 0, and the lower limits of the 95% confidence interval of the differences in antibody positive seroconversion rates were all greater than 0, except for type 6A (96.63%) and type 19A (100%); and the lower limits of the two-sided 95% confidence interval of the post-immunization antibody GMC ratios in the PCV13-TT group were all greater than 1. Statistical analyses of IgG antibody positive seroconversion rate and antibody level of pre-immunization antibody negative population at 12–23 months of age are shown in Tables 26-1 to 26-4.

6.2.2.5 Antibody positive seroconversion rate and antibody level in the pre-immunization antibody negative population at the 24–71 months of age
After full immunization, among the pre-immunization antibody negative population at 24–71 months of age, the antibody positive seroconversion rates of the other common serotypes were all Confidential 141 / 310
Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

greater than 97% in the 7 common serotypes in the PCV13-TT group, except that the type 19F had no detection value, and the antibody geometric mean concentrations (GMCs) were all greater than 3.0 µg/mL except for the type 19F. Compared with the PCV7 group, except for type 19F and type 14 (the antibody positive seroconversion rates were 100%, and the rate differences with the PCV7 group were 0), the lower limits of the 95% confidence interval of the differences in antibody positive seroconversion rates of the other common serotypes were all greater than –10%; except for type 14 (the GMC ratios were 0.69), the lower limits of the 95% confidence interval of the antibody GMC ratios of the other common serotypes were all greater than 0.5. (Tables 27-1 and 27-3)

Among the 6 newly added types, except for type 3 (84.67%) and type 6A (89.36%), the other types all had an antibody positive seroconversion rate greater than 96%; for the lower limit of the two-sided 95% confidence interval of the antibody positive seroconversion rate, except for type 19A (only one negative case before immunization, and the antibody concentration of the subject reached positive seroconversion after immunization), the other newly added types all had a rate greater than 70%. Compared with the PCV7 group, except for type 6A (difference of positive seroconversion rate being 7.17%) and type 19A (difference of positive seroconversion rate being 10.0%), the other newly added types all had a lower limit of 95% confidence interval of difference greater than 0%; except for type 6A (GMC ratio being 1.42) and type 19A (GMC ratio being 38.13), the other newly added types all had a lower limit of 95% confidence interval of GMC ratio greater than 1. (Tables 27-1 and 27-3)

The number of negative subjects before immunization in types 6B, 14, and 19A was relatively few, and no result was found in type 19F in the PCV13-TT group, resulting in the difficulty of accurate evaluation.

The statistical results of IgG antibody positive seroconversion rate of negative population before immunization at the 24–71 months of age are shown in Tables 27–1 to 27–4.

6.2.3 The proportion of responders at $\geq 1.0 \mu\text{g/mL}$ for serotype-specific IgG response in PCV13-TT and control group

6.2.3.1. The proportion of responders at $\geq 1.0 \mu\text{g/mL}$ for serotype-specific IgG response in PCV13-TT and control group

Among the 7 common serotypes, the lower limit of 2-sided, 95% CI for the difference of the proportion of responders at $\geq 1.0 \mu\text{g/mL}$ in the PCV13-TT and control group was more than -10%, except serotype 6B in subgroup aged 3-71 months, serotype 6B and 23F in subgroup aged 3 months and serotype 9V in subgroup aged 7-11 months. The results were shown in table 28-1 to 28-4. Among the 6 additional serotypes, the lower limit of 2-sided, 95% CI for the ratio of the proportion of responders at $\geq 1.0 \mu\text{g/mL}$ in the PCV13-TT and control group was more than 0. The statistical analysis of proportion of responders at $\geq 1.0 \mu\text{g/mL}$ for serotype-specific IgG response in subjects aged 3-71 months after immunization in PCV13-TT and control group was shown in tables 28-1 to 28-10.

6.2.3.2.The proportion of responders at ≥ 1.0 µg/mL for serotype-specific IgG response in
 PCV13-TT and control group for subjects whose antibody responder ≥ 0.35 µg/mL pre-
 immunization

Among the 7 common serotypes, the lower limit of 2-sided, 95% CI for the difference of the
 proportion of responders at ≥ 1.0 µg/mL in the PCV13-TT and control group for subjects whose

antibody responder ■ 0.35 µg/mL pre-immunization was more than -%10, except serotype 6B in subgroup aged 3-71 months, serotype 6B and 23F in subgroup aged 3 months, serotype 9V in subgroup aged 7-11 months, and serotype 19F in subgroup aged 12-23 months. There were a little subjects whose antibody responder ■ 0.35 µg/mL pre-immunization for serotype 14 and 19F in subgroup aged 12-23 months, serotype 6B, 14 and 19A in subgroup aged 24-71 months, and there was no available value for 19F. Therefore, it was difficult to evaluate accurately.

Among the 6 additional serotypes, the lower limit of 2-sided, 95% CI for the difference of for the ratio of the proportion of responders at ≥1.0 µg/mL was more than 0 between the PCV13-TT and control group, except serotype 6A in subgroup aged 24-71months. For serotype 6A in subgroup aged 24-71months, the lower limit of 2-sided, 95% CI for the difference of for the ratio of the proportion of responders at ≥1.0 µg/mL was -0.43%.

The statistical analysis of proportion of responders at ≥ 1.0 µg/mL for serotype-specific IgG response in subjects aged 3-71 months after immunization in PCV13-TT and control group was shown in tables 29-1 to 29-10.

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

6.2.4 Non-inferiority test between the serotype-specific IgG response (positive rate or GMC values) for 6 additional serotypes in PCV13-TT and the lowest serotype-specific IgG response for the 7 common serotype in control group

6.2.4.1 Analysis for serotype-specific IgG response (positive rate or GMC values) for 6 additional serotypes in PCV13-TT aged 3-71 months and the lowest serotype-specific IgG response for the 7 common serotype in control group aged 3-71 months

The the lowest serotype-specific IgG response for the 7 common serotypes of positive rate was 23F in control group after primary series, the positive rate was 98.31% for serotype 23F. The lower limit of 2-sided, 97.5% CI for the differences of positive rate between the IgG response for 6 additional serotypes and the lowest IgG response of serotypes 23F was greater than -10% (refer to table 30-1) in primary series.

The lowest GMC was serotype 6B (3.11) for the 7 common serotypes in control group. The lower limit of 2-sided, 97.5% CI for the GMC ratio (the 6 additional serotype/serotype 6B) for 4 of the 6 additional serotypes (including serotypes 1, 6A, 7F and 19A) and serotype 6B for the 7 common serotypes in control group was great than 0.5, the result was shown in table 30-3.

The statistical analysis of serotype-specific IgG response (positive rate or GMC values) for 6 additional serotypes in PCV13-TT aged 3-71 months and the lowest serotype-specific IgG response for the 7 common serotype in control group aged 3-71 months were shown in table 30-1 to 30.4.

6.2.4.2. Analysis for serotype-specific IgG response (positive rate or GMC values) for 6 additional serotypes in PCV13-TT aged 3 months and the lowest serotype-specific IgG response for the 7 common serotype in control group aged 3 months
The the lowest serotype-specific IgG response for the 7 common serotypes of positive rate was 18C in control group after primary series, the positive rate was 97.74% for serotype 18C. The lower limit of 2-sided, 97.5% CI for the differences of positive rate between the IgG response for 6 additional serotypes and the lowest IgG response for serotype 18C was greater than -10% (refer to table 31-1) in primary series.
The lowest GMC was serotype 6B (3.52) for the 7 common serotypes in control group. Aged 3 months. The GMC ratio (the 6 additional serotype/serotype 6B) was greater than 0.5 among the 6 additional serotype except serotype 3. For serotype 3, te GMC ratio (the 6 additional serotype/serotype 6B) was 0.48. The lower limit of 2-sided, 97.5% CI for the GMC ratio was great than 0.5 among 3 of 6 additional serotypes (except serotypes 3, 5 and 6A). For serotype 3, 5 and 6 A, the lower limit of 2-sided, 97.5% CI for the GMC ratio was 0.42, 0.47 and 0.48, respectively. The result was shown in table 31-3.
The statistical analysis of serotype-specific IgG response (positive rate or GMC values) for 6 additional serotypes in PCV13-TT aged 3 months and the lowest serotype-specific IgG response for the 7 common serotype in control group aged 3 months were shown in table 31-1 to 31-4.

6.2.4.3. Analysis for serotype-specific IgG response (positive rate or GMC values) for 6 additional serotypes in PCV13-TT aged 7-11 months and the lowest serotype-specific IgG response for the 7 common serotype in control group aged 7-11 months

The the lowest serotype-specific IgG response for the 7 common serotypes of positive rate was 23F in control group after primary series, the positive rate was 96.83% for serotype 23F. The lower limit of 2-sided, 95% CI for the differences of positive rate between the IgG response for 6 additional serotypes and the lowest IgG response for serotype 27F was greater than -10% (refer to table 32-1) in primary series.

The lowest GMC was serotype 6B (2.20) for the 7 common serotypes in control group. aged 3 months. The lower limit of 2-sided, 95% CI for the GMC ratio (the 6 additional serotype/serotype 6B) was great than 0.5 among 5 of 6 additional serotypes (except serotype 5). The result was shown Confidential 160 / 310

6.2.4.4. Analysis for serotype-specific IgG response (positive rate or GMC values) for 6 additional serotypes in PCV13-TT aged 12-23 months and the lowest serotype-specific IgG response for the 7 common serotype in control group aged 12-23 months

The the lowest serotype-specific IgG response for the 7 common serotypes of positive rate and GMC was 6B in control group after complete immunization, the positive rate and GMC was 98.43% and 2.71 separately for serotype 6B. The lower limit of 2-sided, 95% CI for the differences of positive rate between the IgG response for 6 additional serotypes and the lowest IgG response for serotype 6B was greater than -10% (refer to table 33-1) after complete immunization. The lower limit of 2-sided, 95% CI for the GMC ratio (the 6 additional serotype/serotype 6B) was great than 0.5 among 4 of 6 additional serotypes (except serotypes 3 and 5). The result was shown in table 33-3.

The statistical analysis of serotype-specific IgG response (positive rate or GMC values) for 6 additional serotypes in PCV13-TT aged 12-23 months and the lowest serotype-specific IgG - response for the 7 common serotype in control group aged 12-23 months were shown in table 33-1 to 33-4.

6.3. BOOSTER DOSE ANALYSIS

The primary population of Per Protocol Set for booster dose analysis included subjects aged 2 months (minimum 6 weeks), subjects aged 3 months and subjects aged 7-11 months who completed immunization. The proportion of subjects achieving serum IgG antibody concentrations ≥ 0.35 $\mu\text{g/mL}$, was calculated, the IgG geometric mean antibody concentration (GMC) was measured and the antibody increase fold was calculated thirty days after the booster dose.

6.3.1. Status for booster dose

A total of 1,884 subjects should be enrolled to receive a booster dose, while 1833 subjects received a booster dose actually, including 482 subjects aged 2 months, 486 subjects aged 3 months in PCV13-TT and 490 subjects aged 3 months in control group. There were 51 subjects dropped off during the study. The primary reason for dropped off was voluntary withdrawal rather than adverse reaction. There were 9 subjects withdrawals due to serious adverse events or non-serious adverse events. The safety set (SS) included 1845 subjects. For immunogenicity analysis, the full analysis set (FAS) included 1840 subjects and the pre protocol set (PPS) included 1813 subjects.

The status for subjects

The details for completion and shedding of subjects with booster dose were shown in table 35-1 to 35-3.

6.3.2. Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis
6.3.2.1. Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis
for subjects in PCV13-TT and control group aged 3 months before and after booster dose
(1).Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for
subjects in PCV13-TT and control group aged 3 months before booster dose
Before booster dose, for 4 of the 7 common serotypes (except serotypes 4, 9V and 18C), the
proportion of responders at ≥ 0.35 $\mu\text{g/mL}$ was more than 96% in the PCV13-TT. The GMCs for
the 7 common serotypes were greater than 0.35 $\mu\text{g/mL}$ in PCV13-TT and control group (refer to
table 36-3).
For 4 of the 6 additional serotypes (except serotypes 1, 3 and 5), the proportion of responders at
 ≥ 0.35 $\mu\text{g/mL}$ was more than 94% in the PCV13-TT. The GMCs for the the 6 additional serotypes
were greater than 0.35 $\mu\text{g/mL}$ in PCV13-TT and control group.
Before booster dose, among the 13 serotypes, 6B, 14, 19F, 23F, 6A, 7F and 19A did not show a
significant decrease of positive rate after primary series, but the antibody levels of each serotypes
decreased in different degrees compares to levels when primary series finished. The trends for
positive rate and antibody level were the same for each serotype in PCV13-TT and control group
aged 3 months.
(2) Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for
subjects in PCV13-TT and control group aged 3 months after booster dose
For subjects aged 3 months, among the 7 common serotypes, the positive rate and GMC of 7
common serotype in the PCV13-TT were non-inferior to the control group. After booster dose,
both the PCV13-TT and the control group had a 3.7-fold increase in antibody GMCs .(refer to
Table 36-4). Among the 7 common serotypes (except serotypes 4 and 18C), the proportion of
responders at ≥ 1.0 $\mu\text{g/mL}$ was greater than 95% in the PCV13-TT except for 93.26% for type 4
and 88.84% for type 18C. The lower limit of 2-sided, 95% CI for the difference of proportion ratio
of responders at ≥ 1.0 $\mu\text{g/mL}$ was greater than -10% after booster dose(refer to table 36-2).
Among the 6 additional serotypes, the positive rate for PCV13-TT was superiority to the control
group, except serotype 19A, the lower limit of 2-sided, 95% CI for the positive rate was -0.2%.
The GMCs for the 6 additional serotypes were superiority to the control group, the PCV13-TT had
a at least 3.5-fold increase in antibody GMCs after booster dose.
Among the 6 additional serotypes (except serotypes 1, 3 and 5), the proportion of responders at
 ≥ 1.0 $\mu\text{g/mL}$ was greater than 95% in the PCV13-TT. The lower limit of 2-sided, 95% CI for
difference of the proportion ratio of responders at ≥ 1.0 $\mu\text{g/mL}$ was greater than 0 after booster dose.
(3) Analysis for serotype-specific IgG response (positive rate or GMC values) for 6 additional
serotypes in PCV13-TT aged 3 months and the lowest serotype-specific IgG response for the

Confidential 166 / 310
Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

7 common serotype in control group aged 3 months
The the lowest serotype-specific IgG response for the 7 common serotypes of positive rate was
18C in control group afterbooster dose, the positive rate was 99.59%.
The lower limit of 2-sided, 97.5% CI for the differences of positive rate between the IgG response
for 6 additional serotypes and the lowest IgG response for serotype 18C was greater than -10%
(refer to table 36-5) after booster dose.
The lowest GMC was serotype 9V (3.87) for the 7 common serotypes in control group aged 3
months. The GMC ratio (the 6 additional serotype/serotype 9V) was greater than 0.5 among the 6
additional serotypes except serotypes 3 and 5. For serotypes 3 and 5, the GMC ratio (the 6
additional serotype/serotype 6B) was 0.49 and 0.41. The lower limit of 2-sided, 97.5% CI for the
GMC ratio was great than 0.5 among 4 of 6 additional serotypes (except serotypes 3 and 5). For
serotype 3 and 5, the lower limit of 2-sided, 97.5% CI for the GMC ratio was 0.44 and 0.37,
respectively. The result was shown in table 36-6.
The analysis of positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis
for subjects aged 3 months before and after booster dose in PCV13-TT and control group were
shown in table 36-1 to 36-4, and the forest chart was shown in Figures 159 to 162.
The statistical analysis of serotype-specific IgG response (positive rate or GMC values) for 6
additional serotypes in PCV13-TT aged 3 months and the lowest serotype-specific IgG response
for the 7 common serotype in control group aged 3 months were shown in table 36-5 to 36-6.

6.3.2.3. Positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects in PCV13-TT aged 2 months and PCV13-TT aged 3 months before and after booster dose

Before booster dose, the positive rates of serotypes 4, 5 and 6B in PCV13-TT aged 2 months were significantly lower than the positive rate in PCV13-TT aged 3 months. and there was no statistically significant difference between the two PCV13-TTs for the other serotypes. After booster dose, the positive rate of 13 serotypes in PCV13-TT aged 2 months were non-inferiority to positive rate of 13 serotypes in PCV13-TT aged 3months (refer to table 38-1). Before booster dose, the GMCs for serotype 4,5,19A in subjects in PCV13-TT aged 2 months were lower than the GMCs for serotype 4,5,19A in subjects in PCV13-TT aged 3 months. While the GMC for serotype 9V in PCV13-TT aged 2 months was higher than PCV13-TT aged 3 months. And there was no statistically significant difference between the two PCV13-TTs for the other

serotypes. After booster dose, the GMCs of 13 serotypes in PCV13-TT aged 2 months were non--inferiority to the GMCs of 13 serotypes in PCV13-TT aged 3months (refer to table 38-3). After booster dose, antibody GMCs had at least 3-fold increase in PCV13-TT aged 2 months The analysis of positive rate of IgG antibody and the IgG antibody concentrations (GMCs) analysis for subjects in PCV13-TT aged 2 months and teatl group aged 3 months before and after booster dose were shown in table 38-1 to 38-4.

6.3.2.4. Analysis for antibody concentrations in the PCV13-TT aged 2 months and 3 months
and control group aged 3 months after booster dose
The results of pneumococcal serotype antibody concentrations for subjects in PCV13-TT (2
months) group, PCV13-TT (3 months) group and PCV7 (3 months) group post booster dose were
shown in Table 60. to Table 72. The reverse cumulative distribution curves were shown in Figure 14
to 26.

6.3.2.6. Pneumococcal Serotype antibody concentrations in the subjects aged 7-11 months in PCV13-TT group and PCV7 group after booster dose
The results of pneumococcal serotype antibody concentrations for subjects aged 7-11 months after booster dose in PCV13-TT group and PCV7 group were shown in Table 73. to Table 85. The reverse cumulative distribution curves were shown in Figure 40 to 52.

6.3. SUMMARY OF BOOSTER DOSE
6.3.1. Summary of booster dose for subjects aged 2-6 months
In subjects aged 3 months, after booster dose of PCV13-TT, the OPA positive rates of all common serotypes exceeded 98%, reaching the lower limit defined in non-inferiority test compared to PCV7 group. The OPA positive rates of additional serotypes all exceeded 95% and reached the lower limit defined in superiority test except for serotype 6A as compared with PCV7 group. The positive rate of serotype 6A was 95.83% in PCV13-TT group and 92.78% in PCV7 group, which were both at a relatively high level. The lower limit of 95% CI for difference of positive rates was -3.47%, which was consistent with the reported evidence of possible cross-protection between pneumococcal serotype 6B and 6A in prior literature. The GMT of serotype 7F in PCV13-TT (3 months) group post booster dose rose to a similar level as that after primary series, while GMTs of other serotypes after booster dose were higher than that after primary series to varied degrees. In subjects aged 2 months, after booster dose of PCV13-TT, the OPA positive rates of 10 serotypes reached 100%, meanwhile the positive rates of other 3 serotypes exceeded 95%. The OPA positive rates of 7 common serotypes all reached the lower limit defined in non-inferiority test when compared with PCV7 (3 months) group. Five of the 6 additional serotypes reached the lower limit defined in superiority test except for 6A. The positive rate for serotype 6A was 97.83% after

booster dose in PCV13-TT (2 months) group. The lower limit of 95% CI for the difference between the PCV13-TT (2 months) group and PCV7 (3 months) group was -0.91%, which was similar to the result obtained in PCV13-TT (3 months) group for serotype 6A, consistent with the reported Confidential 203 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

evidence of possible cross-protection between pneumococcal serotype 6B and 6A. The overall trend of the OPA positive rates for all serotypes was similar in PCV13-TT (2 months) group vs PCV7 (3 months) and PCV13-TT (3 months). Through booster dose, the GMT of serotype 3 rose to a similar level as that after primary series, while GMTs of other serotypes after booster dose were higher than that after primary series to varied degrees.

6.3.2. Summary of booster dose for subjects aged 7-11 months

In subjects aged 7-11 months, after booster dose of PCV13-TT, the OPA positive rates of 13 serotypes all exceeded 90%, among which the positive rates of 8 serotypes reached 100%. For OPA positive rates, the lower limit of 95% CI for the difference of OPA positive rates (PCV13-TT - PCV7) was greater than -10% (lower reference limit) for the 7 common serotypes in PCV13-TT group vs PCV7 group. The lower limit of 95% CI for the difference of OPA positive rates all exceeded 0% in all 6 additional serotypes. For the GMT of OPA, the lower limit of 95% CI for GMT ratio (PCV13-TT / PCV7) was greater than 0.5 (lower reference limit) for 5 of the 7 common serotypes in PCV13-TT group vs PCV7 group. The only two serotypes with lower limit of 95% CI for GMT ratio lower than 0.5 (lower reference limit) in PCV13-TT group were serotype 6B and 23F, while GMTs (PPS) of serotype 6B and 23F in PCV13-TT group had achieved 110- and 197-fold increase as compared with the positive threshold (1:8), respectively. The lower limits of 95% CI for intergroup GMT ratio in 6 additional serotypes were all higher than 1.

7. SAFETY ANALYSIS

7.1. INCIDENCE OF ADVERSE EVENTS

7.1.1. Incidence of Adverse Events for subjects aged 3-71 months

In Phase III clinical trial, 790 (2282 events) cases of adverse events were observed in the 3-71 month group, and 851 (2440 events) cases of adverse events were observed in the control group. The overall incidence of adverse events was 70.73% and 76.05% in the PCV13-TT and the control group, respectively. There was significant difference in the incidence of adverse events between groups, and the overall incidence of adverse events in the PCV13-TT was lower than that in the control group.

The incidence of adverse events related to the study vaccine was 60.79% in the PCV13-TT and 64.79% in the control group. The PCV13-TT was slightly lower than the control group but no significant difference was observed.

The incidence of vaccine-independent adverse events was 35.00% in the PCV13-TT and 36.82% in the control group. No significant difference was observed between groups.

The incidence of adverse events with grade 3 severity was 7.07% in the PCV13-TT and 5.36% in the control group. The grade 3 adverse events related to the study vaccine were 4.21% and 2.41% respectively, and the grade 3 adverse events unrelated to the study vaccine were 3.13% and 3.13% respectively. No significant difference was observed.

Since the subjects in this study were all infants and toddlers, in order to determine the severity of SAE in time for risk control, this study assessed the severity of the solicited symptoms or the most severe symptoms in SAE by referring to the Guidelines for The Classification of Adverse Reactions in Clinical Trials of Prophylactic Vaccines. A total of 31 subjects with 41 cases of grade 4 adverse events were observed (all included as SAE and detailed analysis was given in 7.1.7), of which 15 cases were in PCV13-TT and 16 in control group. The incidence was 1.34% and 1.43% respectively. Only 1 case of adverse event in the PCV13-TT was probably related to the study vaccine. The incidence of grade 4 adverse events related to the study vaccine were 0.09% and 0.00% in the PCV13-TT and the control group, and the incidence of grade 4 adverse events unrelated to the study vaccine was 1.25% and 1.43%, respectively. No significant intergroup difference was observed for grade 4.adverse event.

Confidential 204 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

The incidences of adverse events were higher in 3 months and 7-11 months age groups, with lower rates noted in PCV13-TT than in control group.

The incidences of adverse events in the 3-71 month group and the control group are shown in Table 42-1 to 42-5.

7.1.2. Adverse events within 30 minutes time period, during the first 7 days and withing 30 days after vaccination

7.1.2.1. Adverse events occurred within 30 minutes after vaccination

Adverse events within a 30 minutes time period
The incidence of adverse events within a 30 minutes time period after vaccination for each subgroup was shown in Tables 43-1 to 43-5.
The incidence of adverse events within a 30 minutes time period after vaccination was 14.95% and 16.71% in the test and PCV7 group, respectively. The severity of adverse events was predominantly level 1, with no significant differences in the incidence of adverse events and in the incidence of adverse events among the subgroups.

7.1.2.2. Adverse events during the first 7 days after vaccination

Adverse events mainly occurred during the first 7 days after vaccination. The incidence of adverse events 7 days after vaccination was 63.56% and 67.20% in the test and PCV7 group, respectively. The incidence of adverse events related to the study vaccine was 60.25% in the PCV13-TT and 63.90% in the control group, respectively. There was no significant differences in the incidence of adverse events and in the incidence of adverse events among the subgroups.

The incidence of adverse events 7 days after vaccination in test and PCV7 group was shown in Tables 44-1 to 44-5.

7.1.3. Adverse events related to study vaccine

7.1.3.1. Solicited adverse events

(1) Systemic reactions in 3-71 months old PCV13-TT and control group

The incidence of systemic adverse reactions in the study and the control group was 54.52% and 58.98%, respectively, and the incidence of systemic adverse reactions in the PCV13-TT was lower than that in the control group (p=0.0364). The main symptom of systemic adverse reaction was fever, which was less in PCV13-TT than in control group (p=0.0035). No significant difference was observed for the incidence of other systemic reactions between groups. The systemic reactions were primarily grade 1 or 2, similar incidence rates of grade 3 systemic reactions were noted between PCV13-TT and control group. Systemic reactions and their incidence at different time observed in study and control group of the 3-71 months olds are shown in Table 47-1.

(2)Local reactions in 3-71 months old PCV13-TT and control group
The incidence of local adverse reaction was 15.67% in the PCV13-TT and 14.66% in the control group, indicating no significant difference. The most common symptom of local adverse reaction was redness at injection site, followed by swelling and pain. The severity of local reactions was mainly grade 1. The incidence of local reactions with severity of grade 3 in the PCV13-TT was higher than that in the control group (p=0.0007). The symptoms of local reactions achieving grade 3 in the PCV13-TT were mainly redness, swelling and induration, however, no intergroup difference was observed with respect to redness, swelling and induration in 3-month-old population. The symptoms mainly occurred in the population over 7-month-old. Local reactions and their incidence at different time observed in study and control group of the 3-71 months olds are shown in Table 47-2.

(3)The time of occurrence of systemic and local reactions in 3-71 months old PCV13-TT and control group

The occurrence of systemic and local adverse reactions in the PCV13-TT and the control group 30 minutes and 7 days after vaccination are shown in Table 48-1 and 48-2. Within 30 minutes, only fever was observed as systemic reaction. The incidence of fever in the control group was higher than that in the PCV13-TT. Redness was the main local reaction, and was similar between groups in terms of incidence rate.

(4)Systemic reactions and local reactions observed in study and control group of different age groups

No significant difference was observed in the incidence of systemic and local adverse reactions between study and control group of the 3 months olds, the 7-11 months olds, the 12-23 months olds and the 24-71 months olds.

Fever was the most common systemic reaction in all age groups. The incidence of fever in 3-month age PCV13-TT was lower than that in the control group ($p=0.0072$), and the incidence of allergies in 7-11 month age PCV13-TT was lower than that in the control group ($p=0.0301$), the incidence of local itching in 24-71 months old PCV13-TT was higher than that in the control group ($p=0.0358$). No significant difference was observed between study and control group of other ages in fever and other systemic or local symptoms

The incidence of systemic and local reactions in the study and control group of each age stratification is shown in Table 49-1 to 49-4.

7.1.3.2 Unsolicited events related to study vaccine

Unsolicited adverse events (coincidental) that occurred 0-30 days after vaccination collected from the study and PCV7 group during the observation period are shown in Table 50-1 to 50-7.

Vaccine-related unsolicited events in the study and PCV7 group were mainly respiratory, thoracic and mediastinal disorders, gastrointestinal disorders, infections and infestations, general disorders and administration site conditions. General disorders and administration site conditions occurred mainly in 8-30 days after vaccination, and the most common symptom was fever. Considering from the time of occurrence, unsolicited adverse events related to the study vaccine occurred mainly within 7 days after vaccination. In view of age groups, more types and higher incidence rates of unsolicited adverse events related to the vaccine were reported in the 3-month age group, and a decreasing trend was observed in 7-11 month age group, 12-23 months age group and 24-71 months age group sequentially.

No significant difference was observed between the study and control group in the incidence of any vaccine-related unsolicited adverse events.

7.1.4. Adverse events unrelated to study vaccine

7.1.4.1. Solicited events unrelated to study vaccine

A total of 231 cases (313 events) were determined by the investigators as solicited adverse events unrelated to study vaccine, including 109 cases in the PCV13-TT and 122 cases in the control group, and the incidence rate was 9.76% and 10.90% respectively. No significant intergroup difference was observed for the incidence of vaccine-independent solicited adverse events.

Symptoms of solicited adverse events unrelated to study vaccine were mainly fever, cough, diarrhea, and nausea / vomiting.

The severity of vaccine-independent solicited adverse events was concentrated on grade 1 and 2.

The severity of 6 cases (0.54%) in the PCV13-TT and 13 cases (1.16%) in the control group were determined to be grade 3. No significant intergroup difference was observed in the incidence.

Fever, cough, and diarrhea were the most common vaccine-independent solicited adverse events in all age groups.

Incidences of solicited adverse events unrelated to study vaccine are shown in Table 51-1 to 51-5.

7.1.4.2. Unsolicited events unrelated to study vaccine

A total of 717 cases (1155 events) of unsolicited adverse events unrelated to study vaccine were collected during the observation period, including 325 cases in the PCV13-TT and 365 cases in the control group, with incidence rates being 31.51% and 32.62%, respectively. No significant intergroup difference was observed for the incidence of vaccine-independent unsolicited adverse events.

Unsolicited adverse events unrelated to study vaccine were primarily infections and infestations, followed by gastrointestinal disorders, respiratory, thoracic and mediastinal disorders, general disorders and administration site conditions. Fever was observed with the highest proportion within the class of general disorders and administration site conditions, and was of relatively higher incidence rates among subjects aged 3 months, 7-11 months, and 12-23 months that were within 2 years old. No significant difference was observed for unsolicited adverse events between the PCV13-TT and the control group.

Incidences of vaccine-independent unsolicited adverse events in the study and control group of each age group are shown in Table 52-1-1 to 52-5.

7.1.5. The Incidence of Adverse Events Observed in 2-month and 3-month Subjects in Different Immunization Schedules

The comparison of overall incidence of adverse events in the 2-month study group (0, 2, 4 schedule) with that in the 3-month study and control group was shown in Table 53-1.

No significant difference was observed in the overall adverse events, vaccine-related adverse events and vaccine-independent adverse events between the 2-month study group and the 3-month groups. The incidence of adverse events with a severity reaching grade 3 in the 2-month study group was lower than that in the 3-month study and control group.

The incidence of hypodynamia/somnolence and local redness in the 2-month study group was lower than that in the 3-month study and control group. The incidence of fever and redness in the 2-month study group and 3-month study group was lower than that in the 3-month control group. No significant difference was observed in the incidence of other adverse reactions among the three groups.

The incidence of adverse events in the 2-month study group and the 3-month study/control group in different immunization schedules are shown in Table 53-1 to 53-2.

7.1.6. The Comparison of Adverse Events after Vaccination of Each Dose
 7.1.6.1. The Incidence of Adverse Events after Vaccination of Each Dose in the 2-month
 Group and 3-month Study/Control Group
 The number of adverse events did not increase with the number of vaccination in 2-month group
 and 3-month study/control group. The incidence of vaccine-related adverse events after
 vaccination of each dose in the 2-month and 3-month PCV13-TT groups was lower than that in
 the 3-month control group.
 The incidence of vaccine-related adverse events after the first dose of vaccination in the 2-month
 and 3-month study groups was lower than that in the 3-month control group and the difference was
 statistically significant ($P = 0.0344$). The incidence of fever and local redness in the 2-month and
 3-month PCV13-TT group was lower than that in the 3-month control group, and the incidence of
 hypodynamia/somnolence in the 2-month study group was lower than that in the 3-month study
 and control group. The difference was statistically significant ($P = 0.0064$). No intergroup
 significant difference was observed for other symptoms.
 The incidence of vaccine-related adverse events after the second dose of vaccination in the 2-
 month and 3-month PCV13-TT group was lower than that in the 3-month control group and the
 difference was statistically significant ($P = 0.0242$). The incidence of local redness in the 2-month
 and 3-month PCV13-TT group was lower than that in the 3-month control group and the difference
 was statistically significant ($P = 0.0160$). No intergroup significant difference was observed for
 other symptoms.
 The incidence of vaccine-related adverse events after the third dose of vaccination in the 2-month
 and 3-month PCV13-TT group was 41.35% lower than that in the 3-month control group and the
 difference was statistically significant ($P = 0.0492$). The incidence of local redness in the 2-month
 study group was lower than that in the 3-month study and control group and the difference was
 statistically significant ($P = 0.0015$). The incidence of local induration in the 2-month study group
 was lower than that of the 3-month study group. No intergroup significant difference was observed
 for other symptoms.
 The analysis of incidence of adverse events after the vaccination of each dose in the 2-month study
 group and 3-month study and control group are shown in Table 54-1 to 54-6.

23 months. Except that the incidence of local swelling after the first dose of vaccination in the
 study group of subjects aged 7-11 months was higher than that in the control group, no significant
 intergroup difference was observed for other symptoms. The incidence of adverse events after the
 first dose of vaccination was higher than that of the second dose, as shown in Table 55-1 to 55-8.

7.1.7. Serious Adverse Events

A total of 80 cases (105 events) of SAE were collected in the primary immunization stage, including 34 cases (49 events) in the PCV13-TT and 34 cases (43 events) in the control group of subjects aged 3-71 months. No significant difference was observed with respect to SAE incidence between the study and control group; a total of 12 cases (13 events) of SAE were reported in the subjects 2 months of age.

With the exception of 1 case of SAE in 3-month-old PCV13-TT whose fever symptom was determined to be possibly related to the study vaccine, other SAEs were all independent of study vaccine. The SAE incidence in subjects aged 2 months and 3 months subjects was higher than that of other age groups. The major SAEs were "infections and infestations".

The severity of solicited symptoms or the most severe symptoms in SAEs was assessed in accordance with Guidelines for The Classification of Adverse Reactions in Clinical Trials of Prophylactic Vaccines, with a purpose to timely understand and analyze the possible risks of SAE. Results showed that the severity was grade 4 in 32 cases, grade 3 in 34 cases, and grade 2 in 2 cases, notwithstanding no intergroup difference was observed for SAEs with different severity. See Table 56-1 to 56-9 for analysis of SAE incidence.
