7.1.8. Safety Analysis for Booster Dose
7.1.8.1. Overall incidence of adverse events
The subjects with booster immunization included subjects aged 2 months and 3 months receiving 3-dose series, and those aged 7-11 months who received 2 doses of vaccination during primary immunization stage, and booster dose was given as 1 dose.
The incidence of adverse events was 35.46% in the PCV13-TT and 34.50% in the control group for 3-11 month of age who received booster immunization. The severity was mainly grade 1 and 2. Thirteen and seven grade 3 adverse events were reported in the PCV13-TT and the control group, and the incidence rate was respectively 1.93% and 1.02%. No significant difference was observed between the groups. One case of grade 4 adverse event was observed in each group (reported as SAE), which were both not related to the study vaccine.
There was no significant difference in the incidence of adverse events among study and PCV7 group in subjects 3 months and 7-11 month of age.
Adverse events after booster immunization in the study and control group were shown in Table 57-1 to 57-3.

7.1.8.3. Analysis for Adverse Events Related to Vaccine

(1) Systemic reactions and local reactions

No significant difference was observed in the incidence of systemic and local reactions among all 3-11 months old subjects and between the study and control group of different age groups, as shown in Table 59-1 to 59-3.

Table. 59-1 Systemic and local reactions post booster dose in subjects aged 3 through 11 months

(2). Unsolicited adverse events related to the study vaccine

Unsolicited adverse events related to the study vaccine as determined by the investigators are listed in Table 60-1 to 60-3.

Five and nine cases of unsolicited adverse events in the PCV13-TT and control group were judged to be related to the study vaccine. No significant difference was observed in the intergroup incidences.

7.1.8.4. Analysis for Adverse Events Unrelated to Vaccine
(1). Solicited events unrelated to study vaccine
Solicited adverse events unrelated to study vaccine were all systemic reactions. Twelve solicited cases (occurred within 7 days after vaccination) were observed in the PCV13-TT of the 3-11 months olds and 18 cases in the control group, which mainly occurred in subjects 3 months of age,

difference was observed for vaccine-independent solicited adverse events between groups (Table 61-1 to 61-2).

(2). Unsolicited events unrelated to study vaccine
The incidence rate of unsolicited adverse events was respectively 9.5% and 9.21% in the study and control group during the observation period. No intergroup difference was observed for the incidence of unsolicited adverse events in each age group, which were mainly infections and infestations (Table 62-1 to 62-3).

7.1.8.5. Occurrence of adverse events with different procedures in the 2-month and 3-month trial / PCV7 group

The incidence of vaccine related adverse events after the booster immunization in the 2-month group was significantly lower than that in the 3-month-old group ($p=0.0180$). The incidence of fever and diarrhea in the 2-month PCV13-TT was lower than that in the 3-month-old trial and control group (fever: $p=0.0360$, diarrhea: $p=0.0156$). No significant difference was observed among other symptom groups, see table 63-1 to 63-2.

7.1.8.6. Serious Adverse Events (SAE)
A total of 8 cases (10 events) of SAE were observed after the booster immunization, including 3 cases in the PCV13-TT and 4 cases in the control group of subjects aged 3-11 months (no significant intergroup difference was observed); and 1 case in PCV13-TT of the 2 months olds. SAEs after booster immunization were not related to the study vaccine (Table 64-1 to 64-6).

7.1.8.7 Analysis of concomitant medications
Concomitant medications were recorded in 239 subjects (414 cases) in the PCV13-TT group at the 3–11 months of age and in 237 cases (447 cases) in the PCV7 group during the period of enhanced immunization. The most commonly used drugs were vaccine, followed by antipyretic/analgesics/nonsteroidal anti-inflammatory drugs, antiallergic drugs, and antibiotics. There were no statistical differences between the PCV13-TT group and the PCV7 group in the incidence of various concomitant medications. During the period of enhanced immunization, the concomitant medications of the subjects are shown in Tables 65-1 to 65-4.

7.2. SUMMARY OF SAFETY

Significant difference was observed in the incidence of adverse events between the study group and the control group. The overall incidence of adverse events in the study group was lower than that in the control group. The incidence of vaccine-related adverse events in the study group was slightly lower than that in the control group, but the difference was not significant.

The main symptom of systemic adverse reaction was fever. The incidence of systemic reactions in study group was lower than that in the control group. The main symptoms of local adverse reactions were redness, swelling and pain at the injection sites.

The incidence of adverse events with a severity reaching grade 3 was 7.07% and 5.36% in the study group and the control group respectively. The incidence of vaccine-related grade 3 adverse events was 4.21% and 2.41% respectively. Significant difference was observed between groups ($p = 0.0182$).

A total of 80 cases of SAEs were observed in the primary immunization stage, and 8 cases were observed in the booster immunization stage. No significant difference was observed in the inter-group incidence. Except for one case in the 3-month study group during the primary immunization stage which might be related to the study vaccine, the rest of SAEs were all not related to the study vaccine.

 Protocol No.: 022152015003

8. DISCUSSION AND CONCLUSION

8.1 DISCUSSION OF IMMUNOGENICITY

8.1.1 Analysis of common serotypes

8.1.1.1 Antibody positive rate and antibody level

After primary immunization series in test group, the antibody positive rate (antibody concentration $\geq 0.35 \mu\text{g/mL}$) was high, though in common serotypes, the positive rate of 6B was 90.45% in 3-month age group, besides this, the positive rate of all other serotypes in remaining age groups was above 95%, with antibody GMC consistently over $2.0 \mu\text{g/mL}$.

Apart from the serotype 6B in subjects aged 3-71 months, 6B and 23F in subjects aged 3 months, and 9V in subjects aged 7-11 months, the lower limit of two-sided 95% CI for percentage difference (test group – control group) of other IgG antibody with concentration $\geq 1.0 \mu\text{g/mL}$ was $> -10\%$. The percentage of IgG antibody concentration $\geq 1.0 \mu\text{g/mL}$ in subjects of test group aged 12-23 months and 24-71 months were higher than that in control group.

8.1.1.2 Noninferiority Analysis of Primary Endpoint and the Antibody Positive rate and

Antibody Level in target population

The lower limit of 97.5% CI was $> -10\%$ for the rate difference of antibody positive rate of 7 common serotypes (test group – control group) in subjects aged 3-71 months after primary immunization series, the lower limit of 97.5% CI for antibody GMC ratio (test group/control group) was > 0.5 , demonstrating the Noninferiority between test group and control group for common serotypes.

In the 3-month main target population, 6 out of 7 common serotypes

8.1.1.3 Sequential comparison of different immunization procedures

For test group subjects aged 2 months versus control group subjects aged 3 months, the lower limit of 97.5% CI was $> -10\%$ for the rate difference of antibody positive rate of 7 common serotypes; the lower limit of 2-sided 97.5% CI was > 0.5 for the antibody GMC ratio of serotypes 6B, 9V, 14, 19F, and 23F. The 7 common serotypes in test group subjects aged 2 months were noninferior to control group subjects aged 3 months.

For test group aged 2 months versus test group aged 3 months, the additional serotype 5 was observed with a lower limit of 2-sided 97.5% CI $> -10\%$ (-10.84%) for the rate difference of antibody positive rate, and a lower limit of 2-sided 97.5% CI < 0.5 for antibody GMC ratio, besides, the common serotype 4 was with a lower limit of 2-sided 97.5% CI < 0.5 for antibody GMC, apart from the exceptions above, all other serotypes achieved noninferiority criteria in this comparison.

8.1.1.4. Antibody positive rate and antibody level analysis for other age groups

For 7-11 months age group, the lower limit of 95% CI was $> -10\%$ for the rate difference of antibody positive rate (test group – control group), the lower limit of 95% CI was > 0.5 for GMC ratio (test group/control group) of 6 common serotypes except serotype 14. In 12-23 months age group and 24-71 months age group, the lower limit of 95% CI was $> -10\%$ for rate difference of antibody positive rate (test group – control group), and the lower limit of 95% CI was > 0.5 for GMC ratio (test group / control group) for 7 common serotypes.

8.1.1.5 Antibody seroconversion rate and antibody level analysis for population with negative antibody before immunization

In 3-71 months age group, the lower limit of 97.5% CI was $> -10\%$ for antibody seroconversion

rate (test group – control group) of 6 common serotypes except serotype 6B; the antibody GMC ratio of 7 common serotypes was all > 0.5.
The antibody seroconversion rates of common serotypes in test group subjects aged 2 months were noninferior to control group subjects aged 3 months, while serotype 6B did not meet the
Confidential 301 / 310
Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine
Protocol No.: 022152015003

noninferiority criteria, which was consistent with the findings of total population.
Accurate analysis might not be performed for 12-23 months age group and 24-71 months age group due to lack of adequate subjects with negative antibody before immunization.

8.1.2 Analysis of additional serotypes

8.1.2.1 Efficacy analysis

In 3-71 months age groups, the antibody positive rates of all additional serotypes were > 90%, and the lower limit of 95% CI was > 0 for the rate difference (test group – test group), besides, the lower limit of 95% CI was > 1 for GMC ratio (test group / control group) of each additional serotype, demonstrating the achievement of superiority of each additional serotype in PCV13-TT group.

8.1.2.2 Noninferiority analysis of antibody positive rate for common serotypes and serotypes with lowest GMC

The serotypes with lower antibody positive rate were 23F in 3-71 months age group, 18C in 3 months age group, 23F in 7-11 months age group, 6B in 12-23 months age group, and 23F in 24-71 months age group; serotype 6B was confirmed to be with the lowest antibody GMC in all groups.

Of all comparisons, apart from the serotype 5 in 7-11 months and serotype 3 in 24-71 months age group, the lower limit of 97.5% / 95% CI was > -10% for the rate difference of antibody positive rates of additional serotypes with lowest antibody positive rates, and thus were considered to be noninferior to common serotypes with lowest antibody positive rates according to noninferiority criteria.

8.1.3. Discussion of booster immunizations

8.1.3.1. Antibody positive rate and antibody level before booster immunization

Before booster dose, the antibody positive rates of 4 common serotypes (6B, 14, 19F, and 23F) and 2 additional serotypes (7F and 19A) in test group subjects aged 2 months and 3 months remained above 95% of the effects after primary doses; the antibody GMC of common serotypes 4, 9V, 18C and additional serotypes 1, 3 and 5 were <1.0 µg/mL, and all were > 0.35 µg/mL but serotype 5 in test group subjects aged 2 months with GMC of 0.32 µg/mL. Similar trend of change was noted for common serotypes between PCV13-TT group and PCV7 group.

In 7-11 months age group, a total of 7 serotypes had sustained relatively high antibody positive rates and antibody GMC before booster dose, with no significant inter-group differences observed for antibody positive rates between test group and control group, the GMC in test group were higher than that in control group except for serotypes 9V and 14. Among the 6 additional serotypes, antibody rates were all above 95% apart from serotype 5 with a rate of 77.84%.

8.1.3.2. After booster immunization

After booster dose, in test group subjects aged 3 months, the antibody positive rates and antibody GMC of 7 common serotypes were noninferior to those in control group, both the test group and control group had more than 3.5-fold increase in antibody GMC compared to that before booster dose. As to the 6 additional serotypes, the lower limit of 95% CI for antibody positive rate of 19A was -0.2%, though other serotypes were superior to control group; all the 6 additional serotypes attained superiority criteria with respect to antibody GMC, with > 3.5-fold increase compared to that before booster dose.

The antibody positive rates of 7 common serotypes in test group subjects aged 2 months were noninferior to control group subjects aged 3 months. As to the 6 additional serotypes, despite the lower limit of 95% CI for antibody positive rate of 19A was -0.2%, other serotypes were superior to control group; all the 6 additional serotypes attained superiority criteria with respect to antibody GMC.

Protocol No.: 022152015003

GMC. The antibody positive rates and antibody GMC of 13 serotypes in test group subjects aged 2 months were noninferior to those in test group subjects aged 3 months, with > 3.5-fold increase in GMC after booster dose compared to that before.

The antibody positive rates and antibody GMC of 7 common serotypes in test group subjects aged 7-11 months were noninferior to those in control group, for the 6 additional serotypes, the lower limit of 95% CI for the rate difference of serotype 19A was -1.93%, though all other serotypes were superior to control group; all the 6 additional serotypes attained superiority criteria with respect to antibody GMC. The antibody GMC of 13 serotypes in test group and 7 serotypes in control group were with more than 1-fold increase after booster dose.

8.2 SAFETY ANALYSIS

8.2.1. Primary immunization period

A total of 790 cases (2282 events) of adverse events were observed in test group (3-71 months), compared to 851 cases (2440 events) in control group, with the overall incidence of adverse events being 70.73% and 76.05% in test group and control group, and the difference between groups was of statistical significance, the overall incidence of adverse reactions was notably lower compared to control group. Incidence rates of investigational vaccine-related adverse reactions in test group and control group were 60.79% and 64.79%, respectively, with only numerical difference observed. Incidence of adverse reactions were relatively higher in 2-6 months and 7-11 months age groups, and major inter-group differences of adverse reactions were noted among subjects aged 7-11 months.

The incidence of systemic adverse reactions were 54.52% and 58.98% in test group and control group, and it was obviously lower in test group versus control group ($p=0.0364$). As to incidence of local adverse reactions, 15.67% and 14.66% were observed in test group and control group, respectively, demonstrating no significant differences.

The most common systemic adverse reaction was fever, which occurred in 47.54% and 53.80% of subjects in test group and control group, respectively, with lower incidence rate in test group compared to control group ($p=0.0035$), no evident differences regarding other systemic reactions or symptoms between test group and control group were generated. The most frequent local adverse reaction was redness of injection site, followed by swelling and pain.

The severity of adverse reactions in 3-71 months age group was primarily grade 1 or 2, and the investigational vaccine-related adverse reactions of grade 3 affected 4.21% and 2.41% in test group and control group subjects. No significant differences were seen between test group and control group with regard to systemic reactions of grade 3. Incidence of grade 3 local reactions were higher in test group versus control group ($p=0.0007$), and were predominantly redness, swelling and pain

in subjects aged 7 months and above, though there were no evidence of significant differences for grade 3 adverse events between test group and control group in subjects aged months. Totally, 80 cases with 105 events of SAE were collected during primary immunizations, in subjects aged 2 months, 12 cases with 13 events were observed, in test group subjects aged 3-71 months, there were 34 cases with 49 events, compared to 34 cases with 43 events in control group, while the incidence of SAE was of no statistical significance between test group and control group. All SAE, other than 1 case of SAE (fever) in subjects aged 3 months was adjudicated to be likely related to investigational vaccine, were irrelevant to the vaccine under investigation. The incidence of adverse events-related dropout and solicited/unsolicited events unrelated to investigational vaccine showed no difference between test group and control group.

8.2.2 Booster immunization period

In 3-11 months age group, the incidence of adverse events in test group and control group were 35.46% and 34.50%, with grade 3 adverse events occurred in 1.93% and 1.02% of each group, though the difference was not significant. Absence of significance regarding the incidence of

Confidential 303 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

adverse events between PCV13-TT group and PCV7 group in 3 months and 7-11 months age groups. The incidence of investigational vaccine-related adverse events in subjects aged 2 months was lower compared to test group and control group subjects aged 3 months.

Similar to what was observed during primary immunization period, main adverse reactions in booster immunization period were fever and local swelling, the incidence of any symptoms were similar across PCV13-TT group and PCV7 group in 3 months and 7-11 months age groups, while the incidence of symptoms such as fever and diarrhea were notably lower in 2 months age group compared to test group and control group subjects aged 3 months.

Adverse events were mainly grade 1 and 2, and there were 13 cases and 7 cases of grade 3 adverse events in test group and control group, respectively, corresponding to an incidence of 1.93% and 1.02%, with no inter-group differences observed.

After booster immunization, 8 cases with 10 events of SAE were recorded in all, with 3 cases in 3-11 months age group, 4 cases in 3-11 months age group, and 1 case in 2 months age group, the difference of incidence among these groups were insignificant, besides, SAE were not related to investigational vaccine.

8.3. CONCLUSION

This clinical trial is designed to evaluate the immunogenicity and safety of a 13-valent pneumococcal conjugate vaccine, jointly developed by Yunnan Walvax Biotechnology Co., Ltd and Yuxi Walvax Biotechnology Co., Ltd, as administered in subjects aged 3 months (dosed at 0, 1, 2 months), 7-11 months (dosed at 0, 2 months), 12-23 months (2 doses) and 24-71 months (1 dose), with marketed 7-valent pneumococcal conjugate vaccine as control, and to assess the immunization procedures of 13-valent pneumococcal conjugate vaccine in subjects aged 2 months (at least 6 weeks) and 3 months.

In main target population (3 months), during primary immunization period, all common serotypes, except 6B, were noninferior to control group, the serotypes in test group were noninferior to control group after booster immunization, meanwhile, additional serotypes in test group were superior to control group after primary immunization; in subjects aged 7-31 months, the common serotypes were noninferior to control group during primary immunization period, with all additional serotypes being superior to control group.

For subjects aged 2 months versus control group subjects aged 3 months, all common and additional serotypes after primary immunization achieved noninferiority or superiority criteria.

For subjects aged 2 months versus test group subjects aged 3 months, 12 serotypes, apart from serotype 5 in subjects aged 2 months during primary immunization period, were noninferior to test group subjects aged 3 months; all 13 serotypes after booster immunization were noninferior to test group aged 3 months.

The antibody positive rates of common serotypes in subjects aged 7-11 months, 12-23 months, and 24-71 months were noninferior to that in corresponding PCV7 group. For additional serotypes, the antibody positive rates in 7-11 months reached superiority criteria after primary immunization; and were generally superior to control group for test group subjects aged 12-23 months and 24-71 months.

The findings of before and after booster immunization indicated that, several serotypes were with moderately decreased antibody levels before booster immunization in subjects of either PCV13-TT group or PCV7 group, while the antibody positive rates and antibody GMC following 1 dose of booster immunization had reached or even exceeded the antibody response after primary immunization, with significant booster effects, demonstrating evident immune memory effects of conjugate vaccines. Subjects aged 2-6 months had more than 3-fold increase in antibody GMC after booster dose, and higher than 1-fold increase was noted among subjects aged 7-11 months. The overall incidence of adverse reactions were lower in test group compared to control group,

Confidential 304 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

though there was no significant inter-group difference with regard to investigational vaccine-related adverse reactions. Fever was the main systemic adverse reaction, and the incidence of systemic reactions in test group was lower than control group. Local adverse reactions included mainly redness, swelling and pain in injection site. No obvious differences were observed between test group and control group regarding the incidence of local adverse reactions.

In PCV13-TT group and PCV7 group, investigational vaccine-related adverse events of grade 3 occurred in 4.21% and 2.41% of subjects, respectively. Higher incidence of local adverse reactions of grade 3 was noted in test group versus control group, while there was no obvious difference observed in the subjects aged 3 months.

During primary immunization period, 80 cases with 105 events of SAE were collected, while in booster immunization period, 8 cases with 10 events of SAE were recorded, no differences were noted between PCV13-TT group and PCV7 group for the incidence of SAE. All SAE, other than 1 case of SAE (fever) in subjects aged 3 months was adjudicated to be likely related to investigational vaccine, were irrelevant to the vaccine under investigation.

In conclusion, the main population aged 3 months had achieved the noninferiority criteria for immunogenicity for 7 common serotypes after booster immunization, and reached the superiority criteria for immunogenicity for 6 additional serotypes after primary immunization. All common serotypes and additional serotypes in 3-71 months age groups had met the criteria of noninferiority or superiority. The common serotypes and additional serotypes in test group subjects aged 2 months were noninferior and/or superior to control group subjects aged 3 months. In test group subjects aged 2 months, 13 serotypes were noninferior to test group subjects aged 3 months after

booster immunization. The incidence of adverse events / reactions in test group was no higher than in control group. Evaluations of immunogenicity and safety in this clinical trial achieved study objective as defined in protocol.

9. DESCRIPTION OF SPECIAL CONDITIONS IN THE STUDY

N/A.

10. SUMMARY FROM RESEARCH CENTERS OF PARTICIPATING UNITS

Entrusted by Yunnan Walvax Biotechnology Co., LTD. and Yuxi Walvax Biotechnology Co., LTD., the Hebei Provincial CDC, the Henan Provincial CDC, and the Shanxi Provincial CDC, as the sub-centers, were responsible for the phase III clinical trial of 13-valent pneumococcal polysaccharide conjugate vaccine (PCV13).

10.1 HEBEI SUB-CENTER

10.1.1 Overview of Hebei sub-center

The Hebei Provincial CDC and its subordinate Zhengding County CDC and Dingxing County CDC were reviewed and approved by Ethics Committee of the Center for Disease Control and Prevention of Hebei Province to obtain "Ethical Approval Certificate" on Sep. 9, 2015; these research institutions obtained the "One-Time Certification for Vaccine Clinical Trial Institution" after review and approval by Center for Food and Drug Inspection of NMPA on Dec. 8, 2015; and these institutions convened this launch meeting and training session on Apr. 2, 2016. The major timelines of the trial are shown in Table 66-1.

10.1.2 Enrollment and vaccination in Hebei sub-center

Hebei sub-center was planned to receive 840 subjects as the samples, including 160 subjects at the 2 months of age, 320 subjects at the 3 months of age, and each 120 subjects at the 7–11 months, 12–23 months, and 24–71 months of age. The enrollment and vaccination are shown in Table 66-2.

10.1.3 Completion of the trial in Hebei sub-center

In Hebei sub-center, 1030 subjects were screened and 840 subject were enrolled, 839 of which completed the first dose of vaccination and safety observation, and 784 subjects completed the full vaccination, with the compliance rate being 93.33%; 753 subjects completed vaccination and effective blood collection before and after immunization, with the compliance rate being 89.64%.

A total of 5405 serum samples were collected, including 2708 samples pending testing and 2697 standby samples. The samples pending testing were sent to the Institute for Biological Product Control, NIFDC (National Institutes for Food and Drug Control) for test on Jan. 13, 2017 and Jun. 8, 2017. The number of serum samples of each age group is shown in Table 66-3.

Confidential 306 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

10.1.4. Protocol violations/deviations in Hebei sub-center

There was no serious deviation of the trial protocol in Hebei sub-center. A total of 159 cases of individual protocol violations/deviations occurred, including 42 cases in the 2-month-old test group, 78 cases in the 3-month-old test group, 28 cases in the 7- to 11-month-old PCV13-TT group, 10 cases in the 12- to 23-month-old PCV13-TT group, and 1 case in the 24- to 71-month-old PCV13-TT group. The protocol violations/deviations were mainly due to failure of blood collection, lack of enough interval for other vaccinations, and visits exceeding the time window.

10.1.5 Serious adverse events (SAEs) in Hebei sub-center

In Hebei sub-center, 27 SAEs were observed. All SAEs were reported using "Report Form of Serious Adverse Event" within the 24 hours of being noticed by the investigator and followed periodically. The follow-up reports were submitted until the submission of final report when the event ended. All the SAEs were not related to the test vaccine. No suspicious and unexpected serious adverse reactions (SUSAR) were observed.

10.2 HENAN SUB-CENTER

10.2.1 Overview of Henan sub-center

The Henan Provincial CDC and its subordinate Puyang County CDC and Wen County CDC were reviewed and approved by Ethics Committee of the Center for Disease Control and Prevention of Henan Province to obtain "Ethical Approval Certificate" on Oct. 12, 2015; these research institutions obtained the "One-Time Certification for Vaccine Clinical Trial Institution" after review and approval by Center for Food and Drug Inspection of NMPA on Apr. 5, 2016; and these institutions convened this launch meeting and training session on Apr. 6, 2016. The major timelines of the trial are shown in Table 67-1.

10.2.2 Enrollment and vaccination in Henan sub-center

Henan sub-center was planned to receive 1080 subjects as the samples, including 200 subjects at the 2 months of age, 400 subjects at the 3 months of age, and each 160 subjects at the 7–11 months, 12–23 months, and 24–71 months of age.. The enrollment and vaccination are shown in Table 67-2.

10.2.3 Completion of the trial in Henan sub-center

In Henan sub-center, 1278 subjects were screened and 1080 subjects were enrolled, 1075 of which completed the first dose of vaccination and safety observation, and 1037 subjects completed the full vaccination, with the compliance rate being 96.02%; 1022 subjects completed vaccination and effective blood collection before and after immunization, with the compliance rate being 94.63%.

A total of 7056 serum samples were collected, including 3552 samples pending testing and 3504 standby samples. The samples pending testing were sent to the Institute for Biological Product Control, NIFDC (National Institutes for Food and Drug Control) for test on Jan. 16, 2017 and Jun. 8, 2017. The number of serum samples of each age group is shown in Table 67-3.

Confidential 307 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

10.2.4 Protocol violations/deviations in Henan sub-center

There was no serious deviation of the trial protocol in Henan sub-center. A total of 116 cases of individual protocol violations/deviations occurred, including 31 cases in the 2-month-old test group, 50 cases in the 3-month-old test group, 26 cases in the 7- to 11-month-old PCV13-TT group, 7 cases in the 12- to 23-month-old PCV13-TT group, and 2 case in the 24- to 71-month-old PCV13-TT group. Four subjects with protocol violations/deviations withdrew the trial because they met the "Termination and Withdrawal Criteria". The protocol violations/deviations were mainly due to vaccinations to subjects who met the exclusion criteria, lack of enough interval for other vaccinations, enrollment of subjects who violated the inclusion criteria, and visits exceeding the time window.

10.2.5 Serious adverse events (SAEs) in Henan sub-center

In Henan sub-center, 58 SAEs were observed. All SAEs were reported using "Report Form of Serious Adverse Event" within the 24 hours of being noticed by the investigator and followed periodically. The follow-up reports were submitted until the submission of final report when the event ended.

Except for one SAE (occurrence of fever in subject) in the 3-month-old test group that might be related to the test vaccine, all the other SAEs were not related. No suspicious and unexpected serious adverse reactions (SUSAR) were observed.

10.3 SHANXI SUB-CENTER

10.3.1 Overview of Shanxi sub-center

The Shanxi Provincial CDC and its subordinate Xiangfen County CDC and Wanrong County CDC were reviewed and approved by Ethics Committee of the Center for Disease Control and Prevention of Shanxi Province to obtain "Ethical Approval Certificate" on Aug. 12, 2015; these research institutions obtained the "One-Time Certification for Vaccine Clinical Trial Institution" after review and approval by Center for Food and Drug Inspection of NMPA on Nov. 20, 2015; and these institutions convened this launch meeting and training session on Apr. 9, 2016. The major timelines of the trial are shown in Table 68-1.

Confidential 308 / 310

Phase III Clinical Study Report of the 13-Valent Pneumococcal Polysaccharide Conjugate Vaccine Protocol No.: 022152015003

10.3.2. Enrollment and vaccination in Shanxi sub-center

Shanxi sub-center was planned to receive 840 subjects as the samples, including 160 subjects at the 2 months of age, 320 subjects at the 3 months of age, and each 120 subjects at the 7–11 months, 12–23 months, and 24–71 months of age. The enrollment and vaccination are shown in Table 68-2.

10.3.3 Completion of the trial in Shanxi sub-center

In Shanxi sub-center, 932 subjects were screened and 840 subjects were enrolled, 807 of which completed the first dose of vaccination and safety observation, and 810 subjects completed the full vaccination, with the compliance rate being 96.43%; 805 subjects completed vaccination and effective blood collection before and after immunization, with the compliance rate being 95.83%.

A total of 6277 serum samples were collected, including 3557 samples pending testing and 2720 standby samples. The samples pending testing were sent to the Institute for Biological Product Control, NIFDC (National Institutes for Food and Drug Control) for test on Jan. 16, 2017 and Jun. 8, 2017. The number of serum samples of each age group is shown in Table 68-3.

10.3.4 Protocol violations/deviations in Shanxi sub-center

There was no serious deviation of the trial protocol in Shanxi sub-center. A total of 37 cases of individual protocol violations/deviations occurred, including 18 cases in the 2-month-old test group, 10 cases in the 3-month-old test group, 8 cases in the 7- to 11-month-old PCV13-TT group, 0 case in the 12- to 23-month-old PCV13-TT group, and 1 case in the 24- to 71-month-old PCV13-TT group. The protocol violations/deviations were mainly due to sampling exceeding the time window, vaccination exceeding the time window, lack of enough interval for other vaccinations, participating in other drug clinical trials during this trial, and failure to collect blood according to trial protocol.

10.3.5 Serious adverse events (SAEs) in Shanxi sub-center

In Shanxi sub-center, 11 SAEs were observed. All SAEs were reported using "Report Form of Serious Adverse Event" within the 24 hours of being noticed by the investigator and followed periodically. The follow-up reports were submitted until the submission of final report when the event ended. All the SAEs were not related to the test vaccine. No suspicious and unexpected serious adverse reactions (SUSAR) were observed.

1.0 |Objective |
 |To lay down a procedure for the preparation, approval and control of |
 |Standard Operating Procedures. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable for the preparation and |
 |implementation of Standard Operating Procedures to be followed at Company |
 |Name XYZ. |
 3.0 |Responsibility |
3.1	Staff, Initiator Department shall be responsible for:	
	3.1.1	Preparation of SOP as per the procedure given in this SOP
	3.1.2	Updation of the existing SOP whenever required
3.2	Reviewing person shall be responsible for:	
	3.2.1	The correctness and technical contents of SOP
	3.2.2	Formatting of the SOP as per the procedure contained in SOP
3.3	HOD/designee, Initiator department shall be responsible for:	
	3.3.1	Review and verification of SOP
	3.3.2	Training of the concerned staff
3.4	HOD/designee, QA shall be responsible for:	
	3.4.1	Review of SOP for its correctness and adequacy with respect to
		regulations/ guidelines and as per procedure mentioned in SOP
	3.4.2	Final approval and subsequently compliance of the SOP
4.0	Abbreviations and Definitions	
4.1	Initiator	Department who shall initiate the preparation of SOP
	Department :	
4.2	SOP	Standard Operating Procedure; a document where step
		by step instructions are cited to serve as support
		for methods or manners of fulfilling a function or
		functions reliably and consistently
4.3	Corporate SOP	An SOP which shall be applicable for corporate
4.4	CQA	Corporate Quality Assurance
4.5	QA	Quality Assurance
5.0	Procedure	
5.1	Preparation of SOP:	
	5.1.1	All SOPs shall be written in clear and easy to understand
		language.
	5.1.2	All the SOPs shall be generated on computer in the format as
		defined in Annexure-1 and as followed in SOP. The text of the
		SOP shall be typed in font type 'Times New Roman' with font
		size '12'.
	5.1.3	Text of header and footer of SOP shall be typed in font size
		and type as mentioned below:
		S.No.
		1.
		2.
		3.
	5.1.4	An SOP shall be printed in black color on standard A-4 size
		sheet of xxx color of good quality.
	5.1.5	All SOPs shall be prepared using Microsoft Word application
		software
		5.1.5.1
	5.1.6	Description of the format for SOP preparation (Refer
		Annexure-1)
	5.1.6.1	Company logo shall be pasted on the top left hand side
		of the page
	5.1.6.2	Name of the initiator department e.g. Quality
		Assurance, Production, etc. shall be typed in bold on
		the top right hand side of the page.
	5.1.6.3	'STANDARD OPERATING PROCEDURE' shall be typed in bold
		capital letters.
	5.1.6.4	'Title' of the SOP shall be brief and self descriptive
		in nature. It shall be typed keeping the first letter
		of the key words in capitals (i.e. title case shall be
		typed in unbold).
	5.1.6.5	SOP No. - Denotes the number allotted for the
		particular SOP by QA Department. SOP No. shall be
		typed in Capital. The numbering of an SOP shall be
		carried out as follows:
		The departments / major activities are represented by
		alphabets as enlisted in annexure 2 e.g. PR for
		Production, QC for Quality Control and QA for Quality

			Assurance.	
			In case the SOPs are general in nature i.e.	
			irrespective of the product the departmental code	
			shall be followed by a slash and three-digit numeral	
			assigned to the SOP e.g. No. PR/001 represents the	
			first SOP of Production department which is general in	
			nature.	
			In case the SOP is product specific, the departmental	
			code shall be followed by a slash (/) followed by	
			product code of two digit number followed by a slash	
			(/) and followed by the three digits numeral assigned	
			to the SOP e.g. the No. represents the first SOP	
			pertaining to Production Department for a product with	
			product code '00'.	
			5.1.6.6	'Revision No.' shall be denoted in two numeric
			characters. New SOP shall carry Revision No. '00' and	
			the subsequent revisions shall be denoted by 01, 02,	
			03 and so on.	
			5.1.6.7	'Supersedes': Superseded number of the SOP along with
			the revision no. shall be given in this column. For	
			example, PR/001 Rev.00 (the first general SOP of	
			Production department) when prepared for the first	
			time (first revision), 'Supersedes' column shall be	
			filled with the word 'None' and when the same is	
			revised for the first time, 'Supersedes' shall be	
			given as 'PR/001, Rev.00' and the 'Revision No.' for	
			this SOP shall be filled as '01'.	
			5.1.6.8	'Page No.' shall be numbered as specific page number
			of the total pages of the SOP e.g. first page of SOP	
			of total 5 pages shall be 1 of 5.	
			5.1.6.9	Standard Operating Procedure prepared by the user
			department(person well versed with the procedure) and	
			reviewed by the User supervisor and accordingly shall	
			write their names and sign with date in columns	
			'Prepared by' and 'Reviewed by'. 'Prepared by' and	
			'Reviewed by' shall be typed in bold.	
			5.1.6.1	Head of Department/designee of concerned department
			shall sign with date in the column 'Approved by'.	
			'Approved by' shall be typed in bold text.	
			5.1.6.1	Head/designee, QA shall also sign with date in the
			1 column 'Approved by' hence approving the proposed SOP	
			for implementation.	
			5.1.6.1	Front page of an SOP shall exhibit the columns of
			2 Prepared By, Reviewed By and Approved By (departmental	
			and QA) also 'Effective Date' and 'Next Review date',	
			while the subsequent pages shall not bear these	
			columns.	
			5.1.6.1	'Effective Date' is the date when the content of SOP
			3 becomes operational. It shall be given by QA	
			department in consultation with concerned HOD/designee	
			after completion of training on the approved SOP, in	
			DD-MM-YY or DD.MM.YY format, by hand.	
			5.1.6.1	Once the concerned SOP is approved by
			4 Head/designee-QA, the approved copy shall be sent to	
			initiator department for the training of concerned	
			personnel and initiator department shall conduct	
			training of the SOP and evaluation of training	
			thereupon, as per SOP .	
			Note: If a department prepares an SOP that involves other	
			departments(s) in its execution, then the persons from this	
			(these) department(s) shall also be trained as per the	
			approved SOP and the training records generated thereupon	
			shall be compiled by the initiator department and shall be	
			submitted to QA.	
			5.1.6.1	After completion of training on SOP, the initiator
			5 department shall forward the QA approved SOP and SOP	
			training record to QA, for assigning 'Effective Date'	
			on it.	
			5.1.6.1	The 'Next Review Date' shall be after two years from
			6 the Effective Date of the SOP given by QA department	
			in DD-MM-YY or DD.MM.YY format, by hand (e.g. Next	
			review date assigned for SOP effective on	
			DD.MM.YYshall be DD.MM.YY). Every SOP shall be	
			reviewed within 60 days of the Next Review Date, or	
			earlier, if any amendment is required.	
			Note: All the entries made in hand by the concerned personnel shall be	
			in black ink, using ballpoint pen. Ink of good quality shall be used	
			for the purpose.	
			5.1.7	The contents of the SOP shall be covered under 09 subheadings,
			which are compulsory for each SOP. In case a subheading is not	
			applicable, mention 'Not applicable' under that subheading.	
			All the subheadings shall be written in bold with first letter	
			in capital. The narrative text of each subheading shall be	
			aligned below the subheading, not after the length of the	
			heading. In case the insertion of a 'Note' is absolutely	
			necessary, Note shall be typed in Times New Roman and unbold	
			text.	
			5.1.7.1	Objective as first point; an overview of the intention
			of preparation of Standard Operating Procedure shall	
			be briefly mentioned under this heading. The	
			'Objective' shall always start with the word 'To'.	
			5.1.7.2	Scope as second point; describes the site(s),

			location(s), plant(s) and/ or department(s) to which	
			the Standard Operating Procedure is applicable.	
			5.1.7.3	Responsibility as third point; specifies designation
			of the personnel and name of department that shall be	
			responsible for implementation and compliance of the	
			Standard Operating Procedure.	
			5.1.7.4	Abbreviations and Definitions as fourth point;
			describes the meaning or explanation of term(s) which	
			is (are) not common or having any specific meaning and	
			expansion of abbreviation(s) used in the SOP.	
			5.1.7.5	Procedure as fifth point; describes the detailed, step
			by step procedure in chronological sequence to be	
			followed in simple and clear sentences. It may include	
			the details of all operations, operational conditions	
			and precautions to be taken, if any, etc.	
			5.1.7.6	Forms and Records as sixth point; it shall enlist all
			specimen formats, specimen labels, flow charts or any	
			other attachment with the SOP as Annexure.	
			5.1.7.7	References as seventh point; References must be
			included for key documents appropriate to the SOP.	
			Enlist the references relevant to the procedure. While	
			listing the references, the SOPs shall be listed first	
			followed by other guidelines, pharmacopoeia etc. First	
			write the SOP number followed by its title. Reference	
			article(s) consulted, if any, while preparing the SOP	
			shall also be mentioned.	
			5.1.7.8	Distribution as eighth point shall describe the
			distribution of the SOP to concerned	
			departments/locations. QA shall issue the controlled	
			copies as per distribution list.	
			5.1.7.9	History as ninth point; history shall contain a
			chronological record of significant changes in an SOP	
			in brief, mentioned in three columns, namely: 'Date',	
			'Revision Number' and 'Reason for Revision'. Only last	
			five histories shall be mentioned in the SOP.	
			Note: Under 'Date' put Effective Date of the SOP.	
			Under 'Revision Number' current revision number of the	
			SOP shall be mentioned. Under 'Reason for Revision'	
			give reasons why the SOP at previous revision number	
			is revised. In case of new SOP write 'New SOP' under	
			'Reason for Revision' and in case of routine revision,	
			write 'Routine Revision' under this column. (For more	
			clarity refer 'History' at point no. 9.0 of this SOP.)	
		5.1.8	Main headings of the SOP as discussed shall be numbered 1.0.	
		2.0, 3.0,and so on. Each heading shall be typed in bold		
		keeping first letter capital and rest in small for each word.		
		The subsequent numbering for headings or steps shall be typed		
		with outline numbering system through five levels. For		
		instance, first level number for the heading at fifth position		
		shall be '5.0' and its second level shall be 5.1, 5.2.....so on		
		and the fifth level shall be '5.1.1.1.1'against the first step		
		of every subsequent level. After fifth level the sub-numbering		
		can be marked as 'a', 'b' and so on or 'i', 'ii' and so on.		
		5.1.9	Recordings, if required, as a result of implementation of an	
		SOP shall be discussed in the relevant SOP by defining a		
		format for the recording purpose which is termed as 'Form' of		
		the SOP and shall be annexed to the SOP.		
		5.1.10	Formatting and Contents of the Annexure:	
		Specimen forms for recording of data during performance of a		
		procedure, flow charts, diagrammatic illustrations etc. shall		
		be attached to SOP as an annexure.		
		5.1.10.1	Formatting:	
		The font type shall be 'Times New Roman' of preferable		
		size 12.However a font size of 10-12 is acceptable		
		depending upon the nature of annexure where relevant		
		information is to be accommodated in the same page for		
		better presentation. In such cases all the pages of		
		annexure shall be of uniform font size.		
		5.1.10.2	Header:	
		The header shall contain the following information		
		repeating on each page:		
		5.1.10.2.1	Logo of the company, on Top Left hand side	
		of the page and not surrounded by the		
		border.		
		5.1.10.2.2	'Title' of the Annexure.	
		5.1.10.2.3	Annexure No., on Top Right hand side of the	
		page and not surrounded by the border.		
		Annexure No. shall be mentioned on the		
		first page of the annexure only.		
		5.1.10.3	Contents of Annexure:	
		Following aspects shall be covered depending upon the		
		Nature of activity		
		5.1.10.3.1	Include the brief instructions which	
		correspond to SOP.		
		5.1.10.4.2	Establish the flow of information in such a	
		way so as to have a chronology in relation		
		to the operations/information established		
		in the procedure.		
		5.1.10.2.3	Reduce the information to be filled to a	
		minimum. For example: fill in the blanks,		
		check list from a list, circle the correct		
		one etc.		

				5.1.10.2.4	The materials solutions, equipment etc. to be used during the process are to be written along with their part numbers/ID No. and shall be enlisted preferably on the first page of the form, as applicable	
				5.1.10.2.5	Record form shall include space to fill in the required data, date(s), time and space for signature/initials, wherever appropriate, of the person(s) performing the activity and those who supervise and/or approve it.	
				5.1.10.4	Footer:	
				The Footer shall contain the following information		
				repeating on each page:		
				5.1.10.4.1	Form No. on bottom left hand side of the	
				all pages and not surrounded by the		
				border.(Form No. shall be typed with font		
				size 10)		
				5.1.10.4.2	'Page No.' on bottom Right hand side of the	
				page. Page shall be numbered as specific		
				page number of the total pages of the SOP		
				e.g. first page of annexure of total 5		
				pages shall be 1 of 5. .(Page No. shall be		
				typed with font size 10)		
				5.1.10.5	Revision no. of annexure/Forms shall be the same as	
				that of respective SOP.		
				5.1.11	SOP(s) prepared for the	
				operation/calibration/cleaning/maintenance of equipment or		
				instrument of one make and model number can be applied for the		
				operation/calibration/cleaning/maintenance of other equipment		
				for instrument(s) of same make or model number.		
				5.1.12	The initiator department shall forward the draft(s) of SOP	
				under preparation (putting "DRAFT" word on every page of the		
				SOP as water mark of appropriate size) to QA department for		
				comments and necessary input, if any.		
				5.1.13	Once the Draft SOP is finalized, the SOP shall be forwarded to	
				Documentation section of QA for final printing on xxx color		
				paper.		
				5.1.14	Documentation section shall send the SOP to the initiator	
				department for signatures on the relevant columns of the SOP		
				and then initiator department shall forward the same to QA for		
				final approval.		
				Note: The drafts reviewed by QA, if available with the		
				concerned department, shall be sent to Documentation section		
				for the destruction.		
				5.2	Review and/ or Revision and Distribution of SOPs:	
				5.2.1	Review of SOP	
				5.2.1.1	The SOP shall be reviewed by a person very well	
				acquainted with the activity and of supervisory level		
				as determined by the Head of the Department.		
				5.2.1.2	The reviewer shall ensure:	
				5.2.1.2.1	Technical contents are correct and	
				complete.		
				5.2.1.2.2	That the language is clear and easy to	
				understand.		
				5.2.1.2.3	The formatting is as mentioned in SOP xxxx	
				5.2.1.2.4	Data record forms are numbered correctly	
				and have provision to record all relevant		
				data.		
				5.2.2	Biennial review of an SOP shall be undertaken as per SOP xxx.	
				However change in any SOP shall be undertaken through SOP xxx.		
				5.2.3	Master Copies and Controlled Copies (for distribution) of the	
				SOPs shall be prepared by Documentation section of QA as per		
				SOP xxx. Other copies (controlled and uncontrolled) of the		
				master copy for distribution purpose, shall be xerox on white		
				paper of A-4 size of good quality. The controlled and		
				uncontrolled copy shall be stamped and signed by concerned		
				personnel in the documentation section of QA before		
				distribution.		
				5.3	Vernacular SOPs:	
				If an SOP is required to be prepared in vernacular for operational		
				purpose, the same shall be prepared as that of English version by the		
				concerned department. The 'Master Copy' of the vernacular SOP shall be		
				archived in Quality Assurance Department and controlled copy shall be		
				issued to concerned department by QA.		
				6.0	Forms and Records	
				7.0	References	
				8.0	Distribution	
				8.1	Master copy	
				8.2	Controlled	
				copies

1.0 |Objective |
 |To lay down the overall procedure for organization of documentation and |
 |numbering system. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to the organization of |
 |documentation and Numbring system at Company Name XYZ for various |
 |documentation aspects such as: |
2.1	Issue and control of documents
2.2	Review of documents
2.3	Changes in documents
2.4	Archiving of documents
2.5	Cancellation of documents
2.6	Destruction of documents
3.0	Responsibility
3.1	Quality Assurance Department is responsible for organization of
	documentation system.
3.2	The department receiving any document shall be responsible for its
	proper preservation and custody.
3.3	HOD/designee, Quality Assurance shall ensure the implementation of
	this procedure.
4.0	Abbreviations and Definitions
HOD	Head of the Department
:	
No.	Number
:	
QA	Quality Assurance
:	
Rev.	Revision
:	
SOP	Standard Operating Procedure
:	
OG	Operating Guideline
:	
Documents	An official written/printed text that can be used to
:	furnish evidence, information and taking decisions such
	as SOPs, Specifications and log books etc.
Master Copy	The original set of controlled documents or written
:	procedures which are retained at quality assurance
	department.
Controlled Copy	The photocopy of master copy of controlled documents or
:	written procedures which shall be distributed to user
	department(s) as a part of document distribution
	procedure and shall bear a stamp as 'Controlled copy'.
	These documents are retrievable by QA.
Uncontrolled Copy	The photocopy of master copy of controlled documents or
:	written procedures which shall be given to any department
	for person for reference purpose only. These documents are
	not controlled documents; hence are not retrievable by
	QA.
5.0	Procedure
5.1	Preparation and maintenance of master documents:
	5.1.1
	5.1.2
	5.1.3
	5.1.4
	5.1.5
	5.1.6
	5.1.7
	5.1.8
5.2	Issuance of controlled and uncontrolled copies of master documents:
	The procedure for issue and control of documents is as described
	below:
	5.2.1
5.2.2	Issuance of Controlled Copies:
	5.2.2.1

				Quality Assurance Department and can be retrieved	
				as and when required.	
				5.2.2.2	All controlled copies shall be reproduced from
				the approved Master Copy (Original) by	
				photocopying by Quality Assurance Department.	
				5.2.2.3	Quality of photocopy of master document should be
				legible and photocopies shall be taken by	
				concerned QA person.	
				5.2.2.4	Controlled copy (s) shall be issued against a
				requisition (justifying reason for its	
				requirement) which is duly approved by the	
				concerned HOD and Quality Assurance Department	
				except those which are mentioned in section	
				5.2.2.5.	
				5.2.2.5	The first controlled copy of Specifications/SOPs
				and subsequent controlled copies of SOPs as per	
				distribution list.	
				5.2.2.6	At the time of issue of any controlled copy, the
				document shall be stamped as 'Controlled copy' in	
				blue ink on right hand side bottom of each page	
				not covering the text part.	
				The stamp shall bear Copy No., Date of issue and	
				Signature of the issuing official of QA	
				Department.	
				5.2.2.7	The copy no. shall be a two digit consecutive
				number. e.g.	
				the first controlled copy of a document (SOP,	
				Specification) shall be numbered as Copy No. 01.	
				5.2.2.8	In case of approved changes in a document, the
				issued controlled copies shall be retrieved from	
				circulation and replaced with changed version.	
				5.2.3	Issuance of Uncontrolled Copies:
				5.2.3.1	Uncontrolled copies are those on which QA
				Department has no retrieval control.	
				5.2.3.2	An uncontrolled copy shall be issued against a
				requisition	
				duly approved by HOD, QA or his/her designee,	
				justifying the reason for its requirement.	
				5.2.3.2	At the time of issue of an uncontrolled copy, the
				document shall be stamped as 'Uncontrolled copy'	
				in blue ink on right hand side bottom of each	
				page with Issued by signature and date filled by	
				QA Department.	
				5.2.4	Issuance of forms:
				5.2.4.1	Data record forms related to batch production
				records, forms related to QC analytical file and	
				forms related to Quality management system shall	
				be controlled.	
				5.2.5	Issuance of Log books:
				5.2.5.1	The routine operation activity shall be logged in
				a log books and log books shall be issued to all	
				concerned departments as per SOP QA/000.	
				5.2.6	Unauthorized photocopying of any document (Master Copy/
				Controlled copy) is prohibited.	
				5.2.7	Wastage of photocopy (ies), if identified due to bad quality
				of photocopy shall be undertaken by destroying photocopy (ies)	
				by shredding or by incineration.	
				Note:	While stamping the documents, the documents should be stamped in such
				a way that the text part of document should not be covered with	
				stamp.	
				5.3	Maintenance of soft copies of approved documents:
				5.3.1	The back up data of documents in electronic soft copies shall
				be updated.	
				5.4	Review and Revision of documents:
				5.4.1	Documents such as Standard Operating Procedures,
				Specifications, Production Orders and Batch Records etc. shall	
				be periodically reviewed every two years from effective date.	
				However the document review is need based and can be carried	
				out earlier also by the concerned department if the situation	
				so demands.	
				5.4.2	Documents which do not have any specified effective date shall
				also be reviewed every two years.	
				5.4.3	The QA department shall plan and organize the periodic review
				exercise so as to complete the reviewing activity on time.	
				5.4.4	The QA department shall send review form to concerned
				department.	
				5.4.5	The documentation section of QA department shall fill the
				relevant portion of 'Document Review Form' and forward it to	
				the HOD of the concerned department at least 45 days in	
				advance of 'review date'.	
				5.4.6	The HOD of the concerned department or his/her designee shall
				get the documents reviewed and return the review form duly	
				filled in to Quality Assurance Department with in the	
				specified time (maximum 20 days) with their opinion whether	
				the documents require a change or no change is needed.	
				5.4.7	If change(s) are suggested, the same shall be carried out as
				per the procedure mentioned in this SOP.	
				5.4.8	During periodic review of documents, in case no change in text
				of document the same shall be checked for compliance for the	
				format of document, if format is a part of any SOP.	
				5.4.9	If the format matches with that mentioned in relevant SOP,
				document shall be stamped as mentioned below.	

|| 5.4.10|Stamping procedure: |

||| 5.4.10.|The concerned master copy shall be stamped in blue ink|

||| 1 |on the front side (Top middle) of the document bearing|

||| |following |

||| |Reviewed and Approved by : |

||| |Sign/Date : |

||| |Next Review Date : |

||| 5.4.10.| QA person shall review, approve the document and |

||| 2 |shall sign with date in column 'Sign/Date'. |

||| 5.4.10.|'Next Review Date' shall be the date on which review |

||| 3 |of same document shall be undertaken. |

||| 5.4.10.|Controlled copies of stamped documents shall be |

||| 4 |prepared and distributed/retrieved as per 5.2.2.1 to |

||| 5.2.2.8 |

|| 5.4.11|With the option of stamping procedure, review of relevant |

|| |document shall be done once only. Next review of same shall be|

|| |done through reprinting with the change in its revision number|

|| |as per SOP QA/xxx. |

|| 5.4.12|If the format does not match with that mentioned in current |

|| |relevant SOP, the document shall be reprinted in the current |

|| |applicable format changing its 'Revision number' wherever |

|| |applicable. |

|| 5.4.13|Documents shall be reviewed 60 days before or after the |

|| |'Review Date'. |

|| 5.4.14|Changes in documents: |

|| |Changes in a document can be as a result of a periodic review |

|| |or as a result of any variation to be carried out in a |

|| |process, analytical technique, procedure or acceptance |

|| |criteria etc. |

|| 5.4.14.|Any change to be made in a document shall be carried |

||| 1 |as per SOP QA/000. |

||| 5.4.14.|In case two or more documents (e.g. SOPs) of |

||| 2 |interrelated subjects are to be merged to make single |

||| |document with or without any change in its contents, |

||| |the same shall be processed through change control. |

||| |The newly formed document shall bear a new document |

||| |number as decided by QA and shall have revision number|

||| |00 and supersedes column shall bear None. The change |

||| |shall be mentioned in brief in history of the |

||| |document. The abandoned numbers shall stand vacant. |

||| |For the abandoned numbers, a request for cancellation |

||| |of document shall be filled by the concerned |

||| |department. |

|| 5.4.14.|In case there is change in the code (category) of a |

||| 3 |document the same shall be processed through change |

||| |control. The document shall bear new code and shall |

||| |have revision number 00; the abandoned number shall |

||| |stand vacant. The change shall be mentioned in brief |

||| |in history of the document, as applicable and the |

||| |supersedes column shall bear previous document number |

||| |with its revision. For the abandoned number, a request|

||| |for cancellation of document shall be filled by the |

||| |concerned department. |

|| 5.4.14.|In case of new and revised versions of SOPs, the HOD |

||| 4 |of concerned department or his/her designee requesting|

||| |the change (in case of revised SOPs) shall ensure that|

||| |the concerned personnel are trained as per the amended|

||| |SOP and the training records are submitted to Quality |

||| |Assurance Department before the effective date is |

||| |assigned to the SOPs by QA Department. |

|| 5.4.14.|The defunct Master Copy (Original) shall be stamped as|

||| 5 |'Not In Force' in red ink on all pages on the right |

||| |hand side bottom and shall be archived; the stamp |

||| |shall bear signature and date. |

|| 5.4.14.|The controlled copies of the previous version already |

||| 6 |issued shall be retrieved, destroyed and record of |

||| |destruction shall be filled. |

|| 5.5 |Control of Documents: |

|| 5.5.1 |A list of approved documents shall be prepared and updated at |

|| |least once a year (from the date of last update) by the |

|| |Quality Assurance Department. |

|| 5.5.2 |SOPs, Specifications, Batch Records and other documents shall |

|| |be enlisted separately. |

|| 5.5.3 |The list shall exhibit the following: |

||| 5.5.3.1|Document type |-Mention the type of document, i.e. |

||| |SOPs, Specification etc. |

||| 5.5.3.2|Department |-Mention the department to which the |

||| |document pertains to. |

||| 5.5.3.3|Update as on |-This is the date on which the List |

||| |has been updated and shall be |

||| |depicted on first page of document |

||| |list. |

||| 5.5.3.4|Document number |-Mention the document number |

||| 5.5.3.5|Revision number |-Mention the revision number |

||| 5.5.3.7|Approvals |-List of document shall bear name |

||| |signature and date of personnel |

||| |performing activity of preparation, |

||| |review and approval of list and shall|

||| |be depicted on last page of the list.|

|| 5.6 |Archiving of documents: |

	5.6.1	Documents shall be archived in such a way that they can be		
		readily retrieved as and when required and protected from		
		deterioration.		
	5.6.2	Master copy of all documents which are 'In Force' and which		
		are 'Not in Force' shall be archived separately in Quality		
		Assurance Department with restricted access.		
	5.6.3	Documents and records related to manufactured batches of drug		
		substance such as Batch Records, Analytical files shall be		
		archived at least for a period of one year beyond the expiry		
		date of the last batch of drug product manufactured from that		
		batch of drug substance. However in case of documents and		
		records such as batch associated SOPs, Specifications,		
		logbooks the archiving period shall be considered from the		
		concerned not in force date or the date of last record, as		
		applicable (Category I).		
	5.6.4	Documents and records, not related directly with the batch or		
		process, shall be archived for at least seven years from the		
		concerned Not in force date or after the date of the record,		
		as applicable (Category II).		
	5.6.5	Documents related to preliminary process performance and its		
		integration into manufacturing such as Product Development,		
		Clinical studies, Technology transfers, Scale up, Consistency		
		batches, Stability data used in assigning shelf life,		
		Specifications pertaining to critical stage, ARM and final		
		bulk, Process Validation, initial qualification/validation of		
		facility, equipment, systems, Site master file, Policy		
		document, Quality Manual and any such document shall be		
		archived forever (Category III).		
	5.6.5	All documents shall be archived in a year-wise manner, as		
		applicable.		
	5.7	Cancellation of documents:		
	5.7.1	An approved document pertaining to an activity, product or		
		procedure if no longer necessary can be cancelled through a		
		change control.		
	5.7.2	The department desiring cancellation of a document shall fill		
		the 'Requisition for cancellation of a document' after the		
		approval of change control and submit it to Quality Assurance		
		Department.		
	5.7.3	Quality Assurance Department shall review this requisition and		
		submit it to HOD, Quality Assurance or his/her designee for		
		approval.		
	5.7.4	Once the cancellation request is approved, the defunct master		
		copy shall be stamped as 'Cancelled' and 'Not in Force' in red		
		ink and shall be archived.		
	5.7.5	All the controlled copies shall be retrieved from circulation,		
		destroyed and record of destruction shall be filled.		
	5.7.6	The number of the cancelled document shall stand vacant and		
		shall not be re-assigned.		
	5.7.7	Quality Assurance Department shall fill the 'Record of		
		cancelled documents'.		
	5.8	Destruction of documents:		
		Documents to be destroyed shall either be destroyed by shredding or		
		by incineration and the details shall be filled in its corresponding		
		data record form.		
	6.0	Forms and Records		
	6.1	Document control record	- Annexure 1	
	6.2	Requisition for copy of document	- Annexure 2

[1.0]Objective: |
| |To lay down the procedure for an effective training of all the personnel |
| |engaged in the manufacture and analysis of the products manufactured. |
[2.0]Scope: |
| |This Standard Operating Procedure is applicable for training of personnel |
| |working in xxx company |
[3.0]Responsibility: |
	3.1	Human Resource Department shall be responsible for the induction of new	
		joinees.	
	3.2	Training section in QA shall be responsible for conducting GMP training	
		of new joinee, issuance and verification of individual training	
		records, preparation of cGMP annual training planner, coordination of	
		trainings and its documentation.	
	3.3	Trainer shall be responsible for conducting training as per the	
		training plan, its evaluation and submitting the evaluation sheets to	
		trainees or training coordinator of concerned department.	
	3.4	Concerned personnel shall be responsible for updating and archiving	
		individual training file.	
	3.5	Concerned Area in charge shall be responsible for the preparation of on	
		the job training programme for new joinee and compilation of on the job	
		training report.	
	3.6	Training coordinator of respective department shall be responsible to	
		ensure the updation of training documents and all the training	
		activities pertaining to his/her department.	
	3.7	Head of each department shall be responsible	
		3.7.1	To nominate training coordinator(s).
		3.7.2	To nominate SOP trainers
		3.7.3	For approval of On the Job Training Programme and its report.
		3.7.4	To ensure each individual in department has been imparted
			required training.
		3.7.5	For identification of department training needs.
	3.8	Head, QA or designee shall be responsible for approval of training	
		planners and overall compliance to the SOP.	
[4.0]Abbreviations and Definitions:			
4.1 cGMP : Current Good Manufacturing Practices			
4.2 HOD : Head of the Department			
4.3 HRD : Human Resource Development			
4.4 JR : Job Responsibility			
4.5 OJT : On the job training			
4.6 QA : Quality Assurance			
4.7 SOP : Standard Operating Procedure			
4.8 QMS : Quality Management System			
4.9 CQA : Corporate Quality Assurance			

On the Job Training:

Training on Standard Operating Procedures applicable in the different department for the adequate and accurate operations. This training shall be imparted to those, who directly or indirectly fall in the scope of execution of a SOP.

cGMP Training:

Training pertaining to current Good Manufacturing Practices which are supposed to be followed at different stages of manufacturing of drug product. This type of training shall be given to all those who are directly or indirectly associated with the quality of the drug product.

Job Responsibility:

A job responsibility sets out the purpose of a job, where the job fits into the Organization structure, the main accountabilities and responsibilities of the job and the key task to be performed. The JR of the person shall be assigned by the HOD of the concerned department and duly signed by HOD and respective person, and authorized by HRD department and finally JR shall be archived in HR. Person who shall be designee in absence shall give the acceptance that he / she shall do the activity in the absence of the job card holder.

[5.0 | Procedure |
	5.1	Training		
		Following types of training shall be imparted to the personnel :-		
		a.	Induction to new joinee	
		b.	GMP training to new joinee	
		c.	On the job training	
		d.	cGMP training for existing employees as per annual training	
			planner	
		5.1.1	Induction to new joinee	
			5.1.1.	Human Resource Development shall conduct induction of
			1	new joinee which covers the overview of the
				organisation, unit and department as per approved
				procedure.
			5.1.1.	After completion of induction, HRD shall give a copy of
			2	induction program to new joinee to file it in his/her
				individual training file.
			5.1.1.	New joinee shall be issued Individual training record by
			3	training section,QA at the time of induction where in
				he/she shall record each training attended.
		5.1.2	GMP training to new joinee	
			5.1.2.	GMP training includes introduction to basic concepts of
			1	GMP to new joinee so as to provide overview of GMP.
			5.1.2.	GMP training shall be given by training section, QA to
			2	new joinee after the completion of induction program so

			as to acquaint the new joinee with the GMP, which shall
			be followed by evaluation.
			5.1.2. The GMP training shall be conducted as class room
			3 training or computer based training by showing the
			trainee different videos on the topics mentioned below ,
			selection of videos to be shown shall be based on the
			job requirement of the individual.
			5.1.2.3. Introduction to GMP
			1
			5.1.2.3. First day at work with GMP
			2
			5.1.2.3. Understanding Sterile Production
			3
			5.1.2.3. Basic Contamination Control
			4
			5.1.2.3. GMP of Cleaning & Disinfecting Clean Rooms
			5
			5.1.2.3. Cleaning Procedure & Techniques
			6
			5.1.2.3. Validating Cleaning
			7
			5.1.2.3. Laboratory Documentation
			8
			5.1.2.3. Understanding Training
			9
			5.1.2.3. Training and Presentation Techniques
			10
			5.1.2. Trainer can conduct training in vernacular language if
			4 required.
			5.1.2. GMP training planner shall be prepared by training
			5 section – QA and shall be given to new joinee to file it
			in individual training file.
			5.1.3. On the Job Training
			5.1.3. For new joinee
			1
			5.1.3.1. On the job training for new joinee shall include
			1 the training on SOPs in the concerned and cross
			functional departments as per his/her job
			requirement before he/she is allowed for the
			execution of any activity.
			5.1.3.1. Area in charge in consultation with the HOD
			2 shall prepare the on the job training program
			based on the job to be performed by new joinee
			as per on the job training program.
			5.1.3.1. The mode of imparting training shall be through
			3 Standard Operating Procedure, or practical
			demonstration for subject such as aseptic
			practices, gowning procedure, sterility testing,
			aseptic connection, wherever applicable.
			5.1.3.1. In addition to training on SOP, on the job
			4 training shall include cGXP training related to
			each department. (For e.g. GLP training for QC
			department, GEP for engineering department.
			5.1.3.1. Evaluation of training shall be done (as
			5 applicable) and recorded in Training attendance
			and evaluation sheet).
			5.1.3.1. After successful completion of training and
			6 evaluation of on the job training, on the job
			training report shall be prepared, reviewed and
			finally approved by Head of the concerned
			department. On the job training report shall be
			submitted to training section, QA.
			5.1.3.1. On the basis of the on the job training report
			7 and successful evaluation new joinee is
			certified by Head QA to perform activities in
			their department
			5.1.3.1. However if new joinee is having experience of
			8 more than two years then it could be decided by
			HOD to first impart on the job training on
			specific process activity. Once new joinee has
			submitted OJT report and relevant training
			records after due approvals from department, for
			specific activity, then he/she shall be
			certified as "trained" for performing that
			activity. However he/she shall complete full
			training as per on the job training program.
			5.1.3. For existing employees
			2
			5.1.3.2. Employee has to be trained on the current
			1 version of SOP' s as per their job
			responsibility and if there is any updation in
			SOP or new SOP is approved training on the same
			shall be given to the concerned before making
			it effective. However, after two years at the
			time of review of SOP, all concerned shall be
			trained on SOP even if there is no change in
			SOP.
			5.1.3.2. Trainee shall update all the trainings attended
			2 (internal as well as external), Individual
			training record.
			5.1.3.2. If any employee is transferred from one area of
			3 operation to other area of operation, he/she

			For supervisor level (fresher	
			to 05 years of experience)	
			Level-II (Specific cGMP) : For supervisor	
			(having experience	
			more than 05 years)	
			Level-III (Advanced cGMP) : For managers and above	
			5.1.4.5	Training section, QA shall prepare the training agenda
			to inform the trainees and HODs about the date, time	
			and location of training session which shall be	
			approved by Head QA or his/her designee.	
			5.1.4.6	Feedback of trainer and training program for cGMP
			training shall be taken by providing the Course	
			evaluation and feedback form to trainees to check the	
			effectiveness of training and performance of the	
			trainer.	
			5.1.4.7	HOD, QA/CQA shall decide the schedule of external
			training which will be conducted, as and when,	
			required.	
			5.1.4.8	The training planned as per cGMP annual training
			planner can be conducted $\pm$ 15 days of the month .	
			5.1.4.9	Although training topics for the month are specified
			in planner but monthly training topics can be	
			re-shuffled as per the requirement but it is required	
			that all the training topics are covered by the end of	
			calendar year. However in case the training needs are	
			identified for the topics other than those mentioned	
			in training planner, revision of planner can be taken	
			in such case.	
			5.1.4.10	All documents pertaining to cGMP and external
			trainings shall be archived in training section, QA.	
			5.2	Selection of Trainer
			5.2.1	Trainer selection shall be based on knowledge and skills to
			effectively teach and evaluate others. Trainers shall be	
			categorised as SOP (includes protocols etc.) and GMP trainers	
			5.2.1.	SOP's trainers
			1	
			5.2.1.	For selection of SOP trainer, concerned HODs shall
			1.1	identify personnel from their departments based on
			his / her qualification, knowledge and experience	
			in relevant areas.	
			5.2.1.	The personnel shall be regular permanent employees
			1.2	of the company, at least graduate, with an
			experience of at least of 3 years in the relevant	
			field.	
			5.2.1.	For certification of SOP trainer shall be
			1.3	submitted to training section, QA, and after the
			approval of QA Head, the personnel shall be	
			certified as trainer for SOPs.	
			5.2.1.	GMP trainer
			2	
			5.2.1.	Selection of GMP trainers shall be done by the
			2.1	committee consisting of HOD's/ designees and
			training section shall coordinate for selection	
			and qualification of GMP trainers. The candidates	
			to be qualified as a trainer shall be asked to	
			give mock training, if required.	
			5.2.1.	The personnel shall be regular, permanent employee
			2.2	of the company, at least graduate with an
			experience of at least 5 years in the relevant	
			field with good knowledge. He/she shall possess	
			good communication, presentation skills and shall	
			have exposure to trainings and audits.	
			5.2.1.	For certification of GMP trainer shall be filled
			2.3	by training section, QA and after the approval of
			QA Head the personnel shall be certified as GMP	
			trainer.	
			5.2.2	Train the trainer
			Trainers shall be trained for upgrading of different training	
			skills through train the trainer which shall be done once in a	
			year.	
			5.2.3	Training section, QA shall prepare list of internal trainers
			which shall be approved by Head – Quality Assurance, internal	
			trainer List. The list shall be updated as and when required and	
			archived in training section QA.	
			5.2.4	External trainer selection shall be based on his experience,
			qualification, skills and expertise on the training topics.	
			External trainers shall be selected by CQA/QA HOD.	
			5.3	Evaluation of Training
			5.3.1	Employee undergoing training shall be evaluated to check the
			effectiveness of training. A questionnaire shall be prepared by	
			the trainer	
			5.3.2	Training attendance and evaluation shall be recorded
			5.3.3	Written evaluation of training shall be done by means of a
			questionnaire as per the training topic. Questionnaire can be	
			descriptive / multiple choice true or false / choose the correct	

			the individual training file for each new joinee and handover	
			the file to the individual so that he/she can archive all	
			training documents in the file.	
		5.5.6	Each employee (technical staff/worker/operators) shall archive	
			the following documents in Individual training file:	
			5.5.6.1	Copy of final educational qualification
			5.5.6.2	Any other qualification/training certificate
			5.5.6.3	Copy of induction program
			5.5.6.4	GMP training planner for new joinee and questionnaire
			5.5.6.5	On the job training program
			5.5.6.6	On the job training report
			5.5.6.7	Copy of Job Responsibility
			5.5.6.8	Individual training Record
			5.5.6.9	Evaluation sheet (Except for cGMP trainings)
			5.5.6.10	Any other certificate.
		5.5.7	Whenever Job responsibility of any personnel is changed, he/she	
		shall archive the copy of changed JR in the individual training		
			file.	
		5.5.8	Any employee resigning the organization shall submit his	
		individual training file in QA which shall be archived in		
			training section.	
		5.6	Training Coordinator	
		5.6.1	HOD shall nominate training coordinator (s) from concerned	
			department.	
		5.6.2	Training coordinator shall be responsible for ensuring updation	
			of Individual training files of all personnel's in concerned	
			department and shall ensure the archival of documents given in	
			section 5.5.6 in training files of every individual of	
			respective department.	
		5.6.3	Training coordinators shall coordinate for cGXP training of new	
			joinee and on time submission of on job training documents.	
		5.6.4	Training coordinators shall ensure that schedules of all	
			training conveyed from QA are conveyed to concerned individuals.	
		5.6.5	Training coordinators shall ensure the submission of training	
			need identification	
			in Training section, QA.	
		5.6.6	Training coordinator shall provide the questionnaires to	
			personnel's in there department	
		6.0	Form and Records:	
		7.0	Reference	
		8.0	Distribution	
		Master Copy :		
		Controlled Copy :		
		9.0	History	
		Date	Revision No.	Reason for Revision

1.0	Objective	
	To lay down the procedure for Design qualification of Equipment/System.	
2.0	Scope	
	This Standard Operating Procedure is applicable for Design Qualification of	
	Equipment / instrument / system in all departments of Company Name XYZ.	
3.0	Responsibility	
	3.1	It is the responsibility of QA in execution of qualification,
		validation / revalidation with the support of user department.
	3.2	Head QA/ his designee shall be responsible for implementation and
		compliance of this SOP.
	3.3	Head-QA or his/her designee shall be responsible for review and
		authorization of qualification of documents
4.0	Abbreviations and Definitions	
	4.1	Operating System: An organization of components that have a defined
		operational function (e.g. piping, instrumentation, equipment,
		facilities, computer hardware/ software etc.)
	4.2	Calibration : The performance of tests and retests to ensure that
		measuring equipment (e.g. for temperature, weight, pH) used in a
		manufacturing process or analytical procedures (in production or
		quality control) give measurements that are correct within established
		limits.
		Design Qualification (DQ): Design Qualification is documented
	4.3	evidence that the proposed design of the facilities, systems and
		equipment are suitable for intended purpose.
	4.4	Factory Acceptance Test (FAT): Testing conducted at the supplier's
		factory usually involving the user to determine whether or not a
		system satisfies its acceptance criteria and to enable the customer to
		determine whether or not to accept the system.
	4.5	Installation Qualification (IQ): Installation Qualification is a
		documented verification that the facilities, systems and equipment as
		installed or modified; comply with the approved design and
		manufacturer's recommendations.
	4.6	Operational Qualification (OQ): The documented action of
		demonstrating that process equipment and ancillary systems work
		correctly and operate consistently in accordance with established
		specifications for the anticipated range of operation.
	4.7	Performance Qualification (PQ): Performance Qualification is the
		documented evidence, which verified that the equipment or system
		operates consistently, and gives reproducibility with in defined
		specifications and parameters for prolonged period.
	4.8	Qualification: Qualification is the act of planning, carrying out and
		recording of tests on equipment and systems, which form part of the
		validated process, to demonstrate that it will perform as intended.
	4.9	Re-validation: validation exercise to validate the system /equipment
		/process / method which is in state of validation & changes done which
		may impact it's earlier state of validation.
	4.10	User Requirement Specification (URS): A requirement specification
		that describes, what the equipment or system is supposed to do, thus
		containing at least asset of criteria or conditions that have to be
		met.
	4.11	Functional Design Specification(FDS):It is the technical Specification
		provided by the vendor against the User Requirement Specification
	4.12	Validation: Validation is the establishment of documented evidence
		that a system does what it is supposed to do. It is the collection and
		evaluation of data, which ensure that the manufacturing process
		including equipment, building, materials are capable of achieving the
		intended results on the consistent and continuous basis.
	4.13	Validation Protocol: The validation protocol is a written plan
		stating how validation will be conducted, including test parameters,
		product characteristics, and production equipment and decision points
		on what constitutes acceptable test results.
	4.14	Validation Report: The validation report is a written report on the
		validation activities, validation data and the conclusions drawn.
5.0	Procedure	
	Equipment qualification shall be performed as per the steps defined in	
	Validation master plan of respective block. Following shall be the	
	generalized plan for equipment qualification	
	Equipment URS	
	Design Qualification	
	Risk Analysis	
	IQ	
	FAT	
	PQ	

	SAT/IQ			
	Re-Qualification			
	5.1	Certain qualification activities can be combined depending upon size		
		and operation of the equipment. In some equipment like weighing		
		balance, plug and play Equipment, Table top centrifuge, conductivity		
		meter etc. commissioning report along with the IQ and OQ Checks shall		
		hold good as qualification document.		
	5.2	User Requirement Specification(URS)		
		Users Requirement Specifications are base documents that describe the		
		basic quality, intended parameters and shall be prepared by the		
		concerned personnel of the department tendering the equipment, with		
		co-ordination of Quality Assurance and Engineering departments. URS		
		shall include list of requirements from the system and define what		
		the equipment to perform. Users Requirement specification shall		
		include but not be limited to:		
		5.2.1	Description of equipment.	
		5.2.2	Description of concerned process steps.	
		5.2.3	Required Inputs/ Outputs. (utilities)	
		5.2.4	Change parts	
		5.2.5	Capacity, speed of the equipment	
		5.2.6	Operational parameters required	
		5.2.7	Space required and space available (length,width,height)	
		5.2.8	GMP consideration	
		5.2.9	Specifications (MOC)	
		5.2.10	Print out required for outputs.	
		5.2.11	Specific requirement like temperature, moisture ,	
		sensitivity, protection from light etc.		
		5.2.12	Safety parameters	
		5.2.13	Online sampling	
		Note: Functional Design Specification (FDS) Shall be provided by the		
		Vendor Against the Approved Users Requirement Specification (if		
		applicable)		
	5.3	Equipment Design Qualification (DQ)		
		Design qualification shall follow the below mentioned activities:		
		5.3.1	Design qualification shall verify that premises, facilities,	
		equipment and processes have been designed in accordance with		
		URS.		
		5.3.2	This document shall be used as a specified checklist for the	
		verification of design specification of the facility,		
		equipment.		
		5.3.3	The DQ shall be prepared by vendor, review by user; gap	
		analysis shall be performed with respect to URS and its impact		
		shall be concluded in DQ and finally approved by Head Quality		
		Assurance/Designee. For example:		
		5.3.3.1	Suitability of the equipment with site	
		5.3.3.2	Modification in basic design (if needed) matched with	
		URS.		
		5.3.3.3	Acceptability of risk level	
		5.3.4	The DQ document shall include the following details but not	
		limited to:		
		Pre-Approval		
		Objective		
		Scope		
		Overview		
		Qualification team and responsibility		
		Pre-requisites		
		Equipment / System description		
		Equipment / System / Technical Specification		
		Review / Evaluation of vendor design against user requirement		
		Deficiency Sheet		
		Review Inclusive of follow up action		
		Abbreviations		
		Recommendations / Conclusions		
		Post Approval		
		5.3.5	The DQ document must cover	
		All the necessary diagrams		
		Layouts		
		Location suitability desired special feature of components		
		Equipment and their specification		
		Desired material of construction		
		Location of control panel		
		Electrical requirement and utility requirement		
		Note: Any changes after approval of DQ of Equipment which may have		
		direct or indirect impact on quality, safety and efficacy of product		
		shall be evaluated and incorporated through change control procedure.

1.0	Objective	
	To lay down the procedure for Installation qualification of	
	Equipment/System.	
2.0	Scope	
	This Standard Operating Procedure is applicable for Installation	
	Qualification of Equipment / instrument / system in all departments of	
	Company Name XYZ.	
3.0	Responsibility	
	3.1	It is the responsibility of QA in execution of qualification,
		Validation / revalidation with the support of user department.
	3.2	Head QA/ his designee shall be responsible for implementation and
		compliance of this SOP.
	3.3	Head-QA or his/her designee shall be responsible for review and
		authorization of qualification of documents
4.0	Abbreviations and Definitions	
	4.1	Operating System: An organization of components that have a defined
		operational function (e.g. piping, instrumentation, equipment,
		facilities, computer hardware/ software etc.)
	4.2	Calibration : The performance of tests and retests to ensure that
		measuring equipment (e.g. for temperature, weight, pH) used in a
		manufacturing process or analytical procedures (in production or
		quality control) give measurements that are correct within established
		limits.
		Design Qualification (DQ): Design Qualification is documented
	4.3	evidence that the proposed design of the facilities, systems and
		equipment are suitable for intended purpose.
	4.4	Factory Acceptance Test (FAT): Testing conducted at the supplier's
		factory usually involving the user to determine whether or not a
		system satisfies its acceptance criteria and to enable the customer to
		determine whether or not to accept the system.
	4.5	Installation Qualification (IQ): Installation Qualification is a
		documented verification that the facilities, systems and equipment as
		installed or modified; comply with the approved design and
		manufacturer's recommendations.
	4.6	Operational Qualification (OQ): The documented action of
		demonstrating that process equipment and ancillary systems work
		correctly and operate consistently in accordance with established
		specifications for the anticipated range of operation.
	4.7	Performance Qualification (PQ): Performance Qualification is the
		documented evidence, which verified that the equipment or system
		operates consistently, and gives reproducibility with in defined
		specifications and parameters for prolonged period.
	4.8	Qualification: Qualification is the act of planning, carrying out and
		recording of tests on equipment and systems, which form part of the
		validated process, to demonstrate that it will perform as intended.
	4.9	Re-validation: validation exercise to validate the system /equipment
		/process / method which is in state of validation & changes done which
		may impact it's earlier state of validation.
	4.10	User Requirement Specification (URS): A requirement specification
		that describes, what the equipment or system is supposed to do, thus
		containing at least asset of criteria or conditions that have to be
		met.
	4.11	Functional Design Specification(FDS):It is the technical Specification
		provided by the vendor against the User Requirement Specification
	4.12	Validation: Validation is the establishment of documented evidence
		that a system does what it is supposed to do. It is the collection and
		evaluation of data, which ensure that the manufacturing process
		including equipment, building, materials are capable of achieving the
		intended results on the consistent and continuous basis.
	4.13	Validation Protocol: The validation protocol is a written plan
		stating how validation will be conducted, including test parameters,
		product characteristics, and production equipment and decision points
		on what constitutes acceptable test results.
	4.14	Validation Report: The validation report is a written report on the
		validation activities, validation data and the conclusions drawn.
5.0	Procedure	
	Equipment qualification shall be performed as per the steps defined in	
	Validation master plan of respective block. Following shall be the	
	generalized plan for equipment qualification	
	Equipment URS	
	Design Qualification	
	Risk Analysis	
	IQ	
	FAT	

||PQ |
 ||
 ||
 ||SAT/IQ |
 ||
 ||
 ||
 ||Re-Qualification |
 ||
 ||
	5.1	Certain qualification activities can be combined depending upon size
	and operation of the equipment. In some equipment like weighing	
	balance, plug and play Equipment, Table top centrifuge, conductivity	
	meter etc. commissioning report along with the IQ and OQ Checks shall	
	hold good as qualification document.	
	5.2	User Requirement Specification(URS)
	Users Requirement Specifications are base documents that describe the	
	basic quality, intended parameters and shall be prepared by the	
	concerned personnel of the department tendering the equipment, with	
	co-ordination of Quality Assurance and Engineering departments. URS	
	shall include list of requirements from the system and define what	
	the equipment to perform. Users Requirement specification shall	
	include but not be limited to:	
	5.2.1	Description of equipment.
	5.2.2	Description of concerned process steps.
	5.2.3	Required Inputs/ Outputs. (utilities)
	5.2.4	Change parts
	5.2.5	Capacity, speed of the equipment
	5.2.6	Operational parameters required
	5.2.7	Space required and space available (length,width,height)
	5.2.8	GMP consideration
	5.2.9	Specifications (MOC)
	5.2.10	Print out required for outputs.
	5.2.11	Specific requirement like temperature, moisture ,
	sensitiveness, protection from light etc.	
	5.2.12	Safety parameters
	5.2.13	Online sampling
	Note: Functional Design Specification (FDS) Shall be provided by the	
	Vendor Against the Approved Users Requirement Specification (if	
	applicable)	
	5.3	Equipment Design Qualification (DQ)
	Design qualification shall follow the below mentioned activities:	
	5.3.1	Design qualification shall verify that premises, facilities,
	equipment and processes have been designed in accordance with	
	URS.	
	5.3.2	This document shall be used as a specified checklist for the
	verification of design specification of the facility,	
	equipment.	
	5.3.3	The DQ shall be prepared by vendor, review by user; gap
	analysis shall be performed with respect to URS and its impact	
	shall be concluded in DQ and finally approved by Head Quality	
	assurance/Designee. For example:	
	5.3.3.1	Suitability of the equipment with site
	5.3.3.2	Modification in basic design (if needed) matched with
	URS.	
	5.3.3.3	Acceptability of risk level
	5.4	Factory Acceptance Test(FAT)
	5.4.1	FAT shall be conducted and documented at the supplier/
	manufacturer site, to take care problems and resolution of the	
	equipment prior to shipment, to assure that the system will	
	meet its specifications and operational functions. Before	
	doing FAT, the FAT protocol shall be prepared by vendor,	
	review by user and finally approved by Head Quality	
	assurance/Designee.	
	5.4.1.1	Verification as per FAT protocol
	5.4.1.2	Verification of equipment documents with respect to
	design review.	
	5.4.1.3	Operational verification or any feasible test
	5.4.1.4	Verification of alarm and safety measures.
	5.4.1.5	Verification of critical instrument calibration
	certificates or any other certificates.	
	5.5	Site Acceptance Test(SAT)
	5.5.1	The site acceptance test (SAT) shall be performed on site to
	determine that the system and any associated equipment has not	
	been damaged and function correctly in its operating	
	environment. Before doing SAT, the SAT protocol shall be	
	prepared by vendor, review by user and finally approved by	
	Quality assurance.	
	Site acceptance test shall consider the following elements but	
	not limited to:	
	5.5.1.1	Adequate availability of space (personnel and material
	movement)	
	5.5.1.2	Verification of recommended utilities as per FAT
	report.	
	5.6	Head Quality Assurance or his/ her designee in consultation with Head
	of concerned department shall decide whether to use IQ and OQ	
	document of vendor or In house IQ OQ document will be sufficient. If	
	IQ, OQ document of vendor has to be used, the Head of concerned	
	department/designee shall review and provide the departmental	
	approval and final approval shall be provided by Head Quality	
	assurance/Designee.	
	5.7	Equipment installation qualification (IQ)
	Installation Qualification activity shall be crosschecked with	
	respect to adherence to approved design and that manufacturer's	

|| recommendations and documented as follows: |

|| 5.7.1 |General: |

|| 5.7.1.1|Before doing IQ of an equipment, Equipment ID shall be |

|| |generated as per QA/000 (Equipment Identification |

|| |number) |

|| 5.7.1.2|The Installation Qualification document (annexure 1) |

|| |shall be filled for each equipment as identified in |

|| |Validation Master Plan. |

|| 5.7.2 |The IQ document shall preferably have the following contents: |

|| |The first page shall show the installation location of the |

|| |Equipment with date of its installation and the index. |

|| 5.7.2.1|Persons performing installation qualification: |

|| |The work group as formed by the Head of concerned |

|| |area shall be documented. |

|| 5.7.2.2|Equipment details: |

|| |Equipment description including the manufacturer, |

|| |supplier, Model, serial no, dimensions; location, |

|| |working capacity and supporting utilities etc. shall |

|| |be mentioned. |

|| 5.7.2.3|Description & Function of Equipment: |

|| |A brief description about the equipment and its |

|| |function shall be stated. |

|| 5.7.2.4|List of Components: |

|| |Serial No., vendor tag no. if any, component name and |

|| |location of the main components shall be mentioned. |

|| 5.7.2.5|Equipment Component Specification Data Sheet: |

|| |Description of the component (as specified, actual as |

|| |well as its verification) for which the IQ protocol |

|| |is to be filled shall be mentioned in the equipment |

|| |component specification data sheet. Depending upon |

|| |the equipment, relevant data sheet shall be filled. |

|| 5.7.2.6|Description of other components, if any: |

|| |Description of any other component, if any (as |

|| |specified, actual as well as its verification) shall |

|| |also be mentioned. |

|| 5.7.2.7|Recommended Spare Part List: |

|| |Enlist spare parts received under this heading. |

|| 5.7.2.8|Material in Product Contact Review: |

|| |Identity of the material of construction of |

|| |equipment/components shall be mentioned and their |

|| |verification that they confirm to specifications and |

|| |will not adversely affect the product shall also be |

|| |stated. |

|| 5.7.2.9|Instrument Calibration List: |

|| |The list of instruments requiring calibration shall |

|| |be mentioned under this heading. |

|| 5.7.2.1|Preventive maintenance Requirements for the |

|| |Equipment: |

|| |Components that need preventive maintenance and the |

|| |frequency for checks shall be mentioned under this |

|| |heading. |

|| 5.7.2.1|Installation Qualification Attachments |

|| |1 |

|| |List of Drawings, List of Certificates and any other |

|| |attachments shall be mentioned under this heading. |

|| 5.7.2.1|Documentation Provided By Vendor: |

|| |2 |

|| |List of documents provided by the vendor shall be |

|| |mentioned. |

|| 5.7.2.1|Discrepancy/Justification and Corrective Action: |

|| |3 |

|| |Any discrepancy during installation shall be |

|| |documented in the IQ document itself with proper |

|| |justification and Corrective Action. |

|| 5.7.2.1|Installation Qualification Summary & Conclusion: |

|| |4 |

|| |Installation qualification Summary & Conclusion shall |

|| |be filled by the person associated with the |

|| |Installation of the respective equipment and got |

|| |verified by the departmental Head and approved by |

|| |QA/designee. |

|| 5.7.2.1|References: |

|| |5 |

|| |At the last page the References shall be mentioned. |

|| Note: Risk Analysis Shall be done before the Installation |

|| Qualification as per SOP QA/000 |

|| 5.8 |Flow of updation of equipment/instrument in the calibration planner |

|| 5.8.1 |Whenever new equipment will be installed in the facility the |

|| |calibration planner (Refer Sop EN/000) shall be updated to |

|| |incorporate new equipment/instrument. Also when old equipment |

|| |will be shifted from one area to other, the same shall be |

|| |updated. Following is the flow for updation of |

|| |equipment/instrument in calibration planner. |

|| 5.8.2 |Before execution of IQ issuance of Equipment ID shall be given |

|| |as per SOP QA/000, Equipment identification number. |

|| 5.8.3 |System level impact analysis, as per SOP EN/000 Part number |

|| |system for component of Equipment/ Instrument/Devices |

|| 5.8.4 |For the instrument & component which require calibration or |

|| |replacement, Part number shall be given as per SOP EN/000 Part |

|| |number system for component of Equipment/ Instrument/Devices |

|| 5.8.5 |Updation of Equipment/Instrument in calibration planner as per |

|| |SOP xxx Calibration of instrument/ equipment |

| |5.9 |Equipment transfer |

| |5.9.1 |Transfer on temporary basis: In case of temporary transfer the|

| | |equipment ID of the equipment shall remain same and hence |

| | |there will be no updation in the calibration planner |

| |5.9.2 |Transfer on permanent basis: In case of permanent transfer of |

| | |equipment |

| | |from one area to other there shall be a change in the |

| | |equipment ID of the |

| | |equipment hence calibration planner shall be updated as per |

| | |above said flow |

| |5.9.3 |Based on the type of transfer, QA in consultation with user |

| | |and engineering shall evaluate the transfer process and its |

| | |further usage. |

| |5.9.4 |Based on evaluation, risk assessment shall be conducted (if |

| | |required) for finalizing requirement of qualification. |

|5.10 |Revalidation |

| |5.10.1 |Revalidation of any equipment/system shall be performed as per|

| | |revalidation planner on a defined frequency. |

| |5.10.2 |Revalidation of any equipment/system shall be performed in |

| | |case of any major change in the existing validated |

| | |system/equipment or on permanent shifting of equipment. |

|5.11 |The hard copies of annexure 3 shall be archived in Quality assurance |

| |at an interval of every six month; however the soft copy shall be |

| |updated in routine basis. |

	PQ	
	SAT/IQ	
	Re-Qualification	
	5.1	Certain qualification activities can be combined depending upon size
		and operation of the equipment. In some equipment like weighing
		balance, plug and play Equipment, Table top centrifuge, conductivity
		meter etc. commissioning report along with the IQ and OQ Checks shall
		hold good as qualification document.
	5.2	User Requirement Specification(URS)
		Users Requirement Specifications are base documents that describe the
		basic quality, intended parameters and shall be prepared by the
		concerned personnel of the department tendering the equipment, with
		co-ordination of Quality Assurance and Engineering departments. URS
		shall include list of requirements from the system and define what
		the equipment to perform. Users Requirement specification shall
		include but not be limited to:
	5.2.1	Description of equipment.
	5.2.2	Description of concerned process steps.
	5.2.3	Required Inputs/ Outputs. (utilities)
	5.2.4	Change parts
	5.2.5	Capacity, speed of the equipment
	5.2.6	Operational parameters required
	5.2.7	Space required and space available (length,width,height)
	5.2.8	GMP consideration
	5.2.9	Specifications (MOC)
	5.2.10	Print out required for outputs.
	5.2.11	Specific requirement like temperature, moisture ,
		sensitivity, protection from light etc.
	5.2.12	Safety parameters
	5.2.13	Online sampling
		Note: Functional Design Specification (FDS) Shall be provided by the
		Vendor Against the Approved Users Requirement Specification (if
		applicable)
	5.3	Equipment Design Qualification (DQ)
		Design qualification shall follow the below mentioned activities:
	5.3.1	Design qualification shall verify that premises, facilities,
		equipment and processes have been designed in accordance with
		URS.
	5.3.2	This document shall be used as a specified checklist for the
		verification of design specification of the facility,
		equipment.
	5.3.3	The DQ shall be prepared by vendor, review by user; gap
		analysis shall be performed with respect to URS and its impact
		shall be concluded in DQ and finally approved by Head Quality
		assurance/Designee. For example:
	5.3.3.1	Suitability of the equipment with site
	5.3.3.2	Modification in basic design (if needed) matched with
		URS.
	5.3.3.3	Acceptability of risk level
	5.4	Factory Acceptance Test (FAT)
	5.4.1	FAT shall be conducted and documented at the supplier/
		manufacturer site, to take care problems and resolution of the
		equipment prior to shipment, to assure that the system will
		meet its specifications and operational functions. Before
		doing FAT, the FAT protocol shall be prepared by vendor,
		review by user and finally approved by Head Quality
		assurance/Designee.
	5.4.1.1	Verification as per FAT protocol
	5.4.1.2	Verification of equipment documents with respect to
		design review.
	5.4.1.3	Operational verification or any feasible test
	5.4.1.4	Verification of alarm and safety measures.
	5.4.1.5	Verification of critical instrument calibration
		certificates or any other certificates.
	5.5	Site Acceptance Test (SAT)
	5.5.1	The site acceptance test (SAT) shall be performed on site to
		determine that the system and any associated equipment has not
		been damaged and function correctly in its operating
		environment. Before doing SAT, the SAT protocol shall be
		prepared by vendor, review by user and finally approved by
		Quality assurance.
		Site acceptance test shall consider the following elements but
		not limited to:
	5.5.1.1	Adequate availability of space (personnel and
		material movement)
	5.5.1.2	Verification of recommended utilities as per FAT
		report.
	5.6	Head Quality Assurance or his/ her designee in consultation with Head
		of concerned department shall decide whether to use IQ and OQ
		document of vendor or In house IQ OQ document will be sufficient. If
		IQ, OQ document of vendor has to be used, the Head of concerned
		department/designee shall review and provide the departmental
		approval and final approval shall be provided by Head Quality
		assurance/Designee.
	5.7	Equipment Operational Qualification (OQ)
		Operational Qualification activity shall be undertaken in after

		successful completion of Installation qualification. The Equipment	
		shall be crosschecked with anticipated range of operation, control	
		parameters and tolerances routinely used in manufacturing, testing	
		and critical utilities.	
		5.7.1	General:
		The Operational Qualification document (annexure 2) shall be	
		filled for each equipment as identified in Validation Master	
		Plan.	
		5.7.2	The OQ protocol shall preferably have the following contents
		The first page of the OQ protocol shall mention the initiation	
		and completion date of the study and the index.	
		5.7.2.2	Description & function of equipment:
		A brief description about the equipment and its	
		function shall be stated.	
		5.7.2.2	Persons performing operational qualification:
		A work group to perform the activity as constituted	
		by the Head of the department shall be documented.	
		5.7.2.3	A draft SOP for operation of the equipment shall be
		prepared before carrying out the operational	
		qualification.	
		5.7.2.4	Staff personnel shall be trained on the operational
		attributes of the equipment by the vendor service	
		engineer, for carrying out the qualification study.	
		5.7.2.5	Qualification test components:
		Qualification test components including vendor tag	
		no., component name and location shall be mentioned.	
		5.7.2.6	Material and equipment required for carrying out
		operational qualification: Material and equipment	
		required with purpose and quantity/specification of	
		material required shall be stated.	
		5.7.2.7	Calibration/ verification documentation:
		Calibration details for measuring	
		instrument/equipment before and after adjustment	
		shall be stated.	
		5.7.2.8	Initial set points:
		Checking of actual operating procedure and recording	
		of all initial set points of the utility shall be	
		stated.	
		5.7.2.9	Operational settings: Operational settings of
		components with tag No., parameters to be checked and	
		their verification shall be stated.	
		5.7.2.1	Qualification tests:
		0	
		Qualification tests for the equipment for which the	
		OQ document is to be filled shall be mentioned in the	
		qualification test sheets. It should include results	
		of the operational checks applied on the control	
		points of the equipment and alarms, specific	
		challenge of the equipment under normal condition as	
		well as under worst case shall be detailed. Depending	
		upon the equipment, relevant qualification test	
		sheets shall be filled.	
		5.7.2.1	Operational qualification attachments:
		1	
		The type and details of the attachments to OQ	
		document shall be mentioned.	
		5.7.2.1	Discrepancy /justification and corrective action:
		2	
		Any discrepancy observed during the operational	
		qualification shall be documented in the OQ document	
		itself with proper justification and Corrective	
		Action.	
		5.7.2.1	Summary of operational qualification:
		3	
		Operational qualification summary and conclusion	
		shall be filled by the person performing the	
		operational qualification, verified by the	
		departmental Head and approved by QA.	
		5.7.2.1	The SOP will be made effective for routine purpose
		4	after confirming in performance qualification.
		5.7.2.1	After completion of OQ, a training record shall be
		5	prepared as per respective SOP like operation,
		cleaning and preventive maintenance.	
		5.8	Flow of updation of equipment/instrument in the calibration planner:
		5.8.1	Whenever new equipment will be installed in the facility the
		calibration planner (xxx) shall be updated to incorporate new	
		equipment/instrument. Also when old equipment will be shifted	
		from one area to other, the same shall be updated. Following	
		is the flow for updation of equipment/instrument in	
		calibration planner.	
		5.8.2	Before execution of IQ issuance of Equipment ID shall be given
		as per SOP QA/xxx, Equipment identification number.	
		5.8.3	System level impact analysis, as per SOP EN/xxx Part number
		system for component of Equipment/ Instrument/Devices	
		5.8.4	For the instrument & component which require calibration or
		replacement, Part number shall be given as per SOP EN/xxx Part	
		number system for component of Equipment/ Instrument/Devices	
		5.8.5	Updation of Equipment/Instrument in calibration planner as per
		SOP EN/xxx Calibration of instrument/ equipment	
		5.9	Equipment transfer
		Equipment transfer can be of two type's viz. Temporary and Permanent.	
		5.9.1	Transfer on temporary basis: In case of temporary transfer the

			equipment ID of the equipment shall remain same and hence	
			there will be no	
			update in the calibration planner.	
		5.9.2	Transfer on permanent basis: In case of permanent transfer of	
			equipment	
			from one area to other there shall be a change in the	
			equipment ID of the	
			equipment hence calibration planner shall be updated as per	
			above said flow	
		5.9.3	Based on the type of transfer, QA in consultation with user	
			and engineering shall evaluate the transfer process and its	
			further usage.	
		5.9.4	Based on evaluation, risk assessment shall be conducted (if	
			required) for finalizing requirement of qualification.	
		5.10	Revalidation	
		5.10.1	Revalidation of any equipment/system shall be performed as per	
			revalidation planner on a defined frequency.	
		5.10.2	Revalidation of any equipment/system shall be performed in	
			case of any major change in the existing validated	
			system/equipment or on permanent shifting of equipment.	
		6.0	Forms and Records

		co-ordination of Quality Assurance and Engineering departments. URS
		shall include list of requirements from the system and define what
		the equipment to perform. Users Requirement specification shall
		include but not be limited to:
	5.2.1	Description of equipment.
	5.2.2	Description of concerned process steps.
	5.2.3	Required Inputs/ Outputs. (utilities)
	5.2.4	Change parts
	5.2.5	Capacity, speed of the equipment
	5.2.6	Operational parameters required
	5.2.7	Space required and space available (length,width,height)
	5.2.8	GMP consideration
	5.2.9	Specifications (MOC)
	5.2.10	Print out required for outputs.
	5.2.11	Specific requirement like temperature, moisture ,
		sensitivity, protection from light etc.
	5.2.12	Safety parameters
	5.2.13	Online sampling
		Note: Functional Design Specification (FDS) Shall be provided by the
		Vendor Against the Approved Users Requirement Specification (if
		applicable)
	5.3	Equipment Design Qualification (DQ)
		Design qualification shall follow the below mentioned activities:
	5.3.1	Design qualification shall verify that premises, facilities,
		equipment and processes have been designed in accordance with
		URS.
	5.3.2	This document shall be used as a specified checklist for the
		verification of design specification of the facility,
		equipment.
	5.3.3	The DQ shall be prepared by vendor, review by user; gap
		analysis shall be performed with respect to URS and its impact
		shall be concluded in DQ and finally approved by Head Quality
		assurance/Designee. For example:
	5.3.3.1	Suitability of the equipment with site
	5.3.3.2	Modification in basic design (if needed) matched with
		URS.
	5.3.3.3	Acceptability of risk level
	5.4	Factory Acceptance Test(FAT)
	5.4.1	FAT shall be conducted and documented at the supplier/
		manufacturer site, to take care problems and resolution of the
		equipment prior to shipment, to assure that the system will
		meet its specifications and operational functions. Before
		doing FAT, the FAT protocol shall be prepared by vendor,
		review by user and finally approved by Head Quality
		assurance/Designee.
	5.4.1.1	Verification as per FAT protocol
	5.4.1.2	Verification of equipment documents with respect to
		design review.
	5.4.1.3	Operational verification or any feasible test
	5.4.1.4	Verification of alarm and safety measures.
	5.4.1.5	Verification of critical instrument calibration
		certificates or any other certificates.
	5.5	Site Acceptance Test(SAT)
	5.5.1	The site acceptance test (SAT) shall be performed on site to
		determine that the system and any associated equipment has not
		been damaged and function correctly in its operating
		environment. Before doing SAT, the SAT protocol shall be
		prepared by vendor, review by user and finally approved by
		Quality assurance.
		Site acceptance test shall consider the following elements but
		not limited to:
	5.5.1.1	Adequate availability of space (personnel and
		material movement)
	5.5.1.2	Verification of recommended utilities as per FAT
		report.
	5.6	Head Quality Assurance or his/ her designee in consultation with Head
		of concerned department shall decide whether to use IQ and OQ
		document of vendor or In house IQ OQ document will be sufficient. If
		IQ, OQ document of vendor has to be used, the Head of concerned
		department/designee shall review and provide the departmental
		approval and final approval shall be provided by Head Quality
		assurance/Designee.
	5.7	Equipment Installation qualification (IQ)
	5.8	Equipment Operational Qualification (OQ)

			system/equipment or on permanent shifting of equipment.

STANDARD OPERATING PROCEDURE SOP No. : QMS 008
Revision No.: 00

Title: Requalification of Equipment Supersedes : None
Page No. : 1 of 3

1.0 Objective

To lay down the procedure for Re-qualification of Equipment

2.0 Scope

This SOP applies to all equipment that requires re-qualification within the organization.

3.0 Responsibility

3.1 Equipment Owner/Operator: Responsible for initiating and overseeing the re-qualification process for the equipment

3.2 Quality Assurance: Responsible for reviewing and approving the re-qualification plan and report

3.3 Maintenance Personnel: Responsible for performing any maintenance or adjustments required before re-qualification.

3.4 Operations Personnel: Responsible for executing the re-qualification activities as per the SOP.

4.0 Abbreviations and Definitions

QA Quality Assurance

SOP Standard operating procedure

5.0 Procedure

5.1 Pre-Re-qualification Preparations:

1. Review the equipment's usage history, any recent maintenance, and any changes made to its components or configuration.

2. Identify the need for re-qualification based on factors such as changes in process requirements, maintenance activities, or a predetermined time interval

5.2 Re-qualification Plan:

1. Develop a re-qualification plan detailing the objectives, scope, methodology, acceptance criteria, and schedule.

STANDARD OPERATING PROCEDURE SOP No. : QMS 008

Revision No.: 00

Title: Requalification of Equipment Supersedes : None
Page No. : 2 of 3

2. Include details about the equipment's current status, maintenance activities, and any adjustments needed before re-qualification

5.3 Maintenance and Adjustment:

1. Perform any required maintenance activities or adjustments to ensure that the equipment is in optimal working condition.

2. Calibrate the equipment as necessary, using traceable standards and tools.

5.4 Data Collection:

1. Start the re-qualification process according to the plan

2. Collect relevant data during the re-qualification process, including performance parameters, measurements, and observations.

5.5 Data Analysis:

1. Use appropriate software and tools to analyze the collected data.

2. Compare the obtained data with the equipment's original specifications and acceptance criteria to determine its compliance.

5.6 Reporting:

1. Prepare a comprehensive re-qualification report that includes:

■ Re-qualification objectives and scope

■ Re-qualification plan and methodology

■ Equipment maintenance and calibration details

■ Data collected during re-qualification

■ Data analysis results

■ Deviations from specifications (if any)

■ Conclusions and recommendations

5.7 Review and Approval

STANDARD OPERATING PROCEDURE SOP No. : QMS 008

Revision No.: 00

Title: Requalification of Equipment Supersedes : None
Page No. : 3 of 3

1. Submit the re-qualification report to the Quality Assurance department for review

2. Upon approval, the report should be archived for future reference.

6.0 Documentation

Re-qualification plan

Maintenance and calibration records

Re-qualification report

Quality Assurance approvals

7.0 Post-Re-qualification Actions:

- 1 Implement corrective actions if deviations from specifications are identified.
- 2 Update the equipment's status and maintenance records as needed.

8.0 References

List any relevant standards, guidelines, or references used in developing this SOP.

9.0 Distribution

Background/Introduction:

HVAC system function is to condition (heating and cooling), replace (makeup, fresh air, oxygen replacement), pressurize (containment), and clean (filter) the air in the environment to meet the required operational conditions.

HVAC system operational qualification program is designed to provide assurances that all the components of the HVAC system meet the environmental specification in a consistent and reproducible way. In one word it should demonstrate the robustness of the system.

Components of an HVAC system:

Air-Handling Units

Ductwork-Air Distribution Network

Air Filters

Purpose:

The purpose of this protocol is to establish documentary evidence to ensure that the Heating, Ventilation and Air Conditioning Systems installed at different areas and supporting facilities are performing as per their intended use and the predetermined specifications.

Scope:

This protocol is applicable to the Heating ventilation and air conditioning systems installed in xxx facility.

Responsibility:

It is the responsibility of Biobridge Healthcare solutions Pvt. Ltd. to provide the Operational qualification protocol and carryout the activity.

Safety considerations:

Follow the safety consideration as per the equipment specific SOPs.

Follow the gowning procedures of the respective areas before entering the classified areas.

Use personal protective equipment during the study, as required.

Allow the test results reading to stabilize adequately prior to reporting.

While handling aerosols, use synthetic gloves if necessary to prevent excessive skin contact. Do not wear contact lenses and always use ANSI approved safety glasses or splash shield.

Inhalation of vapors or spray mist may cause headaches, and/or nose and throat irritation.

Pre Requisites:

Training:

Training shall be imparted to the concerned personnel on this protocol before the execution of the activity. All necessary aspects related to the operational activity shall be explained during training program.

A copy of the training record shall be attached to the operational qualification report.

Equipment:

Non-viable particle counter

Digital Anemometer (Vane/Wire type)

Digital Thermo-hygrometer

PAO (Poly Alpha Olefin) Aerosol Generator or suitable alternate

Aerosol Photometer

Smoke Generator

Digital Video Camera

Lux Meter

Sound Level Meter (dBA meter)

Material and Reagents:

Poly Alpha Olefin Aerosol or suitable alternate

Flow Marker / WFI or suitable reagent for Smoke generation

70% v/v IPA (Filtered)

Prior to conducting/ executing the operational qualification activity following conditions must be fulfilled:

Ensure that all the test and measuring instruments are in calibrated state before initiation of activity.

System should be safe for execution.

Check availability of materials and reagents.

Record the pre-requisite details in Annexure-1.

Procedure:

Test Parameter and Frequency:

Air Velocity Test and Calculation of Air changes per hour:

Objective:

To demonstrate that air system is balanced and capable of delivering sufficient air velocity / volumes to maintain a desired cleanliness class/ hygiene level at operational condition.

Use Digital Anemometer to measure air velocity of the HEPA filter at five different locations with four locations at corners and one location at center of HEPA filter.

Measure the filter velocity downstream of the filter as a distance of about 150mm as shown in Figure 1.

Measuring time at each position should be at least 10 seconds duration, and the average, maximum and minimum values should be recorded. Allow the reading to stabilize completely.

Figure-1

Calculate the average air velocity as per formula given below:

Average velocity of each HEPA filter:

Calculate the Average Velocity (Vav, in Feet per Minute) of HEPA filter as:

V1, V2 etc. = Velocity observed at different points

Calculate the $\pm 20\%$ of Average as mentioned below:

Review all the observed velocities are within the specified limits of $\pm 20\%$ of Average velocity as calculated by above formulas.

Calculation of Air changes per hour:

7.2.7.1 Calculate the area of the filter by multiplying the length and width of the filter in feet

$A = l \times w$

l = length of HEPA filter

w = Width of HEPA filter

7.2.7.2 Calculate the total air volume per minute supplied in the clean room by following formula:

$T = A \times V$

A = Area of HEPA filter in square feet

V = Average air velocity in feet per minute

7.2.7.3 Calculate the total air in the room by multiplying length, width and height of the room in feet:

Volume = L x W x H

7.2.7.4 Calculate the air change per hour by using formula:

Air Change per Hour = $T \times 60$

Volume

Record the results as per the Annexure-2.

Installed HEPA Filter Integrity Testing:

Objective:

To ensure that the HEPA filters installed are not damaged during operation and/ or fixed properly in the appropriate place, such that there is no leakage from the filter media and the other joint gaskets, frames etc.

The filter testing shall be performed after operational velocities have been verified and adjusted where ever necessary.

The measuring and testing instruments being used shall be calibrated prior to usage with reference to the NPL or any other traceable reference standard.

Adjust the aerosol generator to achieve the PAO challenge concentration of approximately 20-80 µg/L of air (Ref: ISO 14644 Part III). Adjust this challenge to 100% scale of the upstream concentration at upstream of the HEPA filter and check for detection in photometer.

Select downstream scanning mode from the control panel. Scan the subjected HEPA filter by holding the photometer probe approximately 3-5 cm from the filter face and passing the probe in slightly overlapping strokes, at a scan rate of not more than 5cm/sec so that the entire filter face is sampled.

The entire periphery of the filter, the bond between the filter medium and the frame, all other joints shall be scanned.

Record the results as per the Annexure-3.

Air Borne (Non-viable) Particle count

Objective:

To provide the documented evidence that installed equipment's are capable to maintain the desired level of air borne particulate concentration as per regulatory standards.

Particulate cleanliness of the critical and controlled areas shall be evaluated as per the guideline of ISO 14644 Clean rooms and associated controlled environments, Part 1 (Classification of airborne particulates) and Part 2 (Specifications for testing and monitoring to prove continued compliance with ISO 14644-1, 2 & 3).

Air borne (Non –Viable) particle counts for HVAC system in Classified Area shall be tested at Rest Condition.

Determine the minimum number of sampling point locations from the following equation:

Where,

'NL' is the minimum number of sampling locations (rounded off to a whole number)

'A' is the area of the cleanroom or clean zone (cross section of the moving air perpendicular to the direction of the airflow) in square meters (1m=3.2808 Feet and 1Feet =0.3048m).

Ensure that the sampling locations are evenly distributed throughout the area of the cleanroom or clean zone and positioned at the height of the work activity.

Minimum single sample volume VS per location is determined by using equation:

Where,

'VS' is the minimum single sample volume per location, expressed in liters (except see

'Cn,m' is the class limit (number of particles per cubic meter) for the largest considered particle size specified for the relevant class.

'20' is the defined number of particles that could be counted if the particle concentration were at the class limit.

Based upon the above equation following sampling volume shall be considered for the different grades as follows:

Set up the particle counter at a working height according to appropriate test equipment operating procedures at the sample point as identified.

The sampling probe shall be positioned pointing into the airflow.

Identification of the sampling locations as per the attached sheet.

Collect the print and compile the data and attach with respective Annexures.

Interpretation of data shall be done as per the Acceptance Criteria.

Original along with a photocopy of the location wise non-viable particles counts prints out shall be attached with the report and annexure.

Record the results as per as Annexure-4.

Differential Pressure, Temperature & Humidity Monitoring:

Objective:

To ensure that the differential pressures, temp and humidity of the area are within the acceptable range to maintain the cleanroom environment.

Record the temperature and humidity readings from digital thermo hygrometers and monitor the parameters of areas for three consecutive readings at 4hrs interval in operation condition.

Review the data with respect to the acceptance criteria as specified in Clean room data sheet and record the results as per the Annexure-5.

Recovery Test:

This test is to be performed for determining operation and efficiency of HVAC system to eliminate airborne particulates.

Prior to recovery testing, airflow velocity and the uniformity of velocity must be in compliance to the acceptance criteria.

Setup the non-viable particle counter in the clean zone where the recovery time has to be determined.

Particle counter should not be placed directly under the air outlet. Adjust the single sample volume, number of cycles and delay time of the counter should be adjusted to not more than 10 seconds.

Adjust the single sample volume to the same value used for determining the cleanliness class.

In the case two different particle sizes are used for the cleanliness classification both shall be chosen for the study (e.g. >0.5 µm and > 5.0 µm).

Place the Particle Counter Probe at the test point and the probe should not be placed directly under the air outlet.

First, check and record the actual particle count level in the clean area, generate the smoke using the Aerosol Generator at the air inlet to the clean area in such a way that the generated smoke distributed uniformly, until the particle count level in the clean area becomes approximately >100 times (worst case) the target cleanliness level for 0.5µm particle (i.e. Acceptance Level)

Start measuring & recording the particle count each minute. Particle count level gradually comes down and particle count readings to be taken until the 100:1 ratio in the clean area is restored to the original condition recorded & record the recovery time.

Plot the data of decreasing particle concentration on a rectangular graph, with particle concentration in Y Axis and time in X Axis.

Based on the obtained particle concentration with respect to the time, plot the graph till the particle concentration in the clean area reaches the specified cleanliness level (i.e. Acceptance Level).

Cleanliness recovery rate is obtained from the slope value of the line.

In case it is difficult to raise the particle concentration 100 times the target cleanliness level, recovery time shall be calculated on the basis of the slope calculated from the graph plotted as follows:

The overall recovery time shall be calculated for the clean zone as follows:

Where,

TR is Recovery Time

N is number of tested location

TRI is the recovery time at each location

Record the results as per as Annexure-6.

Recovery test for humidity and temperature:

7.6.16.1 The humidity and temperature are checked at the off position of the HVAC system.

7.6.16.2 The humidity is increased to 75% and temperature to 40 °C.

7.6.16.3 The HVAC system is switched ON and humidity and temperature

Readings are checked at 1 min interval until the original condition of room restored as per clean room data sheet.

7.6.16.4 Record the time required to stabilize the humidity and temperature in Annexure-7.

Air Flow Visualization Test:

Objective:

Air Flow Visualization is performed to demonstrate that the air flow pattern below the HEPA filter to prevent air turbulence or stagnant air in clean zone.

Air Flow Visualization is performed to demonstrate that the airflow direction and its uniformity conform to the design and operational specifications

Place the smoke generator discharge port below the HEPA filter and observe the flow of smoke.

Videography and/or still photography shall be done during this test to record the activity.

Review the flow of the air and the direction shall be as per the area design and pressure cascade.

A copy of videography/photography shall be attached to the report.

Record the results as per the Annexure-8.

Light Intensity Test:

Objective:

To determine the light intensity level and its uniformity throughout an area at pre-determined points.

Record the light intensity levels on a pre-determined grid pattern/layout of lux level or on a 3m X 3m grid pattern in the absence of a specification.

Divide the room into four equal locations.

Record the light intensity level at working height or 1 meter above finished floor height.

The area under test must have all fitted lights working and the area structure should be complete. Also, if required, emergency lighting levels can be recorded.

Record the light intensity levels in lux for each position on the grid in Annexure-9.

Note down all variations from specification, if any.

Acceptance Criteria: It should meet the acceptance criteria as mentioned in the attached room data sheet.

Sound Level Test:

Objective:

To determine the Sound level and its uniformity throughout an area at pre- determined points.

Verify that the air conditioning system is operating in the stable condition and in operational condition.

Map out the area under test as required by the specification in a 2400 mm x 2400 mm x grid or on a previously agreed location. Divide the area into four equal parts.

Set the instrumentation to work and ensure that unauthorized entry and exits from the room are prevented.

Measure the sound levels at 750 mm from the finished floor level and away 1 meter from equipment.

Record the results of sound level test in Annexure-10.

Note down all variations from the specifications, if any.

Acceptance Criteria:

Operational Qualification Report:

A report shall be prepared based on the results obtained in study. Report shall be in a narrative form which describes the works as well as conclusion regarding acceptability.

All the results shall be recorded in the annexure of protocol and attached with the report; the following data (but not limited to) will be archived and attached with the report (as applicable) for HVAC system.

Test Parameter | Frequency /Duration

Air Velocity | Once

Installed HEPA Filter Integrity Testing | Once

Differential Pressure, Temperature and RH monitoring | Three (3) consecutive readings after every four hours- In Operation

Non-Viable Particle Count Test | Once

Air Flow Visualization Test | Once

Recovery Test | Once

Light Intensity Test | Once

Sound Level Test | Once
 S. No. | Grade | Sampling Volume
 1 | Grade A | ≥ 1000 Liters
 2 | Grade B | ≥ 700 Liters
 3 | Grade C | ≥ 2 Liters
 4 | Grade D | ≥ 2 Liters
 S. No. | Test Parameter | Acceptance Criteria
 | Air Velocity | 90 ± 20 % of the Average Velocity
 Observed velocities should be within the specified limits of $\pm 20\%$ of Average velocity of installed filters.
 Unidirectional flow velocity should not disrupt the sensitivity of balances in weighing areas.

Refer Room data sheet for designed air volume & ACPH
 | Installed HEPA Filter Integrity Testing | Leak should not be more than 0.01% of total upstream concentration
 | Differential Pressure, Temp & Humidity | As per clean room data sheet
 | Non-Viable Particulate Count Test |
 | Air Flow Visualization Test | Air Flow shall be unidirectional and perpendicular from the HEPA Filter.
 Air should pass through positive to negative area
 | Recovery Test | Recovery time should not be more than 15 Minutes
 | Light Intensity Test | As per specification in room data sheet
 | Sound Level Test | Not more than 85 dB
 Annexure No. | Annexure Title
 Annexure 1 | Pre- Requisite for operational qualification of HVAC system
 Annexure 2 | Air Velocity Test Report
 Annexure 3 | Installed HEPA Filter Leak Integrity Test Report

1.0 Objective |
 |To lay down the procedure for issuance of controlled copies of Production |
 |Order, Batch Record, Solution Preparation Record and Cleaning Record. |
 2.0 Scope |
 |This Standard Operating Procedure is applicable for the issuance of |
 |controlled copies of Production Order, Batch Record, Solution Preparation |
 |Record, Cleaning Record and forms which shall be part of batch production |
 |records. |
 3.0 Responsibility |
 |3.1 The Production department shall give requisition duly approved by the |
 |head of production or his/her designee for the required Production |
 |Order, Batch Record, Solution Preparation Record, Cleaning Record and |
 |forms which shall be part of batch production records (hence-forth |
 |referred as forms) when a batch/activity is planned in production. |
 |3.2 The Head QA or his/her designee shall be responsible for authorizing |
 |the issue of requisitioned documents. |
 |3.3 The Documentation section of QA Department shall be responsible for |
 |issue of controlled copies of the Production Order, Batch Record, |
 |Solution Preparation Record, Cleaning Record and forms as per QA |
 |authorized requisition. |
 |3.4 The Head of the production department or his/her designee shall be |
 |responsible to return unused Production Order, Batch Record, Solution |
 |Preparation Record, Cleaning Record and forms if any. |
 |3.5 Head, QA Department shall ensure the implementation of this SOP. |
 4.0 Abbreviations and Definitions |
 |4.1 HOD : Head of the Department |
 |4.2 SOP : Standard Operating Procedure |
 |4.3 QA : Quality Assurance |
 |4.5 No. Number |
 | : |
 |4.6 PO Production Order |
 | : |
 |4.7 BR Batch Record |
 |4.8 SPR Solution Preparation record |
 | : |
 |4.9 CR Cleaning Record |
 5.0 Procedure |
 |5.1 Request for controlled copies of Production Order, Batch Record, |
 |Solution Preparation Record, Cleaning Record and forms: |
 |5.1.1 A requisition duly approved by the Head of the Production |
 |Department or his/her designee for the issue of controlled |
 |copies of PO/BR/SPR/CR/forms shall be submitted to Quality |
 |Assurance Department prior to the start of the activity. |
 |5.1.2 After authorization of the said requisition by the HOD QA or |
 |his/her designee, folio number shall be assigned to the |
 |requisition. |
 |5.1.3 Assigning of Folio Number: |
 |5.1.3.1 The folio number shall be assigned such as xx/zzz. |
	For example: 23/001, where
	23 corresponds to last digits of the year 2023
	followed by a slash followed by, 001 (three digit
	consecutive number) indicates the first folio number
	of the year.
	For different products; product having different
	independent entity and different serotypes/strains of
	a product, the folio no. and records shall be
	maintained separately.
5.1.4 Controlled copies of Production Order, Batch Record, Solution	
Preparation Record, Cleaning Record and Forms shall be	
reproduced by photocopying from approved copies archived in	
Quality Assurance Department. All pages of the Production	
Order, Batch Record, Solution Preparation Record, Cleaning	
Record and forms shall be stamped and signed by a person from	
QA-Docmentation section.	
Specimen of Controlled Copy stamp:	
5.1.5 Assigning of date:	
	In the date XX YYY ZZZZ format xx correponds to the day, YYY
	corresponds to abbreviation for the month and zzzz for the
	year.
5.1.6 Assigning Controlled Copy Number:	
5.1.6.1 The controlled copy number for Production Order,	
Batch Records and Solution Preparation Records,	
Cleaning Record, Forms pertaining to batch production	
activities shall bear the block code (single digit	
numeral), followed by product code (of two digits)	
followed by last two digits of the current year,	
followed by a three-digit consecutive number assigned	
to the controlled copy.	
	For example:
	Controlled Copy No. 10012001
	Where numeral '1' depicts department name, '00' is
	product code assigned to the product say X, digits
	'23' corresponds to last two digits of the year 2023
	and 001 represents the first control copy number
	assigned to a Production Order, Batch Record,

				Solution Preparation Record, Cleaning Record and	
				Forms of a batch in the year.	
				5.1.6.2	The controlled copy number for Solution Preparation
				Record/Cleaning Record for general activities (i.e	
				not pertaining to production batch) shall bear the	
				block code (single digit numeral), followed by last	
				two digits of the current year, and followed by a	
				three digit consecutive number assigned to the	
				controlled copy.	
				For example:	
				Controlled Copy No. 123001	
				Where numeral '1' depicts department name, digits	
				'23' corresponds to last two digits of the year 2023	
				and 001 represents the first control copy number	
				assigned to a Sample Preparation Record/Cleaning	
				Record for general activities of the year.	
				5.1.6.3	In case of product(s) having different independent
				entities, the product code in the controlled copy	
				number shall bear a capital alphabet in subscript	
				form (Handwritten) for distinction of its entity.	
				For example in:	
				Controlled Copy No. 30012001	
				A	
				The alphabet A is a distinct independent entity of	
				the product X (bearing product code 00) distinguished	
				by its independent batch no.	
				5.1.6.4	In case of product with different serotypes/strains,
				the product code in controlled copy number shall bear	
				a capital alphabet in subscript form (as per 5.1.6.2)	
				for distinction of its entity followed by (in	
				bracket) the code of serotype/strains (Handwritten),	
				as applicable.	
				For example in:	
				Controlled Copy No. 30012001	
				A(1)	
				The alphabet A is a distinct independent entity of	
				product X, followed by (1) which is serotype/strain	
				of the product X.	
				5.1.6.5	The same copy number shall be applicable to all the
				PO/BR/CR/SPR/Forms of a batch of the product.	
				5.1.6.6	However in case the batch is to be distributed later,
				the parent controlled copy number shall be followed	
				by a hyphen (-), followed by capital alphabet 'D'	
				(Handwritten) depicting distribution followed by two	
				digits numeral 01,02 and so on indicating number of	
				times the distribution activity being carried out for	
				the said batch.	
				5.1.6.7	In case re-issuance of PO/BR/SPR/CR/Forms is
				necessitated for the same activity, the initially	
				assigned controlled copy number shall be followed by	
				hyphen (handwritten), followed by capital letter	
				'R'(depicting reissuance), followed by numeral 01,02	
				and so on (depicting number of the times the	
				reissuance activity being performed for the said	
				document). The requisition for these documents shall	
				also bear reason for reissuance in remarks column.	

	5.2	Record of issued controlled copies of Production Order, Batch		
		Record, Solution Preparation Record and Cleaning Record:		
		5.2.1	The requisitions shall be kept separately for different	
		products; for independent entities and for different		
		serotypes/strains of the product and shall be assigned folio		
		number.		
		5.2.2	Folio Number:	
			5.2.2.1	The folio number shall be assigned such as xx/zzz.
				For example:
				23/001, where 23 corresponds to last digits of the
				year 2023 followed by a slash followed by, 001
				(three-digit consecutive number) indicates the first
				folio number of the year.

	5.3	Return of unused Production Order, Batch Record, Solution Preparation	
		Record, Cleaning Record and Forms:	
		5.3.1	The Head of the production department or his/her designee
			shall be responsible for returning the unused Production
			Order, Batch Record, Solution Preparation Record and Cleaning
			Record, if any. Reason for return shall be mentioned in
			remarks column.

	5.4	Destruction of unused Production Order, Batch Record, Solution	
		Preparation Record Cleaning Record and Forms:	
		5.4.1	The documentation section in QA Department is responsible for
			destroying the Production Order, Batch Record, Solution
			Preparation Record, Cleaning Record and Forms which were not
			used.

||5.4.2 |The destruction will be carried out either by incineration or |
 ||||by shredding. |

1.0 |Objective |
 |To lay down the procedure for handling of returned products. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable for handling of returned |
 |products manufactured at (Name of Organization). |
 3.0 |Responsibility |
3.1	The Quality Assurance department is responsible for proceeding
	according to the procedure laid down in this SOP.
3.2	Head, QA department is responsible for checking the compliance of
	this procedure and shall ensure that the SOP is reviewed every two
	years or if required earlier.
4.0	Abbreviations and Definitions
	QA : Quality Assurance
	QAR : Quality Assurance Record
	QC : Quality Control
	QE : Quality Engineering
	SOP : Standard Operating Procedure
5.0	Procedure
5.1	The QA department shall handle returned products.
5.2	The Supply and Distribution department (Warehouse) shall communicate
	in writing to the QA department about the arrival of returned
	products.
5.3	The following information shall be given in the communication:
	5.3.1
	5.3.2
	5.3.3
	5.3.4
5.4	QA Personnel shall assign a code and shall fill the form XXXX
	"Returned Products"
5.5	QA Inspector shall carry out a visual inspection of the returned
	product.
	5.5.1
	5.5.2
5.6	This report shall be sent to QA.
5.7	The inspector shall mark the returned product with the established
	(Returned) label.
5.8	Top management must be informed of any returned product and
	conclusions about its final destiny.
5.9	QA shall investigate the causes of the return, taking into
	consideration the original complaint or any other circumstance about
	the returned product.
	5.9.1
5.10	QA shall investigate, as well, the conditions in which the product
	was stored and handled, starting from its delivery to the client
	until the moment that the return was processed and shall also be
	included in the above report.
5.11	If it is necessary, sampling and testing shall be performed on the
	returned batch, as well as a checking of the batch production record.
5.12	The QA shall, also investigate the causes of deficiencies, if any, to
	plan corrective actions as per SOP XXXXXXXX.
5.13	Returned products shall be destroyed in case they do not meet the
	specified quality or if there are any doubts about the safety,
	identity, strength, quality or purity of the product due to storage
	conditions, shipment and handling.
5.14	They shall, also, be destroyed if the state of the product, its
	container and labeling indicates some doubt to this respect.
5.15	If the final decision is destruction, QA shall send a copy of Form
	XXXXXX Returned Products (Annexure 2) to the EOHS so that they
	proceed as per SOP XXXXXX.
5.16	In case the investigations show that the product complies with
	specifications for safety, identity, strength, quality or purity of
	the product, it could be sold or dedicated to other uses (reference

		material, analyst qualification etc.)	
	5.17	Documentation of Returned Products:	
		5.17.1	Returned products shall be documented in Form XXXXX
			Returned Products (Annexure 2).
		5.17.2	All inspections, records, etc. shall be annexed to this
			form.
6.0	Forms and Records		
	6.1	Return product intimation form	
			: Annexure 1
	6.2	Returned product	
			: Annexure 2

[illegible][illegible]

1.0 |Objective |
 |To lay down the procedure for implementation of effective CAPA system. |
 2.0 |Scope |
 |This SOP is applicable to all the departments of Name of organization where |
 |Corrective and Preventive actions are planned to address identified issues |
 |or to implement quality improvements. These requirements apply to all GMP |
 |operations and areas which have been recommended for quality improvements. |
 3.0 |Responsibility |
 |3.1 |Personnel of all concerned department shall be responsible to follow |
 |the procedure mentioned in this SOP. |
 |3.2 |Head-QA shall be responsible for approval of proposed CAPA, extension |
 |of existing CAPA. |
 |3.3 |Heads of the concerned departments or their designee, shall be |
 |responsible for implementation of this SOP. |
 |3.4 |Head-Quality Assurance or his/her designee shall be responsible for |
 |overall compliance of this SOP. |
 4.0 |Abbreviations and Definitions |
CAPA	: Corrective and Preventive Action
QA	: Quality Assurance
CQA	: Corporate Quality Assurance
MQR	: Monthly Quality Report
SOP	: Standard Operating Procedure
Operating	: A set of instructions which give the information to do the
guideline A	particular activity.
set of	
instructions	
which give	
the	
information	
to do the	
particular	
activity.	
Correction	: An action taken to eliminate a detected non-conformity. A
correction can be made in conjunction with a corrective	
action.	
Corrective	: The action taken to eliminate or minimize the causes of a
action	detected non- conformity, defects or other undesirable
situation in order to prevent recurrence of the	
non-conformity.	
Preventive	: An action taken to eliminate or minimize the cause(s) of a
action	potential non-conformity or other undesirable situation. A
preventive action is taken to prevent the initial occurrence	
of a non-conformity.	
Non-Conformit	: The non-fulfillment of a specified requirement
y	
5.0	Procedure
5.1	Personnel from initiator department shall request QA for the issuance
of CAPA form which can be triggered from various sources.	
CAPA sources can be as follows (but not limited to):	
5.1.1	Complaints
5.1.2	Deviations
5.1.3	Product rejections
5.1.4	Recalls
5.1.5	Self Inspection
5.1.6	Regulatory inspections & findings
5.1.7	External audits (Consultant or customer)
5.1.8	Out of specifications and Out of limits
5.1.9	Trends of process performance
5.1.10	Outcome of Risk assessment
5.1.11	Investigation of non-conformance
5.1.12	Product quality review recommendations
5.1.13	Management Review Actions(e.g. MQR)
5.1.14	Ineffective CAPA
5.1.15	Incidents
5.2	QA personnel shall allocate twelve digit number to CAPA. The number
shall be in LCAPA/Department/ YY/ XXX format, where :	
L-stands for the site	
CAPA - Denotes Corrective action and Preventive action	
followed by a slash	
Department represents the departmental code	
	YY - Indicates last two digits of the year e.g. 23 for 2023, A
	new series of CAPA shall start at the beginning of New Year,
	followed by slash (/)
	XXX - Three digit consecutive numeral (001, 002, 003, etc)
	assigned to particular CAPA
	Each deficiency/discrepancy shall be assigned a separate CAPA
	number e.g. In case of Self Inspection/Audits, each deficiency
	shall be assigned a separate CAPA number.
5.3	Designated QA personnel shall log CAPA details in annexure 2 as per
the CAPA process (Sr. No, Source of CAPA, CAPA number etc.)	
5.4	Initiator shall fill the section B of CAPA Form (Annexure 1) which
includes source name and document no., brief details of	
discrepancies/deficiencies, Details of root cause, description of	
CAPA.	
5.5	Planning of corrective and preventive actions shall be based on the
root cause identified through investigations (carried out as per	
respective SOP No: XXXXX) for systems like deviation, incident, OOS,	
product recall etc. or based on audit reports, risk assessment	
report, etc.	

	5.5.1	The CAPA shall be planned by concerned personnel from user		
		department. Wherever required the CAPA shall be planned by a		
		cross-functional team consisting of designated personnel from		
		Production, Engineering, QC, QA, RA etc. coordinated by the		
		concerned personnel from user department.		
	5.5.2	During planning of CAPA actions, team shall assess the		
		objective of proposed CAPA and decide on best possible CAPA		
		actions.		
	5.5.3	The concerned personnel from user department shall list all		
		activities, tasks, documents and training requirements that		
		must be accomplished to prevent recurrence of an existing		
		non-conformity or occurrence of potential non-conformance.		
	5.5.4	Team shall fix CAPA target completion date based on action		
		points and the same shall be approved by QA personnel. However		
		if timeline is not proposed by the user then same shall be		
		considered as 30 days from the date of submission of CAPA.		
	5.5.5	Team shall identify the need to raise change control based on		
		proposed CAPA e.g. CAPAs that require changes to process,		
		procedures or equipment etc. as per Change control SOP		
		no.XXXXX.		
	5.5.6	The concerned department head shall forward the CAPA plan with		
		responsibilities and target completion date within 20 days		
		after the issuance of CAPA Form from QA.		
	5.5.7	A Unique Number shall be assigned to each CAPA action by the		
		initiator. The unique number shall be a combination of "CAPA		
		No. followed by dot followed by Serial Number" i.e.		
		LCAPA/Department/YY/XXX (.) Serial number (e.g. LCAPA/		
		QC/23/001.1,LCAPA/QC/23/001...2 so on.).		
	5.5.8	QA shall review the CAPA plan on the basis of root cause		
		analysis and send to Head-QA for approval. If CAPA actions are		
		justified then Head QA approve the plan otherwise reject the		
		plan and suggest initiating department to re-define the CAPA		
		plans.		
	5.6	Implementation of CAPA action plan:		
	5.6.1	Initiator shall ensure the implementation of corrective and		
		preventive action plans within defined timelines.		
	5.6.2	This section should contain a complete record of the actions		
		that were taken to correct the problem. This includes changes,		
		preventive measures, process controls, training, etc.		
	5.6.3	If initiator identifies that the completion of CAPA plan is		
		not achievable during the defined time period, then he/she		
		shall request for extension of CAPA target timelines with		
		justification (as per annexure 3).		
	5.6.4	Designated personnel in QA department shall monitor the agreed		
		timelines as per the CAPA action plan. In case agreed		
		timelines are not met, QA shall escalate the details to Head –		
		QA.		
	5.7	Verification of CAPA plan(s):		
	5.7.1	Designated QA personnel shall verify the CAPA completion		
		status as per respective target dates of CAPA completion and		
		record the verification activity as per section D of annexure		
		1.		
	5.7.2	While QA personnel reviewing the documentary evidences of CAPA		
		completion, if they find the CAPA is incomplete then they		
		shall recommend user department personnel to raise CAPA		
		extension form (annexure 3) in order to avail revised target		
		dates of CAPA completion.		
	5.7.3	In case of extended CAPA plan, designated QA personnel shall		
		verify the CAPA completion status as per revised target dates		
		of CAPA completion and record the verification activity as per		
		section E of annexure 1.		
	5.8	Incase, the CAPA is found to be ineffective, the same shall be		
		investigated for the cause, assessment of the impact shall be done		
		and the CAPA process shall be re-followed. When the Follow up is		
		complete, the document shall be made in place which shall be reviewed		
		by the concerned and approved by QA.		
	5.9	CAPA monitoring for effectiveness evaluation and CAPA closure		
	5.9.1	Designated QA personnel shall monitor the ongoing		
		effectiveness of the CAPA implemented through monthly quality		
		reviews, product quality reviews, monitoring of change		
		control, deviations of similar nature, anticipated potential		
		failures and other sources as described above.		
	5.9.2	Designated QA personnel to close the CAPA as per section F of		
		annexure 1.		
	6.0	Forms and Records		
	6.1	Annexure 1 – Corrective and preventive action form		
	6.2	Annexure 2 – Corrective and preventive action log		
	6.3	Annexure 3 – CAPA extension form

Receipt and verification of recalled products at the Warehouse

Storage of recalled products in the designated and secured area in
Warehouse

Reconciliation between delivered & recovered quantities

Evaluation of effectiveness of recall by means of internal audit

Warehouse to handle recovered recalled products as per decision on form
"Product recall - Strategy & Disposition"

1.0 |Objective |
 |To lay down the procedure for product recall and handling of recalled |
 |product. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to handling of product |
 |recalls and recalled products at company name. |
 3.0 |Responsibility |
3.1	Head, Quality Assurance/ designee shall be responsible for the
	coordination of product recall, final disposition of recalled product
	and must keep top management informed of progress in product recall.
3.2	Head, Quality Assurance/ designee shall be responsible to decides if
	the batch shall be brought back to premises or destroyed in client's
	premises.
3.3	Head, Warehouse/ designee shall be responsible for providing the
	relevant information to the Head, Quality Assurance and execution of
	the product recall activity. He shall also be responsible for handling
	of recalled products as per this SOP.
3.4	Head administration shall be responsible to provide the necessary
	support for handling of recalled product and other administrative
	support if required.
3.5	Head of corporate quality assurance shall be responsible to authorize
	the decision of the batch recall taken by the QA head.
4.0	Abbreviations and Definitions
HOD	:
QA	:
RA	:
R&D	:
SOP	:
Product Recall: A system designed to remove the product from market/clients	
known or suspected to be defective promptly and effectively. Recall may be	
voluntary or directed by the regulatory agencies.	
Product Recall and Review Team: A group comprising heads of Quality	
Assurance, Production, Quality Control, Warehouse, Regulatory Affairs and	
this committee shall decide the recall strategy.	
Recall Strategy: Planned course of action to be taken in conduction of a	
specific recall which addresses depth & level of recall and extent of	
effectiveness of checks for recall it shall be customized strategy w.r.t	
case to case.	
5.0	Procedure
5.1	Dispatch or sale of the batch shall be stopped immediately once recall
	has been decided. There shall be designated QA person handling the
	product recall.
5.2	On receipt of any complaint on the product safety, efficacy, purity,
	identity, etc. the same shall be handled as per SOP XXXXX "Handling of
	product complaint". During the course of investigation and assessment
	of degree of seriousness of health hazard, if it emerges that the
	product is defective (or) and if company undertakes a voluntary recall
	for recall directed by the regulatory body(s), then the procedure
	mention in the SOP shall be followed.
	Note: If a batch has been dispatched under "ON TEST" status, return of
	that product shall not be considered as recall.
5.3	Apart from the complaint the decision to recall the product may be
	taken due to other concern such as by the results from the ongoing
	stability testing report, annual product review report, and detection
	of GMP failure after release, directions from the national authorities
	/ regulatory authorities, result of an inspection.
5.4	Head, Quality Assurance/ designee shall initiate Annexure-1 'Product
	Recall-Strategy & Disposition' by filling product details, nature of
	the product defect/complaint and name of the committee members (HODs
	of concerned departments to be provided by Head-QA/ designee).
5.5	Each product recall shall be coded as defined below by means of an
	example: LREC/00/12001
	L : Corresponds to Site name
	REC : Corresponds to product recall
	00 : Corresponds to the product code
	12 : last two digits of the year (XXXX) in which the recall took
	place.
	001: a three digit consecutive number of the recall in that year.
	In this example, the code corresponds to the first recall of product
	XX in year 2012 at company site.
5.6	Any batch of a product for which partial distribution has already
	begun and there is a product defect, the remaining quantity, if any
	shall be put under HOLD by Quality Assurance till the committee takes
	a final decision.
5.8	Head, QA/designee shall coordinate with other members of the committee
	of product recall.
5.9	Depending on the investigation, the QA head decides that the product
	shall be recalled or not and its execution.
5.10	Final approval and authorization for a product recall shall be
	obtained from Head CQA along with Head QA/ designee.
5.11	Recall committee shall devise a recall strategy for conducting product
	recall
	5.11.1
	5.11.2

		destruction shall be inspected by the QA person deputed by the
		head QA.
	5.12	In case of products which shall be dispatched/sold to any external
	customer, Head, RA on behalf of company shall inform the drug	
	authorities regarding decided product recall with following details.	
	5.12.1	Product Name, Batch No., Batch Size, Manufacturing Date, Retest
		Expiry Date.
	5.12.2	Reason for recall.
	5.13	The distribution and dispatch records shall be checked to list down
	the name, addresses and contact numbers of customers with quantities	
	distributed to each customer.	
	5.14	Inform Head QA of the concerned clients for retention of the batch if
	it has not been used or initiation of recall of those final products	
	made from the affected batch that has already been distributed by the	
	client.	
	5.15	All customers to whom products have been distributed / dispatched
	shall be informed promptly by Head, Warehouse. The list of contacts of	
	all customers, and delivered batch numbers and quantities of product	
	delivered shall be maintained by Warehouse.	
	5.16	The head warehouse shall send the recall letter to customers as per
	Annexure -3.	
	5.17	Recalled products shall be received by Warehouse personnel. Warehouse
	personnel shall physically verify the details of the recalled products	
	like Product name, Batch No., Mfg. Date, Expiry Date and packing	
	details. The product shall be stored in a designated area under the	
	recommended storage conditions in the Warehouse and shall be marked	
	with established labels while awaiting a decision on further course of	
	action. Remaining stock, if any, of the suspected batch of the product	
	in the warehouse shall also be moved into this secure storage area and	
	entry to the area shall be restricted.	
	5.17.1	Reconciliation between the delivered and recovered quantities
	of the product shall be recorded on form 'Product Recall –	
	Reconciliation' (Annexure-4) by Warehouse personnel and	
	approved by Head, Warehouse and Head, Quality Assurance.	
	5.17.2	The concerned person from Warehouse shall handle the recalled
	products as per the decision taken by the committee, if the	
	committee decide that the product is to be destroyed it shall	
	be destroyed as per SOP No. XXXX "Waste Disposal Management".	
	5.18	In case of product recall, the batch preceding and succeeding the
	recalled batch shall be Investigated as suggested by the investigation	
	team e.g. if batch number XX of product is recalled, then the samples	
	and documents of the previous manufactured batch and post manufactured	
	batch shall be reviewed and proper investigation undertaken.	
	5.19	An internal audit shall be carried out after reconciliation of
	recalled product to check the effectiveness of the product recall.	
	5.20	Product recall effectiveness shall be recorded as per Annexure- 5.
	5.21	Recall committee shall finally review the complete recall operation
	including all documentation and QA head shall close the recall putting	
	a stamp RECALL COMPLETED on form Product Recall Reconciliation.	
	Product recall should be completed with in 15 days after product	
	recall has been decided.	
	5.22	Record shall be maintained for the recalled product as per Annexure-6.
	5.23	Recall communication should be brief and to the point. It should
	clearly identify the product, lot number(s), contain a concise	
	statement of the reason for the recall, the known or potential	
	hazard(s), the initial shipping date, and instructions for consignees	
	to follow in handling the recall.	
	Communication pertaining to the recall with the customers or drug	
	authority shall be having the complete information about the product	
	under the recall, such as	
	5.23.1	Product name
	5.23.2	Description of the product
	5.23.3	Type of packaging (i.e. glass and bottle capacity).
	5.23.4	Product content details
	5.23.5	Registration number
	5.23.6	Expiration date(s) or Retest date(s).
	5.23.7	Manufacturer details, address, city, state, zip code
	5.23.8	Type of defect
	5.23.9	Explain in detail how product is defective
	5.23.1	If the recall is due to the presence of a foreign object,
	0	description of the foreign objects' size, composition.
	5.23.1	If the recall is due to the presence of a contaminant
	1	(cleaning fluid, machine oil), explain level of contaminant in
	the product.	
	5.23.1	If the recall is due to failure of the product to meet product
	2	specifications, provide the specifications and report all test
	results If the recall is due to a label/ingredient issue,	
	provide and identify the correct and incorrect label(s),	
	description(s).	
	5.23.1	The date on which problem was identified.
	3	
	5.24	The intimation of the recall to the top management shall be given
	through Annexure-2 (Product recall intimation to top management)	
6.0	Forms and Records	
6.1	Product Recall strategy and Disposition form	- Annexure-1

1.0	Objective		
	To lay down the procedure for the release of a batch(s) of a biological		
	product(s).		
2.0	Scope		
	This Standard Operating Procedure is applicable to the release of batches of		
	different biological products manufactured at name of the organization.		
3.0	Responsibility		
	3.1	Head, Production shall be responsible for forwarding the Batch	
		Production Record (BPR) to Quality Assurance.	
	3.2	Head, Quality Control shall be responsible for forwarding the	
		Analytical file to Quality Assurance.	
	3.3	Lot Release Section of QA Department shall be responsible for review	
		of lot dossier.	
	3.4	Head, Quality Assurance shall be responsible for taking final decision	
		regarding the release / rejection of the batch.	
4.0	Abbreviations and Definitions		
	CoA	:	Certificate of Analysis
	GMP	:	Good Manufacturing Practice
	OOT	:	Out of Trend
	QA	:	Quality Assurance
	QC	:	Quality Control
	SOP	:	Standard Operating Procedure
	WHO	:	World Health Organization
	BPR	:	Batch production record
	CAPA	:	Corrective and Preventive Actions
5.0	Procedure		
	General considerations:		
	The Lot Release section in QA department shall review the Lot Dossier i.e.		
	Batch Production Record (BPR) and Analytical file (Quality Control tests		
	records) and based on review, assessment shall made to recommend release /		
	rejection of the batch to the Head, Quality Assurance / designee and final		
	decision shall be taken within 21 days from date of receiving of Lot		
	Dossier. Decision for release / rejection of the batch can only be extended		
	if is required.		
	5.1	Once the production activity of the batch is over, head Production	
		issue a Certificate of Integral Evaluation and forward the BPR to QA	
		for review.	
	5.2	The BPR shall be submitted to QA completed in all respects, within	
		five working days of the last record attached in the BPR.	
	5.3	Head, Quality Control or his designee shall forward to QA, the	
		Analytical File containing the results with supportive relevant data	
		record sheets on the tests put up on the product. The QC- Summary of	
		analysis of results also carries his opinion regarding compliance to	
		the specifications of the product, as a whole entity including the	
		tests outsourced, if any. The Analytical file shall be submitted to QA	
		within three days from the last record attached.	
	5.4	During the checking of the Lot Dossier, if any excursion(s) come to	
		the knowledge of Head, Production / QC, it shall be ensured that they	
		are documented, investigated and deviation reports are filed as per	
		the established procedure (in SOP XXXX "Handling of Deviation" and	
		attached with BPR and Analytical file before the documents are	
		submitted to QA for review).	
	5.5	Lot Dossier once received in QA, is reviewed taking into consideration	
		the following	
		aspects :	
		5.5.1	Manufacturing and testing done as per approved procedures.
		5.5.2	Raw materials used have been released by Quality Control
		5.5.3	Solutions have been used before their expiry date.
		5.5.4	Part numbers and Batch numbers are mentioned.
		5.5.5	Performance of in process controls.
		5.5.6	Calculations are correct.
		5.5.7	Conformity of intermediate products with specifications.
		5.5.8	The print outs as per activity requirements are attached, if
		any.	
		5.5.9	Results of environmental and critical system monitoring are
		considered.	
		5.5.10	Records are complete and signed by authorized persons.
		5.5.11	Corrections, if any are adequately made and signed with date.
		5.5.12	Compliance of Critical Quality Attributes with specifications.
		5.5.13	Compliance the control limits derived from control charts,
		wherever applicable.	
		5.5.14	Compliance w.r.t established trend.
		5.5.15	Investigation of OOT, out of control limits, deviations and out
		of specification results, if any.	
		5.5.16	cGMP compliance.
		5.5.17	IPQA spot check.
	5.6	During the review of BPR and Analytical file of respective batch, the	
		checklist shall be filled taking into consideration the production	
		process, testing parameters, acceptance criteria, wherever applicable	
		and cGMP compliance as per product specific SOP for review of lot	
		dossier.	
	5.7	Conclusions of the review :	
		5.7.1	If the Lot Dossier review reveals compliance with respect to
			points mentioned under 5.6 and there is no excursion which may
			affect the quality of the product, the conclusion is that the
			batch can be released.
		5.7.2	If the Batch has not been manufactured according to the
			established parameters as per established procedures or does not
			comply with the established specifications and investigation
			shows that Batch is not of the intended quality, it shall be

		recommended to be rejected. Investigation shall be carried to
		trace the root cause of excursion in the batch which shall be
		extended to nearby batches and CAPA shall be taken as per SOP
		XXXXX accordingly.
	5.7.3	The conclusion of lot review shall be documented in "Report on
	Lot Dossier" (Annexure 1) which includes the following :	
	5.7.3.	Product accounting: includes the details of manufactured,
	1	sampled or rejected quantity.
	5.7.3.	Observations on: Raw Materials, GMP inspection,
	2	Environmental monitoring, Critical systems monitoring,
		Batch Production Records , Analytical file, critical
		quality attribute test results , investigation of
		deviations, out of control limit and Out of
		Specification (OOS) results, if any.
	5.7.3.	Conclusion: State if the batch is recommended for release
	3	rejection.
	5.7.4	If the batch is not manufactured up to the final stage i.e.
		abandoned at any stage, Report on Lot Dossier shall be filled in
		"Report on Lot Dossier".
	5.7.5	All this documentation concerning the Batch (Batch Production
		Record, Analytical
		file, checklist, Distribution detail, Record of review of Lot
		Dossier and Report on Lot Dossier) shall be placed for review
		before the Head, Quality Assurance Department / designee in
		absence who takes the decision to release or reject the
		Batch.
		After the approval of Report on lot dossier & checklist, CoA &
		Summary protocol shall be prepared. In case batch is rejected
		only CoA shall be prepared.
	5.7.6	'Certificate of Analysis' (CoA) includes the general information
		about the batch i.e. manufacturer's address, product name, Batch
		No., Date of manufacture, Date of Retest/Expiry, In-house
		specification no., Analytical file no. etc. The characteristics
		(tested parameters) and its acceptance criteria are considered
		as per the specification pertaining to the product and results
		are recorded from the analytical file. Conclusion of CoA shall
		include whether the batch is released / rejected. Remarks column
		should include quantity / volume, no. of containers / container
		capacity, in case batch release for examination, test & analysis
		and any other remark related to batch if required.
	5.7.7	In-house No. for Certificate of Analysis shall be assigned
	5.7.8	Addendum to CoA shall be issued as per template in Annexure 5 in
		case any additional information w.r.t. the contents of CoA have
		to be updated. Additional information may include the updation
		of retest date / assigning shelf life / change in released no.
		of containers due to distribution of material / updation of
		characteristic(s) etc.
	5.7.9	Inhouse Number. for 'Addendum to Certificate of Analysis' shall
		remain the same as for that of the original CoA followed by one
		numeral value (1, 2, 3) where numeral value denotes the no.
		of times the addendum is issued for particular batch and
		activity. Suffix (alphabet) shall be assigned as follows :
		Example: 12/00(XXX)/001/1 where 12/00(XXX)/001 is In-house no.
		of the original CoA and 1 denotes the first addendum to the CoA.
	5.7.10	Summary protocol of the batch shall be prepared as per SOP XXXX.
		Head, Production and Quality Control certifies the manufacturing
		and testing procedure of a particular batch respectively and
		issues compliance certificates accordingly. Head, QA issues
		certificate of internal release. The quantities / result values
		in Summary Protocol and CoA shall be quoted up to two decimal
		points. Round off policy shall be followed according to which if
		the third digit after decimal is 5 to 9, the preceding figure is
		increased by 1, if it is less than 4 then value shall be quoted
		as such up to two decimal points.
	5.7.11	In case the batch is conditionally release or release for
		examination, test & analysis it shall be mentioned in the
		remark.
	5.7.12	Lot Release section shall give a copy of the "Certificate of
		Analysis" to IPQA, Production and Warehouse in charge.
	5.7.13	Lot Release section shall give uncontrolled copy of CoA and
		Summary Protocol to Warehouse in charge for the batches to be
		dispatched. However for critical intermediate product like PRP
		which is under joint custody of Production and QA, copy of CoA
		shall be provided to IPQA & Production department only.
	5.7.14	The IPQA personnel shall label the product as 'Approved' /
		'Rejected'. Rejected batch shall be handled as per SOP XXXX, so
		as to proceed with the control of non-conforming products.

Introduction

According to the definition, given in Annex 15 to the EU-GMP-Guide, a risk assessment is a method to assess and characterize the critical parameters in the functionality of an equipment / system. Therefore, risk assessment is a key element in the qualification and validation approach.

In the project context, risk analyses are performed as basic GMP/EHS-Risk assessment, which shall help to identify important GMP/EHS-requirements.

Aim of the Risk ASSESSMENT

At the very basic stage of design the risk assessment is to verify that all features are taken into consideration to avoid the risk of failure of critical GMP and EHS parameter in the commissioned Facility or System.

During study all GMP and EHS parameters will be identified and assessed for the risk if not considered in the design or requirements.

The Risk assessment report is produced to provide the documented evidence that design concepts or requirement are complete in considering all GMP and EHS risks.

Reference Documents

|S. No |Document Title |Document Number |
| | | | |
Risk ASSESSMENT PERFORMA

Risk Assessment shall be carried out as per annexure-II (FMEA) & III

(HACCP)

Risk ANALYSIS RESULTS

(Risk profile: A graphical representation of risks with high RPN number.

Comparison of Minor, moderate, major and critical risks before and after implementation of corrective actions. Summary of risk acceptance cases and justification

.

MAJOR FINDINGS AND OBSERVATIONS

Any critical or major risk which may affect operations at other locations.

Any risk that has been accepted in spite of having high RPN and management has to take call on that

SUMMARY & CONCLUSION

[1.0]Objective |
	This standard operating procedure aims to provide systematic approach to
	achieve quality standards by assessing, controlling, communicating and
	reviewing risks related to process, product, equipment, utilities,
	facility and environment.
[2.0]Scope	
	This Standard Operating Procedure is applicable to identification,
	assessment, control, communication and review of system level impact and
	risk to the quality of vaccines throughout their lifecycle Company Name
	XYZ
[3.0]Responsibility	
	3.1
	to follow and perform impact and risk assessment.
	3.2
	for tracking of risk assessment activities.
	3.3
	for the implementation of this procedure.
	3.4
	of this procedure.
[4.0]Abbreviations and Definitions	
[4.1]Abbreviations:	
	4.1.1
	4.1.2
	4.1.3
	4.1.4
	4.1.5
	4.1.6
	4.1.7
[4.2]Definitions:	
	4.2.1
	4.2.2
	4.2.3
	4.2.4
	4.2.5
	4.2.6
[5.0]Procedure:	
[5.1]System Level Impact Assessment	
	System level impact assessment shall be performed only for system
	and equipment.
	5.1.1
	5.1.2
	5.1.3
	5.1.4
	5.1.5
	5.1.6

		generator).
		purging is given to the product during filling to avoid
		the oxidation of product by oxygen)
		reject product (e.g. Electronic batch recording system, or
		critical process parameter chart recorder).
		DCS) that may affect product quality and for which there
		is no system for independent verification of control
		system performance in place.
	5.1.8	
		system/equipment than the same system/equipment comes
		under "Direct Impact".
	5.1.9	
		than it comes under "Indirect Impact system"
	5.1.10	
		system" then it comes under "No impact system" criteria.
	5.1.11	
	5.1.12	
		decided based on their impact assessment & criticality of
		system/equipment with respect to product/product nature/
		route of administration and justification for the defined
		frequency shall be provided in the respective column of
		annexure-I
	5.2	
	5.2.1	
		criticality of the system function to product quality,
		strength, purity, identity and efficacy. These
		requirements are determined in a system specific risk
		assessment.
	5.2.2	
		critical parameters or conditions that could affect the
		product quality.
	5.2.3	
		be involved with logical, systematic and science-based
		approach to improve the effectiveness and efficiency of
		decision making.
	5.2.4	
		equipment/system/process/products.
	5.2.5	
		Risk Initiation
		Team Selection
		Identification of Equipment /system/ process/ products
		analysis
		Risk Assessment
		Risk Identification
		Risk Analysis
		Risk Evaluation
		Risk Control
		Risk Reduction
		Risk Acceptance
		Risk Communication
		Risk Review
	5.2.6	
		Prior to commencement of risk assessment, it is necessary
		to ask why the study is being initiated.
	5.2.6.1	
		formed to carry out the risk assessment. It
		provides a level of assurance that the
		qualitative or quantitative evaluation of
		potential hazards will be as objective as
		possible.
		Team member to carry out the risk assessment
		shall be selected from user department,
		Production, Engineering, Quality Control and
		Quality Assurance. Team member should have
		appropriate skill, knowledge & expertise
		necessary to correctly assess and quantify risk
		in team environment.
	5.2.6.2	
		It is important that critical quality
		function/attribute of the equipment, system,
		process & products are identified so that risk
		can be managed or reduces.
	5.6	
	Following tools shall be used to carry out risk assessment.	
	5.6.1	
		used to assess, control and review product quality risks
		related to biological product, process, equipment,
		utilities, facility and environment
	5.6.2	
		exists in controls over the raw materials, environment,
		personnel, storage and distribution.
	5.7	

		carry out as per annexure-III
	5.8	Document number for the FMEA & HACCP shall be assign by QA as
		Company short name /LV/A/YYYY/NNN
		Where...
		A = F (code for FMEA) or H (code for HACCP)
		YYYY= Year
		NNN= Digits
	5.9	Performing FMEA (Failure Mode Effects Analysis):
	5.9.1	FMEA provides for an evaluation of potential failure modes
		for products, equipment, facilities, utilities,
		environment and their likely effect on outcomes product
		quality
	5.9.2	Describe the process/ product/ equipment/ utility/
		facility and its intended use.
	5.9.3	Articulate a clear and specific Title of the risk
		assessment activity undergoing FMEA.
	5.9.4	Breakdown complex processes into manageable steps
		methodically.
	5.9.5	Block diagram, Flow charts, process mapping, mind mapping
		etc tools can be used to derive logical relationships
		between the components of the product or the steps/stages
		of the process.
	5.9.6	Enumerate the items (components, functions, steps, etc.)
		that make up the product or process and then break down
		the equipment / process being subjected to FMEA into its
		major components or steps.
	5.9.7	Final process diagram or output of the activity shall be
		signed by SRM or his/her designee and approved by QA
		representative present in the meeting.
	5.10	List down each of the components or steps identified in step
		number 5.9.6 in the FMEA table in logical manner.
	5.11	Discuss and identify all potential failure modes to define as how
		a system or process is failing to the specified conditions.
	5.12	List down each potential Failure Mode using its technical term
		into the specified format to avoid confusion.
	5.13	Describe the effects of each of the failure modes listed and
		assess the severity of each of these effects of a scale of 1- 10
		as per the table mentioned below.
		Effect
		Scale
		Description of 'Potential effect of system failure'
		No
		1
		No effect on output
		Very Slight
		2
		Stakeholder /customer not annoyed
		Slight
		3
		Slight
		Minor
		4
		Minor effect on performance
		Moderate
		5
		Moderate Effect on performance
		Significant
		6
		Partial Failure but operable
		Major
		7
		Product performance severely affected, but some operability and
		safe
		Extreme
		8
		Very dissatisfied, product Inoperable but safe.
		Serious
		9
		Potentially hazardous effect, time - dependent failure
		Hazardous
		10
		Hazardous Effect, Safety related sudden failure
	5.14	Identify the possible cause(s) of each failure mode identified. A
		potential cause should be something that can actually trigger the
		failure to occur.
	5.15	Quantify the probability of occurrence of each of the failure
		mode causes as per the scale of 1-10 mentioned below:
		Occurrence
		Scale
		Description of 'occurrence'

		Remote
		9
		Detection tools most likely will not detect failure
		Impossible
		10
		Failure not detected
	5.18 Calculate the Risk Priority Numbers (RPN):	
	5.18.1 The Risk Priority Number (RPN) is simply the product the	
		Failure Mode Severity, Occurrence and Control Detection
		Effectiveness ratings.
		$RPN = \text{Severity} \times \text{Probability of Occurrence} \times \text{Level of}$
		detection
	5.18.2 Acceptance Criteria: In case the calculated RPN rating is	
		greater than 27 for a particular identified risk then
		failures are not acceptable.
		Sr. No.
		RPN Rating
		RPN Category
		Action Status
		01
		≥ 76
		Critical
		CAPA is required
		02
		51 to 75
		Major
		CAPA is required
		03
		28 to 50
		Moderate
		5.18.2.1 For RPN rating ≤ 27 , no action plan is required.
		5.18.2.2 Action plan is required if severity, occurrence
		and detection is ≥ 7 (even if RPN is within
		acceptance criteria) for a particular identified
		risk.
	5.18.3 After completion of RPN scoring activity, sort the	
		potential risks in descending order in terms of RPN and
		assign actions against each failure mode until the RPN
		score reaches 27.
	5.18.4 For each recommended action, assign responsibility center	
		based on the expertise and discussion.
	5.18.5 Revised scores shall be filled up by expert team after due	
		consideration of proposed actions.
	5.18.6 If the revised RPN score falls within the range of 27, the	
		risk shall be accepted by default.
	5.18.7 If RPN score doesn't fall within the range of 27 even	
		after risk mitigation actions, then team shall discuss and
		perform either of the following
		5.18.7.1 Team shall propose new recommended action and
		then re-perform all the steps starting from step
		number 5.18.3
		5.18.7.2 Team shall discuss and reaches to a conclusion to
		accept the risk.
	5.18.8 QA shall take custody of the following documents after	
		completion of FMEA activity and prepare a file for every
		risk assessment activity.
		5.18.5.1 FMEA Sheet
		5.18.5.2 Final process map or activity output (QA approved)
		5.18.5.3 Scoring rational
		5.18.5.4 Modified FMEA sheet along with Change controls.
	5.18.9 For each recommended action, CAPA shall be raised as per	
		SOP xxx
	5.18.10 QA personnel shall track the progress & closure of	
		corrective or preventive actions using the CAPA handling
		system.
	5.18.11 User department shall prepare the Risk Assessment Report	
		as per annexure No. IV based on the FMEA and submit to the
		Quality Assurance Department for their review and
		approval.
	5.18.12 Head: Site QA shall forward the risk assessment report to	
		Corporate QA for approval & organizational communication
		through Monthly Quality Review meetings.
	5.18.13 Change control system shall be followed in order to change	
		any information on existing FMEA sheet.
	5.19 Risk Review & monitoring:	
	5.19.1 All critical & major risks shall be reviewed once in 6	
		month & moderate & minor risks shall be reviewed once in
		12 months by review team.
	5.19.2 The expert team shall re-assess the risk based on the	
		present conditions and revise the scores. Scoring
		rationale shall be recorded as per annexure -V
	5.20 Performing Hazard Analysis and Critical Control Points:	
	5.20.1 HACCP is a systematic, proactive, and preventive tool for	
		assuring product quality, reliability, and safety. A
		structured approach applies technical and scientific
		principles to analyze, evaluate, prevent, and control the
		risk or adverse consequence of hazard due to the design,

			development, production and nature of products.	
		5.20.2	Principles of HACCP:	
		5.20.2.1	Conduct a hazard analysis.	
		5.20.2.2	Determine the Critical Control Points (CCPs).	
		5.20.2.3	Establish critical limit(s).	
		5.20.2.4	Establish a system to monitor control of the CCP.	
		5.20.2.5	Establish the corrective action to be taken when	
			monitoring indicates that a particular CCP is not	
			under control.	
		5.20.2.6	Establish procedures for verification to confirm	
			that the HACCP system is working effectively.	
		5.20.2.7	Establish documentation concerning all procedures	
			and records appropriate to these principles and	
			their application.	
		5.20.3	Describe the product and process:	
			The team shall describe the product and process with all	
			relevant quality information such as composition,	
			physical/chemical properties, pH, temperature, cleaning	
			methods, bactericidal/ bacteriostatic treatments,	
			inoculation, fermentation, acid precipitation,	
			purification, filtration etc.	
		5.20.4	Identify the intended use:	
			The team shall describe the intended use of the product	
			with consideration to vulnerable populations like infants.	
		5.20.5	Construct a flow diagram of the process including all	
			relevant steps by the team members using the Batch Record.	
			The flow diagram shall consider all processes and decision	
			points.	
		5.19.5.1	In case of any change in the process flow	
			diagram, shall be routed through formal change	
			control procedure	
		5.20.6	HACCP shall be conducted in two stages...	
		5.20.6.1	1st Stage: List out all potential quality hazards	
			associated with each step by reviewing the	
			materials, activities, equipment, storage,	
			distribution and intended use the process.	
		5.20.6.2	A list of the potential hazards (biological,	
			chemical and physical), which may be introduced,	
			increased or controlled in each step, should be	
			drawn up.	
		5.20.6.3	In the hazard analysis, the following should be	
			included wherever possible:	
			5.20.6.3	The probable occurrence of hazards and
			.1	the severity of their adverse health
			effects.	
			5.20.6.3	The qualitative and/or quantitative
			.2	evaluation of the presence of hazards
			5.20.6.3	The survival or multiplication of
			.3	microorganisms of concern.
			5.20.6.3	The production or persistence in drugs
			.4	of toxins, chemicals or physical
			agents.	
			5.20.6.3	The conditions leading to the above
			.5	
		5.20.6.4	Identify the control measures apply against each	
			hazard. If required more than one control may be	
			required.	
		5.20.7	2nd stage: Team shall assign score against each hazard in	
			terms of the severity of the potential hazards and the	
			probability of their occurrence.	
		5.20.7.1	Score rationale shall be recorded in annexure -V	
		5.20.7.2	Each factor is being measure by giving	
			5-different ratings as below	
			Measures	
			Severity Rating	
			Occurrences Rating	
			Very High	
			5	
			5	
			High	
			4	
			4	
			Moderate	
			3	
			3	
			Low	
			2	
			2	
			None	
			1	
			1	
		5.20.7.3	Calculate the Risk Priority Number (RPN) number	
			by multiplication of Severity and Occurrence.	
			RPN = S x O	
		5.20.7.4	The team shall decide which potential hazard to	
			address, based on RPN score and recommend control	

				measures against that.	
		5.20.8	Determine the critical control points using the		
			questioning technique below.		
		[pic]			
		5.20.8.1	If a hazard has been identified at a step where		
				control is necessary for safety, and no control	
				measure exists at that step, or any other, the	
				product or process should be modified at that	
				step, or at an earlier or later stage, to include	
				such a control measure	
		5.20.9	Establish critical limits for each CCP using the expertise		
			and knowledge base. Regulatory guidelines, historical data		
				shall be used to establish critical limits.	
		5.20.10	The team shall establish the monitoring system of critical		
				control points. If monitoring system exists, then system	
				shall be modified to match recommended criteria. If	
				monitoring system does not exists then corrective action	
				is required which will be managed through CAPA system.	
				Please refer to CAPA SOP for further details.	
		5.20.10.	Team members shall decide the frequency of CCP		
				1	monitoring based on the criticality of the
				control. Regulatory guideline and experience with	
				the process shall be used to reach to the	
				conclusion.	
		5.20.11	Identify and list down the corrective actions to be		
				followed if CCP parameters fail to remain within specified	
				range. If corrective actions are not established during	
				the meeting, in that case expert is requested to provide	
				the corrective actions. Follow the CAPA system to track	
				the activities.	
		5.20.11.	In case of deviation of control parameters, same		
				1	shall be handled through deviation handling
				system.	
		5.20.12	Head: Validation or his/her designee along with team		
				members shall decide the review parameters, methodology	
				and frequency to check adequacy of the improvement system.	
				The expert team shall check the following parameter during	
				system review:	
				5.20.12.	Review of scientific rationale on having the
				1	monitoring tool.
				5.20.12.	Review of the HACCP system and its records
				2	
				5.20.12.	Review of deviations and product dispositions
				3	
				5.20.12.	Confirmation that CCPs are kept under control
				4	
				5.20.12.	In plant observation, measurement and evaluation.
				5	
		5.20.13	Quality Assurance Department takes custody of the		
				following documents after completion of HACCP activity.	
				5.20.13.	Process flow diagram (signed and approved by QA)
				1	
				5.20.13.	Scoring rationale
				2	
				5.20.13.	Critical limit determination.
				3	
				5.20.13.	Verification procedures and schedule
				4	
				5.20.13.	Deviations
				5	
				5.20.13.	Associated corrective actions
				6	
				5.20.13.	Modifications to the HACCP system with change
				7	controls.
		5.20.14	User department shall prepare the risk assessment report		
				after completion of risk assessment activity and submit to	
				site QA head as per format annexure-IV	
		5.20.15	QA head shall review the report and forward to Corporate		
				QA for organizational communication

Introduction:

The document is divided into three parts, Part 1- "Position wise Roles/Functions, Skills, Education Qualification and Experience Requirement" describes the expected roles from various positions in the area concerned, minimum competency level, qualification and experience required for the successful completion of the roles of the position, while part 2 and 3 of the document focuses on the general and lab specific responsibilities of the department.

The intent of this job description document is to provide a representative summary of roles/functions and responsibilities that will be required of positions and shall not be construed as a declaration of specific roles/functions and responsibilities of any particular position. However employees may be required to perform job –related tasks other than those specifically presented in this document.

As Quality Assurance personnel, one has to keep abreast with the latest developments of cGMPs, current industry practices and applicable quality legislations.

1. Position wise Roles/functions, Skills, Education Qualification and Experience Requirements:

Roles/Functions of Doer:

Position	Roles/Functions
Doer	To learn Principles of cGMP/cGLP as per training provided to them
	To record information in the record forms as established
	To document the concerned activity concurrently
	To communicate any deviation to the set procedures promptly to the
	supervisor/section in-charge
	To assist in maintenance of records

Position Specifications:

Skills, Qualification and Experience Requirements of Doer:

Position	Soft Skills	Level required		
	Foundation	Proficiency	Mastery	
Doer	Learning	-	-	Required
	Skills			
	Creativity and	Required	-	-
	Innovation			
	Communication	Required	-	-
	Skills			
	Team Work	-	Required	-
	Technical Skills Required			
	Basic knowledge of cGMP/cGLP principles			
	Knowledge of MS words, MS Excel			
	Record Keeping			
	For Fresher's			
	Knowledge of Microbiological concepts			
	Basic knowledge of lab work			
	Knowledge of computers including MS words, MS Excel etc.			
	Education Qualification and Experience Requirements			
	Qualification: MSc. Microbiology/Biotechnology			
	Experience: Minimum 1 Yr Industrial Experience in the related			
	field.			
	For Fresher's			
	Qualification: MSc. Microbiology/Biotechnology			
	Experience: At least 4-6 months Lab experience which can be			
	summer training, Dissertation work etc.			

Roles/Functions of Supervisor:

Position	Roles/Functions
Supervisor	To supervise the activities of the section
	To develop SOPs, Protocols, Master documents as per the
	requirements of the section and to ensure that the QA documents
	reflect current requirements and best practices.
	To ensure that the established procedures are being followed in
	the concerned section
	To ensure that the activities are being carried out by the trained

	staff
	To ensure implementation of cGMP/cGLP principles, as applicable
	To ensure that the records are being filled concurrently
	To ensure that the study reports duly supported with raw data and
	supportive documentation are properly reviewed and archived after
	necessary corrections

Position Specifications:

Skills, Qualification and Experience Requirements of Supervisor:

Position	Soft Skills	Level required		
		Foundation	Proficiency	Mastery
Supervisor	Customer Focus	-	Required	-
	Creativity and	-	-	Required
	Innovation			
	Communication	-	Required	-
	Skills			
	Team Work	-	-	Required
	Technical Skills Required			
	Execution of SOPs/Protocols as a supervisor			
	Capability of verifying Records/Reports etc			
	Knowledge of cGMP/cGLP principles			
	Faced at-least 2 National / International regulatory audits			
	Education Qualification and Experience Requirements			
	Qualification: MSc. Microbiology/Biotechnology			
	Experience: Minimum 3 Yrs. Industrial Experience in the related			
	field			

Roles/Functions of Section In- charge:

Position	Roles/Functions
Section -In	To Plan, develop and coordinate the activities of the section.
charge	To direct the staff to develop procedures/ protocols/plans etc,
	as required.
	To evaluate results submitted by various departments.
	To participate in departmental major program or policy decisions
	concerned with the section.
	To impart training to the staff.
	To review the SOPs, Protocols, Plans etc and any amendments to
	the established procedures;
	To ensure that the procedures specified are followed, assess and
	document the impact of any deviations from the established
	procedures and to take/devise appropriate corrective action if
	necessary; acknowledge deviations from Standard Operating
	Procedures/Protocols etc.
	To review the final report for validity of the data and to
	indicate the extent to which the activity complies with the
	Principles of cGMP/cGLP;
	To solve technical problems or complex situations.
	To maintain complete records of activities.
	To evaluate staff performance.
	To ensure the security of confidential material at all times.
	To foster a team environment and facilitate the building of
	positive, productive relationships.

Position Specifications:

Skills, Qualification and Experience Requirements of Section In- charge:

Position	Soft Skills	Level required		
		Foundation	Proficiency	Mastery
Section-In	Managerial	-	-	Required
charge	skills			
	Decision Making	-	Required	-
	Customer Focus	-	Required	-
	Team Work	-	-	Required
	Technical Skills Required			
	Knowledge of Regulatory Aspects			
	In-depth knowledge of cGMP/cGLP principles			
	Ability to Independent handling of section			
	Faced at-least 3 National / International regulatory audits			
	Education Qualification and Experience Requirements			
	Qualification: MSc. Microbiology/Biotechnology			
	Experience: Minimum 5 Yrs. Industrial Experience in the			
	related field.			

|2 General Responsibilities/Activities QA Department: |

|To ensure that products are designed and developed in a way that takes account |
|of the requirements of GMP and other associated codes such as those of good |
|laboratory practices (GLP) ,good clinical practice (GCP), GXP ; |
|To ensure Production and control operations are clearly specified in a written |
|form and GMP requirements are adopted; |
|To ensure Job Responsibilities are clearly specified; |
|To ensure arrangements are made for the manufacture, supply, and use of the |
|correct starting and packaging materials; |
|To ensure all necessary controls on starting materials, intermediates, bulk |
|products and other in-process controls, calibrations, and validations are |
|carried out; |
|To ensure the finished product is correctly processed and checked, according to |
|the defined procedures; |
|To ensure products are not sold or supplied before the authorized persons have |
|certified that each production batch has been produced and controlled in |
|accordance with the requirements of the marketing authorization and other |
|regulations relevant to the production, control and release of products; |

[To ensure satisfactory arrangements exist to ensure, as far as possible, that |
the products are stored, distributed, and subsequently handled so that quality |
is maintained throughout their shelf-life; |
To ensure there is a procedure for self-inspection and/or quality audit that |
regularly appraises the effectiveness and applicability of the quality assurance |
system. |
To ensure all manufacturing processes are clearly defined, systematically |
reviewed in the light of experience, and shown to be capable of consistently |
manufacturing products of the required quality that comply with their |
specifications; |
To ensure critical steps of manufacturing processes and any significant changes |
made to the processes are validated; |
To ensure all necessary facilities are provided under the responsibility of the |
production management: |
appropriately qualified and trained personnel; |
adequate premises and space; |
suitable equipment and services; |
correct materials, containers, and labels; |
approved procedures and instructions; |
suitable storage and transport; and |
adequate personnel, laboratories, and equipment for in-process controls; |
To ensure that the instructions and procedures are written in clear and |
unambiguous language, specifically applicable to the facilities provided; |
To ensure operators are trained to carry out assigned activities; |
To ensure records are made (manually and/or by recording instruments) during |
manufacture to show that all the steps required by the defined procedures and |
instructions have in fact been taken and that the quantity and quality of the |
product are as expected; any significant deviations are fully recorded and |
investigated; |
To ensure records covering manufacture and distribution, which enable the |
complete history of a batch to be traced, are retained in a comprehensible and |
accessible form; |
To ensure the proper storage and distribution of the products minimizes any risk |
to their quality; |
To ensure a system is available to recall any batch of product from sale or |
supply; |
To ensure complaints about marketed products are examined; the causes of quality |
defects investigated, and appropriate measures taken in respect of the defective |
products and to prevent recurrence. |

[3. QA Responsibilities/Activities: As applicable to the specific section, but |
not limited to : |

AUDITS AND INSPECTIONS |

[To plan, organize and coordinate Quality Audits & Self Inspection to streamline |
the system. |
To assist in the classification of audit findings. |
To coordinate External audits during the course of audit. |
To plan and perform inspections of product destruction. |
To ensure follow up of Quality Audits and check that corrective actions are |
taken well in time. |
To plan and perform corrective and preventive actions for external audit report |
emitted by Drug authorities or External agency. |
To perform Vendor Audits. |
To coordinate with concerned departments in case of deviation and perform follow |
up visits. |
To handle out of specification results, its investigation and to perform follow |
up of corrective action taken. |
To evaluate and process change control. |
To ensure strict compliance of cGMP and requirements of World Health |
Organization and Indian Pharmacopoeia. |
To support regulatory affairs department for registration of products, review of |
documentation to comply with license and regulatory requirements. |
Lot release |
To review batch production records and analytical files for their correctness, |
legibility, non-deviation, to prescribed control limits/product specifications |
and regulatory compliance to ensure the quality of product/s. |
To prepare checklists of the production process and analytical test result |
parameters. |
To coordinate in Lot release activities. |
To archive batch production record and analytical file as per established |
procedure. |
To prepare annual product review of products manufactured. |
To review trend analysis reports of products manufactured. |
To review stability study reports. |
Documentation |
To ensure organization of documentation system. |
To assist in preparation and issuance of all technical documents such as |
Production Order, Master Formulae, Specifications, Standard operating procedures |
and their timely updation. |
To prepare templates for Standard Operating Procedures, Specifications, |
Production Orders, Master Formulae, Record forms etc. |
Control of documents viz. Layouts, Logbooks and Labels. |
To archive Master copies of SOPs, Specifications, Production Orders, Master |
Formulae and other controlled documents. |
To organize the periodic review activity for timely updation of documents. |
To assign codes to raw materials, intermediates, final product and critical/ |
non-critical equipments components being used in the facility. |
To ensure that cGMP guidelines are being followed in documentation with respect |
to updated regulatory requirements. |
Validation |
To establish Validation Master Plans. |
To establish general guidelines for governing Process validation. |

|To provide guidelines and coordinate in the preparation of Validation Protocols |
 |for various equipments / processes. |
 |To coordinate in the Installation, Operational and Performance Qualification of |
 |equipments. |
 |To participate in the validation activities for the different equipments |
 |installed in Production as |
 |well as Quality Control departments. |
 |To coordinate the Revalidation of equipments / processes as and when required. |
 |To co-ordinate in validation of analytical methods and development of protocols |
 |for the same and review of validation reports. |
 |To co-ordinate in the preparation of campaign change protocol and review of |
 |campaign change reports. |
 |To assist in conducting impact analysis and risk analysis for different |
 |equipment / systems. |
 |To co-ordinate in in-house/contractual calibration activities and review of |
 |calibration reports. |
 |To ensure that all the equipments are timely calibrated and all the processes |
 |and analytical techniques are validated. |
 |To conduct experimental analysis and coordinate in developing the production |
 |process validation for the assigned product. |
 |To keep proper record of calibrations done and validations accomplished. |
 |Quality Engineering |
 |To analyze results of environment and critical system monitoring. |
 |To perform trend analysis on the environment, critical systems and product |
 |parameters. |
 |Coordination in the implementation of environment monitoring program. |
 |To analyze out of control results and coordinate investigation of out of control|
 |results. |
 |Preparation of control charts. |
 |To perform trend analysis on the manufactured product. |
 |To analyze complaints and document the records. |
 |To co-ordinate and maintain records of returned/recalled products. |
 |To ensure controlled areas in production facility meet established environmental|
 |parameters and that the production activities are being carried out under |
 |prescribed conditions. |
 |To plan monitoring schedules during production of vaccine. |
 |To keep regular checks on implementation of monitoring schedules for environment|
 |and critical systems. |
 |Training |
 |To manage the Internal training of Technical and non-technical staff according |
 |to the training needs identified through a need based approach. |
 |To plan, design and prepare training program against the stated QA objectives |
 |and provide support in the implementation of the training program according to |
 |the Training calendar. |
 |To compile and archive individual training files of employees. |
 |To maintain the evaluation system in close co-ordination with HR department and |
 |prepare regular reports for senior management. |
 |To organize, monitor and maintain records for cGMP trainings. |
 |To archive CV's of the external qualified trainers. |

(F) Approval & Disposition By Head-CQA (For Major and Critical Complaints):
Comments:

Note: All the complaint forms, correspondence and investigation annexure shall be attached with this Investigation form.

1.0 |Objective |
 |To lay down the procedure for handling of product complaints. |
 2.0 |Scope |
 |This SOP is applicable to receive, acknowledgement, record, investigate and|
 |respond to all types of products related complaints at xxxxx. |
 3.0 |Responsibility |
3.1	Production Head or designee:	
	3.1.1	Investigation of complaint.
	3.1.2	To provide all required support to Quality Assurance and other
		departments for handling of product complaints.
	3.1.3	Training to all concerned personnel whenever required.
	3.1.4	Suggesting and Implementation of corrective and preventive
		actions.
3.2	Head QC or designee:	
	To participate in related complaint investigation with complaint	
	investigation team.	
	Analysis of complaint sample or control samples whenever required.	
3.3	Any Department Head if receive product complaint, shall be	
	responsible for forwarding the same to QA department and to provide	
	required support for investigation of product complaint.	
3.4	Head of Clinical Research department (Global Pharmacovigilance	
	Division):	
	Responsible for coordinating, processing and responding to all	
	product complaints related to Adverse Reactions / Adverse Events.	
	Global Pharmacovigilance Division (GPVD) shall reply to the	
	complainant for complaints related to adverse events (AE), or adverse	
	reaction (AR). GPVD if receive the Product Quality Complaint shall be	
	responsible to communicate immediately to the QA Head.	
3.5	Head of R&D department:	
	To participate in related complaint investigation with complaint	
	investigation team.	
	Recommendation of any change in process based on the investigation	
	outcome of the complaint.	
3.6	Head of RA department:	
	Responsible for coordinating & processing to all product complaints	
	related to or from regulatory agencies.	
3.7	QA Head or designee:	
	3.7.1	QA Head or designee shall be responsible for sending all
		intimation regarding Product complaints to Corporate Quality
		Assurance Department (CQA) as soon as complaint is received.
	3.7.2	QA Head or designee shall be responsible for coordinating and
		processing all product complaints, to carry out the recording,
		investigation review and approval, to fix root cause, identify
		appropriate CAPA and to ensure effective implementation of
		CAPA.
	3.7.3	QA Head or designee shall be responsible for prepare the
		complaint response and sent to complainant (the source from
		where the complaint received except Adverse Event/Adverse
		Reaction/Regulatory complaints) & for Periodic review and
		trending of complaints.
	3.7.4	Head-Quality Assurance or his/her designee shall be
		responsible for compliance to this SOP.
3.8	Head Corporate QA:	
	Responsible to ensure the complaints are addressed in timely manner	
	and send the final response regarding complaints received from	
	regulatory agencies.	
4.0	Abbreviations and Definitions	
CAPA	:	Corrective and Preventive Actions
CQA	:	Corporate Quality Assurance
CRD	:	Clinical Research Department
GPVD	:	Global Pharmacovigilance Division
PQC	:	Product Quality Complaint
OG	:	Operating Guideline
SOP	:	Standard Operating Procedure
QA	:	Quality Assurance
RA	:	Regulatory Affairs
WHO	:	World Health Organization
Product Complaint: - An expression of dissatisfaction by a customer that a		
product has not met their expectations in some way.		
Adverse Reaction (AR):- A response to a medicinal product which is noxious		
and unintended and which occurs at doses normally used in human for the		
prophylaxis, diagnosis or therapy of disease or for modification of a		
physiological function.		
Adverse Event (AE):- Any untoward medical occurrence in a patient or		
clinical investigation subject administered a pharmaceutical product and		
which does not necessarily have to have a casual relationship with this		
treatment (An adverse event, can therefore, be any unfavorable and		
unintended sign (e.g. an abnormal laboratory findings), symptom, or disease		
temporally associated with the use of a medicinal product, whether or not		
considered related to the medicinal product).		
Product Quality Complaint :- Product quality complaints are unwanted		
alterations to the physical or chemical attributes to the product, which		
includes but are not limited to :		
Breakage		
Leakage		
Microbiological contaminations / presence of foreign matter		
Change of colors or appearance		
Packaging or labeling issues		
Precipitation / flocculation in product		
Critical Complaints: - It includes those which put patient at life		

| threatening risk and may cause death of the patient, for example but not |
| limited to: |
| Mix – ups |
| Microbiological contaminations / presence of foreign matter |
| Wrong product (label and Content are different) |
| Major Complaints: - It includes those which may put patient at some risk |
| but are not life threatening and are quality related. For example: |
| Assay is low, precipitation / flocculation in product, change in |
| description / color of product. |
| Minor Complaint: - It includes those which may not pose a significant |
| hazard to health. It include those which are not life threatening, for |
| example: |
| Shortage or excess quantity received |
5.0 Procedure |
5.1 Receiving of complaint : |
5.1.1 Product complaint receipt from customer by any way of |
| communication to any employee shall be immediately notified in |
| duly filled Complaint form as per annexure 1 and shall be |
| forwarded to Quality Assurance Head. In case the complaint is |
| about Adverse Event/Adverse Reaction the same shall be sent to |
| GPVD. (A scanned copy of form would be sent immediately) |
5.2 Logging of complaint : |
5.2.1 Each complaint shall be assigned a unique number by QA. |
| Each complaint shall be coded as defined below by means of an |
| example: |
| Code of the complaint: |
| L : Corresponds to xxxx Site |
| COM: Corresponds to complaint |
| 00: Corresponds to product code of xxxx Vaccine |
| 23: last two digits of the year (2023) in which the complaint |
| was logged. |
| 001: a three digit consecutive number of the complaint in that |
| year. |
| In this example, the code corresponds to the first complaint |
| of xxxx vaccine in year 2023 at xxxx site. |
| A new series of the complaint number shall be started at the |
| beginning of a new calendar year. |
5.2.2 QA shall log the complaint as per Annexure 2. |
5.2.3 QA shall intimate CQA about the details of the complaint |
| received as per annexure 1. |
5.3 Acknowledgement of the Product complaint: |
5.3.1 QA shall provide the acknowledgement to the complainant after |
| the complaint is logged in as per annexure 3 "Complaint |
| Acknowledgement form". |
5.4 Complaint Classification: |
5.4.1 Based on the complaint, Head QA shall classify the complaint |
| as Minor, Major and Critical in Annexure 1. |
5.5 Formation of the Product Complaint investigation team: |
5.5.1 QA Head shall nominate the team members from different |
| departments like Production, Quality Control, Ware house, |
| Engineering, R&D etc. as required for investigation purpose |
| based on the nature of the complaint received. |
5.6 Investigation/Findings: |
5.6.1 QA shall initiate the complaint investigation form as per |
| Annexure 4. |
5.6.2 For critical complaint, the initial reply to the complainant |
| shall be given by QA within 72 hours with initial |
| investigation. In case the timeline is exceeded the same shall |
| be appropriately justified. |
5.6.3 Investigation of the product complaint shall include, but |
| shall not be restricted to investigation of batch |
| manufacturing records, control samples, analysis reports and |
| deviation reports, impact on the previous batches manufactured |
| if any. |
5.6.4 Based on the nature of investigation retained sample |
| /complaint samples shall also be examined/ tested (if |
| required) and all the related batch production records and |
| documentation shall be reviewed. |
5.6.5 Detailed findings of the investigation relevant to the |
| retained sample/complaint samples, production, storage and |
| distribution records shall be clearly mentioned. |
5.6.6 The investigation of product complaint shall be carried out as |
| per SOP xxxx and the extent of investigation shall depend upon |
| the particular case of product complaint received. |
5.7 CAPA, feedback to the Complainant/ Regulatory bodies and closing of |
| the Product Complaint: |
5.7.1 Based on the investigation and root cause of the Product |
| complaint corrective and preventive action shall be initiated. |
5.7.2 In case regulatory complaints the response shall be send by |
| CQA marking copy to Site QA. |
5.7.3 In case of Adverse Reaction/Adverse Event, response shall be |
| sent by GPVD marking copy to QA. All other complaints except |
| Adverse Reaction/Adverse Event /Regulatory complaints, |
| response shall be sent by QA to complainant. |
5.7.4 During the course of investigation and final disposition, if |
| it emerges that there is a need of product recall then SOP of |
| Product Recall and handling of recalled products shall be |
| followed. |
5.7.5 All forms, detail complaint samples, documents and |
| correspondences associated with the complaint shall be filed |
| in the Product Complaint File. |
5.7.6 One photocopy of product complaint shall be attached in the |

			Batch Manufacturing Record of respective batch.
		5.7.7	The complaint shall be shared with business partner if any,
		when received at site directly from the complainant.	
		5.7.8	If required, legal advice can be taken through legal
		department of the company.	
		5.7.9	Any product complaint received shall be closed by QA Head in a
		period of not more than 45 days from the date of logging. In	
		case the timeline is exceeded the same shall be justified and	
		approved by QA Head.	
		5.8	Periodic Review and trends:
		5.8.1	The product complaint trends shall be prepared at least
		Quarterly and shall be considered in Annual product Review.	
		5.8.2	There shall be annual compilation and review of all the
		complaints product wise.	
6.0	Forms and Records		
6.1	Product Complaint form	- Annexure-1	
6.2	Product Complaint log	- Annexure-2	
6.3	Product complaint Acknowledgement form	- Annexure-3	
6.4	Product Complaint Investigation form	- Annexure-4

1.	INTRODUCTION	
	1.1	Manufacturer Details
		The firm M/s XXXX company have filling and formulation facility for
		vaccine. The fill and formulation facility of M/s XXXX company is
		situated inside the larger complex occupies over acres of land.
		This is located in the non-polluting clean surroundings in the
		industrial area of xxxxx.
	1.2	Project Details
		M/s XXXX company is constructing an integrated Vaccine
		manufacturing unit consisting of xxxx manufacturing and fill finish
		facility for vials with Lyophilization capability.
		Vaccine facility is a state of the art cGMP and BSL 2
		enhanced compliant Vaccine filling and formulation Facility. The
		facility consists of environmentally controlled rooms for
		formulation, filling, storage areas. The facility is spread over
		xxxx square meter area. The offices and document storage area is

	located on the	
	Vaccine filling and formulation facility	
	The production areas of fill finish facility have been designed as	
	per cGMP requirement as CNC, Grade D (Class 100000), Grade C (Class	
	10000), Grade B (1000) respectively & provided with individual AHUs	
	for individual process areas. All sterile operations are conducted	
	under LAF Grade A (Class 100).	
	The construction material used for walls and ceiling has been	
	selected as GI powder coated clean room wall panels and ceiling	
	panels. The material is easily cleanable and provides tremendous	
	resistance to repetitive cleaning through disinfectants. The floor	
	finish is Epoxy which is a monolithic joint-less floor. Man &	
	Material flow is unidirectional. All entries & exits is through	
	interlocked doors and access to the facility is restricted through	
	access control system. The air exhaust from all areas shall be	
	passed through HEPA filters. Facility has been provided with EN	
	certified A2 Bio safety cabinets for protection of product as well	
	as the person. Dedicated decontamination autoclave has been	
	provided for the decontamination of the biowaste. For process	
	material sterilization dedicated production autoclave & Dry Heat	
	Sterilizer with bio-shield has been provided in the facility. For	
	defumigation of area, dedicated / auto control defumigation system	
	are provided for respective areas and exhaust of the same is ducted	
	before discharging to ambient area. There will be a centralized	
	laundry facility for clean room garments.	
	Installed Capacities	
	The facility is designed for filling of liquid vaccine in vials,	
	half stoppering, lyophilization and aluminium sealing. In case of	
	fully liquid vaccines the filled vials can be stoppered and sealed	
	on a continuous basis.	
	The filling machine will have a filling speed of vials per min	
	and the lyophilizer will have a shelf size of sqm. Operation	
	areas consist of material preparation area, Bottle washing & drying	
	area, formulation area, washing and sterilization area, vial fill	
	and half stoppering, lyophilization, aluminum capping, Labeling &	
	Packing, Vial collection area	
	Dedicated critical utilities have been provided for the facility.	
	PW & WFI loops are provided with on line TOC sensors. Pure steam	
	generator has an additional provision for removal of	
	non-condensable gases. All inter/intra room transfers are affected	
	through a closed loop system. All process equipments are either	
	controlled through SCADA or through DCS. Cold Storage facilities	
	are available.	
	1.3	Objective
	The objective of Validation Plan is to outline the requirements	
	that will demonstrate and document that all the	
	equipment/systems/facility/control systems and their associated	
	functionality in the facility are appropriate for the cGMP	
	regulated process. It serves as the basis for the entire validation	
	effort and defines the overall validation philosophy of M/s XXXX	
	Recombinant Protein company for Pentavalent filling and formulation	
	facility. It delineates equipment, systems and procedures to be	
	validated, outlines the general acceptance criteria for validation	
	and establishes the responsibilities for performing the validation.	
	1.4	Scope
	The Validation Plan shall cover in its scope the utilities,	
	critical equipment, manufacturing processes, cleaning and	
	sanitizing procedures, analytical techniques, laboratory equipment,	
	automated systems (SCADA, DCS &BMS) to be kept in validated state	
	so as to produce drug substances of consistent quality following	
	cGMP, with high degree of confidence through established documented	
	evidence as per requirements of the marketing authorization. It is	
	applicable for the designing, commissioning, installation,	
	operational and performance qualification activities of the	
	facility. These activities play a significant role in delivering	
	and maintaining operationally safe and efficient validated	
	processes, utilities and qualified equipment.	
	This Validation Plan document shall describe the process	
	validation, facility qualification and validation, utility	
	qualification and validation ,equipment qualification and	
	validation as per current Good Manufacturing Practices (cGMP) norms	
	as advocated by World Health Organization (WHO),US Food and Drug	
	Administration, European guidelines, Pharmaceutical Inspection	
	Convention –PIC/S , Parenteral Drug Association -PDA and to	
	register its products for UNICEF supplies through WHO	
	prequalification, as well as US Food and Drug Administration	
	approval in case of its selected products to move in International	
	Commerce. Last but not the least the provisions applicable as per	
	Law of the Land shall also be upheld.	
	1.5	Organizational Structure
		Quality Assurance Department
	1.5.1	
		Quality Assurance Department shall establish the validation
	policy, general guidelines and approve all general documents	
	that govern process validation.	
		Review and approve all the documentation relating to the
	validation work. This will include the Validation Master	
	Plan, Product specific Validation Plan, Supplementary	
	Validation Plan(s), Validation Protocols, SOPs, executed	
	complied test results and validation reports, etc.	
		Coordinate in the execution of different programs supporting
	the validation work(s), such as Preventive Maintenance, Staff	

||| Training, Calibration, Environmental Monitoring and Internal
		Audits.	
		Authorization of validation documents.	
		1.5.2	Validation Section in Quality Assurance Department
		Validation Section coordinates with the Validation Work	
		Groups/ Project Validation Team formed to carry out the	
		various validation activities. As such the responsibilities	
		of Validation Section are combined in scope with validation	
		work groups in many cases:	
		Development and review of Validation Master Plan, Product	
		specific.	
		Supplementary Validation Plan(s).	
		Review of validation documentation, which includes SOPs,	
		Protocols (DQ, IQ, OQ and PQ as applicable), Study and	
		Summary reports, etc.	
		Coordination and participation in the execution of validation	
		activities.	
		Review and approval of Impact assessment and Risk analysis	
		documentation.	
		1.5.3	Project Validation Team
		The Project Validation Team or the Specific Validation	
		Commission (SVC) shall be formed only for the validations to	
		be carried out in case of establishment of a new project,	
		while in case of an already established manufacturing unit	
		the validations shall only be conducted by the concerned	
		department independently.	
		Project Validation Team shall be formed by the heads of all	
		the departments viz. Production, Quality Control, Quality	
		Assurance and Maintenance. Project validation Team shall be	
		formed to carry out the validation of a particular product,	
		process or system and is constituted from qualified and	
		experienced personnel from Production and Quality Unit to	
		carry out validation work.	
		Responsibilities of Validation Team -	
		Carry out validation work as per QA approved protocols.	
		Draws up the Validation Protocols.	
		Formulate necessary report forms to be filled up for the	
		tests to be performed during validation activity.	
		Fill the data forms related to the activities and tests	
		performed.	
		Elaborate Discrepancy, if any, and its impact.	
		1.5.4	Validation Work Group
		In case of an already established manufacturing unit the	
		validations shall only be conducted by the work group	
		independently. The work group shall be constituted by persons	
		from the concerned department viz.	
		Production Department:	
		Participation in the preparation of Validation Protocols for	
		production related processes and equipment.	
		Participation in validation activities, review and approval	
		of validation documents as required. Each document may have	
		different approval requirements, which is determined on	
		case-to-case basis.	
		Operation of equipment as per requirements in the validation	
		activity.	
		Participation in preparation of validation reports with	
		complete supporting data.	
		Execution of process/equipment/system associated risk	
		analysis and impact analysis.	
		Quality Control Department:	
		Preparation of Validation Protocols and getting them approved	
		from Quality Assurance department before starting the	
		validation activity.	
		Participation in validation activities, new method	
		development, review and approval of validation documents as	
		required. Each document may have different approval	
		requirements, which is determined on case-to-case basis.	
		Providing analytical testing facilities in support of	
		validation activities.	
		Ensuring that all relevant analytical laboratory techniques	
		are validated.	
		Preparing all necessary SOPs required for the validation	
		exercise and to ensure that the concerned technicians are	
		trained in cGMP and GLP as per requirements.	
		Engineering / Maintenance Department:	
		Participation in the development, review and approval of	
		validation documents, as and if required. Each document may	
		have different requirements of approval at different levels,	
		which is determined on case-to-case basis.	
		Support as required for drawings, documentation and operation	
		of equipment.	
		1.6	Validation Philosophy
		Validation is "Establishing documented evidence which provides a	
		high degree of assurance that a specific process will consistently	
		produce a product meeting its predetermined specifications and	
		quality attributes."	
		The validation philosophy focuses on a few questions like Does the	
		system/equipment requires validation. What will be the extent of	
		validation? What aspects of the system or process are critical to	
		product and patient safety?	
		The answers to these questions are found by evaluating the	
		criticality of the cGxP elements, their associated risks and impact	

	non-functional requirements, and what deliverables are to be	
	supplied by the vendor. The user requirement shall be prepared for	
	each piece of equipment in terms of function, throughput,	
	operability and applicable standards.	
	2.3	System Specifications:
	The information is the Basis of Design documents is used to develop	
	Proposed / purchase specifications such as speed, time, temperature	
	and volume for specific processes. The product quality	
	characteristics are the requirements that the equipment and process	
	performance can be measured against.	
	2.4	Factory Acceptance Test (FAT):
	An acceptance test in the supplier's factory, usually involving the	
	customer. Testing conducted to determine whether or not a system	
	satisfies its acceptance criteria and to enable the customer to	
	determine whether or not to accept the system.	
	2.5	Site Acceptance Test (SAT):
	An acceptance test in the customer's factory, usually involving the	
	customer. Testing conducted to determine whether or not a system	
	satisfies its acceptance criteria and to enable the customer to	
	determine whether or not to accept the system.	
	2.6	Commissioning:
	Commissioning is the phase of a project which includes: mechanical	
	completion, installation qualification, operational qualification,	
	start-up, and turn over. It incorporates systematic method of	
	testing and documenting of systems and equipments at the conclusion	
	of a project, but prior to validation. It involves the proper	
	documentation of facility construction and installation.	
	2.7	Design Qualification (DQ):
	Documented evidence that the premises, supporting utilities,	
	equipment and processes have been designed in accordance with the	
	requirements of GMP.	
	2.8	Installation Qualification (IQ):
	The performance of tests to ensure that the installations (such as	
	machines, measuring devices, utilities, manufacturing areas) used	
	in a manufacturing process are appropriately selected and correctly	
	installed and operate in accordance with established specifications.	
	2.9	Operational Qualification (OQ):
	Documented verification that the system or subsystem performs as	
	intended over all anticipated operating ranges.	
	2.10	Performance Qualification (PQ):
	PQ is the documentary evidence which verifies that the equipment or	
	system operates consistently and gives reproducibility within	
	defined specifications and parameters for prolonged periods.	
	2.11	Equipment Qualification:
	Studies that establish that the process equipment and ancillary	
	systems are capable of consistently operating within established	
	limits and tolerances. The studies must include equipment	
	specifications, installation qualification, and operational	
	qualification of all major equipment to be used in the manufacture	
	of commercial scale batches. Equipment Qualification should include	
	simulation of actual production conditions, including / stressed	
	conditions and is a part of validation (initial stage).	
	2.12	Validation Protocol:
	A written plan of actions stating how validation activity will be	
	conducted; will specify the various tasks and define testing	
	parameters; sampling plans, testing methods and specifications and	
	equipment(s) to be used. It will also mention the minimum number of	
	runs/batches to be used for the study; it must specify the	
	acceptance criteria and the authority who will approve/disapprove	
	the study.	
	2.13	Validation Report:
	A document in which the records, results and evaluation of a	
	completed validation program are assembled and summarized. It may	
	also contain proposals for the improvement of processes and/or	
	equipment.	
	2.14	Validation Team:
	A multi-disciplinary team of personnel primarily responsible for	
	conducting validation activities/studies. Such workgroup shall be	
	constituted by trained and experienced personnel in relevant	
	disciplines.	
	2.15	Critical Process Parameter:
	A parameter which if not controlled will contribute to the	
	variability of the end product.	
	2.16	Critical Systems:
	Critical Systems are those that generate utilities which become	
	part of the final product, or come in contact with the final	
	product during production or with the surfaces of processing	
	equipment and the quality of which may adversely affect the	
	efficacy, safety and quality of the final product.	
	2.17	Worst Case Condition:
	A set of conditions encompassing upper and lower limits and	
	circumstances that poses the greatest chance of failure when	
	compared with ideal conditions. These highest and lowest values of	
	a given parameter shall actually be evaluated in the validation	
	exercise.	
	2.18	Analytical Method Validation:
	Analytical Method validation is the process to confirm that the	
	analytical procedure employed for a specific test is suitable for	
	its intended use.	
	2.19	Linearity and Range:
	The linearity of an analytical procedure is its ability to produce	
	results that are directly proportional to the concentration of	

	analyte in the samples. The range of the procedure is an	
	expression of the lowest and highest levels of analyte that have	
	been demonstrated to be determinable with acceptable precision,	
	accuracy, and linearity.	
	2.20	Specificity:
		The specificity or selectivity of a procedure is its ability to
	measure the analyte in a manner that is free from interference from	
	other components in the sample being examined (for example,	
	impurities arising from manufacture or degradation or ingredients	
	other than the analyte).	
	2.21	Sensitivity:
		The specificity or sensitivity is the capacity of the test
	procedure to record small deviations in concentration. It is the	
	slope of the calibration curve. A more general use of the term to	
	encompass limit of detection and or limit of quantization should be	
	avoided.	
	2.22	Limit of Detection:
		The limit of detection is the lowest level of analyte that can be
	detected, but not necessarily determined in a quantitative fashion.	
	2.23	Limit of Quantitation:
		The limit of quantitation is the lowest concentration of analyte in
	a sample that may be determined with acceptable accuracy and	
	precision when the required procedure is applied.	
	2.24	Accuracy:
		The accuracy of the procedure is the closeness of the results
	obtained by the procedure to the true value. Accuracy may be	
	determined by applying the procedure to samples of the material to	
	be examined that have been prepared with quantitative accuracy.	
	Wherever possible, these samples should contain all the components	
	of the material, including the analyte.	
	2.25	Precision:
		The precision of the procedure is the degree of agreement among
	individual test results. It is measured by the scatter of	
	individual results from the mean and it is usually expressed as the	
	standard deviation or as the coefficient of variation.	
	2.26	Repeatability (within-laboratory variation):
		This is the precision of the procedure when repeated by the same
	analyst under the same set of conditions (same reagents, equipment,	
	settings, and laboratory) and within a short interval of time.	
	2.27	Reproducibility:
		This is the precision of the procedure when it is carried out under
	different conditions—usually in different laboratories—on separate,	
	putatively identical samples taken from the same homogeneous batch	
	of material.	
	3.	VALIDATION LIFE CYCLE
	[pic]	
		This life cycle shall provide guidance in preparation of a
	validation plan/validation report. This includes planning of	
	validation activities and predefinition of the life cycle (including	
	possible exemptions and possible deviations).	
	3.1	User Requirement Specification:
		The user requirement specification (URS) is typically created at the
	beginning of a qualification project and describes the initial user	
	requirements (e.g. process-, construction- or functionality-related)	
	regarding a system to be commissioned. The user requirement shall be	
	prepared for each piece of equipment in terms of function,	
	throughput, operability and applicable standards.	
		The URS describes what a system shall be capable of, and not how
	this is achieved! The "how" will be defined in collaboration with	
	the supplier of a system and will be documented in the Functional	
	Specific The functional specification is usually compiled by the	
	supplier of a system and describes how it is intended to fulfill the	
	requirements defined in the URS.	
	3.2	Design:
		The technical documentation is compiled by the supplier during the
	technical design phase and is a dossier containing e.g. a P&ID,	
	wiring diagrams, part lists, a measuring point list, etc. Purpose of	
	the technical documentation is to provide all documents relevant for	
	the construction of a system and to provide technical specifications	
	relevant for the qualification.	
		The user will carry review the design to check for availability of
	all construction-relevant documents as e.g. P&I diagrams or part	
	lists, but is mainly understood during the design qualification	
	stage. This review should assure that all relevant requirements have	
	been implemented in the design before the construction phase is	
	initiated (to avoid unnecessary changes afterwards). The design	
	review should provide enough assurance that the elaborated design	
	will lead to a system which is capable of fulfilling the user	
	requirements as defined in the URS.	
	3.3	System Level Impact Assessment (SLIA):
		SLIA shall be carried out for the System, Equipment or utility which
	shall document the performance of a Product Impact Assessment in	
	accordance with the recommendations of the ISPE. The intent of	
	performing SLIA shall be evaluating the impact of a system,	
	equipment or utility on product quality.	
	3.3.1	Direct impact systems:
		Direct Impact systems are expected to have an impact on
	product quality. Examples of such systems are when they are	
	either in direct physical contact with the drug product; a	
	system that produces data that is used to accept or reject	
	products; or the system is a process control system that may	
	affect product quality.	

	3.3.2	Indirect impact systems:
		Indirect Impact systems are not are not expected to have an
		impact on product quality. Examples here include support
		systems such as heat transfer systems, electric power, and
		non-process water sources. These are non-critical and need
		not be qualified. However, the monitoring and control of
		critical parameters, which these support systems affect,
		shall be validated. Both types of systems will require
		commissioning. However, as per the current regulations the
		"direct impact" shall be subject to supplementary
		qualification. Some indirect systems may also require
		supplementary qualification practices to meet the additional
		regulatory requirements.
	3.3.3	No impact systems:
		No Impact systems will not have any impact, either directly
		or indirectly, on product quality. These systems shall be
		designed and commissioned following Good Engineering Practice
		(GEP) only.
	3.3.4	The next step of the impact assessment involves the
		criticality assessment of the system/equipment components.
		The components shall be classified as either critical or non
		critical based on the reply to a set of questions specified
		in ISPE Pharmaceutical Engineering Guide for New and
		Renovated Facilities.
	3.3.5	As a result of the SLIA and Component Criticality Assessment
		the direct impact systems shall bear all critical components
		and may be a few non- critical components while the indirect
		impact systems shall not bear any critical component.
	3.3.6	Depending upon the impact status of the system as decided by
		the impact assessment, the extent of qualification required
		is determined. Those classified as Direct Impact shall
		subject to qualification practices i.e. IQ, OQ and PQ while
		those classified as Indirect Impact or No Impact shall be
		designed, installed and commissioned only.
	3.3.7	The Equipment like peristaltic pumps, Filtration assemblies
		Housings which are part of the process e.g. sterile
		filtration, shall be considered as components of sterile
		filtration process therefore shall undergo components
		criticality analysis instead of impact analysis.

 |qualification activities |
Equipment	Impact Status	Required Qualification Phases	Revalidation
/System			
Description			
Direct			

	4.1	Prospective Process Validation:
		It is the established documented evidence that a specific process
		used in the manufacture of a product does what it purports to do
		based on the preplanned protocol, before the product is put to
		commercial use.
		This type of validation shall be carried out:
		When the optimization of the manufacturing process have been
		completed
		The operators and supervising personnel, who shall be 'running' the
		validation batches, are fully conversant with the process and its
		requirements
		The batch size of the product under validation shall be as close as
		possible with the contemplated production batch size
		Three successful consecutive batches/runs shall be considered
		acceptable for the validation of the process
		All the measuring equipment/devices have been calibrated
		All the equipment, used have been qualified and
		The analytical testing methods used shall be validated.
	4.2	Retrospective Process Validation:
		Conducted for a product already being marketed, and is based on
		historical data accumulated over several lots and over time.
		Retrospective Validation may be used for older products which were
		not validated by the manufacturer at the time they were first
		marketed, and which is now to be validated to conform to the
		requirements established by regulatory agencies.
		The historic data retrieved from the records (Batch Manufacturing
		Records) of the completed production batches shall be used to
		provide documented evidence that the process has been in a state of
		control.
		The retrospective validation shall be conducted in the following
		manner:
		Gather the numerical values from the completed batch record and
		include assay values, end product test and in process data.
		Organize these data in a chronological sequence, according to batch
		manufacturing data using a spread sheet format.
		Include data from at least last 15 manufactured batches for
		analysis. If the number of manufactured batches is less than 15,
		then include all the manufactured batches in the analysis.
		If appropriate, subject the resultant data to statistical analysis
		and evaluation.
		Conclusions shall be drawn on the state of control of the
		manufacturing process, based upon the analysis of retrospective
		validation data taking into consideration the in- process and final
		product specifications.
	4.3	Concurrent Process Validation:

	Concurrent process validation shall establish documented evidence					
	that the process is in a state of control during the actual					
	implementation of the process. In exceptional circumstances it may					
	be acceptable not to complete a prospective validation program					
	before routine production starts. In such a case the decision to					
	carry out concurrent validation shall be justified, documented and					
	approved by heads of Production, Quality Control and Quality					
	Assurance departments. The in-process as well as finished product					
	parameter requirements to be evaluated for the Process Validation					
	is those, which are mentioned, in the approved Specifications of					
	the product. The acceptance limits shall be part of the approved					
	protocol.					
	4.4	Acceptance Criteria for Process Validation				
	In prospective and concurrent validation, the main goal is to					
	demonstrate through the analysis of the critical parameters of					
	minimum three consecutive batches, that the process is consistently					
	performing and the final product accomplish the established quality					
	standards. In all cases the selected parameters must comply with					
	the approved Quality Specifications.					
	As Process Validation can be product dependent, this aspect shall					
	be detailed in product specific Validation Plan(s).					
	5.	ANALYTICAL TEST VALIDATION				
	The main objective of analytical techniques validation is to demonstrate					
	that the technique is not only suitable for its intended purpose but also					
	gives reliable consistent results with in the acceptable statistical					
	limits. An analytical validation protocol shall be prepared by Quality					
	Control department which shall be established by laboratory studies, that					
	the performance characteristics of the analytical method shall meet the					
	intended analytical application. The validation study shall be conducted					
	as applied for detection of impurities, potency, identity and composition					
	of the product as per QA approved protocols, prepared by Quality Control					
	department.					
	5.1	Categories of Assays Requiring Analytical Test Validation:				
	Most common categories of assays for which analytical validation					
	data shall be required are as follows:					
	Category I: Analytical methods for quantization of major components					
	of bulk drug substances or active ingredients (including					
	preservatives) in finished pharmaceutical products.					
	Category II: Analytical methods for determination of impurities in					
	bulk drug substances or degradation compounds in finished					
	pharmaceutical products. These methods include quantitative assays					
	and limit tests.					
	Category III: Analytical methods for determination of performance					
	characteristics (e.g., dissolution, drug release).					
	Category IV: Identification tests.					
	The following table indicates the characteristics to consider during					
	analytical validation:					
	Analytical	Assay	Assay	Assay	Assay	
	Performance	Category	Category II	Category	Category	
	Characteristics	I	III	IV		
		Quantitati	Limits			
		ve Tests	Tests			
	Accuracy	Yes	Yes	*	*	No
	Precision	Yes	Yes	No	Yes	No
	Specificity	Yes	Yes	Yes	*	Yes
	Detection Limit	No	No	Yes	*	No
	Quantization	No	Yes	No	*	No
	Limit					
	Linearity	Yes	Yes	No	*	No
	Range	Yes	Yes	*	*	No
	* May be required, depending on the nature of the specific test.					
	In case of compendia methods, the suitability of testing methods					
	used should be verified, documented and shall be approved by					
	Quality Assurance department.					
	A method is considered acceptable if:					
	• Linearity of the substance assay can be demonstrated.					
	• Reproducibility can be demonstrated.					
	• Accuracy can be demonstrated.					
	• Repeatability can be demonstrated.					
	• Robustness can be demonstrated.					
	• Limits of detection & limits of quantification and known					
	impurities are identifiable.					
	The revalidation of the critical assays involved in the release					
	specifications of established products will be carried out					
	whenever there is any change in the critical assays with respect to					
	manufacturing process , Testing process , change in the testing					
	kits , change in the equipment involved in the testing procedures/					
	assays and change in the specification					
	The strategy and plan for revalidation of critical assays will be					
	prepared and it will be part the change control and CAPA approval					
	process if any.					
	6.	COMPUTERIZED SYSTEM VALIDATION				
	All computerized systems within the facility shall be reviewed from a					
	validation perspective. Depending upon the extent of the GMP					
	functionality performed by the computerized system and the criticality of					
	those functions, the extent of the validation performed shall vary. There					
	will be two categories of validation performed on computerized systems					
	within the scope of this project.					
		Hardware:				
	As part of the validation process appropriate tests and challenges					
	to the hardware shall be performed.					

	The validation/qualification of the hardware should prove:
	That the capacity of the hardware matches its assigned function;
	That it operates within the operational limits;
	That it performs acceptably under worst-case conditions (e.g. long
	hours,
	temperature extremes); and
	Reproducibility/consistency (e.g. by performing at least three runs
	under
	different conditions).
	The validation should be done in accordance with written
	qualification protocols and the results should be recorded in the
	qualification reports. Validation may be performed by the computer
	vendor. However, the ultimate responsibility for the suitability of
	equipment used shall lie with the user department. When validation
	shall be done by outside firm, such as computer vendor, the records
	should be sufficiently complete (including general results and
	protocols) for adequacy of the validation.
	Software:
	Software is the term used to describe the complete set of programs
	used by a computer. Records are considered as software; focus is
	placed on accuracy, security, access, retention of records, review,
	double checks, documentation and accuracy of reproduction. The
	company should identify the key computer programs:
	language, name, function (purpose of the programs), input
	(determine inputs), output (determine outputs), fixed set point
	(process variable that cannot be changed by the operator), variable
	set point (entered by the operator), edits (reject input/output
	that does not conform to limits and minimize errors, e.g. four- or
	five-character number entry), input manipulation (and equations)
	and program overrides (e.g. to stop a mixer before time).
	The personnel who have been authorized to write, alter or have
	access to programs should be identified.
	The automated systems in the production are as follows-
	Tank systems
	Chromatography systems
	Filtration systems
	Water system
	HVAC system
	Centrifugation system
	Tunnel Sterilizer
	Filling, Stoppering and Sealing Machine
	Lyophilizer
	Visual Inspection machine
	SCADA – It stands for supervisory control and data acquisition. It
	is a computer system that monitors and controls the process. A
	Human – Machine Interface (HMI) is an apparatus in it which present
	process data to a human operator and through this the human
	operator monitors and controls the process. Remote terminal units
	connecting to sensor in the process converting sensor signals to
	digital data and sending digital data to the supervisory system. In
	the production, Chromatography system, Water generation system,
	Filtration system, and Centrifugation is regulated through the
	SCADA.
	PLC - Programmable logic controller is a digital computer used for
	automation of electromechanical process. PLC is designed for
	multiple inputs & outputs arrangements, extended temperature,
	immunity to electrical noise, resistance to impact of vibrations.
	In the production, Dry Heat Sterilizer is regulated through the
	PLC.

7. FACILITY DESCRIPTION :

Fill Finish Production Facility Description

7.1 Preparation area:

7.1.1 Rotary vial washing machine:

|| Glass vials for filling of vaccine are washed in an automatic |
 || rotary vial washing machine. |

7.1.2 Sterilizing and Depyrogenating tunnel:

	The washed vials are sterilized in Sterilizing and
	Depyrogenating tunnel, which is online with the rotary vial
	washing machine ensuring minimum handling, proper
	sterilization and depyrogenation.

7.1.3 HPHV steam sterilizer :

	A Double Door HPHV steam sterilizer is used for preparation
	of rubber stoppers, aluminium seals and steam sterilization
	of all materials and components like glassware, solutions and
	other components etc.

7.2 Blending area:

7.2.1 Jacketed stir vessel:

|| Electro polished Jacketed Stir Vessels (SS 316L) are in used |
 || for blending activities: |

7.3 Filling area:

7.3.1 Automatic Vial Filling and half Stoppering machine :

	Vaccine is filled in USP Type I tubular glass vials in an
	automatic filling machine which comprises an automatic
	filling machine.

7.3.2 Lyophilization

	The filled and half stoppered vials are taken to the
	lyophilizer protected under mobile Laminar flow chamber
	After the completion of the lyo cycle the vials are fully
	stoppered automatically within the chamber.
	These vials are then unloaded from the lyo chamber and taken

			into the next room for aluminium sealing.
			The lyophilizer is equipped with in-built CIP-SIP system.
		7.3.3	Vial sealing machine:
			Vials are sealed in an automatic vial sealing machine.
		7.4	Visual Inspection:
		7.4.1	Automatic visual inspection:
			The lyophilized vials are then inspected for integrity,
			absence of any foreign particles, deformity etc., using an
			automatic visual inspection machine.
			Rejected vials from the Visual inspection machine are further
			inspected manually and accepted or rejected based on the
			established criteria.
		7.5	Labeling
		Automatic sticker label application machine:	
		7.5.1	Printed sticker labels are applied on filled and sealed glass
		vials using high-speed Automatic sticker application	
			(Labeling) machine.
		7.6	Laminar flow units :
		7.6.1	All the critical processes are carried out in Grade A with
			laminar flow units having HEPA filters with a Grade B
			background.
		7.7	Facility monitoring System (FMS):
		7.7.1	The Facility Monitoring System (FMS) is a self-contained
			system to monitor the airborne particles 0.5µm and larger
			within those critical areas. Alarm levels are pre-programmed
			to indicate out of specification conditions. Graphs and data
			spreadsheets are also produced for trend analysis.
		7.8	Building monitoring System (BMS):
			Complete HVAC System is monitored with BMS system by placing
			sensors for Temperature, RH, and Differential Pressure as
			required to log the values in BMS works station for trend
			analysis.
		8.	CRITICAL UTILITIES
		Critical Systems are those that generate utilities, which are in direct	
		contact with the product or with the surfaces of processing equipment.	
		The Critical Utility systems comprise of Purified Water, Water for	
		Injection, Pure Steam, Heating Ventilation & Air Conditioning,	
		Compressed Air.	
		8.1	Pre Treatment Plant:
		The Pre Treatment Plant will provide soft water to Purified Water	
		generation System it have drinking water quality and have chemical	
		dosing for control the microbial growth.	
		8.2	Purified Water Generation System (PW):
		The Purified Water Plant will provide the total amount of Purified	
		Water required. The quality of Purified Water will correspond to	
		USP 31. The feed water to the Purified Water Plant would have	
		drinking water quality. The Purified Water plant includes a Reverse	
		Osmosis (RO) stage and an Electric De-ionization (EDI) stage.	
		The Purified Water Generation System includes the following steps,	
		which produces water which meets USP 31 requirements:	
		Pre-Filtration: The feed water is filtered through two filtration	
		stages (10 µm and 5 µm) using successive filter cartridges before	
		it is led into the RO membrane elements, thus reducing the number	
		of particles and colloids.	
		Further details of the Pure Water distribution loop are listed	
		below:	
		Elements	Description
		Piping material	0.065" wall thickness, 316L stainless steel ASTM
		A270	
		Ra (0.6 (m inside (240 grit); Ra (0.9 (m outside	
		)(150 grit) finishing.	
		Valves	Diaphragm sanitary type, with tri-clamp
		connections. Body AISI 316L diaphragm EPDM.	
		Fittings	0.065" wall, 316L stainless steel ASTM A270
		Ra (0.6 (m inside (240 grit), Ra (0.9 (m outside	
		)(150 grit) finishing.	
		Purified water	AISI 316L stainless steel sanitary. Simple
		circulation	mechanical seals tungsten carbide
		pump	AISI 316L stainless steel sanitary section valve
		AISI 316L stainless steel bottom discharge valve	
		Sanitary manometer.	
		Storage Tank to supply the Purified Water to different user points	
		through a distribution loop. The growth of microbes in the system	
		is controlled using continuous ultraviolet irradiation of the PW	
		stream. Deeper sanitation of the system will be carried out	
		periodically, to prevent the growth of microbes / to reduce the	
		microbial count.	
		Purified Water Distribution Loop:	
		The Purified Water distribution loop has points of use with	
		pneumatic sanitary diaphragm valves. The temperature of water at	
		the point of use shall be room temperature and each point of use is	
		provided with pneumatic sanitary diaphragm valves.	
		8.3	Water for Injection System (WFI):
		The Water for Injection System will provide a total amount of WFI,	
		required in the production facility. WFI quality will correspond to	
		USP31.	
		Water Still is fed with Purified Water. The generated WFI is stored	
		in storage tank and supplied to different user points through a	
		distribution loop. WFI is maintained at a minimum temperature of	
		80°C to prevent the growth of microbes and to reduce the microbial	
		count. Sanitation of the system will be carried out with Pure Steam	
		(PS) obtained from a Pure Steam Generator fed with PW.	

	WFI Generator Still consisting of:	
	Four Evaporation columns with condenser.	
	Pre-heaters and coolers manufactured in AISI 316L stainless steel,	
	Ra (0.6 (m (240 grit) interior, with pickled and passivated active	
	surfaces.	
	Condenser, pre-heaters and cooling chamber are insulated and	
	protected by AISI 304 stainless steel sheet in satin-finish.	
	Break tank and pressurizing multi-stage pump made of AISI 316L	
	stainless steel with process valve and accessories.	
	Control instruments incorporated in one main control board provided	
	with synoptic panel and operator interface terminal to indicate the	
	correct working of the whole process and the eventual abnormal	
	operating conditions.	
	8.4	Storage and Distribution Loop:
	The storage tank for WFI has a capacity of 2000L & 1000L and is	
	constructed of AISI 316L,	
	Ra (0.6 (m (240grit) interior and mirror polished. The WFI	
	distribution loop piping has the following characteristics:	
	Elements	Description
	Piping material	0.065" wall thickness, 316L stainless steel
		ASTM A270
		Ra(0.6 (m (240 grit) inside, Ra (0.9 (m (150
		grit) outside finishing
	Valves	Diaphragm sanitary type, with tri-clamp
		connections.
	WFI circulation	AISI 316L stainless steel sanitary
	pump	Pure Steam sterilizing at 3 bar
		Simple mechanical seals tungsten carbide
		AISI 316L stainless steel sanitary section valve
		AISI 316L stainless steel bottom discharge
		valve.
		Sanitary manometer
		Temperature: 121°C
	8.5	Heat Exchanger Cooler:
	The distribution loop has user points where WFI will be used	
	directly at 85°C and 15 points where it will be used at 35°C. Each	
	of these cold points will require heat exchanger cooler for removal	
	of heat.	
	The cold points of use are provided with automatic valves and the	
	control panel for operating logic of the heat exchanger cooler. The	
	heat exchangers are manufactured in AISI 316L stainless steel with	
	double tube sheet and are provided with automatic temperature	
	regulation system and control panels.	
	The cylindrical parts of the heat exchangers are insulated by 30-mm	
	of mineral wool covered by AISI 304 stainless steel sheets in satin	
	finish.	
	8.6	Pure Steam Generating System (PS):
	The Pure Steam is supplied to autoclaves for product materials and	
	containers sterilization, and is also used for the SIP of different	
	equipments and tanks.	
	The pure steam generator is fed with Purified Water (USP) and its	
	operation is fully automatic ensuring that the pure steam pressure	
	remains constant while meeting all demands, as well as the feeding	
	water level in the steam generator would remain constant. The pure	
	steam generator comprises of two parallel bodies: Double tube sheet	
	heat exchanger and Evaporator/ Decontamination chamber. The plant	
	is manufactured in AISI 316L stainless steel, with pickled and	
	passivated active surfaces. Its Exchanger and Evaporator/	
	Decontamination chamber are insulated and protected by AISI 304	
	stainless steel sheet, satin-finished. All the control instruments	
	of the whole plant are incorporated in one main control board	
	provided with synoptic panel and operator interface terminal to	
	indicate the correct performance of the whole process and the	
	eventual abnormal operating conditions.	
	8.7	Pure Steam Distribution System:
	Design details of the PS distribution system are listed below:	
	Elements	Description
	Piping	0.065" wall thickness, 316L stainless steel ASTM
	material	A270
		Ra (0.6 (m inside (240 grit or better),
		Ra (0.9 (m outside (150 grit) finished.
	Valves	Diaphragm valves with forged body and end
		connections with 3-piece construction and all
		wetted parts of AISI 316L stainless steel. All
		other functional parts of AISI 316 stainless steel.
		Internal wetted surfaces roughness of Ra(0.6 (m
		(240 grit or better). Body design includes bottom
		entry stem with double seals, and single piece PTFE
		seats. The ball valve is in line repairable.
		Connections are tri-clamp or flange type.
	Fittings	0.065" wall, 316L stainless steel ASTM A270
		Ra (0.6 (m internal (240 grit), Ra (0.9 (m
		outside (150 grit) finished.
	Thermostatic	Self-adjusting, balanced pressure type steam trap
	Steam Trap	capable of operating close to saturated steam
		temperature. All wetted parts are AISI 316L
		stainless steel with self-draining. Connections are
		screwed or tri-clamped.
	Pressure	Stainless steel direct acting pressure reducing
	Reducing	valves provide accurate downstream pressure control

	Valves	with tight shut off at the set pressure.	
			Connections are screwed or flange.
		Pressure	All Pressure Indicators are sanitary
		Indicator	
		Materials and other general design considerations of PW, WFI and PS	
		systems:	
		All materials in contact with PW, WFI and PS are of stainless steel	
		in AISI 316L with internal surface mechanically polished (Ra	
		(0.6µm) to prevent deposit of particles, undesirable chemicals and	
		substances that could support microbial growth.	
		All parts of the systems are dead leg free design as far as	
		possible and will keep a slope of 1% with valve for drainage at the	
		lowest point of the piping system.	
		Orbital welding (certified tungsten inert gas) and sanitary clamp	
		fittings (Tri clamp) to be used for joining the entire system	
		components.	
		Conductivity and temperature are continuously monitored and	
		recorded to control the quality of the generated and circulated	
		water (both PW and WFI), 24 hours per day. TOC is periodically	
		measured off line also.	
		Care has been taken that the dead leg length should be less than 6D	
		(where D is the inner diameter of the pipe).	
		8.8	Compressed Air System:
		The compressed air should accomplish the ISO 8573-1 Class 1.4.1	
		standard:	
		Particle maximum size (µm) 0.1	
		Polluting solids maximum concentration (mg/m3) 0.1	
		Dew point temperature (°C) +3	
		Oil maximum concentration (mg/m3) 0.01	
		Filtration through activated carbon to remove oil vapor and	
		hydrocarbon odors	
		limiting the maximum oil remaining content to <0.003 mg/m3 @ 21°C.	
		The pressure of processed air shall be reduced to 2 bars and	
		filtered through hydrophobic filters of 0.2 µm before each point of	
		use. This filter shall be sterilized periodically with pure steam	
		or by autoclaving.	
		The compressed air for instruments shall be used at 6 ~ 7 bar	
		pressure.	
		The compressed air will be produced in the Production Plant and	
		would be supplied to different points of use in the Production.	
		9.	HVAC SYSTEM
		The air is drawn by the blower through 10 micron filter and the air is	
		passed through cooling coil and heating coil and then passes through 5	
		µm & 3 micron filter. Thus chilled air passes through the supply duct and	
		enters into the respective rooms. The air is further filtered to 0.3	
		µm HEPA filter supply terminal and distributed in the room.	
		The return air is sucked by the blower through the return air raiser	
		and the air is filtered upto 10 micron filtration and mixes with the	
		fresh air and process continues.	
		Whenever defumigation required the Air Handling Unit will convert from	
		recirculation to Once Through mode, this is done by motorized damper	
		Actuators. In normal mode fresh air VCD for defumigation purpose will	
		be in closed mode and exhaust damper of defumigation unit will be in	
		closed mode, only the return air damper of the AHU will be in open	
		mode.	
		When the AHU is to be converted to defumigation mode both the fresh air	
		VCD and Exhaust air VCD will be in opened. The return air will be	
		closed; this operation is done through motorized damper actuators.	
		9.1	Air Handling Unit Plenum:
		The Structure of the Air Handling Unit has been constructed with	
		extruded aluminum profile of 2mm thick with thermal break. The	
		panels of the Air Handling Unit are of Double Skin. The inner	
		skin of the panel is plain G.I sheet of thickness 0.6mm and the	
		outer skin is of 0.6mm powder coated. The panels are sandwiched	
		and insulated with 40mm thick poly urethane foam.	
		9.2	Blower & Motor:
		The Air Handling Unit consists of SISW backward curved blower	
		driven by motor.	
		The De fumigation Unit consists of SISW backward curved blower	
		driven by motor.	
		9.3	Mixing Chamber:
		The mixing chamber for return and fresh air is built with 2mm	
		thick extruded profile with thermal break. The air from the rooms	
		through the return duct and the fresh air from TFO will be mixed	
		in the mixing chamber	
		9.4	Filter Plenum:
		The filter plenum consists of filter frame made of GI sheet duly	
		powder coated. The plenum for filter is made up of 2mm thick	
		extruded aluminium profile with double skin doors. The filter	
		frame holds the filters. The Stage – 1 (EU4) is of 10 micron	
		filter and the Stage – 2 (EU6) is of 5 micron filter, the	
		velocity across the filters are 500 fpm In the Stage – 3 (EU9) is	
		of 3 micron filter, Stage –4 (EU13) there are supply terminal	
		HEPA filters of 0.3 micron which are kept in the terminal boxes,	
		the filtered air passes through the grills and evenly distributed	
		in to rooms. The velocity across the filters is 500 fpm. In Stage	
		– 5 (EU4) 10 micron filters are fixed in the return air terminal	
		boxes and the return air is sucked by the supply blower through	
		return ducts, the velocity across the filter is 500 fpm.The	
		Differential pressures across the filters will be monitored by	
		the Magnehelic gauges which are placed on the panels of the Air	

|| Handling Unit. |

9.5 Cooling Coil Section: |

|| The cooling coil section is built with 2mm thick aluminium |

|| structure with thermal break profile of 0.6 mm thick inner skin |

|| and 0.6mm thick outer skin which is powder coated. The cooling |

|| coil is placed inside the drain pan which is made up of SS-304 |

|| sheet with drain outlet to drain off the condensate water. The |

|| coil is made up of Copper tubes and aluminium fins. The coil |

|| header is of 60mm NB. The velocity across the coil is less than |

|| 500 fpm. |

9.6 Chilled Water Manifold: |

|| The chilled water manifold consists of isolation valves, 3 – way |

|| mixing valve with actuator, balancing valve, 'Y' strainer, |

|| temperature gauges & Pressure gauges. The chilled water is fed in |

|| to the chilled water coil through this manifold at temperature of |

|| 7°C with a pressure of 1.5 kg/cm² - 2 kg/cm². The temperature |

|| sensor senses the temperature of the return air and actuates the |

|| actuator of the 3 – way mixing valve. Whenever the temperature |

|| reaches the desired condition the 3 – way mixing valve closes and |

|| the chilled water is by passed. |

|| The Chilled Water manifold is insulated with 50mm thick Thermocol |

|| sections with 0.6mm thick aluminium cladding as vapour barrier. |

9.7 Heating Coil Section: |

|| The Heating Coil is made up of copper tube and aluminium for the |

|| velocity across the coil is less than 500 fpm. The heating coil |

|| is kept in drain pan of the Air Handling Unit. The header of the |

|| heating coil is of 35NB. The hot water to be given at a |

|| temperature of 50°C at the suction end of the coil. |

9.8 Hot Water Manifold: |

|| The Hot water manifold consists of isolation valves, 3 – way |

|| mixing valve with actuator, balancing valve, 'Y' strainer, |

|| temperature gauges & Pressure gauges. The Hot water is fed in to |

|| the chilled water coil through this manifold at temperature of |

|| 50°C with a pressure of 1.5 kg/cm² - 2 kg/cm². The Humidity |

|| sensor senses the humidity of the return air and actuates the |

|| actuator of the 3 – way mixing valve. Whenever the humidity |

|| reaches the desired condition the 3 – way mixing valve closes |

|| The Hot Water manifold is insulated with 50mm thick glass wool |

|| with 0.6mm thick aluminium cladding as vapour barrier. |

9.9 Ducting: |

|| The Supply Duct is connected to the Supply Air Volume Control |

|| Damper, which is insulated with Aluminium Nitrile Rubber duly |

|| pasted with Aluminium Foil that not to transfer any heat loses. |

|| The supply ducts are connected to the terminal boxes which are |

|| holding 0.3 micron terminal HEPA filter through which the |

|| filtered air enters in to the rooms. From the return air raisers |

|| the return air duct which is insulated with nitrile rubber which |

|| is prelaminated with aluminium foil not to transfer any heat |

|| loses. |

|| The Supply Ducting has been made from galvanized steel sheet of |

|| 275 GSM coating thickness. The branches and the termination to |

|| the terminals has been done by galvanized sheets only. The supply |

|| ducting has been insulated by 19mm Nitrile rubber which is pre |

|| insulated with aluminium foil as vapor barrier. |

|| The return ducting has been made from galvanized steel sheets of |

|| 275 GSM coating thickness. The branches & termination to the |

|| terminals has been done by galvanized sheets only. The return |

|| ducts are also insulated with Nitrile Rubber of 9mm thickness |

|| which is also prelaminated with aluminium foil. |

9.10 Volume Control Dampers : |

|| The unit is provided with Volume control dampers at the supply |

|| end of the duct and after the end of return duct. These control |

|| dampers are used for controlling the air flow. |

|| The outer casing for the Volume Control Dampers are manufactured |

|| by Galvanized Iron Sheets duly powder coated. The Damper Profiles |

|| used are extruded aluminium aerofoil type. The Velocity for |

|| supply air volume control damper is 1400 fpm, for return air |

|| volume control damper is 1000 fpm and for fresh air volume |

|| control damper is 500 fpm. |

9.11 Fire Dampers: |

|| The Fire Dampers which are kept in the return air duct are made |

|| up of Galvanized Iron Sheets. The type of fire dampers are |

|| fusible link type. When the fire exists in the room due to the |

|| heat generated by the fire the fusible link will be fused when |

|| the temperature reaches 70°C. When the fusible link fuses the |

|| fire damper automatically closes. |

9.12 Air Filtration System and Room's Pressure Level: |

|| The air filtration system was designed to guarantee the optimum |

|| working conditions for filters. It is composed of pre filters of |

|| 85% and 90% Efficiency ASHRAE (EU-3), fine filters of 95% |

|| Efficiency Dust Spot (EU-8) and HEPA terminal filters of 99.97% |

|| Efficiency DOP (EU-12). Pre and fine filters will be placed in |

|| all the AHU. |

|| HEPA filters have been placed in all the terminals at the clean |

|| rooms ceiling. |

|| To ensure prospective working of fresh air intake and exhaust air |

|| outlet system elements which are in contact with the external |

|| environment, common protective grills have been provided. |

|| The pressure gradients have been established as follows: |

|| 5 Pa between external non-classified rooms and external |

|| environment. |

|| 15 Pa between external clean rooms and non-classified rooms. |

	13 Pa between adjacent clean rooms of different grade.	
	Measures have been taken for continuous monitoring of Relative	
	Pressure Values in the critical working rooms.	
	9.13	Dry Bulb Temperature and Relative Humidity Control:
		Dry Bulb Temperature (DBT) and Relative Humidity (RH) ranges are
		as follows:
		Clean Rooms Working Condition: DBT: 22±3°C, NMT 55±5%
		Conventional Rooms Condition: DBT: 24±3°C, RH: Not Controlled
		Relative Humidity Control was conceived by means of a three-way
		electric valve to regulate the chilled water flow to be passed
		through Air Handling Units cooling coils. A humidifier device is
		placed in system 00 to provide the correct set parameters to the
		fresh air in dry conditions. Relative Humidity sensors are placed
		in the air return main branch of all the systems.
		Two-way and three-way electrical valves would be used to regulate
		the chilled water and industrial steam flows respectively, and in
		this manner control the Dry Bulb temperature in the AHU units
		through cooling and heating coils.
	10.	CLEANING /CAMPAIGN CHANGE
		The objectives of Good Manufacturing Practices (GMP) include the
		prevention of possible contamination and cross-contamination of
		pharmaceutical starting materials and products. Adequate cleaning
		procedures play an important role in preventing contamination and
		cross-contamination. Contamination can be through a variety of agents
		such as microbes, with previous products, residues of cleaning agents,
		airborne matter such as dust and particulates lubricants and ancillary
		material such as disinfectants. Validation of cleaning methods provides
		documented evidence that an approved cleaning procedure will provide
		clean equipment/clean premises suitable for use.
		Cleaning validation should be considered important and should be
		performed for equipments, sanitization procedures, garment laundering
		and area cleaning.
		There should be written SOPs detailing the cleaning process for
		equipment and apparatus. Cleaning procedures shall be validated.
		Cleaning procedures shall be based upon established and validated
		methods.
		At least three consecutive applications of the cleaning procedure should
		be performed and shown to be successful in order to prove that the
		method is validated.
		If automated procedures are utilized (Clean-In-Place: CIP),
		consideration should be given to monitoring the critical control points
		and the parameters with appropriate sensors and alarm points to ensure
		the process is highly controlled.
	11.	STORAGE FACILITIES
		Typically the different storage facilities include:
		Cold Rooms (2 to 80C) – For storage of Bulk, In process samples, filled
		vaccine vials, Intermediate product and Support Area solutions.
		Deep freezer (-200C) – For Storage of specific raw materials and
		solutions, Bulk (which require low temperature storage).
	12	SHIPPING VALIDATION
		The shipping procedure of final product bulk shall be validated in
		order to ensure product quality is unharmed during transportation.
		Shipping Validation is the measurement and/or confirmation that
		temperatures inside the shipping containers remain within the
		defined temperature range (for the specific vaccine/s being
		transported) for a period of 48 hours minimum. The shipping
		validation typically includes :
		Container Closure/Packaging Studies
		Temperatures within the container should be continuously monitored
		within an accuracy of ± 0.5°C; the sensors used for this purpose
		must not be allowed to influence the test in any way. A minimum of
		8 simultaneous temperature measurements are required for an
		insulated box. The ambient temperatures at which the insulated box
		is tested must remain within a tolerance of ± 1°C. Every packaging
		size shall be validated.
		Insulated boxes should be fully loaded with vaccine vials
		conditioned at +5°C ±3°C. Loads can be pre-fitted with
		thermocouples. Loading should be carried out as quickly as
		possible and the time taken for loading should be recorded for
		each container.
	13.	PERSONNEL
		Procedure for conducting training of personnel and their evaluation is
		laid down. Every personnel undergoes training session depending on the
		job to be performed, for up gradation of skills and knowledge. Every
		departmental Head has to ensure that each individual in his department
		has been imparted training, relevant to the activities performed by the
		individual. Quality assurance department shall be responsible for
		preparation of annual training plan and maintaining the documents
		related to training.
	14.	CALIBRATION
		All the measuring equipments, instruments and devices shall be
		calibrated on an established schedule as per the established standards,
		which shall be traceable to National Accreditation Testing & Calibration
		Laboratories, Russia or any other standards maintained at National or
		International Standards Laboratory.
		The calibration program shall be implemented by Quality Assurance
		Department in coordination with Maintenance and concerned departments.
	15.	VALIDATION STRATEGY
		The validation of the equipments / system to be used for the products
		manufactured or to be manufactured should be carried out as per
		validation strategy provided in the validation master plan. The
		validation strategy define the equipments to be validated , the

| parameters to be included for the validation , acceptance criteria for |
 | validation studies performed , frequency of the validation planned for |
 | the current year. The progress made based on this plan will be reviewed |
 | by the upper and mid management periodically. |
 | The Validation protocols should include the following criteria, but |
 | should not be limited to them. Other additional criteria could be |
 | included in the specific validation protocols, which will help to |
 | support the validation studies on case to case basis. |
15.1	Process Equipments in Bulk vaccine and fill finish Facility:	
15.1.1	Autoclave:	
		Bowie Dick test should be carried out to demonstrate the
		removal of air pockets and heat penetration. Three
		consecutive runs in the empty chamber should be carried out
		to demonstrate the uniform heat distribution using
		temperature probes/thermocouples and data loggers.
		Three consecutive runs should be carried out by placing
		temperature probes/ thermocouples within the load to find
		out the coolest points during the sterilization cycles.
		Three consecutive runs should be carried out by placing
		Biological Indicators (spore count 10-6) at the coolest
		points detected above along with the temperature probes/
		thermocouples to achieve 12 D lethality.
15.1.2	Dry Heat Sterilizer:	
		Three consecutive runs in the empty chamber should be
		carried out to demonstrate the heat distribution using
		temperature probes/ thermocouples with data loggers. Three
		consecutive runs should be carried out with temperature
		probes/ thermocouples with in the load to find out the
		coolest points with in the load. Three consecutive runs
		should be carried out with Endotoxin Indicators vials (with
		known amount of endotoxin units) along with temperature
		probes/ thermocouples placed at the above deducted coolest
		points with in the load should be carried out. There should
		be more than 3 log reduction in the exposed vials.
15.1.3	Incubator:	
		It should be demonstrated that the temperature is
		homogeneous inside the equipment, within acceptable limits.
		During performance qualification of incubators, temperature
		distribution study (Empty chamber), temperature distribution
		study (loaded chamber) and variation in temperature on stock
		replenishment should be performed.
15.1.4	Cold Room:	
		During performance qualification of cold room, temperature
		distribution study (empty cold room), temperature
		distribution study (loaded cold room) and variation in
		temperature on stock replenishment (three times) should be
		done.
15.1.5	Laminar Air Flow Cabinets and Laminar Air Flow Ceiling:	
		It should be demonstrated that Laminar Air Flow Cabinets and
		LAF Ceiling remains in continued compliance with current
		regulatory norms. The validation shall include DOP testing
		(installed filter leak test), air velocity testing, ACPH
		testing, Smoke profile and non viable particle counting,
		which shall be carried out biannually. In addition other
		parameters should be monitored as per frequency mentioned in
		the Environment Monitoring Program.
15.1.6	Chromatography System:	
		The chromatography system validation should be performed to
		ensure consistent performance of the system. Chromatographic
		profiles for a specific chromatography obtained repeatedly
		in each case show a reproducible pattern.
		Performance qualification of chromatography system should
		include the integrity testing of the column and system so as
		to check for any leakage due to loose connections , checking
		of the flow rate (with and without column) to check pressure
		drop and HETP of column.
15.1.7	Purified Water System:	
		Purified water system should comply with Specifications
		incorporating requirements of pharmaceutical waters as per
		the compendia. The Performance Qualification of purified
		water system shall be carried out in three phases.
		During phase-1, verification of the operating range of the
		system shall be done. This phase shall involve daily
		testing of pH, conductivity, TOC and microbiology from all
		user points for 21 consecutive days. After successful
		completion of phase-1 study, phase-2 study of purified
		water system shall be initiated.
		During phase-2, the demonstration of the system to produce
		desired quality of purified water consistently shall be
		done. This phase shall involve daily testing of pH,
		conductivity, TOC and microbiology from all user points for
		next 21 consecutive days. After successful completion of
		phase-2 study, phase-3 study of purified water system shall
		be initiated.
		During phase-3, potential seasonal variations affecting the
		water quality shall be checked. This phase shall involve
		testing of pH, conductivity, TOC and microbiology from all
		user points as per sampling plan for a period of one year.
		For new system and for existing system whenever any major
		change is undertaken which warrants the revalidation of the
		water system, the trending at each phase shall be performed
		to decide alert and action levels. The alert and action

|||level obtained from Phase I will be implemented for phase I
 |||II, alert and action levels obtained for phase II will be I
 |||used for Phase III. The alert and action level obtained I
 |||from phase III will be used for monitoring the quality of I
 |||the water for long term usage till any deviation is I
 |||noticed. I
 |||15.1.8|Water for Injection System: I
 |||Water for Injection system should comply with I
 |||Specifications incorporating requirements of pharmaceutical
 |||waters as per the compendia. The Performance Qualification I
 |||of water for injection system shall be carried out in three
 |||phases. I
 |||During phase-1, verification of the operating range of the I
 |||system shall be done. This phase shall involve daily I
 |||testing of pH, conductivity, TOC, microbiology and I
 |||endotoxin from all user points for 21 consecutive days. I
 |||After successful completion of Phase-1 study, Phase-2 study
 |||of water of injection system shall be initiated. I
 |||During phase-2, the demonstration of the system to produce I
 |||desired quality of water of injection consistently shall be
 |||done. This phase shall involve daily testing of pH, I
 |||conductivity, TOC, microbiology and endotoxin from all user
 |||points for next 21 consecutive days. After successful I
 |||completion of phase-2 study, phase-3 study of water of I
 |||injection system shall be initiated. I
 |||During phase-3, potential seasonal variations affecting the
 |||water quality shall be checked. This phase shall involve I
 |||testing of pH, conductivity, TOC, microbiology and I
 |||endotoxin from all user points as per sampling plan for a I
 |||period of one year. I
 |||For new system and for existing system whenever any major I
 |||change is undertaken which warrants the revalidation of the
 |||water system, the trending at each phase shall be performed
 |||to decide alert and action levels. The alert and action I
 |||level obtained from Phase I will be implemented for phase I
 |||II, alert and action levels obtained for phase II will be I
 |||used for Phase III. The alert and action level obtained I
 |||from phase III will be used for monitoring the quality of I
 |||the water for long term usage till any deviation is I
 |||noticed. I
 |||15.1.9|Pure Steam System: I
 |||Pure Steam System should comply with Specifications I
 |||incorporating requirements of the compendia. The I
 |||Performance Qualification of pure steam system shall be I
 |||carried out in three phases. I
 |||During phase-1, verification of the operating range of the I
 |||system shall be done. This phase shall involve daily I
 |||testing of pH, conductivity, TOC, microbiology and I
 |||endotoxin from all user points for 21 consecutive days. I
 |||After successful completion of phase-1 study, phase-2 study
 |||of water of injection system shall be initiated. I
 |||During phase-2, the demonstration of the system to produce I
 |||desired quality of pure steam consistently shall be done. I
 |||This phase shall involve daily testing of pH, conductivity,
 |||TOC, microbiology and endotoxin from all user points for I
 |||next 21 consecutive days. After successful completion of I
 |||phase-2 study, phase-3 study of pure steam system shall be I
 |||initiated. I
 |||During phase-3, potential seasonal variations affecting the
 |||quality of pure steam shall be checked. This phase shall I
 |||involve testing of pH, conductivity, TOC, microbiology and I
 |||endotoxin from all user points as per sampling plan for a I
 |||period of one year. I
 |||For new system and for existing system whenever any major I
 |||change is undertaken which warrants the revalidation of the
 |||water system, the trending at each phase shall be performed
 |||to decide alert and action levels. The alert and action I
 |||level obtained from Phase I will be implemented for phase I
 |||II, alert and action levels obtained for phase II will be I
 |||used for Phase III. The alert and action level obtained I
 |||from phase III will be used for monitoring the quality of I
 |||the water for long term usage till any deviation is I
 |||noticed. I
 |||15.1.1|Compressed Air System: I
 |||0 I
 |||Compressed Air System should comply with specifications. I
 |||The performance qualification of compressed air system I
 |||shall be carried out for different parameters monitored I
 |||daily for pressure, microbiology and pressure dew point for
 |||a period of 21 consecutive days. I
 |||15.1.1|Deep Freezer: I
 |||1 I
 |||During performance qualification of deep freezer, I
 |||temperature distribution study for 7 days, variation in I
 |||temperature on opening the door for 30 seconds, three times
 |||for the door shall be done. I
 |||15.1.1|Vial Washer I
 |||2 I
 |||Operational Qualification I
 |||1. The system shall retain less than 100 ml of WFI after 15
 |||minutes of drainage (all normal drain valves open. I
 |||2. The washing machine can operate properly throughout its I

			operating range.
			3. Vial washing room is free of condensate and visible
			water vapor from the machine throughout its operating
			range.
			4. Glass breakage through the machine shall not exceed 1%
			of the number of bottles processed.
			5. Water at the last rinse station shall contain not more
			than 10% of USP SVP particulate matter limits [NMT 1000
			particles ~10 microns and NMT 100 particles >25 microns per
			100 ml].
			6. Air used to blow vials free of residual moisture shall
			meet FS 209 D Class 100particulate requirements.
			Performance Qualification
			1. The washing machine shall discharge vials containing
			less than 10% of the USP Large Volume Parenteral
			particulate matter limit [NMT 500 particles > 10microns and
			NMT 50 particles >25 microns per 100 ml] for bottles of 100
			ml and 200 ml. The number of particulates present in vials
			shall be reduced by passage through the machine.
			2. Any residual water in the washer after draining shall
			contain less than 0.25 EU/ml of residual endotoxin.
			4. Vials washed in the machine shall contain less than 1
			EU/vial after processing. There shall be no increase in
			vial endotoxin content as a result of passage through the
			machine.
		15.1.1	Depyrogenation Tunnel
		3	
			Installation Qualification
			1. The HEPA filters installed in the machine shall be
			certified to retain a minimum of 99.97% of particles larger
			than 0.5 micrometer.
			Operational Qualification
			1. Air within the tunnel shall meet FS 209 D Class 100
			requirements at operating temperature [circa 330°C].
			2. The tunnel shall be able to operate properly while
			maintaining a maximum 0.10" H2O pressure differential from
			discharge to indeed.
			3. The dry heat tunnel shall operate properly throughout
			its operating range of 0 to 100, 100 and 200 ml vials per
			minute.
			4. The tunnel shall maintain a distribution temperature
			range [belt edge to belt edge] of not more than 30°C
			throughout its length when empty.
			5. The tunnel shall maintain a distribution temperature
			range [belt edge to belt edge] of not more than 25°C
			throughout its length when full of 200 ml vials.
			Performance Qualification
			1. The tunnel shall be capable of a minimum 3.0 log
			reduction in endotoxin content for all vial sizes. The
			minimum challenge level shall be 1000 EU/vial
			[recoverable]]
			2. There shall be no increase in vial particulate matter
			content as a result of passage through the tunnel.
			3. The tunnel shall maintain a penetration temperature
			range [belt edge to belt edge] of not more than 20°C
			throughout its length when full of 200 ml vials.
		15.1.1	Vial Filler/Stoppering
		4	
			Operational qualification
			1. The vial filler / stoppering machine shall operate
			properly throughout its operating range.
			2. There shall be no increase in vial particulate matter
			content as a result of passage through the filling machine
			[without liquid addition].
			3. There shall be no more than a 10% increase in stopper
			particulate matter level as a result of passage through the
			stoppering bowl and discharge chute of the machine.
			Performance Qualification
			1. The machine shall maintain weight control within + 3% of
			set point for all fill weights. Weight control shall be
			demonstrated at 10, 50 and 100% of operating speed for all
			container sizes.
			2. The machine shall pass a series of media fill challenges
			as specified in the aseptic processing section of this
			document.
		15.1.1	Vial Capper
		5	
			Performance Qualification
			1. Vials of each size shall be tested for adequacy of
			container-closure integrity by immersion in a dye bath and
			pressurization at 15 psig for thirty ~30] minutes. Testing
			shall be performed at the extremes of seal pressure and
			operating speed.
		15.1.1	Vial Inspection
		6	
			Operational Qualification
			1. The system shall correctly reject the proper vial as
			indicated by the operators console selection.
			Reject vials shall not be discharged from the inspection
			machine.
			2. The inspection machine shall operate properly throughout
			its operating range.

			Performance Qualification
			Specific KNAPP test shall be performed on the inspection
			machine during PQ stage.
		15.1.1	Labeller/Label Verification
		7	
			Operational Qualification
			1. The inspection equipment shall demonstrate the ability
			to correctly identify all bar-codes imprinted on the label
			in the range of sizes to be utilized.
			Performance Qualification
			1. The labeller shall be capable of labeling with
			appropriate printing with positional accuracy of + 1/16".
			Printing shall be completed on each label with a positional
			accuracy of + 1 /32".
			2. The labeling and inspection machine shall operate
			properly throughout its operating range.
			3. The machine shall stop on the detection of a vial
			without a label or a label without a proper bar-code prior
			to the vial leaving the machine.
		15.1.1	Stopper Processor
		8	
			Operational Qualification
			1. At steady state [121°C] the unit shall exhibit a heat
			distribution of + 0.5°C about the set point temperature.
			2. Sterile air filters must pass manufacturers filter
			integrity test after completion of in-situ sterilization.
			3. Chamber vacuum leak rate shall not exceed 1 mm HG/minute
			when tested at 50 mm HG.
			Performance Qualification
			1. Biological challenge with Bacillus stearothermophilus
			spore strips [106 spores/strip] shall be inactivated in all
			locations when exposed to a minimum Fo of 15 minutes.
			2. The stopper washing machine shall discharge stoppers
			with less than 20% of the USP Large Volume Parenteral
			particulate matter limit [NMT 1000 particles > 10 microns
			and NMT 100 particles >25 microns per stopper] for stoppers
			to be utilized on vials of 100 and 200 ml. The number of
			particulates present on the stoppers shall be reduced by
			passage through the machine.
			3. Stoppers washed in the machine shall contain less than
			0.25 EU/stopper after processing. There shall be no
			increase in stopper endotoxin content as a result of
			passage- through the machine.
			4. The stopper washing machine shall be capable of a
			minimum 3.0 log reduction in endotoxin content for all
			stopper formulations. The minimum challenge. level shall be
			1000 EU/vial [recoverable].
		15.1.1	HVAC
		9	
			Installation Qualification
			1. Verification of cleaning of all ducts [supply and
			return] in the system.
			2. Confirmation of HVAC system [including all filters]
			conformance to design specifications and construction
			drawings.
			3. Review of documentation on air system testing to
			include: balancing reports, supply and return air
			velocities, air distribution, and air changes per hour.
			4. Initial cleaning of each room shall have been completed
			in accordance with the expected routine SOP.
			Operational Qualification
			1. Air changes per hour, pressure differentials between
			rooms, temperature and relative humidity must conform to
			the design criteria.
			2. Air velocities, pressures and temperatures throughout
			each HVAC system shall conform to the design
			specifications.
		HVAC System [Class 1,000, 10,000 and 100,000]	
			The criteria established in this section are for use during
			the PQ of the systems, Final limits will be developed upon
			a review of the PQ environmental monitoring results.
		Installation Qualification	
			1. Verification of cleaning of all ducts [supply and
			return] in each system.
			2. Confirmation of HVAC system [including all filters]
			conformance to design specifications are construction
			drawings.
			3. Review of documentation on air system testing to
			include: room pressurization, damper adjustments, balancing
			reports, supply and return air velocities, air distribution
			[smoke tests or equivalent], air changes per hour, and
			differential pressures.
			4. Documentation of duct leak testing for all controlled
			environment HVAC systems [supply and return ducts].
			5. Initial sanitization of each room shall have been
			completed in accordance with the expected routine SOP.
			6. All HEPA filter installations shall have been tested
			with DOP [or an equivalent challenge material] to confirm
			their integrity.
		Operational Qualification	
			1. Design criteria for air changes per hour, air flow
			patterns pressure differentials between rooms, temperature

		and relative humidity must conform.
		2. Air velocities, pressures and temperatures throughout
		each HVAC system shall conform to the design
		specifications.
		3. Airborne particulate testing performed under static [no
		equipment in operation, no components present,
		environmental monitoring personnel only] conditions shall
		be not more than 10% of the applicable FS 209 D particulate
		requirement for each controlled environment [i.e. Class 100
		must demonstrate less than 10 particles larger than 0.5
		microns per cubic foot of air sampled]. This monitoring
		shall be performed daily for a period of ten [10] days.
		4. Microbial testing under static conditions shall
		demonstrate an average microbial content of not more than
		25% of the proposed USP microbial levels for each
		controlled environment. No individual sample shall exceed
		75% of the proposed USP microbial limits. This monitoring
		shall be performed daily for a period of ten [10] days.
	Performance Qualification	
		1. Air flow patterns, pressure differentials between rooms,
		temperature and relative humidity must conform to the
		design criteria for load conditions.
		2. Airborne particulate testing performed under routine
		operation [equipment in operation, components present,
		normal complement of personnel] conditions shall be not
		more than 25% of the applicable FS 209 D particulate
		requirement for each controlled environment [i.e. Class 100
		must demonstrate less than 25 particles larger than 0.5
		micron per cubic foot of air sampled]. Particulate counts
		shall be taken in the absence of ZZZ powder. Data shall be
		accumulated for a period of ninety (90) days before the
		start of filling operations.
		3. Microbial testing under routine operating conditions
		shall demonstrate an average microbial content of not more
		than 75% of the proposed USP microbial levels for each
		controlled environment. No individual sample shall exceed
		200% of the proposed USP Microbial Limits. Microbial
		sampling will utilize neutralizing agents to assure that
		the results are valid. Data shall be accumulated for a
		period of ninety (90) days before the start of operations.
	15.1.2	Fixed Environmental Monitoring System
	0	
		Operational Qualification
		1. Particle measurement equipment shall be calibrated in
		accordance with manufacturer's recommendations prior to use
		in validation studies.
	15.1.2	Portable Environmental Monitoring Units
	1	
		Operational Qualification
		1. Particle measurement equipment shall be calibrated in
		accordance with manufacturer's recommendations prior to use
		in validation studies.
	15.1.2	Building Monitoring System
	2	
		Performance Qualification
		1. All data recorded by the Building Monitoring system
		shall be within +2% of independent measurements taken
		during the validation of the individual systems. Critical
		measurements shall be within +0.5% of the value reported by
		the local device.
		2. All alarms reportable by the Building Monitoring System
		shall be activated within 5 seconds of that alarm being
		reported by the local device.
	15.1.2	Plant Steam
	3	
		Installation Qualification
		1. Verification of hydrostatic testing, and cleaning of the
		distribution system.
		2. Confirmation of system conformance to design
		specifications and construction drawings.
	15.1.2	Gowning Procedures
	4	
		Operational Qualification
		1. The sterilization of all uniform components shall be
		validated [either on-site or at the vendors location as
		appropriate.
		2. Individual shall demonstrate their ability to do sterile
		gowns without undue difficulty. Each individual shall be
		monitored for their ability to properly put on sterile
		gowns by being subjected to microbial monitoring.
		Individuals shall demonstrate on three separate occasions
		that they can meet the USP proposed microbial limits for
		gown surfaces.
	15.1.2	Media Fills
	5	
		Performance Qualification
		A minimum of three process simulation tests will be
		conducted for each different vial size produced in the
		sterile powder facility. Initially, the process simulation
		tests should bracket the fill volumes in each size
		container with two maximum fills and one minimum fill. A
		minimum of three thousand (3,000) vials per test must be

			run with a failure rate of less than 0.1%. Any
			micro-organisms found must be identified to the extent
			possible. The media must be capable of supporting microbial
			growth for low numbers (less than one hundred [100]
			organisms per vial) of the USP growth promotion organisms.
			The medium to be utilized is Soybean-Casein Digest Medium
			(SCDM) [also known as Trypticase Soy Broth (TSB)]. The
			powder hopper shall be filled with a radiation sterilized
			excipient. The test units are to be incubated at 30-35°C
			for fourteen (14) days in an inverted position. During the
			course of the media fill process, environmental monitoring
			of viable and non-viable particulates in the environmental
			air should be performed. Personnel and surface monitoring
			of critical locations is also required. The monitoring
			should include the set-up of the line prior to the start of
			the fill.
16	DEVIATION		
		Any discrepancy during a validation exercise must be analyzed to	
		identify the origin of the discrepancy. Results and parameters out	
		of specified limits constitute a deviation.	
		Any incident regarding deviation from the written procedures shall	
		be documented. Investigations shall be carried out in case of	
		critical discrepancies which may affect the quality of the product.	
		Concerned departmental personnel along with personnel from Quality	
		Assurance department shall perform investigation needed to	
		establish if the deviation has an impact on the quality of the	
		product and validation status, as per established procedures	
17	CHANGE CONTROL		
		Written procedures should be in place to describe the actions to be	
		taken if a change is proposed to a design process equipment,	
		starting material, product component, process environment (or	
		site), method of production or testing or any other change that may	
		affect product quality or reproducibility of the process. Change	
		control procedures should ensure that sufficient supporting data	
		are generated to demonstrate that the revised process will result	
		in a product of the desired quality, consistent with the approved	
		specifications. The potential impact of the proposed change on the	
		quality of the product shall be evaluated and the level of testing,	
		validation, and documentation needed to justify changes to a	
		validated process shall be determined. Significant changes to	
		process need appropriate supporting data obtained through	
		revalidation. Through the provisions of this procedure of change	
		control a proposed change shall be formally requested, documented,	
		evaluated and approved internally on its scientific merit and	
		appropriate external authorization shall be sought for those that	
		have impact on regulatory submissions.	
18	REVALIDATION		
		Facilities, systems, equipment and processes, including cleaning,	
		should be periodically evaluated to confirm that they remain valid.	
		Where no significant changes have been made to the validated	
		status, a review with evidence that facilities, systems, equipment	
		and processes meet the prescribed requirements should be performed.	
		It shall be done in accordance with a defined revalidation program.	
		It has to be performed in the following cases:	
		Periodic revalidation: It is performed to guarantee that there has	
		been no drift in the equipment/system, process performance due to	
		passage of time. Periodic revalidation is performed even if no	
		changes have been implemented.	
		For product contact equipments/system the data of regular	
		production batches shall be compiled and shall hold good for	
		periodic revalidation.	
		All the equipments/systems shall be revalidated before starting	
		regular batch production after production shutdowns/breaks.	
		Revalidation due to changes: It is performed when a change in the	
		equipment/system, procedure, quality of the product and /or product	
		characteristics, process or facility is implemented.	
		Changes requiring revalidation may include:	
		Changes in starting materials,	
		Change in the location/site,	
		Changes of primary packaging material,	
		Changes in the manufacturing process,	
		Changes in the equipment*,	
		Relocation of equipment to other vaccine block / facility,	
		Any change in the support system,	
		Any change in the facility	
		*Changes of equipment which involve the replacement of equipment on	
		a "like-for-like" basis would not normally require a revalidation.	
		For example, installation of a new centrifugal pump to replace an	
		older model would not necessarily require revalidation. The extent	
		of revalidation will depend on the nature and significance of the	
		change(s). The Revalidation program shall be approved by the Heads	
		of Production, Quality Control, Maintenance and Quality	
		Assurance and the revalidation activity shall be performed in	
		accordance with approved protocols.

RM:

- Wt of each empty box (PUFF Lined)
- Boxes acclimatized at vaccine storage temperature by placing at 5+ 30 C
- Load the bottles containing placebo in the PUFF lined box, as quickly as possible (15 Minutes)
- Pack the bottles with Soft Ice pack, Frozen soft Ice packs and then Hard Ice packs
- Number of Ice packs shall be as per the table
- Place 3 thermocouples in each box and 1 thermocouple in the environment wherever the study shall be carried out i.e. incubator for + 43 °C and deep freezer for -5°C. Each thermocouple should be positioned to a distance of 2.5/3.0 cm from the nearest ice pack
- Record the temperature at an interval of 10 minutes from thermocouples and every 2 Hours from digital display of incubator / deep freezer for 48 hours
- Place the packed boxes in the incubator at + 43 oC and in a deep freezer at -5 oC
- Carry out 3 Runs for each packing

[1. |Purpose: |

	The purpose is to validate the temperature during shipping of ARM /
	bulk vaccine, transported at 5 + 3°C so as to maintain the desired
	cold chain conditions during transportation.

[2. |Scope: |

	2.1	Applicable to the ARM /bulk vaccine (that comes under class C as
	per WHO Guidelines on the packaging and shipping of vaccines	
	WHO/IVB/R/05.23 December 2005) to be transported at the	
	temperature of 5 + 3°C.	

[4. |Safety considerations: |

	4.1	The ARM / bulk vaccine is to be maintained at recommended
	temperature at 5 + 3 °C. The ARM / bulk vaccine should not	
	freeze.	

| |4.2 |The containers of the ARM / bulk vaccine should be properly |
| |packed |

| |to avoid any breakage. |

| |4.3 |Ensure proper connections of thermocouples and their |
| |positioning. |

[5. |Equipments: |

| |5.1 |Data logger with thermocouples (accuracy ± 0.5°C) |

| |5.2 |BOD Incubator and Deep Freezer |

[6. |Materials and reagents: |

| |6.1 |Materials: |

| |6.1.1 |Glass bottles of appropriate capacity (20L, 10L, 5L, 2L |
| |and 1L)containing Placebo |

| |6.1.2 |PUF lined corrugated boxes (to house 10L/20L glass |
| |bottle) |

| |6.1.3 |PUF lined corrugated boxes (to house 1L/2L /5L glass |
| |bottle) |

| |6.1.4 |Ice packs hard / soft (stored at 5± 3°C and -20°C) |

| |6.1.5 |Polypropylene caps for sealing bottles |

| |6.1.6 |Thermocol sheets for immobilization |

| |6.1.7 |Adhesive tape |

| |6.2 |Reagents: |

| |6.2.1 |3% Alhydrogel |

| |6.2.2 |Di-sodium Hydrogen phosphate anhydrous |

| |6.2.3 |Sodium di-hydrogen phosphate dehydrate |

| |6.2.4 |Sodium Chloride |

| |6.2.5 |Thiomersal |

| |6.2.6 |Water for Injection |

[7. |Preparation of solutions: |

| |7.1 |Preparation of Placebo (50L): |

| |7.1.1|Take 3.0L of 3% alhydrogel in a 50 L glass bottle and add|
| |27 L of water for injection. |

| |7.1.2|Weigh Di-sodium Hydrogen phosphate anhydrous = 56gm, |
| |Sodium di-hydrogen phosphate dehydrate = 62 gm and Sodium|

| |Chloride = 400 gm. |

| |Dissolve the above weighed chemicals in 22L of water for |
| |injection. |

| |7.1.3|Weigh 20 gm Thiomersal and dissolve in 1.0 L of water for|
| |injection. |

| |7.1.4|Add 22L of phosphate buffer and 1L of Thiomersal |

| |solutions to 27L of alhydrogel in 50L glass bottle and |

| |homogenize by manual shaking. |

[8. |Procedure: |

| |8.1|Validation Study Plan: |

| |The study shall be carried out by keeping the bottles filled |

| |with Placebo (containing all the constituents of the vaccine |

| |except the ARM, having concentration equivalent to the |

| |concentration present in the vaccines) in incubator and deep |

| |freezer at + 43 °C and -5°C respectively, for a period of 48 |
| |hours. |

| |For monitoring of temperature 03 thermocouples (as per |

| |annexure-1) connected to the data logger shall be placed in |

| |side the PUF lined corrugated box and 01 thermocouple in the |

| |environment wherever the study shall be carried out i.e. |

| |incubator for + 43 °C and deep freezer for -5°C.The above study|

| |shall be repeated 03 times. These temperatures (+43 °C and |

| |-5°C) are representative of worst case environment. The |

| |temperature monitoring from the display of incubator and deep |

|| |freezer shall be done after 02 hours. |

||8.2 |Take appropriate capacity bottles containing Placebo properly |

|| |capped and sealed. |

||8.3 |Store the Placebo bottles at 5°C + 3°C for acclimatization and |

|| |Ice packs (Hard/Soft) at -20°C overnight. |

||8.4 |Take the packaging materials of required specifications, which |

|| |are to be validated and make a record of these. |

||8.5 |Pack the bottles in the boxes as per the standard packaging |

|| |procedure(FR/012) as follows: |

||8.5.1 |Glass bottles of pack size 20.0 and 10.0 L |

|| | |Check the weight of each empty box and load the 20 L and|

|| | |10 L bottles containing Placebo individually in the PUF |

|| | |Lined Corrugated boxes which shall be placed at 5 + 3°C |

|| | |to get acclimatize to vaccine storage temperature. |

|| | |Pack the bottles with the soft and hard ice packs. The |

|| | |soft ice packs of 5 + 3°C shall be placed adjacent to |

|| | |the bottle followed by frozen soft ice packs and hard |

|| | |ice packs. Immobilize the bottle by filling the |

|| | |remaining space, if any, with the thermocol sheets. |

|| | |Ice packs used for packing (Box Size) |

|| | |Number of Ice Packs |

|| | |

|| | |20L bottle |

|| | |Soft: 20-22no. |

|| | |Hard: 22-24 no. |

|| | |

|| | |10 L Bottle |

|| | |Soft: 16-18no. |

|| | |Hard: 18-20 no. |

|| | |

|| | |5 L Bottle |

|| | |Soft: 14-16no. |

REPORT

1. EXECUTIVE SUMMARY OF THE STUDY

The validation program has been carried out to validate the packaging method for the shipping of ARM/Bulk vaccine (which comes under class C as per WHO Guidelines on the packaging and shipping of vaccines WHO/IVB/R/05.23 December 2005) transported at temperature 5 + 3°C so as to maintain the desired cold chain conditions during transportation. The study shall be carried out by keeping the Placebo (containing all the constituents of the vaccine except the active raw material having concentration equivalent to the concentration present in the vaccines) in incubator and deep freezer at + 43 °C and -5°C respectively, for a period of 48 hours. For monitoring of temperature three thermocouples connected to the data logger shall be placed in side the PUF lined corrugated box and one thermocouple in the environment wherever the study shall be carried out i.e. incubator for + 43 °C and deep freezer for -5°C. The above study shall be repeated three times. These temperatures (+43 °C and -5°C) are

representative of worst case environment. The temperature monitoring from the display of incubator and deep freezer shall be done after two hours. Two types of PUF lined corrugated boxes were used in the validation study were:

- PUF lined corrugated box to house 10L/20L glass bottle (PMS.18000)
- PUF lined corrugated box to house 1L/2L /5L glass bottle (PMS.18004)

7. TESTS PERFORMED & ACCEPTANCE CRITERIA CONSIDERED:
[Sr. No |Tests Performed |Acceptance criteria |
[1. |The packed box containing Placebo |The warmest temperature in the |
| |placed in environmental |packed box containing Placebo does|
| |temperature of 43 ±1 oC for a |not rise above |
| |period 48 hours. |5 ± 3oC. |
[2. |The packed box containing Placebo |The coolest temperature in the |
| |placed in environmental |packed box containing Placebo |
| |temperature of -5 ± 1 oC for a |does not fall below |
| |period of 48 hours. |+ 2oC |

SHIPPING VALIDATION PROTOCOL

RM:

- Wt of each empty box (PUFF Lined)
- Boxes acclimatized at vaccine storage temperature by placing at 5+ 30 C
- Load the bottles containing placebo in the PUFF lined box, as quickly as possible (15 Minutes)
- Pack the bottles with Soft Ice pack, Frozen soft Ice packs and then Hard Ice packs
- Number of Ice packs shall be as per the table
- Place 3 thermocouples in each box and 1 thermocouple in the environment wherever the study shall be carried out i.e. incubator for + 43 °C and deep freezer for -5°C. Each thermocouple should be positioned to a distance of 2.5/3.0 cm from the nearest ice pack
- Record the temperature at an interval of 10 minutes from thermocouples and every 2 Hours from digital display of incubator / deep freezer for 48 hours
- Place the packed boxes in the incubator at + 43 oC and in a deep freezer at -5 oC
- Carry out 3 Runs for each packing

1. Purpose:

The purpose is to validate the temperature during shipping of ARM / bulk vaccine, transported at 5 + 3°C so as to maintain the desired cold chain conditions during transportation.

2. Scope:

2.1 Applicable to the ARM /bulk vaccine (that comes under class C as per WHO Guidelines on the packaging and shipping of vaccines WHO/IVB/R/05.23 December 2005) to be transported at the temperature of 5 + 3°C.

4. Safety considerations:

4.1 The ARM / bulk vaccine is to be maintained at recommended temperature at 5 + 3 °C. The ARM / bulk vaccine should not freeze.

4.2 The containers of the ARM / bulk vaccine should be properly packed to avoid any breakage.

4.3 Ensure proper connections of thermocouples and their positioning.

5. Equipments:

5.1 Data logger with thermocouples (accuracy $\pm 0.5^{\circ}\text{C}$)

5.2 BOD Incubator and Deep Freezer

6. Materials and reagents:

6.1 Materials:

1 of 11

SHIPPING VALIDATION PROTOCOL

6.1.1 Glass bottles of appropriate capacity (20L, 10L, 5L, 2L and 1L) containing Placebo

6.1.2 PUF lined corrugated boxes (to house 10L/20L glass bottle)

6.1.3 PUF lined corrugated boxes (to house 1L/2L /5L glass bottle)

6.1.4 Ice packs hard / soft (stored at $5\pm 3^{\circ}\text{C}$ and -20°C)

6.1.5 Polypropylene caps for sealing bottles

6.1.6 Thermocol sheets for immobilization

6.1.7 Adhesive tape

6.2 Reagents:

6.2.1 3% Alhydrogel

6.2.2 Di-sodium Hydrogen phosphate anhydrous

6.2.3 Sodium di-hydrogen phosphate dehydrate

6.2.4 Sodium Chloride

6.2.5 Thiomersal

6.2.6 Water for Injection

7. Preparation of solutions:

7.1 Preparation of Placebo (50L):

7.1.1 Take 3.0L of 3% alhydrogel in a 50 L glass bottle and add 27 L of water for injection.

7.1.2 Weigh Di-sodium Hydrogen phosphate anhydrous = 56gm, Sodium di-hydrogen phosphate dehydrate = 62 gm and Sodium Chloride = 400 gm.

Dissolve the above weighed chemicals in 22L of water for injection.

7.1.3 Weigh 20 gm Thiomersal and dissolve in 1.0 L of water for injection.

7.1.4 Add 22L of phosphate buffer and 1L of Thiomersal solutions to 27L of alhydrogel in 50L glass bottle and homogenize by manual shaking.

8. Procedure:

8.1 Validation Study Plan:

The study shall be carried out by keeping the bottles filled with Placebo (containing all the constituents of the vaccine except the ARM, having concentration equivalent to the concentration present in the vaccines) in incubator and deep freezer at + 43 °C and -5°C respectively, for a period of 48 hours.

2 of 11

SHIPPING VALIDATION PROTOCOL

For monitoring of temperature 03 thermocouples (as per annexure-1) connected to the data logger shall be placed in side the PUF lined corrugated box and 01 thermocouple in the environment wherever the study shall be carried out i.e. incubator for + 43 °C and deep freezer for -5°C. The above study shall be repeated 03 times. These temperatures (+43 °C and -5°C) are representative of worst case environment. The temperature monitoring from the display of incubator and deep freezer shall be done after 02 hours.

8.2 Take appropriate capacity bottles containing Placebo properly capped and sealed.

8.3 Store the Placebo bottles at 5°C + 3°C for acclimatization and Ice packs (Hard/Soft) at -20°C overnight.

8.4 Take the packaging materials of required specifications, which are to be validated and make a record of these.

8.5 Pack the bottles in the boxes as per the standard packaging procedure(FR/012) as follows:

8.5.1 Glass bottles of pack size 20.0 and 10.0 L

■ Check the weight of each empty box and load the 20 L and 10 L bottles containing Placebo individually in the PUF Lined Corrugated boxes which shall be placed at $5 \pm 3^{\circ}\text{C}$ to get acclimatize to vaccine storage temperature.

■ Pack the bottles with the soft and hard ice packs. The soft ice packs of $5 \pm 3^{\circ}\text{C}$ shall be placed adjacent to the bottle followed by frozen soft ice packs and hard ice packs. Immobilize the bottle by filling the remaining space, if any, with the thermocol sheets.

3 of 11

SHIPPING VALIDATION PROTOCOL

Ice packs used for packing Number of Ice Packs
(Box Size)

20L bottle Soft: 20-22no.

Hard: 22-24 no.

REPORT

1. EXECUTIVE SUMMARY OF THE STUDY

The validation program has been carried out to validate the packaging method for the shipping of ARM/Bulk vaccine (which comes under class C as per WHO Guidelines on the packaging and shipping of vaccines WHO/IVB/R/05.23 December 2005) transported at temperature $5 \pm 3^{\circ}\text{C}$ so as to maintain the desired cold chain conditions during transportation.

The study shall be carried out by keeping the Placebo (containing all the constituents of the vaccine except the active raw material having concentration equivalent to the concentration present in the vaccines) in incubator and deep freezer at $+43^{\circ}\text{C}$ and -5°C respectively, for a period of 48 hours. For monitoring of temperature three thermocouples connected to the data logger shall be placed inside the PUF lined corrugated box and one thermocouple in the environment wherever the study shall be carried out i.e. incubator for $+43^{\circ}\text{C}$ and deep freezer for -5°C . The above study shall be repeated three times. These temperatures ($+43^{\circ}\text{C}$ and -5°C) are representative of worst case environment. The temperature monitoring from the display of incubator and deep freezer shall be done after two hours.

Two types of PUF lined corrugated boxes were used in the validation study were:

■ PUF lined corrugated box to house 10L/20L glass bottle (PMS.18000)

■ PUF lined corrugated box to house 1L/2L /5L glass bottle (PMS.18004)

STANDARD OPERATING PROCEDURE SOP No. : QMS 032
Revision No.: 00

Title: IPQA Supersedes : None
Page No. : 1 of 7

1.0 Objective

To lay down the procedure for Quality Assurance overview on area/processes/activities of Production, Quality Control, Warehouse, Utility system and Animal House.

2.0 Scope

This Standard Operating Procedure is applicable for Quality Assurance overview of all the manufacturing facilities, Quality Control Laboratory, Warehouse, Utility system and Animal House at Company name.

3.0 Responsibility

3.1 IPQA personnel shall be responsible to visit and check the facility regarding cGMP compliance of Manufacturing area, Quality Control Laboratory, Warehouses, utility systems and Animal House.

3.2 IPQA personnel shall monitor and verify critical processes of Manufacturing.

3.3 Head, Quality Assurance Department shall ensure the implementation of this SOP.

4.0 Abbreviations and Definitions

4.1 AHU Air Handling unit

4.2 BR Batch Record

4.3 cGMP Current Good Manufacturing Practices

4.4 CR Cleaning Record

4.5 EMP Environmental Monitoring Program

4.6 GMP Good Manufacturing Practice

4.7 IPQA In Process Quality Assurance

4.8 IPA Iso Propyl Alcohol

4.9 LAF Laminar Air Flow

4.10 PW Purified Water

4.11 QA Quality Assurance

4.12 QC Quality Control

4.13 SOP Standard Operating Procedure

4.14 SS Stainless Steel

4.15 WFI Water for Injection

5.0 Procedure

5.1 IPQA Personnel shall overview all the areas/critical activities/processes to ensure

5.1.1 All the areas in a state of GMP compliance.

STANDARD OPERATING PROCEDURE SOP No. : QMS 032
Revision No.: 00

Title: IPQA Supersedes : None
Page No. : 2 of 7

5.1.2 The activities/processes are carried out as per approved procedure/protocols.

5.1.3 IPQA personnel shall be trained on clean room behavior, aseptic handling and QMS SOPs but not limited to.

5.1.4 Apart from manufacturing processes IPQA person shall oversee other areas/ processes like Utility system, Warehouse, Animal House and Quality Control activities.

5.2 IPQA checks/overview during various operations/process, as follows:

5.2.1 IPQA personnel shall check in manufacturing area as follows, but not limited to:

5.2.1.1 Gowning of personnel present for entry in work area as per the respective SOP.

5.2.1.2 Personnel movement in classified area to avoid turbulence into the specified area.

5.2.1.3 General cleanliness of area, type of disinfectant used and its correspondence logbook.

5.2.1.4 Clean room behavior of personnel.

5.2.1.5 Cleaning and sterilization status of material and equipment to be used in processes.

5.2.1.6 The overview of physical environmental conditions i.e. Temperature, Differential pressure and Relative humidity

5.2.1.7 Status of reagent used for carrying manufacturing procedure.

5.2.1.8 Equipment, raw materials, in process materials and Solutions with proper status label & ensure they are within expiry period.

5.2.1.9 The use of calibrated measuring instruments and their identification

5.2.1.10 Verify the batch number of Raw Materials against the approved label.

5.2.1.11 Ensure that manufacturing and cleaning process are being carried as per approved BR and CR.

5.2.1.12 The presence of the Batch Record, SOP and relevant documents in the area.

5.2.1.13 Batch Records and logbooks shall be filled concurrently and accurately.

5.2.1.14 Check the physical condition of manufacturing facility i.e. peel off

STANDARD OPERATING PROCEDURE SOP No. : QMS 032
Revision No.: 00

Title: IPQA Supersedes : None
Page No. : 3 of 7

epoxy, cracks in wall, floor, coving, door damage etc.

5.2.1.15 IPQA personnel shall check the manufacturing process/area as per the annexure no.2

5.2.2 IPQA personnel shall check during campaign change process, but not limited to:

5.2.2.1 IPQA personnel shall verify the line clearance as per checklist of respective SOP of concerned manufacturing block.

5.2.2.2 Whether the unused raw materials of previous batch removed from area or returned to warehouse (When applicable).

5.2.2.3 Whether any Solutions, media or waste left over from previous production batch removed from area.

5.2.2.4 Whether batch processing records pertaining to previous batch has been remove from the area.

5.2.2.5 Whether the documents pertaining to the processing of previous campaign are removed from the area.

5.2.2.6 Whether the cleaning and sanitization of equipment /systems/Area has been carried out after previous campaign as per the campaign change protocol.

5.2.2.7 Are the cleaning and sanitization records available?

5.2.2.8 Whether the results of cleaning and sanitation are comply to recommended limits

5.2.2.9 Whether the records available for the campaign product.

5.2.2.10 IPQA personnel shall also check the area as per Annexure no.2 during the campaign change process.

5.2.3 IPQA personnel shall check over warehouses as follows but not limited to:

5.2.3.1 General cleanliness of the cold room area.

5.2.3.2 Segregation of approved and under test materials.

5.2.3.3 Operating temperature of the cold room and deep freezer as per the requirement.

5.2.3.4 Temperature and Relative Humidity monitoring in material storage area.

5.2.3.5 Segregation of materials with respect to their status.

5.2.3.6 Log books for opening & closing of cold room & verification of data

STANDARD OPERATING PROCEDURE SOP No. : QMS 032

Revision No.: 00

Title: IPQA Supersedes : None

Page No. : 4 of 7

recorded.

5.2.3.7 Ensure that all the materials are properly labeled.

5.2.3.8 IPQA personnel shall check the warehouse as per the annexure no. 3.

5.2.4 IPQA personnel shall check over utility system as follows but not limited to:

5.2.4.1 Operational SOP's in place.

5.2.4.2 Availability of operational instructions & diagrams at the site.

5.2.4.3 Operating ranges & operation modes of the equipment, as per the respective SOPs.

5.2.4.4 Verify record for sanitization status of water storage & distribution system.

5.2.4.5 Check calibration status of all measuring devices/instruments.

5.2.4.6 Proper coding of the supply pipeline to different areas.

5.2.4.7 Proper coding of the instruments with respective I.D Nos.

5.2.4.8 Log books are maintained by the user and are update.

5.2.4.9 Data recorded by the machine operators.

5.2.4.10 IPQA personnel shall check the utility system as per the annexure no. 4.

5.2.5 IPQA personnel shall check over clean room behavior & aseptic process as follows, but not limited to:

5.2.5.1 Entry of personnel in to clean room with proper gowning as per the SOP.

5.2.5.2 Disinfection of the hands with 70% IPA after final gowning & gloving.

5.2.5.3 Prior to commencement of work, disinfection of hands with 70% IPA.

5.2.5.4 Under LAF station, ensure for minimum movement of personnel hands.

5.2.5.5 Man and Material movement in facility.

5.2.5.6 Restricted number of personnel in a specified area.

5.2.5.7 Use of sterile forceps while picking up silicon tubes, caps during aseptic process, does not touch with gloved hands.

5.2.5.8 Disinfection of hands & forceps used after each intervention.

STANDARD OPERATING PROCEDURE SOP No. : QMS 032

Revision No.: 00

Title: IPQA Supersedes : None

Page No. : 5 of 7

5.2.5.9 Sterilization status of the materials being used in the manufacturing process.

5.2.5.10 Effective removal & decontamination of the used materials.

5.2.5.11 Temperature, relative humidity and differential pressure are within the acceptance limit.

5.2.5.12 Transfer of materials IN/OUT to the clean room area through pass boxes only.

5.2.6 IPQA personnel shall check over Quality control area as follows, but not limited to:

5.2.6.1 Entry of personnel in to laboratories with proper gowning as per the SOP.

5.2.6.2 Ensure the in process samples and retention samples stored according to established procedure.

5.2.6.3 Under LAF station, ensure for minimum movement of personnel hands.

5.2.6.4 Ensure the log books maintained by user are updated.

5.2.6.5 Check the stability chambers are maintained as per established storage condition.

5.2.6.6 Availability of SOP for the respective test and instruments.

5.2.6.7 Recording of physical parameters (Pressure differential, Humidity, Temperature)

5.2.6.8 Use of sterilized material and its status, as applicable.

5.2.6.9 Ensure the status label on instruments of Calibration / Qualification.

5.2.6.10 Adequate identification of reagents, solutions and materials used in

laboratories and their uses log.

5.2.6.11 Disposal of used materials/media plates & its effective decontamination.

5.2.6.12 Log books/records are filled correct and concurrent.

5.2.6.13 IPQA personnel shall check the Quality control as per Annexure-5.

5.2.7 Monthly schedule for IPQA checks shall be prepared as per Annexure No.6 and IPQA personnel shall perform these checks as per following schedule, but not limited to

STANDARD OPERATING PROCEDURE SOP No. : QMS 032

Revision No.: 00

Title: IPQA Supersedes : None

Page No. : 6 of 7

■ For Xxxx-I and Xxxx-IV:

During manufacturing: Each working day

During non-manufacturing: Thrice a week

■ For Xxxx-II ,Xxxx-III, QC, Warehouse and Animal House, Critical

Utility : Twice a week

5.3 In case of manufacturing activity IPQA personnel shall verify the activity following tentative batch schedule prepared as per SOP QA/000.

5.4 IPQA personnel shall record the exact observation in Form No. QA/000/00as per Annexure 1 for each check in manufacturing area, Critical Utilities area, Warehouse and Quality Control and Animal House if needed, will send to user department for necessary action. User department shall write the corrective measures in the form and submit to QA within two working days.

5.5 In case any observation related to physical condition of manufacturing facility as per point no. 5.2.1.14, IPQA shall share the observation with the user department as per annexure-1. Based on the observation user department and engineering department shall perform impact assessment as per SOP EN/000 prior to commencement of civil work.

5.6 Observations reported during the QA overview shall be dealt with applicable non-conformance/deviation handling procedures.

5.7 In case of facility shut down IPQA checks shall be performed on requirement basis.

6.0 Forms and Records

6.1 QA/000/00IPQA Observation Report Annexure - 1

6.2 QA/000/00IPQA check list for manufacturing area Annexure - 2

6.3 QA/000/00IPQA check list for Warehouse Annexure - 3

6.4 QA/000/00IPQA check list for Critical Utilities Annexure - 4

6.5 QA/000/00- 03 QA check list for Quality Control Annexure - 5

IPQA CHECK LIST FOR MANUFACTURING AREA Annexure-2

DATE: DEPARTMENT/ AREA:

PRODUCT NAME: BATCH NO.

ASPECTS (Write the appropriate application If meets-Y for yes, N for No and NA for not applicable)

Personnel: Y/N/NA

Are the Personnel wearing appropriate protective clothing according to relevant SOP?

Is there adequate use of safety devices by personnel, where applicable?

Is there a compliance with health and hygiene requirements e.g.: no eating and drinking etc. in production classified areas?

Are there sufficient numbers of persons available for performing each activity?

Are the personnel working as per relevant SOP and following aseptic handling? if applicable.

Check for the aseptic handling and clean room behavior at classified area.

Personnel movement in classified area to avoid turbulence into the specified area.

Areas, Equipment, Materials:

Sampling for environmental monitoring being followed, if applicable

Are the manufacturing area cleaned according to established procedure and the cleaning data recorded?

Are the materials adequately stored in the area and adequately labeled?

Are the physical environmental conditions i.e. temperature, Differential pressure, Relative humidity within the control limits?
Are the raw materials approved by QC and adequately labeled?
Are the cleaning / sterilization records of Bottles and other accessories available?
Are the identification, calibration and operation status label of equipment/instrument, available and correct?
Check for the proper screw cap fitting & status label on solution bottles, ARM/bulk bottles.
Check the physical condition of manufacturing facility i.e. peel off epoxy, cracks in wall, floor, coving, door damage etc.
Documentation:
Does the correspondence of data, batch number and quantity of raw materials and other incoming materials with the information recorded in the Batch Record of the stage being inspected?
Is there presence of the Master Formula and SOP in the area and are concurrent?
Are log books being maintained by the user?
Are the records of temperature, differential pressure, relative humidity and area cleaning, available and updated?

Page 1 of 2

IPQA CHECK LIST FOR MANUFACTURING AREA

Production and Process Controls: Y/N/NA

Does the Batch Records filled as operations are performed?
Are the filter used for sterile filtration tested for integrity before and after use?
Check the identification and approved status of incoming material
Check the retest or expiry date of incoming material
During aseptic operation, after every contact with sterile/non sterile surface ensure for disinfection of hands
Check the aseptic behavior of personnel while work under LAF station, and restricted movement of material IN/OUT of LAF so as to avoid the turbulence.
Check effective removal & decontamination of the used materials
Check transfer of materials IN/OUT to the clean room area through pass boxes only
Ensure the sampling as per sampling schedule.
Check the storage condition of final ARM/bulk?

4.11	QA	Quality Assurance
4.12	QC	Quality Control
4.13	SOP	Standard Operating Procedure
4.14	SS	Stainless Steel
4.15	WFI	Water for Injection
5.0	Procedure	
5.1	IPQA Personnel shall overview all the areas/critical	
activities/processes to ensure		
5.1.1	All the areas in a state of GMP compliance.	
5.1.2	The activities/processes are carried out as per approved	
procedure/protocols.		
5.1.3	IPQA personnel shall be trained on clean room behavior,	
aseptic handling and QMS SOPs but not limited to.		
5.1.4	Apart from manufacturing processes IPQA person shall oversee	
other areas/ processes like Utility system, Warehouse, Animal		
House and Quality Control activities.		
5.2	IPQA checks/overview during various operations/process, as follows:	
5.2.1	IPQA personnel shall check in manufacturing area as follows,	
but not limited to:		
5.2.1.1	Gowning of personnel present for entry in work area	
as per the respective SOP.		
5.2.1.2	Personnel movement in classified area to avoid	
turbulence into the specified area.		
5.2.1.3	General cleanliness of area, type of disinfectant	
used and its correspondence logbook.		
5.2.1.4	Clean room behavior of personnel.	
5.2.1.5	Cleaning and sterilization status of material and	
equipment to be used in processes.		
5.2.1.6	The overview of physical environmental conditions	
i.e. Temperature, Differential pressure and Relative		
humidity		
5.2.1.7	Status of reagent used for carrying manufacturing	
procedure.		
5.2.1.8	Equipment, raw materials, in process materials and	
Solutions with proper status label & ensure they are		
with in expiry period.		
5.2.1.9	The use of calibrated measuring instruments and their	
identification		
5.2.1.10	Verify the batch number of Raw Materials against the	
approved label.		
5.2.1.11	Ensure that manufacturing and cleaning process are	
being carried as per approved BR and CR.		
5.2.1.12	The presence of the Batch Record, SOP and relevant	
documents in the area.		
5.2.1.13	Batch Records and logbooks shall be filled	
concurrently and accurately.		
5.2.1.14	Check the physical condition of manufacturing	
facility i.e. peel off epoxy, cracks in wall, floor,		
coving, door damage etc.		
5.2.1.15	IPQA personnel shall check the manufacturing	
process/area as per the annexure no.2		
5.2.2	IPQA personnel shall check during campaign change process, but	
not limited to:		
5.2.2.1	IPQA personnel shall verify the line clearance as per	
checklist of respective SOP of concerned		
manufacturing block.		
5.2.2.2	Whether the unused raw materials of previous batch	
removed from area or returned to warehouse (When		
applicable).		
5.2.2.3	Whether any Solutions, media or waste left over from	
previous production batch removed from area.		
5.2.2.4	Whether batch processing records pertaining to	
previous batch has been remove from the area.		

		5.2.2.5	Whether the documents pertaining to the processing of
			previous campaign are removed from the area.
		5.2.2.6	Whether the cleaning and sanitization of equipment
			systems/Area has been carried out after previous
			campaign as per the campaign change protocol.
		5.2.2.7	Are the cleaning and sanitization records available?
		5.2.2.8	Whether the results of cleaning and sanitation are
			comply to recommended limits
		5.2.2.9	Whether the records available for the campaign
			product.
		5.2.2.10	IPQA personnel shall also check the area as per
			Annexure no.2 during the campaign change process.
	5.2.3	IPQA personnel shall check over warehouses as follows but not	
			limited to:
		5.2.3.1	General cleanliness of the cold room area.
		5.2.3.2	Segregation of approved and under test materials.
		5.2.3.3	Operating temperature of the cold room and deep
			freezer as per the requirement.
		5.2.3.4	Temperature and Relative Humidity monitoring in
			material storage area.
		5.2.3.5	Segregation of materials with respect to their
			status.
		5.2.3.6	Log books for opening & closing of cold room &
			verification of data recorded.
		5.2.3.7	Ensure that all the materials are properly labeled.
		5.2.3.8	IPQA personnel shall check the warehouse as per the
			annexure no. 3.
	5.2.4	IPQA personnel shall check over utility system as follows but	
			not limited to:
		5.2.4.1	Operational SOP's in place.
		5.2.4.2	Availability of operational instructions & diagrams
			at the site.
		5.2.4.3	Operating ranges & operation modes of the equipment,
			as per the respective SOPs.
		5.2.4.4	Verify record for sanitization status of water
			storage & distribution system.
		5.2.4.5	Check calibration status of all measuring
			devices/instruments.
		5.2.4.6	Proper coding of the supply pipeline to different
			areas.
		5.2.4.7	Proper coding of the instruments with respective I.D
			Nos.
		5.2.4.8	Log books are maintained by the user and are update.
		5.2.4.9	Data recorded by the machine operators.
		5.2.4.10	IPQA personnel shall check the utility system as per
			the annexure no. 4.
	5.2.5	IPQA personnel shall check over clean room behavior & aseptic	
			process as follows, but not limited to:
		5.2.5.1	Entry of personnel in to clean room with proper
			gowning as per the SOP.
		5.2.5.2	Disinfection of the hands with 70% IPA after final
			gowning & gloving.
		5.2.5.3	Prior to commencement of work, disinfection of hands
			with 70% IPA.
		5.2.5.4	Under LAF station, ensure for minimum movement of
			personnel hands.
		5.2.5.5	Man and Material movement in facility.
		5.2.5.6	Restricted number of personnel in a specified area.
		5.2.5.7	Use of sterile forceps while picking up silicon
			tubes, caps during aseptic process, does not touch
			with gloved hands.
		5.2.5.8	Disinfection of hands & forceps used after each
			intervention.
		5.2.5.9	Sterilization status of the materials being used in
			the manufacturing process.
		5.2.5.10	Effective removal & decontamination of the used
			materials.
		5.2.5.11	Temperature, relative humidity and differential
			pressure are within the acceptance limit.
		5.2.5.12	Transfer of materials IN/OUT to the clean room area
			through pass boxes only.
	5.2.6	IPQA personnel shall check over Quality control area as	
			follows, but not limited to:
		5.2.6.1	Entry of personnel in to laboratories with proper
			gowning as per the SOP.
		5.2.6.2	Ensure the in process samples and retention samples
			stored according to established procedure.
		5.2.6.3	Under LAF station, ensure for minimum movement of
			personnel hands.
		5.2.6.4	Ensure the log books maintained by user are updated.
		5.2.6.5	Check the stability chambers are maintained as per
			established storage condition.
		5.2.6.6	Availability of SOP for the respective test and
			instruments.
		5.2.6.7	Recording of physical parameters (Pressure
			differential, Humidity, Temperature)
		5.2.6.8	Use of sterilized material and its status, as
			applicable.
		5.2.6.9	Ensure the status label on instruments of Calibration
			/ Qualification.
		5.2.6.10	Adequate identification of reagents, solutions and
			materials used in laboratories and their uses log.

			5.2.6.11	Disposal of used materials/media plates & its
			effective decontamination.	
			5.2.6.12	Log books/records are filled correct and concurrent.
			5.2.6.13	IPQA personnel shall check the Quality control as per
			Annexure-5.	
		5.2.7	Monthly schedule for IPQA checks shall be prepared as per	
			Annexure No.6 and IPQA personnel shall perform these checks as	
			per following schedule, but not limited to	
			For Xxxx-I and Xxxx-IV:	
			During manufacturing: Each working day	
			During non-manufacturing: Thrice a week	
			For Xxxx-II ,Xxxx-III, QC, Warehouse and Animal House,	
			Critical Utility : Twice a week	
		5.3	In case of manufacturing activity IPQA personnel shall verify the	
		activity following tentative batch schedule prepared as per SOP		
		QA/000.		
		5.4	IPQA personnel shall record the exact observation in Form No.	
		QA/000/00as per Annexure 1 for each check in manufacturing area,		
		Critical Utilities area, Warehouse and Quality Control and Animal		
		House if needed, will send to user department for necessary action.		
		User department shall write the corrective measures in the form and		
		submit to QA within two working days.		
		5.5	In case any observation related to physical condition of	
		manufacturing facility as per point no. 5.2.1.14, IPQA shall share		
		the observation with the user department as per annexure-1. Based on		
		the observation user department and engineering department shall		
		perform impact assessment as per SOP EN/000 prior to commencement of		
		civil work.		
		5.6	Observations reported during the QA overview shall be dealt with	
		applicable non-conformance/deviation handling procedures.		
		5.7	In case of facility shut down IPQA checks shall be performed on	
		requirement basis.		
	6.0	Forms and Records		
		6.1	QA/000/00IPQA Observation Report	Annexure - 1
		6.2	QA/000/00IPQA check list for manufacturing area	Annexure - 2
		6.3	QA/000/00IPQA check list for Warehouse	Annexure - 3

5.3 5.3 Procedure:						

All personnel should avoid making entry errors
Information recorded should be legible, do not leave scope for misreading.
Print or use handwriting that is legible and easy to read
Always use permanent black ball pen for writing documents.
Short sentences preferred to long sentences
All defined spaces provided for entries that are not used must be filled as 'NA'. The spaces must be strike off starting from Top left to the bottom right corner with "NA" between the line. This should be followed by signature and date of the person at bottom right corner of the empty space. As this is not a quality impacting action, this should not be interpreted in a strict sense.
Correct

Wrong

In case of multiple entries in a single page, the intermittent empty spaces are to be filled by a Hyphen “-” where there is no scope for strike the space and put NA and Sign & Date. The situation can be clearly explained by the below mentioned Examples

Wrong

If an entry is missed on a controlled document, (e.g.) incase where there is a missing data that is retrievable from another document or database, make a copy or printout of the information, write an explanation, sign and date and attach it to the record.

When entries are made in record, these should be made indelibly in spaces provided for such entries, directly after performing the activities, and should identify the person making the entry.

If any error is found, immediately after recording the data cross out the incorrect information with single line (Horizontal / Vertical) and Enter correct data. Correction to entries should be dated and signed near the correction. Leave the original entry still readable

Correct

Wrong

Typographical error changes or additions do not require approval.

No page of a record or pre-numbered worksheet may be destroyed or removed. To invalidate a page, cross the page out with a single line, sign and date the cross out

If the date of correction is after the date of approval, a rationale must be provided

Backdating is prohibited. Neither signing nor initializing may be pre-dated nor post-dated.

Entries and observations must be recorded immediately after obtaining/verifying them. Do not proceed to the next step until the current step is documented.

Documents or sections of documents shall not be changed or nullified except by following change control procedure

All documentation changes must be carefully documented, reviewed, and approved.

Original Information should be recorded on proper formats, immediately after action is completed. Entries of signatures or initials under Specified column must be made at the same time.

Signatures or initials must be unique.

Your signature or initials mean that you take responsibility for the accuracy and correctness of the information you have written or verified.

There must be a signature record that identifies the signature and initials of an individual.

Pre-Inked stamps are not allowed for signature or initials on Documents.

Documentation lists are advisable as they assist personnel in retrieving exactly what was specified.

Every page of a document shall be marked with the page number as well as the total number of pages in the document.

Do not use block letters for signatures

Correct

Wrong

- Photographs can be documented
- Flow charts provide substantial information at a momentary look
- Do not misrepresentation of data

Do not fabrication of data
Do not over-writing on the recorded data
The use of correction fluid, liquid paper, correction tape and the use of erasers are not allowed.
Documents or parts of documents may be copied for use as reference copies, but must be segregated from the official document
Documents must be stored or filed for the full retention period required by the company policy in a manner that allows convenient and easy retrieval of information for audit or inspection
Recording the data on document:
Use the following standards for writing letters and numbers, and for recording the date and time.
Use standard familiar English when writing information. Write clearly to avoid misunderstandings
Record numeric values using universal Arabic numbers (0,1,2,3,4,5...9)
Record time in a standard format with 24 hrs.
For e.g.: with traditional format, use the 24 hrs clock.
22:10 (for 10:10 PM)
Abbreviated date should be recorded as day/month/year (dd / mm / yyyy).
For e.g.: 21/07/2021
For all GMP activities, calendar year should be used as a reference.
Verification of data, information, calculations and tasks.

Attachments, printouts and charts:
Identify all printouts, charts attachments, etc. that are used to support a analytical record or process with the applicable Product name, batch number, time, date, and operator Full signature/Short signature.
Confirm there is enough ink supply for all print out and chart devices to make the printout easily readable. Print outs need to be continuous and if broken there needs to be an explanation included.
Do's and Dont's during Documentation
Do's
Use only Black, Indelible, Ball – point ink.
Make All entries legible (readable).
Sign and Date all entries.
Document each step in the respective sections of the document immediately before moving to the next step.
Put "NA", Sign & date empty spaces if it is not appropriate to fill them.
Record numbers less than one with a zero before the decimal point.
Dont's
Overwrite.
Use Liquid correction fluid.
Back date.
Record data before the action or event has occurred
Use ditto marks
Leave required data spaces blank.
Approve, Verify, review your own performance | Procedure:

Abbreviated date should be recorded as day/month/year (dd / mm / yyyy).

For e.g.: 21/07/2021

For all GMP activities, calendar year should be used as a reference.

Verification of data, information, calculations and tasks.

Attachments, printouts and charts:

Identify all printouts, charts attachments, etc. that are used to support a analytical record or process with the applicable Product name, batch number, time, date, and operator Full signature/Short signature.

Confirm there is enough ink supply for all print out and chart devices to make the printout easily readable. Print outs need to be continuous and if broken there needs to be an explanation included.

Do's and Dont's during Documentation

Do's

Use only Black, Indelible, Ball – point ink.

Make All entries legible (readable).

Sign and Date all entries.

Document each step in the respective sections of the document immediately before moving to the next step.

Put "NA", Sign & date empty spaces if it is not appropriate to fill them.

Record numbers less than one with a zero before the decimal point.

Dont's

Overwrite.

Use Liquid correction fluid.

Back date.

Record data before the action or event has occurred

Use ditto marks

Leave required data spaces blank.

Approve, Verify, review your own performance | Procedure:

All personnel should avoid making entry errors

Information recorded should be legible, do not leave scope for misreading.

Print or use handwriting that is legible and easy to read

Always use permanent black ball pen for writing documents.

Short sentences preferred to long sentences

All defined spaces provided for entries that are not used must be filled as 'NA'. The spaces must be strike off starting from Top left to the bottom right corner with "NA" between the line. This should be followed by signature and date of the person at bottom right corner of the empty space. As this is not a quality impacting action, this should not be interpreted in a strict sense.

Correct

Wrong

In case of multiple entries in a single page, the intermittent empty spaces are to be filled by a Hyphen "-" where there is no scope for strike the space and put NA and Sign & Date. The situation can be clearly explained by the below mentioned Examples

Correct

Wrong

If an entry is missed on a controlled document, (e.g.) in case where there is a missing data that is retrievable from another document or database, make a copy or printout of the information, write an explanation, sign and date and attach it to the record.
When entries are made in record, these should be made indelibly in spaces provided for such entries, directly after performing the activities, and should identify the person making the entry.
If any error is found, immediately after recording the data cross out the incorrect information with single line (Horizontal / Vertical) and Enter correct data. Correction to entries should be dated and signed near the correction. Leave the original entry still readable
Correct

Wrong

Typographical error changes or additions do not require approval.
No page of a record or pre-numbered worksheet may be destroyed or removed. To invalidate a page, cross the page out with a single line, sign and date the cross out
If the date of correction is after the date of approval, a rationale must be provided
Backdating is prohibited. Neither signing nor initializing may be pre-dated nor post-dated.
Entries and observations must be recorded immediately after obtaining/verifying them. Do not proceed to the next step until the current step is documented.
Documents or sections of documents shall not be changed or nullified except by following change control procedure
All documentation changes must be carefully documented, reviewed, and approved.
Original information should be recorded on proper formats, immediately after action is completed. Entries of signatures or initials under Specified column must be made at the same time.
Signatures or initials must be unique.
Your signature or initials mean that you take responsibility for the accuracy and correctness of the information you have written or verified.
There must be a signature record that identifies the signature and initials of an individual.
Pre-Inked stamps are not allowed for signature or initials on Documents.
Documentation lists are advisable as they assist personnel in retrieving exactly what was specified.
Every page of a document shall be marked with the page number as well as the total number of pages in the document.
Do not use block letters for signatures
Correct

Wrong

Photographs can be documented
Flow charts provide substantial information at a momentary look
Do not misrepresentation of data
Do not fabrication of data
Do not over-writing on the recorded data
The use of correction fluid, liquid paper, correction tape and the use of erasers are not allowed.
Documents or parts of documents may be copied for use as reference copies, but must be segregated from the official document
Documents must be stored or filed for the full retention period required by the company policy in a manner that allows convenient and easy retrieval of information for audit or inspection
Recording the data on document:
Use the following standards for writing letters and numbers, and for recording the date and time.
Use standard familiar English when writing information. Write clearly to avoid misunderstandings
Record numeric values using universal Arabic numbers (0,1,2,3,4,5...9)
Record time in a standard format with 24 hrs.
For e.g.: with traditional format, use the 24 hrs clock.
22:10 (for 10:10 PM)
Abbreviated date should be recorded as day/month/year (dd / mm / yyyy).
For e.g.: 21/07/2021
For all GMP activities, calendar year should be used as a reference.
Verification of data, information, calculations and tasks.

Attachments, printouts and charts:
Identify all printouts, charts attachments, etc. that are used to support an analytical record or process with the applicable Product name, batch number, time, date, and operator Full signature/Short signature.
Confirm there is enough ink supply for all print out and chart devices to make the printout easily readable. Print outs need to be continuous and if broken there needs to be an explanation included.

Author Name Signature Date

Effective Date: Effective till

Page 1 of 16

QUALITY AGREEMENT

(Manufacture/Critical consumables)

Introduction

This document intends to provide expert guidance to the raw material supplier (Contract acceptor) and its customers (contract giver) for the implementation and maintenance of appropriate Quality agreements.

Scope

This Quality Agreement outlines the roles, responsibilities, deliverables and time requirements with respect to the Quality Assurance of the manufacture of the specified products (reference is made to the annexes) of Contract Giver (Customer) . It is an appendix to the Service Agreement executed by Contract Giver and Contract Acceptor (further referred as the "Agreement"). Contract Acceptor (Supplier) will operate a compliant GMP (including GDP) operation in all aspects of (where applicable) manufacture, testing, holding, packaging, labelling, shipping and/or distribution of the products of Contract Giver.

Parties to the agreement:

This Quality agreement is by and between the Contract giver i.e. xxxx and Contract Acceptor with office at (address), where the Contract Acceptor supplies Raw material suitable for pharmaceutical/biological use to xxxxx

The Quality Agreement may be revised on an "as-needed" basis or whenever the Agreement is renegotiated. All changes to this Quality Agreement will be reviewed and approved by authorised representatives of Quality Assurance from Contract Giver and Contract Acceptor ("Authorized Quality Representatives"). Any revision of this Quality Agreement must be documented, reviewed and approved by Authorised Quality Representatives from Contract Giver and Contract Acceptor and the Agreement shall be amended accordingly. Unless otherwise defined specifically in this Quality Agreement, all general terms used herein will be interpreted in accordance with the definitions provided in the Agreement. Any terms not so defined will be interpreted with the definitions proscribed in the Contract Acceptor Quality Policy, or when not so specified, will be interpreted with the definitions so stated in guidelines of the USA, Europe, WHO, etc (not limited) where applicable.

The Authorised Quality Representatives will resolve any disputes or conflicts relating to this Quality Agreement in a timely and equitable manner and in compliance with all applicable quality and regulatory requirements. Such resolutions shall be in writing and shall be signed by the authorised Quality Assurance representatives of each company. If any issue remains unresolved for more than twenty (20) business days, the senior Corporate Quality officials from each company should be contacted to resolve this issue.

Page 2 of 16

QUALITY AGREEMENT

(Manufacture/Critical consumables)

All communication affecting the contents of this Quality Agreement will be between the

Authorized Quality Representatives, as set forth below:

For Contract Giver: ____ (name) Quality Assurance

For Contract Acceptor : ____ (name) (Function)

In the event of a change, temporary or otherwise, of either Party's Authorized Quality Representative, the relevant Party shall notify the other in writing of such change.

Excipients Covered by the agreement

This Quality agreement pertains to the Raw material mentioned in Appendix I

Quality criteria:

The Contract Acceptor will manufacture, test and release the Raw material (mentioned in Appendix I) in accordance with the quality criteria / specifications as approved by the Quality Assurance personnel of Contract Giver enclosed as per Appendix II.

Term of Agreement:

This Agreement shall become effective and binding upon the date of the final signature and shall remain in effect until 3 years after the last delivery of Raw material by the Contract Acceptor to the Contract Giver unless the Contract Giver specifically requests an extension of the Agreement.

Revisions to Agreement:

No amendment to the terms of this Agreement shall be binding on the parties hereto unless made in writing and signed by an authorized representative of each of the parties.

Confidentiality:

The Contract Acceptor and Contract Giver should mutually undertake to observe secrecy on each other's know-how. This also applies after the agreement has ended. After the termination of the Agreement, neither of the parties to the contract is entitled to further commercially use the other party's know how disclosed under this agreement or let third parties do so without the other party's consent.

The obligation of confidentiality and of not using information does apply if that information:

Page 3 of 16

QUALITY AGREEMENT

(Manufacture/Critical consumables)

1. was already known to the other party before its disclosure under the Agreement and the other party declares this fact immediately or
2. has become common property through publication or by other means or
3. becomes known to one of the parties without originating directly or indirectly from the other party or
4. is made available to authorities due to legal requirements.

Responsibilities:

This quality agreement will outline the responsibilities of the Contract Giver and Contract Acceptor with regard to the quality activities described in the quality criteria tabulated below:

1. Regulatory Authorizations & GMP Compliance (where applicable)

Contract Contract
No Responsibilities
Giver Acceptor

1.1 Maintain all licenses, registrations and other authorizations as are required to operate a controlled facility and related functions under the Applicable Laws and guidelines ■
(including GMP where applicable)

1.2 Maintain facilities, utilities, equipment and conveyance and perform holding and distribution activities according to GMP guidance documents published by the

■
applicable authorities, approved internal policies and procedures and other regulatory requirements, as applicable.

1.3 Provide all necessary information pertinent to the Production of the Raw Material to ■
keep the regulatory filings current and up to date.

1.4 Prepare, maintain and update the Regulatory filings in accordance with all Applicable
■

Laws. Prepare and submit all required reports related to Product.

1.5 Provide all necessary information to Contract Giver concerning complaints, recalls, returned or salvaged drug products, and investigations associated with those activities,
■

where Contract Acceptor is involved, for the purpose of the issuing of Contract Giver's Annual Product Review.

2. Regulatory Actions & Inspections

Page 4 of 16

QUALITY AGREEMENT

(Manufacture/Critical consumables)

Contract Contract
Responsibilities
Giver Acceptor

2.1 Notify Contract Giver of any Regulatory Authority notice of inspection or inspection of the Facilities directly relating to the Raw Material(s) within two (2) business days.
■

Contract Giver may be on Contract Acceptor site during regulatory inspection as subject matter expert. Contract Acceptor manages all on site regulatory inspections.

2.2 Notify Contract Giver of any Regulatory Authority investigation relating to the Raw

Material(s).

2.3 Provide copies of any observation, FDA Form 483's, Warning Letters or the like from applicable Regulatory Authorities within two (2) business days of receipt, as such notices relate to the Raw Material(s) or Processes performed by the other party.

2.4 Reporting requirements to the respective regulatory agency(ies) with regard to

Contract Giver's registration documentation

2.4 Review of responses to inspection observations and questions prior to submission to

the concerned regulatory agency if pertinent to products distributed

2.5 Reporting requirements with regard to manufacturing site registration that may be required to support Contract Giver related activities, and will notify Contract Giver upon doing so.

2.6 Conduct investigations, prepare and approve corrective actions in response to regulatory observations. Provide copy of responses that could potentially impact

Contract Giver's Raw material(s) / Process to Contract Giver for review and approval prior to submission.

3. Premises and Equipment

Contract Contract

Responsibilities

Giver Acceptor

3.1 Maintaining facilities, utilities and equipment suitable for the production of Contract

Giver's raw material(s) and designed for their intended uses.

3.2 Maintaining facilities, equipment, computerised systems and utilities as are required to operate a manufacturing facility for Raw Material with Pharmaceutical applications under the Applicable Laws.

3.3 Calibrate measuring instruments used to monitor or control conditions of storage,

according to defined schedules.

3.4 Ongoing qualifications and/or verification activities according to Contract Acceptor

policies and procedures

3.5 Verify or validate equipment cleaning procedures to prevent cross-contamination from one raw material(s) to the next raw material(s) or from one batch to the next batch of the same raw material(s).

Page 5 of 16

QUALITY AGREEMENT

(Manufacture/Critical consumables)

4. Personnel

Contract Contract

Responsibilities

Giver Acceptor

4.1 Ensure that a management representative is appointed, who should be

responsible and qualified for maintaining the Quality System.

4.2 Ensure that all staff affected by this Agreement shall be appropriately trained.

4.3 Maintain a system to show training and qualification of personnel in procedures

relating to the Raw Material(s).

5. Manufacturing and batch documentation

Contract Contract

Responsibilities

Giver Acceptor

5.1 Establish procedures for change-over, cleaning, processing, packaging, labeling

and handling.

5.2 Establish provisions, parameters ranges or limits, test requirements and processing.

5.3 Maintain master batch records and ensure that master batch records, including test records, comply with the Regulatory filings, Clinical Trial Applications and/or the Agreed Supplies.

5.4 Contract Acceptor shall use Master batch records to document production process

of each batch in batch record.

6. Materials and consumables

Contract Contract

Responsibilities

Giver Acceptor

6.1 Procure, store, sample, test and release Materials and/or consumables used for the manufacturing of the Raw Material(s) in accordance with Contract Acceptor's written procedures.

6.2 Responsible for verification that materials are free of BSE/TSE (where

applicable) and providing regularly updated certification to Contract Giver.

6.3 Upon request, provide Contract Giver with documented evidence describing the qualifications of Contract Acceptors used to provide components, containers, labeling and packaging materials.

6.4 Develop test methods and specifications in case specifications are deficient or

■
unavailable

No Responsibilities
Giver Acceptor
7.1 Ensure that records are made at each operation on Contract Giver's Product, in

■
such a way that all significant activities or events are traceable.
7.1 Store master record, batch records, distribution and transportation records and all other documentation related to the Product for a minimum of five (5) years.

■
Notify Contract Giver prior to destruction of any such records and provide the option to have the records sent to Contract Giver at Contract Giver's expense.
7.2 Contract Acceptor shall deliver batch record / CoA with every batch
7.3 Provide copies of all documentation necessary for the Contract Giver to respond
■
to enquiries by Regulatory Authorities.

8. Documentation for Safety

Contract Contract
Responsibilities
Giver Acceptor
8.1 Provide safety/hazard and handling data on the Raw Material(s) to Contract Giver ■

9. Samples

Contract Contract
Responsibilities
Giver Acceptor
9.1 Ship side samples and extra samples, where applicable, according to the
■
requirements of the Contract Giver
9.2 Retain reference samples of all materials, per Contract Acceptor procedures. ■
9.3 Store of retained samples under storage conditions in a secure area for 3 years
■
from the Date of Manufacture.

10. Testing & Analysis

Contract Contract
Responsibilities
Giver Acceptor
Page 7 of 16
QUALITY AGREEMENT
(Manufacture/Critical consumables)

Contract Contract
Responsibilities
Giver Acceptor
10.1 Write protocols and perform verification or validation, as appropriate, of test
■
methods related to the release of the Raw Material(s).
10.2 Provide documented finished raw material(s) testing limits and specifications
■ Review
and other requirements.
10.3 Perform in-process testing and finished raw material(s) release testing according
■
to the requirements in 6.2.
10.4 Investigate all out-of-Specification test results ("OOS") and have available a report related to such investigations including a rationale for implemented ■
corrective and preventative actions.

11. Release

Contract Contract
Responsibilities
Giver Acceptor
11.1 Provide final release of Raw Materials for supply (COA) ■
11.2 Review the batch record within thirty (30) calendar days of receipt.
■
Communicate any issues identified to Contract Acceptor.

12. Storage and Shipment

Contract Contract
Responsibilities
Giver Acceptor

12.1 Specify finished raw material(s), packaging, storage and shipping requirements Approve ■
12.2 Store the finished raw material(s) in accordance with the specifications pending ■
■ release of the Raw Material(s).
12.3 Arrange shipments of Raw material(s) according to Contract Giver specified procedure to Contract Giver or Contract Giver's agent only upon written ■ approval from Contract Giver.

Page 8 of 16

QUALITY AGREEMENT

(Manufacture/Critical consumables)

13. Returned Goods

Contract Contract

Responsibilities

Giver Acceptor

13.1 Maintain a controlled and documented system and procedure for handling ■

returned goods and rejected materials.

13.2 Ensure that non-defective products returned from the market are stored separately from saleable stock, and are assessed according to defined procedures ■ before destruction or authorisation for re-use.

14. Deviations

Contract Contract

Responsibilities

Giver Acceptor

14.1 Investigate, resolve and document all abnormal events and deviations from the ■

master batch record and Specifications

14.2 Determine and document impact on raw material, plus corrective and ■

preventative actions related to the deviation(s)

14.3 Deviations will be managed through a written Procedure of the Contract ■

Acceptor

15. Complaints, Recalls and Withdrawals

Contract Contract

No Responsibilities

Giver Acceptor

15.1 Handling and reporting complaints related to the Raw Material. ■

15.2 Investigate complaints,. Issue reports and follow-up on corrective actions within ■

agreed timelines.

15.3 Notification within seven (7) days of any information coming into its possession ■

concerning the quality of previously released batch(es).

15.4 Contract Giver shall promptly notify Contract Acceptor of any complaint or ■

adverse event attributable to the quality of Product

15.2 Investigate complaints as requested by Contract Giver. Issue reports and follow- ■

up on corrective actions within agreed timelines.

15.6 In case of a Recall, Rejection or Withdrawal, Contract Acceptor will utilize its deviation procedure to investigate and manage the event and to the extent the ■ ■

issue directly or indirectly relates to other Contract Acceptor activities

Page 9 of 16

QUALITY AGREEMENT

(Manufacture/Critical consumables)

16. Change Management

Contract Contract

Responsibilities

Giver Acceptor

16.1 Ensure that changes related to

■ The manufacturing Process.

■ Reprocessing or rework

■ Changes in raw materials and consumables specified on the bill of materials. ■

■ Changes in layout, structure or site of manufacturing facility.

■ Changes in primary processing equipment that could affect Product.

■ Changes in testing

are documented including an Quality impact assessment on the quality of the Raw Materials

16.2 Notify Contract Giver of any proposed changes to Contract Acceptor processing Approve ■

that may impact the Product.

16.3 Contract Giver initiates such change by providing written notification through Contract Giver change control system to Contract Acceptor at least 30 days Inform ■ prior to the requested change.

16.4 Changes will be managed through a written Procedure of the Contract Acceptor ■

17. Contract Giver Audits

Contract Contract

No Responsibilities

Giver Acceptor

17.1 Provision of access to facilities and systems as they relate to the storage and

■
distribution of Products.

17.2 Provide timely notification for scheduling an audit. ■

17.3 "for cause" basis audits for product quality reasons as they apply to product distribution may be requested. Timing for a "for-cause" audit must be mutually ■ agreed upon but shall not be unreasonably delayed by both parties

17.4 Respond in writing to written audit observations within thirty (30) days of

■
receipt of report or as advised.

Page 10 of 16

QUALITY AGREEMENT

(Manufacture/Critical consumables)

18. Sub contracting

Contract Contract

No Responsibilities

Giver Acceptor

18.1 Select and approve the use of third party laboratories (subcontractors) for

Approve ■

intermediate and final Product testing, if applicable

18.2 Use of subcontractors for any part of the holding, distribution, packaging or

Approve ■

labelling of the product or intermediates only with the prior written approval.

18.3 Subcontractors will meet requirements for Approved Vendors. Contract Giver will accept Contract Acceptor's documented vendor compliance program ■ subject to outcome of Contract Giver audit.

Contracting of Third parties:

If Contract Acceptor does not do the work covered by the Agreement himself but contracts third parties to do it, the prior written consent of Contract Giver is required. In addition, Contract Acceptor must conclude a written Agreement on contracts manufacturing with the third party.

Also in case Contract Acceptor contracts third parties, Contract Acceptor is solely responsible towards Contract giver for the fulfillments of all contract obligations.

Term and Termination;

This Agreement shall come into force and effect once signed by the parties hereby. It shall be concluded for an indefinite period and may be terminated with due observance of a notice period of six months.

The right for an extraordinary termination for good cause is not affected

Each termination must be effected by registered mail

Definitions

Approval The term "Approval" is defined as concurrence between Contract Giver and Contract Acceptor, such as agreement on a proposed Changes, as evidenced in writing and signed by both companies' Authorized Quality Representatives.

Approved Vendor A vendor who has met minimum approval standards and who has been approved by both parties to provide required items or services that may impact product quality.

Page 11 of 16

QUALITY AGREEMENT

(Manufacture/Critical consumables)

Authorized Quality

Representative An individual named within the Quality Agreement with the authority to resolve any disputes or conflicts relating to this Quality Agreement in a timely and equitable manner and in compliance with all applicable quality and regulatory requirements.

Batch A specific quantity of material produced in a process or fraction of a process. Batches are defined as the material represented at the end of the intermediate processing steps and the material represented at the end of the processing step(s)

CFR Code of Federal Regulations

COA Certificate of Analysis: An authentic document that certifies that a specific batch of material has been evaluated in accordance with the Specification for that material.

Contract Acceptor Shall mean the contractor, which performs Manufacturing and Packaging Operations of the raw material .

Contract Giver Shall mean the contractor, which uses the raw material for the manufacturing of API (ARM) or finished product.

GMP Good Manufacturing Practice, including Current Good Manufacturing Practice: The essential rules governing the production, distribution and use of medicinal products, to safeguard public health. In this

Agreement GMP means both GMP and/or cGMP.

Date of Manufacture The date of fill into final container or packaging for intermediate or Finished Product

Disposition Decision by Contract Acceptor Quality on the suitability of the intermediate or Finished Product for further processing.

EMA European Medicines Evaluation Agency

Finished Product The product in it's agreed upon finished form. When the product is packed and labeled in it's market presentation it is referred to as "Drug Product" as well.

For Cause Visit The term "for cause visit" is used to describe site visits, other than audits or business discussions, for the purpose of reviewing

Page 12 of 16
QUALITY AGREEMENT
(Manufacture/Critical consumables)

documentation, facilities or processes related to a specific deviation affecting Product disposition.

Master Batch Record A detailed description of the production process for manufacturing of the Raw Material outlining the different actions an operator has to perform to complete the production process

OOS Out of Specification

Process Consumables Materials used as an aid in the manufacture of an intermediate or the Raw Material that do not themselves participate in a chemical or biological reaction. For the purposes of this document media, resins, raw materials, filters, membranes, product-contact materials or surfaces, disposable analytical test kits, disposable containers, product contact materials or surfaces, disposable lab supplies unique to the program or other items consumed and subcontracted analytical testing are considered to be process consumables.

Raw Material Any ingredient intended for use in the manufacture of the Raw Material, including those that may not appear in the final commercial presentation. These include chemicals used directly and/or indirectly in the manufacturing process.

Release Package Relevant documentation to be transferred to the Contract Giver to facilitate the release of Contract Giver's Finished Product. This package consists of copies of, Certificate of Analysis (COA) or analytical results, QA disposition of product statement, and where applicable, batch genealogy, and facility deviations.

Specification A set of criteria, limited to Critical In Process Tests or Finished Product, which must conform, to be considered acceptable for its intended use.

SERVICE AGREEMENT

Service Agreement

This agreement made this ____ day of _____ at _____ is entered into by and between

Company Name XYZ, a Company incorporated and existing in accordance with the Companies Act, 1956 and having its Registered Office Location – Pin code, acting through Shri. Name , General Manager- Payment Cell & Compliances a representative duly authorized vide board resolution dated 2nd September, 2002 of the Company (hereinafter referred to as "Company Name") which expression shall unless be repugnant to the context include its successors and assigns of ONE PART.

AND

M/s. _____. Company incorporated and existing in accordance with the Companies Act. 1956 and having its Office at _____ acting through Mr. _____, _____ of M/s. _____, at _____ duly authorized vide General power of Attorney dated _____ (hereinafter referred to as "_____") which expression shall unless be repugnant to the context include its successors and assign of OTHER PART.

WHEREAS

a) Company Name is inter alia carrying on the business of manufacturing, marketing, selling and distributing bulk drugs/ medicines, pharmaceutical formulations, vaccines and other health related products and promotional items. (hereinafter referred to as the "Goods")

b) Company Name as and When required, has to deliver Goods, to and from its sales offices/ Loan Licensee manufacturers/ manufacturing locations/ Third party manufacturers/ clearing & forwarding Associates/ stockiest/ distributors or any associates in India.

c) _____ is carrying on the business of _____ and has represented to Company Name that they have all the necessary expertise, exposure and experience and having requisite infrastructure for _____ the Goods all over India (hereinafter referred to as the "Services") and is ready and willing to render the services to Company Name.

d) On the basis of the above representation of _____, Company name is Desirous of & has agreed to empanel/ engage _____ for the services as aforesaid.

Page 1 of 2

SERVICE AGREEMENT

e) The parties are desirous of recording their understanding into writing upon the terms and conditions hereinafter appearing.

NOW IT IS HEREBY AGREED BY AND BETWEEN THE PARTIES HERETO AS FOLLOWS:

1. Definition
2. Engagement
3. Scope of services
4. Duration/Termination
5. Delivery process
6. Service levels
7. Payment terms
8. Liability or Losses & Damages
9. Statutory compliance, undertaking, warranties and indemnity
10. Force majeure
11. Disputes, Arbitration and Jurisdiction

A. General Information |
	Name of Organization	:	
	Address	:	
	Name & Address of Contact	:	
	Person		
B. Building and Facility			
	Is the Facility easily accessible by suitable means of	:	Yes / No /NA
	transport		
		If yes, mention approximate distance and means to	
	reach the facility		
	Is the location free from possible source of air / water	:	Yes / No /NA
	/ soil, etc.	:	
	Pollution		
	Is ac current version of site plan / floor layout	:	Yes / No /NA
	available		
	Is the access to the facility restricted and controlled.	:	Yes / No /NA
	Are there adequate personnel facilities, like		
	a) Wash rooms,	:	Yes / No /NA
	b) Change rooms	:	Yes / No /NA
	c) Medical room, available	:	Yes / No /NA
	Is there a documented program for pest, rodent and bird	:	Yes / No /NA
	control		
		If yes, what is the frequency	:
	Are air curtains installed and functional	:	Yes / No /NA
	Are documented procedures available for cleaning,		Yes / No /NA
	disinfection or fumigation of the premises.	:	
	Is rotation of disinfectants followed	:	Yes / No /NA
	Is adequate lighting and ventilation provided	:	Yes / No /NA
	Do you have a separate Air Handling Unit at least for	:	Yes / No /NA
	finished product		
	Is quality of air supplied, especially to manufacturing		Yes / No /NA
	and packaging areas controlled, monitored and recorded	:	
	Is there a documented procedure for waste and scrap	:	Yes / No /NA
	disposal		
	Are there adequate utilities available	:	Yes / No /NA
		If yes attach their specifications	
	Is there a documented schedule to conduct preventive	:	Yes / No /NA
	maintenance of equipments		
C. Personnel			
	Attach qualification and experience record of key	:	Attach List
	personnel		
	Is there a documented training program for staff and		Yes / No /NA
	workers on cGMP, cGLP, SOPs, on-job activities,	:	
	personnel hygiene etc.		
		If yes, what is the frequency. Choose 3-4 employees	
	and check record		
	Is there a documented health care program (medical	:	Yes / No /NA
	examination)		
	Choose 3-4 employees and check record		
	Are the personnel provided with clean uniforms	:	Yes / No /NA
D. Stores			
	Are there physically segregated areas for:		
	Raw materials	:	Yes / No /NA
	Packaging materials	:	Yes / No /NA
	Are there physically segregated areas for:		
	Quarantine material (Under Test)	:	Yes / No /NA
	Approved material	:	Yes / No /NA
	Rejected material	:	Yes / No /NA
	Is the dispensing area separate	:	Yes / No /NA
	Is there any excise stores area	:	Yes / No /NA
	Do you have separate areas for non – beta lactum / beta –	:	Yes / No /NA
	lactum / other potent drugs (like cytotoxics)		
	Are there separate areas for materials requiring special	:	Yes / No /NA
	storage conditions controlled temperature & humidity with		
	monitoring devices like thermometers / hygrometers		
	Are the areas adequate for storage of the materials in	:	Yes / No /NA
	relation to their quantity		
	Is stock rotation program followed (like FIFO)	:	Yes / No /NA
E. Manufacturing			
	Is a process flow diagram for the manufacturing	:	Yes / No /NA
	operations available		
		If yes, attach a copy of process flow diagram	
	Is there a list of manufacturing equipment with	:	Yes / No /NA
	information like name, make capacity, Material of		
	Construction, date of procurement		
	Are the process equipment uniquely coded for	:	Yes / No /NA
	identification		
		If No, how are equipment identified during	
	documentation		
	Are the major equipment validated w. r. t. IQ, OQ & PQ	:	Yes / No /NA
	Are batches uniquely identified	:	Yes / No /NA
	Is there a system of line clearance before product or	:	Yes / No /NA
	batch change over		
	Is there any requirement of transportation of semi	:	Yes / No /NA
	finished product or material to other site. If Yes, how		
	is integrity of material guaranteed		
	What is the frequency of in process checks; please		

		exemplify			
			Process		Frequency
		i.	:		
		ii.	:		
		iii.	:		
		Are the sequence and timing of manufacturing operations	:	Yes / No /NA	
		recorded into a batch production record. Check and verify			
		form a current batch record			
		Is there a documented procedure for reprocessing	:	Yes / No /NA	
		What are the packing controls for (mention document	:	Yes / No /NA	
		name):			
			Printed packaging material reconciliation		
			Destruction of printed packaging material		
		Do you have procedure for printing of labels or printed	:	Yes / No /NA	
		material of similar appearance			
		Is there a documented procedure to monitor, control,	:	Yes / No /NA	
		record and prevent process deviations			
		Are the environmental conditions of finished goods	:	Yes / No /NA	
		storage area controlled w. r. t. temperature and			
		humidity?			
		Is there a documented procedure for rejection of finished	:	Yes / No /NA	
		goods			
		How many rejections have been recorded in the last	:	Yes / No /NA	
		quarter (for products offered for contract			
		manufacturing). Check a recent rejection record.			
		Has there been any product recall till date			
			If, yes provide details	:	Yes / No /NA
F	Quality Control				
		Is there a quality control unit	:	Yes / No /NA	
		Does Q.C. perform the following functions:			
		a.	Sampling of raw and packaging material	:	Yes / No /NA
		b.	Release of rejection of each batch of raw and	:	Yes / No /NA
			packaging material		
		c.	Development of specification for raw and packaging	:	Yes / No /NA
			material and in-process tests.		
		d.	Release or rejection of each batch or lot of	:	Yes / No /NA
			in-process bulk material		
		e.	Release or rejection of each batch of finished	:	Yes / No /NA
			product		
		f.	Issue, control and review of Batch Production Records	:	Yes / No /NA
		g.	Take control samples of raw materials and finished	:	Yes / No /NA
			goods		
		h.	Calibration of Q.C. Equipment	:	Yes / No /NA
		i.	Validation of test methods	:	Yes / No /NA
		j.	Evaluation of stability and quality of finished goods	:	Yes / No /NA
		Who performs the functions of Quality Assurance	:		
		Are there separate rooms / areas marked for			
			Storage RM Samples	:	Yes / No /NA
			Storage Control Samples	:	Yes / No /NA
			Stability Testing Equipment	:	Yes / No /NA
		Is there a system of Internal Audit	:	Yes / No /NA	
		Are there any reference books available	:	Yes / No /NA	
G	Documentation				
		Are all documents controlled i.e. bear a unique title,	:	Yes / No /NA	
		number, version number, effective date, etc.			
		Are all documents approved and authorized before	:	Yes / No /NA	
		distribution			
		Is the documents distribution record maintained	:	Yes / No /NA	
		Are the following documents available			
			Specifications (RM, PM, In process product, finished	:	Yes / No /NA
			product)		
			SOPs (RM, PM, In process product. Finished product)	:	Yes / No /NA
			Master Batch Production Record / Master formula	:	Yes / No /NA
			record		
			Raw Material Receipt and Issuance Records	:	Yes / No /NA
			Packaging Records	:	Yes / No /NA
			In-process Testing Records	:	Yes / No /NA
			Finished Goods Records	:	Yes / No /NA
			Microbiological Records (if applicable)	:	Yes / No /NA
			Calibration Records (Manufacturing and Q. C)	:	Yes / No /NA
			Operation , Cleaning & Preventive Maintenance Records	:	Yes / No /NA
			Complaint Records	:	Yes / No /NA
			Rejection Record	:	Yes / No /NA
			Product Recalls	:	Yes / No /NA
		Are SOPs available for the following operations			
			Quarantine and storage of material	:	Yes / No /NA
			Issuance of material	:	Yes / No /NA
			Quality control for In-process	:	Yes / No /NA
			Quality control for Finished Goods	:	Yes / No /NA
			Calibration of instruments	:	Yes / No /NA
			Product Recalls	:	Yes / No /NA
			Microbiological testing	:	Yes / No /NA
		Is a Certificate of Analysis issued for a batch released	:	Yes / No /NA	
		What are the rejection levels	:		
		What is the packaging material used for Primary Packaging	:		
		, Material of Construction

	Is there a documented procedure for handling process	:	Yes / No /
	deviations		NA
	Are there documented procedures for handling reworking	:	Yes / No /
	for rectification of errors		NA
	Are standard procedures of working and similar	:	Yes / No /
	functional documents readily available to employees for		NA
	reference		
	Is the batch or lot reconciled after end of	:	Yes / No /
	manufacturing operation		NA
	Are waste material clearly marked	:	Yes / No /
			NA
	Is there a pest control procedure	:	Yes / No /
			NA
	Are colour standards available, and are they checked on	:	Yes / No /
	a periodic basis for any change in appearance		NA
	Is there a system for 100% inspection of labels	:	Yes / No /
			NA
	In the event of in-process rejections, is there proper	:	Yes / No /
	investigation procedure to prevent recurrence		NA
	Are the equipment adequately identified	:	Yes / No /
			NA
	During operations, is product information displayed on	:	Yes / No /
	the equipment		NA
	Are there adequate procedures for final product	:	Yes / No /
	inspection, sampling and testing		NA
	Are the final inspection / test results recorded	:	Yes / No /
			NA
	Are the batch records reviewed before final dispatch of	:	Yes / No /
	products		NA
	Are the batch records and other related documents stored	:	Yes / No /
	for adequate length of time		NA
	Is the document retrieval system adequate	:	Yes / No /
			NA
	How is non conforming material controlled	:	Yes / No /
			NA
	Are samples of finished product retained	:	Yes / No /
			NA
	How adequate are security systems for drug labels	:	Yes / No /
			NA
	Is there a lot recall procedure	:	Yes / No /
			NA

D	Laboratories and Calibration				
		Is QC adequately staffed	:	Yes / No /	
				NA	
		Are sufficient equipment / instruments available for	:	Yes / No /	
		proper functioning of QC	NA		
		Are samples from incoming, in-process and final product	:	Yes / No /	
		materials properly controlled	NA		
		Is each lot checked against customer approved copy for	:	Yes / No /	
		correct printing	NA		
		Is each lot checked against a drawing for correct die	:	Yes / No /	
		cut	NA		
		Are certifications of inspection / test results	:	Yes / No /	
		available to customers	NA		
		Are tests / inspections properly documented	:	Yes / No /	
				NA	
		Are there acceptable procedures to assure that	:		
		instruments are calibrated and calibration recorded			Yes / No /
		Is calibration traceable to appropriate standards	:	NA	
				Yes / No /	
				NA	
		Are the instruments / equipments maintained in proper	:	Yes / No /	
		order	NA		
E	Document Control				
		Are functional documents like specification, Standard	:	Yes / No /	
		Operating Procedures, etc. comprehensive in content		NA	
		Are the documents in use 'current'	:	Yes / No /	
				NA	
		Are the documents approved and authorized by competent	:	Yes / No /	
		authority prior to distribution	NA		
		Is there a procedure to ensure retrieval and subsequent	:	Yes / No /	
		destruction of obsolete documents	NA		
F	Miscellaneous				
		Is there regular training program for employees,	:	Yes / No /	
		in-house or otherwise	NA		
		If yes, list type of training and frequency	:	Yes / No /	
				NA	
		Is there a program for training	:	Yes / No /	
				NA	
		Is there a documented procedure for performing internal	:	Yes / No /	
		audits	NA		
		Are internal audit reports prepared and circulated to			
		concerned department for compliance of observed	:	Yes / No /	
		deficiency	NA		
		Is there a 'Quality system' that addresses the			
		organizational structure, responsibilities, procedures,	:	Yes / No /	
		processes and resources for implementing quality		NA	
		management			
		Are there periodic management reviews of the 'Quality	:	Yes / No /	
		system'	NA		
		Are there sufficient engineering, production and quality			
		control support to requirements of Company Name XYZ.	:	Yes / No /	
				NA	

Date of Inspection:

Audit Team Representing Company Name XYZ.

1 Quality System:		
1.1 Has the management established its quality policy in Yes / No / NA		
	writing?	
	If yes, please attach a copy.	
1.2 Is there an Organizational Chart? Yes / No / NA		
	If yes, please attach a copy.	
1.3 Are the personnel's responsibilities established in Yes / No / NA		
	their	
	job descriptions?	
1.4 Has the company / organization adequate resources in Yes / No / NA		
	terms of finance and personnel?	
1.5 Has the company / organization designated a responsible Yes / No / NA		
	person	
	with enough authority to assure the established quality	
	system?	
1.6 Is the company / organization approved by government Yes / No / NA		
	(State/Central/UT)	
	Please mention the nature of your organization:	
	(Government/ Semi government/Private)	
1.7 Does your organization carry any recognition or Yes / No / NA		
	accreditation from National / International agency like	
	ISO/WHO or any other agency?	
	If yes, please attach a copy of the latest certificate.	
1.8 Are personnel qualified to perform their tasks? Yes / No / NA		
	Please attach the list of educational qualifications of	
	personnel as a minimum of those working at key	
	positions.	
2. Documentation:		
2.1 Is the system of approval of documents established? Yes / No / NA		
2.2 Is there an established procedure for approving changes Yes / No / NA		
	in documents?	
2.3 Is there a system to keep records of approved documents Yes / No / NA		
	with their edition/revision number?	
2.4 Are procedures in force to assure the identification and Yes / No / NA		
	traceability of works/ tests carried out?	
2.5 Is there a procedure for identifying, coding and Yes / No / NA		
	archiving of records?	
3. Calibration, Maintenance and Validation:		
3.1 Is there a maintenance program in force for all Yes / No / NA		
	measuring and test equipments?	
3.2 Do you have a calibration program? Yes / No / NA		
3.3 Do you have procedures in force for performing Yes / No / NA		
	Calibrations and Maintenance work?	
3.4 Does the measuring and test equipments clearly Yes / No / NA		
	identified with calibration status?	
3.5 Are the standards used for Testing / Validation / Yes / No / NA		
	Calibration traceable to National / International	
	Reference Standards?	
3.6 Are the Instruments / Standards used for calibration Yes / No / NA		
	regularly updated?	
3.7 Do you have Standard Operating Procedures (SOPs) for Yes / No / NA		
	carrying out Testing / Validation / Calibration?	
	If so, can these be made available to the contracting Yes / No / NA	
	party on demand?	
4. Audit and Inspection:		
4.1 Is the facility subjected to quality audits? Yes / No / NA		
4.2 Are quality audits performed to verify the efficacy of Yes / No / NA		
	the Quality System?	
4.3 Is there a defined plan for audits? Yes / No / NA		
4.4 Is there a follow up of corrective actions taken? Yes / No / NA		
5. Training:		
5.1 Is there a procedure for training of staff in their Yes / No / NA		
	respective areas of working?	
5.2 Are training programs established? Yes / No / NA		
5.3 Are training records maintained? Yes / No / NA		
6. Testing:		
6.1 Are documented procedures in force for handling samples Yes / No / NA		
	and testing?	
6.2 Is there a traceability of the records for a test sample Yes / No / NA		
	/ work carried out? i.e. green sheets/logbooks/record	
	forms etc.	
6.3 Do you have required facilities for storage of samples Yes / No / NA		
	before (and after) testing?	
6.4 Are there separate areas for samples requiring special Yes / No / NA		
	storage conditions?	
6.5 Do you issue certificate of analysis for the Yes / No / NA		
	sample/product tested?	
6.6 Are there adequate facilities for testing of sterile Yes / No / NA		
	products including sterility and pyrogen testing?	

6.7	Is the sterility testing room classified?	Yes / No / NA
6.8	Do you maintain an animal house?	Yes / No / NA
6.9	Does the animal house have adequate area and required	Yes / No / NA
	facilities?	
6.10	Is there a qualified veterinarian to look after the	Yes / No / NA
	animal house?	
6.11	Is the animal house registered with regulatory	Yes / No / NA
	authorities?	
6.12	Is permission sought from the regulatory authorities for	Yes / No / NA
	using animals for various tests?	
6.13	Is periodical examination of animals for health status	Yes / No / NA
	carried out?	
6.14	Do you have arrangements to quarantine the animals after	Yes / No / NA
	reception?	
6.15	Do you have provision for isolation of sick animals as	Yes / No / NA
	well as animals under test?	
6.16	Are qualified and experienced personnel available for	Yes / No / NA
	carrying out testing in animals?	
6.17	Do you have an approval system for suppliers from whom	Yes / No / NA
	the testing animals are purchased? Please attach the	
	list of institution (s) from where the animals are	
	procured.

Introduction

This document intends to provide expert guidance to the raw material supplier (Contract acceptor) and its customers (contract giver) for the implementation and maintenance of appropriate Quality agreements.

Scope

This Quality Agreement outlines the roles, responsibilities, deliverables and time requirements with respect to the Quality Assurance of the manufacture of the specified products (reference is made to the annexes) of Contract Giver (Customer) . It is an appendix to the Service Agreement executed by Contract Giver and Contract Acceptor (further referred as the "Agreement"). Contract Acceptor (Supplier) will operate a compliant GMP (including GDP) operation in all aspects of (where applicable) manufacture, testing, holding, packaging, labelling, shipping and/or distribution of the products of Contract Giver.

Parties to the agreement:

This Quality agreement is by and between the Contract giver i.e. xxxx and Contract Acceptor with office at (address), where the Contract Acceptor supplies Raw material suitable for pharmaceutical/biological use to xxxxx

The Quality Agreement may be revised on an "as-needed" basis or whenever the Agreement is renegotiated. All changes to this Quality Agreement will be reviewed and approved by authorised representatives of Quality Assurance from Contract Giver and Contract Acceptor ("Authorized Quality Representatives"). Any revision of this Quality Agreement must be documented, reviewed and approved by Authorised Quality Representatives from Contract Giver and Contract Acceptor and the Agreement shall be amended accordingly. Unless otherwise defined specifically in this Quality Agreement, all general terms used herein will be interpreted in accordance with the definitions provided in the Agreement. Any terms not so defined will be interpreted with the definitions proscribed in the Contract Acceptor Quality Policy, or when not so specified, will be interpreted with the definitions so stated in guidelines of the USA, Europe, WHO, etc (not limited) where applicable.

The Authorised Quality Representatives will resolve any disputes or conflicts relating to this Quality Agreement in a timely and equitable manner and in compliance with all applicable quality and regulatory requirements. Such resolutions shall be in writing and shall be signed by the authorised Quality Assurance representatives of each company. If any issue remains unresolved for more than twenty (20) business days, the senior Corporate Quality officials from each company should be contacted to resolve this issue.

All communication affecting the contents of this Quality Agreement will be between the Authorized Quality Representatives, as set forth below:

For Contract Giver: ____ (name) Quality Assurance

For Contract Acceptor : ____ (name) (Function)

In the event of a change, temporary or otherwise, of either Party's Authorized Quality Representative, the relevant Party shall notify the other in writing of such change.

Excipients Covered by the agreement

This Quality agreement pertains to the Raw material mentioned in Appendix I

Quality criteria:

The Contract Acceptor will manufacture, test and release the Raw material (mentioned in Appendix I) in accordance with the quality criteria / specifications as approved by the Quality Assurance personnel of Contract Giver enclosed as per Appendix II.

Term of Agreement:

This Agreement shall become effective and binding upon the date of the final signature and shall remain in effect until 3 years after the last delivery of Raw material by the Contract Acceptor to the Contract Giver unless the Contract Giver specifically requests an extension of the Agreement.

Revisions to Agreement:

No amendment to the terms of this Agreement shall be binding on the parties hereto unless made in writing and signed by an authorized representative of each of the parties.

Confidentiality:

The Contract Acceptor and Contract Giver should mutually undertake to observe secrecy on each other's know-how. This also applies after the agreement has ended. After the termination of the Agreement, neither of the parties to the contract is entitled to further commercially use the other party's know how disclosed under this agreement or let third parties do so without the other party's consent.

The obligation of confidentiality and of not using information does apply if that information:

1. was already known to the other party before its disclosure under the Agreement and the other party declares this fact immediately or
2. has become common property through publication or by other means or
3. becomes known to one of the parties without originating directly or indirectly from the other party or
4. is made available to authorities due to legal requirements.

Responsibilities:

This quality agreement will outline the responsibilities of the Contract Giver and Contract Acceptor with regard to the quality activities described in the quality criteria tabulated below:

1. Regulatory Authorizations & GMP Compliance (where applicable)

[No |Responsibilities |Contract|Contract|
		Giver	Acceptor
1.1	Maintain all licenses, registrations and other		(
	authorizations as are required to operate a controlled		
	facility and related functions under the Applicable Laws and		
	guidelines (including GMP where applicable)		
1.2	Maintain facilities, utilities, equipment and conveyance and		(
	perform holding and distribution activities according to GMP		
	guidance documents published by the applicable authorities,		
	approved internal policies and procedures and other		
	regulatory requirements, as applicable.		
1.3	Provide all necessary information pertinent to the		(
	Production of the Raw Material to keep the regulatory		
	filings current and up to date.		
1.4	Prepare, maintain and update the Regulatory filings in		(
	accordance with all Applicable Laws. Prepare and submit all		
	required reports related to Product.		
1.5	Provide all necessary information to Contract Giver		(
	concerning complaints, recalls, returned or salvaged drug		
	products, and investigations associated with those		
	activities, where Contract Acceptor is involved, for the		
	purpose of the issuing of Contract Giver's Annual Product		
	Review.		

2. Regulatory Actions & Inspections

	Responsibilities	Contract	Contract
		Giver	Acceptor
2.1	Notify Contract Giver of any Regulatory Authority notice of		(
	inspection or inspection of the Facilities directly relating		
	to the Raw Material(s) within two (2) business days.		
	Contract Giver may be on Contract Acceptor site during		
	regulatory inspection as subject matter expert. Contract		
	Acceptor manages all on site regulatory inspections.		
2.2	Notify Contract Giver of any Regulatory Authority		(
	investigation relating to the Raw Material(s).		
2.3	Provide copies of any observation, FDA Form 483's, Warning		(
	Letters or the like from applicable Regulatory Authorities		
	within two (2) business days of receipt, as such notices		
	relate to the Raw Material(s) or Processes performed by the		
	other party.		
2.4	Reporting requirements to the respective regulatory		(
	agency(ies) with regard to Contract Giver's registration		
	documentation		
2.4	Review of responses to inspection observations and questions		(
	prior to submission to the concerned regulatory agency if		
	pertinent to products distributed		
2.5	Reporting requirements with regard to manufacturing site		(
	registration that may be required to support Contract Giver		
	related activities, and will notify Contract Giver upon		
	doing so.		
2.6	Conduct investigations, prepare and approve corrective		(
	actions in response to regulatory observations. Provide		
	copy of responses that could potentially impact Contract		
	Giver's Raw material(s) / Process to Contract Giver for		
	review and approval prior to submission.		

3. Premises and Equipment

| |Responsibilities |Contract |Contract |
| | |Giver |Acceptor |

3.1 |Maintaining facilities, utilities and equipment suitable for| |(|
|the production of Contract Giver's raw material(s) and | | |
|designed for their intended uses. | | |
3.2 |Maintaining facilities, equipment, computerised systems and | |(|
utilities as are required to operate a manufacturing		
facility for Raw Material with Pharmaceutical applications		
under the Applicable Laws.		
3.3	Calibrate measuring instruments used to monitor or control	
conditions of storage, according to defined schedules.		
3.4	Ongoing qualifications and/or verification activities	
according to Contract Acceptor policies and procedures		
3.5	Verify or validate equipment cleaning procedures to prevent	
cross-contamination from one raw material(s) to the next raw		
material(s) or from one batch to the next batch of the same		
raw material(s).		

4. Personnel

| |Responsibilities |Contract |Contract |
| |Giver |Acceptor |
4.1 |Ensure that a management representative is appointed, who| |(|
|should be responsible and qualified for maintaining the | | |
|Quality System. | | |
4.2 |Ensure that all staff affected by this Agreement shall be| |(|
|appropriately trained. | | |
4.3 |Maintain a system to show training and qualification of | |(|
|personnel in procedures relating to the Raw Material(s). | | |

5. Manufacturing and batch documentation

| |Responsibilities |Contract|Contract|
| |Giver |Acceptor|
5.1 |Establish procedures for change-over, cleaning, | |(|
|processing, packaging, labeling and handling. | | |
5.2 |Establish provisions, parameters ranges or limits, test | |(|
|requirements and processing. | | |
5.3 |Maintain master batch records and ensure that master batch| |(|
records, including test records, comply with the		
Regulatory filings, Clinical Trial Applications and/or the		
Agreed Supplies.		
5.4	Contract Acceptor shall use Master batch records to	
document production process of each batch in batch record.		

6. Materials and consumables

| |Responsibilities |Contract |Contract |
| |Giver |Acceptor |
6.1 |Procure, store, sample, test and release Materials and/or| |(|
consumables used for the manufacturing of the Raw		
Material(s) in accordance with Contract Acceptor's		
written procedures.		
6.2	Responsible for verification that materials are free of	
BSE/TSE (where applicable) and providing regularly		
updated certification to Contract Giver.		
6.3	Upon request, provide Contract Giver with documented	
evidence describing the qualifications of Contract		
Acceptors used to provide components, containers,		
labeling and packaging materials.		
6.4	Develop test methods and specifications in case	
specifications are deficient or unavailable		
6.5	Store raw materials or consumables in accordance with the	
requirements set forth in the specifications provided by		
Contract Giver.		

7. Records

|No |Responsibilities |Contract |Contract |
| |Giver |Acceptor |
7.1 |Ensure that records are made at each operation on | |(|
|Contract Giver's Product, in such a way that all | | |
|significant activities or events are traceable. | | |
7.1 |Store master record, batch records, distribution and | |(|
transportation records and all other documentation		
related to the Product for a minimum of five (5) years.		
Notify Contract Giver prior to destruction of any such		
records and provide the option to have the records sent		
to Contract Giver at Contract Giver's expense.		
7.2	Contract Acceptor shall deliver batch record / CoA with	
every batch		
7.3	Provide copies of all documentation necessary for the	
Contract Giver to respond to enquiries by Regulatory		
Authorities.		

8. Documentation for Safety

| |Responsibilities |Contract |Contract |
| |Giver |Acceptor |
8.1 |Provide safety/hazard and handling data on the Raw | |(|
|Material(s) to Contract Giver | | |

9. Samples

| |Responsibilities |Contract |Contract |
| | |Giver |Acceptor |
9.1 |Ship side samples and extra samples, where applicable, | |(|
| |according to the requirements of the Contract Giver | | |
9.2 |Retain reference samples of all materials, per Contract | |(|
| |Acceptor procedures. | | |
9.3 |Store of retained samples under storage conditions in a | |(|
| |secure area for 3 years from the Date of Manufacture. | | |

10. Testing & Analysis

| |Responsibilities |Contract |Contract |
| | |Giver |Acceptor |
10.1 |Write protocols and perform verification or validation, | |(|
| |as appropriate, of test methods related to the release of | | |
| |the Raw Material(s). | | |
10.2 |Provide documented finished raw material(s) testing | |(Review |
| |limits and specifications and other requirements. | | |
10.3 |Perform in-process testing and finished raw material(s) | |(|
| |release testing according to the requirements in 6.2. | | |
10.4 |Investigate all out-of-Specification test results ("OOS") | |(|
	and have available a report related to such		
	investigations including a rationale for implemented		
	corrective and preventative actions.		

11. Release

| |Responsibilities |Contract |Contract |
| | |Giver |Acceptor |
11.1 |Provide final release of Raw Materials for supply (COA) | |(|
11.2 |Review the batch record within thirty (30) calendar days | |(|
| |of receipt. Communicate any issues identified to | | |
| |Contract Acceptor. | | |

12. Storage and Shipment

| |Responsibilities |Contract |Contract |
| | |Giver |Acceptor |
12.1 |Specify finished raw material(s), packaging, storage and |Approve |(|
| |shipping requirements | | |
12.2 |Store the finished raw material(s) in accordance with the | |(|
| |specifications pending release of the Raw Material(s). | | |
12.3 |Arrange shipments of Raw material(s) according to | |(|
	Contract Giver specified procedure to Contract Giver or		
	Contract Giver's agent only upon written approval from		
	Contract Giver.		

13. Returned Goods

| |Responsibilities |Contract |Contract |
| | |Giver |Acceptor |
13.1 |Maintain a controlled and documented system and procedure | |(|
| |for handling returned goods and rejected materials. | | |
13.2 |Ensure that non-defective products returned from the | |(|
	market are stored separately from saleable stock, and are		
	assessed according to defined procedures before		
	destruction or authorisation for re-use.		

14. Deviations

| |Responsibilities |Contract |Contract |
| | |Giver |Acceptor |
14.1 |Investigate, resolve and document all abnormal events and | |(|
| |deviations from the master batch record and | | |
| |Specifications | | |
14.2 |Determine and document impact on raw material, plus | |(|
| |corrective and preventative actions related to the | | |
| |deviation(s) | | |
14.3 |Deviations will be managed through a written Procedure of | |(|
| |the Contract Acceptor | | |

15. Complaints, Recalls and Withdrawals

|No |Responsibilities |Contract |Contract |
| | |Giver |Acceptor |
15.1 |Handling and reporting complaints related to the Raw | |(|
| |Material. | | |
15.2 |Investigate complaints,. Issue reports and follow-up on | |(|
| |corrective actions within agreed timelines. | | |
15.3 |Notification within seven (7) days of any information | |(|
| |coming into its possession concerning the quality of | | |
| |previously released batch(es). | | |
15.4 |Contract Giver shall promptly notify Contract Acceptor of | |(|
| |any complaint or adverse event attributable to the | | |
| |quality of Product | | |
15.2 |Investigate complaints as requested by Contract Giver. | |(|
| |Issue reports and follow-up on corrective actions within | | |
| |agreed timelines. | | |
15.6 |In case of a Recall, Rejection or Withdrawal, Contract | |(|
	Acceptor will utilize its deviation procedure to		
	investigate and manage the event and to the extent the		
	issue directly or indirectly relates to other Contract		

| | Accepter activities | | |

16. Change Management

| | Responsibilities | Contract | Contract |
| | | Giver | Acceptor |
16.1 | Ensure that changes related to | | (|
The manufacturing Process.		
Reprocessing or rework		
Changes in raw materials and consumables specified on the		
bill of materials.		
Changes in layout, structure or site of manufacturing		
facility.		
Changes in primary processing equipment that could affect		
Product.		
Changes in testing		
are documented including an Quality impact assessment on		
the quality of the Raw Materials		
16.2	Notify Contract Giver of any proposed changes to Contract	Approve
Acceptor processing that may impact the Product.		
16.3	Contract Giver initiates such change by providing written	Inform
notification through Contract Giver change control system		
to Contract Acceptor at least 30 days prior to the		
requested change.		
16.4	Changes will be managed through a written Procedure of	
the Contract Acceptor		

17. Contract Giver Audits

| No | Responsibilities | Contract | Contract |
| | | Giver | Acceptor |
17.1 | Provision of access to facilities and systems as they | | (|
| relate to the storage and distribution of Products. | | |
17.2 | Provide timely notification for scheduling an audit. | (| |
17.3 | "for cause" basis audits for product quality reasons as | (| |
they apply to product distribution may be requested.		
Timing for a "for-cause" audit must be mutually agreed		
upon but shall not be unreasonably delayed by both		
parties		
17.4	Respond in writing to written audit observations within	
thirty (30) days of receipt of report or as advised.		

18. Sub contracting

| No | Responsibilities | Contract | Contract |
| | | Giver | Acceptor |
18.1 | Select and approve the use of third party laboratories | Approve | (|
| (subcontractors) for intermediate and final Product | | |
| testing, if applicable | | |
18.2 | Use of subcontractors for any part of the holding, | Approve | (|
| distribution, packaging or labelling of the product or | | |
| intermediates only with the prior written approval. | | |
18.3 | Subcontractors will meet requirements for Approved | | (|
Vendors. Contract Giver will accept Contract Acceptor's		
documented vendor compliance program subject to outcome		
of Contract Giver audit.		

Contracting of Third parties:

If Contract Acceptor does not do the work covered by the Agreement himself but contracts third parties to do it, the prior written consent of Contract Giver is required. In addition, Contract Acceptor must conclude a written Agreement on contracts manufacturing with the third party.

Also in case Contract Acceptor contracts third parties, Contract Acceptor is solely responsible towards Contract giver for the fulfillments of all contract obligations.

Term and Termination;

This Agreement shall come into force and effect once signed by the parties hereby. It shall be concluded for an indefinite period and may be terminated with due observance of a notice period of six months.

The right for an extraordinary termination for good cause is not affected

Each termination must be effected by registered mail

Definitions

Approval The term "Approval" is defined as concurrence between Contract Giver and Contract Acceptor, such as agreement on a proposed Changes, as evidenced in writing and signed by both companies' Authorized Quality Representatives.

Approved Vendor A vendor who has met minimum approval standards and who has been approved by both parties to provide required items or services that may impact product quality.

Authorized Quality Representative An individual named within the Quality Agreement with the authority to resolve any disputes or conflicts

relating to this Quality Agreement in a timely and equitable manner and in compliance with all applicable quality and regulatory requirements.

Batch A specific quantity of material produced in a process or fraction of a process. Batches are defined as the material represented at the end of the intermediate processing steps and the material represented at the end of the processing step(s)

CFR Code of Federal Regulations

COA Certificate of Analysis: An authentic document that certifies that a specific batch of material has been evaluated in accordance with the Specification for that material.

Contract Acceptor Shall mean the contractor, which performs Manufacturing and Packaging Operations of the raw material .

Contract Giver Shall mean the contractor, which uses the raw material for the manufacturing of API (ARM) or finished product.

GMP Good Manufacturing Practice, including Current Good Manufacturing Practice: The essential rules governing the production, distribution and use of medicinal products, to safeguard public health. In this Agreement GMP means both GMP and/or cGMP.

Date of Manufacture The date of fill into final container or packaging for intermediate or Finished Product

Disposition Decision by Contract Acceptor Quality on the suitability of the intermediate or Finished Product for further processing.

EMA European Medicines Evaluation Agency

Finished Product The product in it's agreed upon finished form. When the product is packed and labeled in it's market presentation it is referred to as "Drug Product" as well.

For Cause Visit The term "for cause visit" is used to describe site visits, other than audits or business discussions, for the purpose of reviewing documentation, facilities or processes related to a specific deviation affecting Product disposition.

Master Batch Record A detailed description of the production process for manufacturing of the Raw Material outlining the different actions an operator has to perform to complete the production process

OOS Out of Specification

Process Consumables Materials used as an aid in the manufacture of an intermediate or the Raw Material that do not themselves participate in a chemical or biological reaction. For the purposes of this document media, resins, raw materials, filters, membranes, product-contact materials or surfaces, disposable analytical test kits, disposable containers, product contact materials or surfaces, disposable lab supplies unique to the program or other items consumed and subcontracted analytical testing are considered to be process consumables.

Raw Material Any ingredient intended for use in the manufacture of the Raw Material, including those that may not appear in the final commercial presentation. These include chemicals used directly and/or indirectly in the manufacturing process.

Release Package Relevant documentation to be transferred to the Contract Giver to facilitate the release of Contract Giver's Finished Product. This package consists of copies of, Certificate of Analysis (COA) or analytical results, QA disposition of product statement, and where applicable, batch genealogy, and facility deviations.

Specification A set of criteria, limited to Critical In Process Tests or Finished Product, which must conform, to be considered acceptable for its intended use.

Contract Giver Contract Acceptor

Service Agreement

This agreement made this ____ day of _____ at _____ is entered into by and between

Company Name XYZ, a Company incorporated and existing in accordance with the Companies Act, 1956 and having its Registered Office Location – Pin code, acting through Shri. Name , General Manager- Payment Cell & Compliances a representative duly authorized vide board resolution dated 2nd September, 2002 of the Company (hereinafter referred to as "Company Name") which expression shall unless be repugnant to the context include its successors and assigns of ONE PART.

AND

M/s. _____. Company incorporated and existing in accordance with the Companies Act. 1956 and having its Office at _____ acting through Mr. _____, _____ of M/s. _____, at _____ duly authorized vide General power of Attorney dated _____ (hereinafter referred to as "_____") which expression shall unless be repugnant to the context include its successors and assign of OTHER PART.

WHEREAS

a) Company Name is inter alia carrying on the business of manufacturing, marketing, selling and distributing bulk drugs/ medicines, pharmaceutical formulations, vaccines and other health related products and promotional items. (hereinafter referred to as the "Goods")

b) Company Name as and When required, has to deliver Goods, to and from its sales offices/ Loan Licensee manufacturers/ manufacturing locations/ Third party manufacturers/ clearing & forwarding Associates/ stockiest/ distributors or any associates in India.

c) _____ is carrying on the business of _____ and has represented to Company Name that they have all the necessary expertise, exposure and experience and having requisite infrastructure for _____ the Goods all over India (hereinafter referred to as the "Services") and is ready and willing to render the services to Company Name.

d) On the basis of the above representation of _____, Company name is Desirous of & has agreed to empanel/ engage _____ for the services as aforesaid.

e) The parties are desirous of recording their understanding into writing upon the terms and conditions hereinafter appearing.

NOW IT IS HEREBY AGREED BY AND BETWEEN THE PARTIES HERETO AS FOLLOWS:

1. Definition
2. Engagement
3. Scope of services
4. Duration/Termination
5. Delivery process
6. Service levels
7. Payment terms
8. Liability or Losses & Damages
9. Statutory compliance, undertaking, warranties and indemnity
10. Force majeure
11. Disputes, Arbitration and Jurisdiction
12. Miscellaneous

Name of Raw Materials (starting materials) used : | |
(Please use separate sheet for different products, if	
required)	
Are your suppliers approved?	Yes / No / NA
Do you have an approved DMF for the products to be	Yes / No/ NA
approved? If yes then:-	
If it is registered in any regulatory, semi-regulatory	
country?	
What is the DMF number?	
Please provide open part of DMF.	
Note: - Please attach extra sheet if required.	
Are procedures for controlling documentation in force?	Yes / No/ NA
What kind of documents do you use:	

Are Batch no(s) assigned to the products produced?	Yes / No / NA
Are there any in-process checks in the manufacturing	Yes / No/ NA
process?	
Are documented procedures available for cleaning,	Yes / No/ NA
disinfection/fumigation of premises?	
Are regular in-process tests performed for quality	Yes / No/ NA
control?	
Are all manufacturing procedures approved, documented	Yes / No/ NA
and controlled?	
Is there documented procedure for handling process	Yes / No/ NA
deviations?	
Is there a pest control procedure?	Yes / No/ NA
Is there documented procedure for waste and scrap	Yes / No/ NA
disposal?	
Are the equipments used in the manufacturing properly	Yes / No/ NA
identified and validated, (if required)?	
Do you have specifications and Standard Operating	Yes / No/ NA
Procedures for raw materials / in-process materials /	
finished products?	
Are the batch records reviewed and the batch released	Yes / No/ NA
before its final dispatch to the indenters?	
Do you keep records for Production process?	Yes / No/ NA
Is the system of line clearance followed before a batch	Yes / No/ NA
change over?	
Is there a lot recall procedure exists?	Yes / No/ NA
Are samples from incoming raw materials, in-process and	Yes / No/ NA
final product properly controlled?	
Is there any material of Animal Origin used during the	Yes / No/ NA
manufacturing procedure? If yes, then Please specify:	
Tissue of the animal used (i.e. brain, lung, blood etc.)	
Country where the animal originated and tissue was	
collected	
Feeding and Slaughtering method	
Means of controlling cross contamination (i.e. dedicated	
equipment, recognized cleaning/sanitization process	
etc.)	
Please provide declaration of BSE/TSE free products?	
Do you use organic solvents in manufacturing of	Yes / No/ NA
products? If yes, please provide declaration of OVI free	
certificate?	
Is there a procedure for return of unused material to	Yes / No/ NA
stores?	
Is there a procedure for retrieval and subsequent	Yes / No/ NA
destruction of obsolete documents?	
Is there a 'Quality system' that addresses the	Yes / No/ NA
organizational structure, responsibilities, procedures,	
processes and resources for implementing quality	
management?	
Do you perform inspection on incoming raw materials?	Yes / No/ NA
Are acceptance and rejection criteria established for	Yes / No/ NA
all raw materials?	
Do you keep records for such Inspections?	Yes / No/ NA
Do you issue certificate of analysis for each batch of	Yes / No/ NA
the product?	
Do you have calibration program?	Yes / No/ NA
Do you perform in-house calibration or it is contracted.	Yes / No/ NA
If contracted name the company?	
Is calibration traceable to appropriate standards?	Yes / No/ NA
Do you keep records for Calibration?	Yes / No/ NA
Do you have preventive maintenance program for	Yes / No/ NA
equipment?	
Do you keep records for preventive maintenance?	Yes / No/ NA
Do you perform control of non-conforming products?	Yes / No/ NA
Do you have adequate storage capacity & are procedures	Yes / No/ NA

	for storage established?	
	Are the environmental conditions of the finished goods	Yes / No/ NA
	storage area controlled w.r.t. temperature and humidity?	
	Do you have training program?	Yes / No/ NA
	Are there physically segregated areas for raw and	Yes / No/ NA
	packaging materials?	
	Do you have a process flow diagram for the manufacturing	Yes / No/ NA
	operations? (If 'Yes', attach copy)	
	Do you perform stability analysis? If yes please provide	Yes / No/ NA
	the result of stability of last one year for the	
	materials to be approved.	
	Do you perform impurity testing?	Yes / No/ NA
	Do you have a procedure for handling of rejection	Yes / No/ NA
	materials	
	Do you have a separate controlled area for rejection	Yes / No/ NA
	materials	

Please provide three pre-purchase samples (3 samples from different batches/lots) along with COA and Method of analysis (in case of non-pharmaceutical products).

Note: Write the information in the assigned space. Put tick (✓) in the answer wherever it is applicable and strike out wherever it is not applicable.

General information:

1. Name of Raw Materials (starting materials) used : | |
 | | |
 |(Please use separate sheet for different products, if | |
 required) | |
 | | |

2. Are your suppliers approved? :
 Yes / No / NA
 (Attach separate sheet, if required)

3. Do you have written procedure/instructions for testing of raw materials? :
 Yes / No / NA

4. Are Batch no(s) assigned to the products produced? :
 Yes / No / NA

5. Are there any in-process checks in the manufacturing process? :
 Yes / No / NA

6. Are documented procedures available for cleaning/ disinfection of premises? :
 Yes / No / NA

7. Are regular in-process tests performed for quality control? :
 Yes / No / NA

8. Are all manufacturing procedures approved, documented and controlled? : Yes /
 No / NA

9. Is there documented procedure for handling process deviations? :
 Yes / No / NA

10. Is there a pest control procedure? :
 Yes / No / NA

11. Is there documented procedure for waste and scrap disposal? :
 Yes / No / NA

12. Are the batch records reviewed and the batch released before its final dispatch to the indenters? :
 Yes / No / NA

13. Is the system of line clearance followed before a batch change over? : Yes / No / NA

14. Is there a lot recall procedure exists? :
 Yes / No / NA

15. Is there a procedure for retrieval and subsequent destruction of obsolete documents, artworks etc.? :
 Yes / No / NA

16. Do you issue certificate of analysis for each batch of the product? :
 Yes / No / NA

17. Do you have calibration program? :
 Yes / No / NA

18. Do you keep records for Calibration? :
 Yes / No / NA

19. Do you have preventive maintenance program for equipment? :
 Yes / No / NA

20. Do you keep records for preventive maintenance? :
 Yes / No / NA

21. Do you perform control of non-conforming products? :
 Yes / No / NA

22. Do you have adequate storage capacity & are procedures for storage established? :
 Yes / No / NA

23. Do you have training program? : Yes /
 No / NA

24. Are there physically segregated areas for raw and finished materials? :
 Yes / No / NA

25. Do you have a process flow diagram for the manufacturing operations? (If 'Yes', attach copy). :
 Yes / No / NA

26. Do you perform stability analysis? If yes, please provide the result of stability of last one year for the materials to be approved. : Yes / No / NA

27. Are the area for storage of materials have controlled temperature & humidity? : Yes / No / NA

28. Do you keep Rejection Records? : Yes / No / NA

29. Do you have a separate controlled area for rejection materials? :
 Yes / No / NA

30. Do you have written established procedure for destruction of rejected materials? : Yes / No / NA

Please provide three pre-purchase samples (3 samples from different batches/lots) along with COA.

STANDARD OPERATING PROCEDURE SOP No. : QMS 034
Revision No.: 00

Title: Assessment and approval of vendors Supersedes : None
Page No. : 1 of 15

1.0 Objective

To lay down the procedure for assessment and approval of vendors.

2.0 Scope

This Standard Operating Procedure is applicable to assess, qualify and approve the vendors of Raw Materials, culture media for testing, critical consumables, Packaging Materials, experimental animals, contractual testing laboratories and various service providers such as calibration agencies, pest control contractors at Company name.

3.0 Responsibility

3.1 Head, Global sourcing department or his/her designee shall be responsible for providing information from vendor, procurement, alternative vendor system, implementation and compliance of the procedure.

3.2 Head, Quality Control or his/her designee shall be responsible for arranging the sampling and testing/analysis of pre-purchase and commercial supply samples, as applicable

3.3 Head, Warehouse, Head, Quality Control and Head Animal House or his/her designee shall be responsible for providing the required testing data and delivery performance respectively for the raw material, culture media for testing, experimental animals and packaging material during performance control of vendors. In case of Service providers (Calibration and validation/revalidation), Engineering department shall provide the annual performance. Head – QC shall provide the annual performance of contractual testing laboratories. Head Administration shall be responsible for providing annual performance of Service provider for Pest Control.

3.4 A team constituted by Head of Quality Assurance department shall be responsible for evaluation/assessment of the vendors, as applicable.

4.0 Abbreviations and Definitions

4.1 SME - Subject Matter Expert

4.2 cGMP - Current Good Manufacturing Practices

4.3 VMT - Vendor Management Team

4.4 QMS - Quality Management System

4.5 WHO - World Health Organization

4.6 RM - Raw Material

4.7 PM - Packaging Material

STANDARD OPERATING PROCEDURE SOP No. : QMS 034
Revision No.: 00

Title: Assessment and approval of vendors Supersedes : None
Page No. : 2 of 15

4.8 DMF - Drug Master File

4.9 VI - Valuation Index

4.10 CAPA - Corrective Action and Preventive Action

4.11 GPT - Growth Promotion Test

4.12 IOM - Inter Office Memorandum

4.13 OOS - Out of Specification

4.14 VAQ - Vendor Assessment Questionnaire

4.15 NRA - National Regulatory Authority

4.16 Vendor - The term shall include the manufacturer and/or supplier of raw and packaging materials, culture media for testing, experimental animals, contractual testing laboratories and service providers.

4.17 Approved Vendor - A vendor who has been approved by Company Name as per this SOP

5.0 Procedure

5.1 The manufacturers (Raw Materials, Packing Materials, Culture media and Lab. Chemicals etc.), suppliers (Eggs and animals), Contractual testing laboratories and service providers (Pest control and Calibration or validation service providers) shall be assessed and qualified before start purchasing material or availing services.

5.2 Selection of vendors

Vendors should be selected based upon following criteria:

5.2.1 Market reputation (global/local existence in the same field, business turnover and QMS etc.).

5.2.2 Information assess through internet (DMF holder/no. of accreditations/no. of clients etc.).

5.2.3 Certification / Qualification from WHO / other reputed regulatory authorities.

5.2.4 Easy to contact.

5.2.5 No. of years in business.

5.2.6 Already approval for other site of xxxxx company and recommendations from CQA.

5.3 Preparation of vendor development Team:

The vendor development team shall include representatives from Global sourcing

STANDARD OPERATING PROCEDURE SOP No. : QMS 034

Revision No.: 00

Title: Assessment and approval of vendors Supersedes : None
Page No. : 3 of 15

department and Quality Assurance with support as appropriate from Production, Quality Control, and Engineering. Selection of the members of the vendor development team should be based upon the following criteria:

5.3.1 Experience of minimum 3 – 4 years.

5.3.2 Expertise in concerned activity.

5.3.3 Good knowledge of cGMP requirements.

5.3.4 Trainings on Vendor Qualification and training on cGMP.

5.4 Classification of Materials:

5.4.1 Critical Materials:

Criticality is decided on the basis of critical factors such as direct contact of the material with final product (ARM), impact on stability of product, printed packing materials, any material of biological origin, sterile materials and de-pyrogenated materials. Contract testing lab. shall be considered equivalent to critical materials. Define the material for critical or non-critical after evaluation as per Material assessment record (Annexure – 1).

5.4.2 Non-Critical Material:

Any material which is not classified as critical material.

5.4.3 Critical consumables:

Materials/consumables that are used during processing of final product, but are not a part of the finished product. For example:- Silicon tubing, 0.2 µm filters etc.

5.4.4 Minimum requisite for critical/non-critical Vendor and Service Provider:

Following is the minimum requisite for vendor approval of critical/non-critical Vendor:

Requirements Non Critical Critical Service

(2)

If the vendor is an approved DMF holder or Approved by WHO for the required material, the site audit may not be necessary for approval of critical vendor.

(3)

Site Audit is mandatory in case of Contractual Testing Laboratories only

(4)

Quality Agreement shall be prepared in case of Analytical Testing Lab only

5.5 Criteria for Evaluation/Assessment of vendors:

5.5.1 Upon request from Global sourcing department, Quality Assurance Department shall provide the "Vendor pre-audit assessment Questionnaire". The pre-audit questionnaire shall be given in two parts i.e. General Questionnaire, Annexure – 2 and Specific questionnaire based upon vendor to be qualified. Following specific questionnaire shall be used as required:-

"Pre-audit questionnaire for RM/Critical consumables vendors" – Annexure 3,

"Pre-audit questionnaire for PM vendors" – Annexure 4,

"Pre-audit questionnaire for eggs suppliers" – Annexure 5,

"Pre-audit questionnaire for animals suppliers" – Annexure 6,

"Pre-audit questionnaire for contractual testing laboratories" – Annexure 7, &

"Pre-audit questionnaire for service providers – Annexure 8.

5.5.2 Send the questionnaire through Global sourcing department and ask to provide the filled questionnaire and other supporting documents. Ask the vendor to provide pre-purchase samples (preferably 3 samples from different batches) along with certificate of analysis, as applicable. Quantity of each sample shall be sufficient to conduct at least one complete testing as per specifications.

Service providers and analytical testing laboratories shall not be subjected to any pre-purchase samples and only filled questionnaire is sufficient for preliminary evaluation.

Note: FAQ (Frequently asked Questions) provided by vendor can be accepted in place of filled checklist for preliminary evaluation if it is able to provide the

STANDARD OPERATING PROCEDURE SOP No. : QMS 034

Revision No.: 00

Title: Assessment and approval of vendors Supersedes : None

Page No. : 5 of 15

information which can fulfils the minimum criteria of evaluation i.e. ≥ 90%.

5.5.3 If required, share the specification of required material(s) with vendor through Global sourcing department.

5.5.4 Upon receipt of filled form "Vendor pre-audit assessment Questionnaire" from the vendor, along with the samples, Quality Assurance Department shall evaluate the information furnished by the vendor as per evaluation of valuation index.

5.5.5 The filled checklist is scored as per the following criteria.

Where the activity mentioned in the Check-list is:

5.5.5.1 Followed (Yes) 1 points
5.5.5.2 Not followed (No) 0 point
5.5.5.3 Not applicable (NA) Not considered for evaluation.

Note: General information and fill in the blanks in the checklist shall not be assigned any point and points in checklist marked as not applicable shall not be considered for valuation index.

5.5.6 Valuation Index is calculated as under and is expressed in percentage:

Marks obtained

Valuation index (VI) = ----- X 100 (%)

Total Marks

5.5.7 In case VI is < 90% vendor should be rejected and samples should not be sent to QC and returned back to the vendor. If the valuation index (VI) is ≥ 90%, then the following steps shall be taken for approval of vendor.

5.5.8 Send the samples to QC along with the COA of respective samples along with the request for analysis (Annexure – 9) for vendor approval. The samples of culture media shall be subjected to Growth promotion Testing (GPT), and if required, additional testing should be carried out.

5.5.9 QC after testing as per in-house/pharmacopeia specifications, shall give results to QA and only those vendors shall be considered for approval whose all samples passes the testing.

5.5.10 After evaluation of the questionnaire and results of the samples analysis, Head – Quality Assurance or his designee or a designated team/trained personnel shall audit the manufacturing location to conduct the site audit of the vendor
STANDARD OPERATING PROCEDURE SOP No. : QMS 034
Revision No.: 00

Title: Assessment and approval of vendors Supersedes : None

Page No. : 6 of 15

facility (in case of critical materials, wherever applicable).

5.5.11 The audit team visits the site of the vendor for evaluating his Quality Management System & material requirements as per vendor site audit checklist filled. Vendor site audit checklist can be used for reference only; site audit can go beyond the information contained in the checklist. Following specific audit checklist shall be used as required:-

"Audit Checklist for RM/Critical consumables vendors" – Annexure 10,

"Audit Checklist for Packaging Materials vendors" – Annexure 11,

"Audit Checklist for eggs suppliers" – Annexure 12,

"Audit Checklist for animals suppliers" – Annexure 13,

"Audit Checklist for contractual testing laboratories" – Annexure 14, &

"Audit Checklist for Service providers – Annexure 15.

5.5.12 After site audit, audit team shall prepare the Vendor Site Audit Report (Annexure – 16) and write recommendations/Observations.

5.5.13 Based upon observations made by auditors, vendor shall be asked to submit CAPA report within 4 weeks. In such case, vendor shall be approved conditionally for first three commercial consignments.

5.5.14 CAPA report submitted for compliance of the audit observations shall be evaluated. If the vendor comply all the recommendations, vendor shall be approved. If the CAPA report is not submitted within defined timeline or it is not effective, a warning letter to vendor shall be issued to vendor for submission of CAPA within one week after receipt of warning letter and if vendor still does not submits CAPA, The vendor shall be delisted and same shall be communicated to CQA, Global Sourcing, WH and other concerned departments.

5.5.15 QA shall prepare "Vendor approval report" – Annexure 17 after review of satisfactory CAPA. Prepare an addendum to the existing list of approved vendors and send information to warehouse, QC, CQA and global sourcing department. Include the name of the vendor in the list of approved vendors for RM/PM, Annexure – 18, & list of contract testing laboratories/service providers, Annexure – 19 on monthly basis.

5.5.16 After approval of vendor, QA department should send a Quality Agreement for STANDARD OPERATING PROCEDURE SOP No. : QMS 034
Revision No.: 00

Title: Assessment and approval of vendors Supersedes : None

Page No. : 7 of 15

manufacturer/Critical materials and contractual testing laboratories Annexure – 20 and Service agreement for service providers, Annexure – 21 to the vendor (preferably through Global sourcing department). The quality agreement shall be valid for three years, however the service agreement shall be prepared annually. The Quality /Service Agreement to be signed in between Company Name. and vendor, shall be prepared. The content of Quality/Service agreement may be prepared on case to case basis depending upon materials/services provided.

5.5.17 In case a vendor has its own developed quality agreement the same may be accepted if it is having following clauses:

- Manufacturing compliance as per cGMP, including batch records.

- Quality control including analysis, stability testing if applicable and OOS handling.

- Quality assurance including documentation, SOPs, product release, Deviation and Investigations, Change management, complaints and Batch disposition.

5.5.18 At least three service providers shall be approved for each type of service taken from external agencies (Except services of Pest Control). Similarly for critical Raw materials, Packaging materials and critical consumables at least one alternative vendor shall be approved as applicable.

5.5.19 Record of vendor approval:

The record of vendor approval contains the following documents (but not limited to):

5.5.19.1 Checklist for the vendor assessment (Pre-audit questionnaires).
5.5.19.2 Vendor's Quality Management System assessment by accredited agency for example:- GMP certificate, GLP approval, CPCSEA approval, NABL accreditation, WHO-GMP certificate or any other regulatory or semi regulatory certification.
5.5.19.3 Test reports.
5.5.19.4 Vendor Site Audit checklist.
5.5.19.5 Vendor Site Audit Report
STANDARD OPERATING PROCEDURE SOP No. : QMS 034
Revision No.: 00

Title: Assessment and approval of vendors Supersedes : None
Page No. : 8 of 15

5.5.19.6 Vendor Approval Report.
5.5.19.7 Quality Agreement.
5.5.19.8 Any other relevant documents.
5.5.20 Updating of vendor approval record :
5.5.20.1 If an approved vendor's Quality Management System certificate is renewed, the renewed certificate is appended to the records.
5.5.20.2 A list of qualified and approved vendors prepared by QA Department shall be issued to Warehouse, QC, Production Department, Animal House, Global sourcing & list of approved service providers to respective functional departments like Engineering/administration on monthly basis.
5.6 When any new material is to be procured from already approved vendor, following steps shall be taken:
5.6.1 In case, where the already approved vendor has to be approved for a new material, Global sourcing department shall send "Pre-audit assessment questionnaire" for the specific questionnaire and procure pre purchase samples (preferably 3 samples from 3 different batches) from vendor.
5.6.2 Global sourcing department shall forward the questionnaire along with samples to QA. Quality Assurance department shall evaluate the questionnaire and if the valuation index (VI) is $\geq 90\%$, then forward the pre-purchase samples to QC along with the request for analysis (Annexure 9). QC shall give the results of analysis to QA. In case VI is $< 90\%$ samples should not be sent to QC and returned back to the vendor.
5.6.3 If pre-purchase samples passes the tests, the material shall be considered as approved material to purchase from already approved vendor and Quality Assurance Department shall prepare the Approval Report of additional material (Annexure – 22) which shall be appended to the record of vendor and the material shall be included in Approved vendor list, when the next review is due. An addendum to approved Vendor list for updating of new material shall be circulated to Warehouse, Quality Control and other concerned departments as per Annexure – 28.
5.6.4 In case, the vendor is already approved for any type of material from any other
STANDARD OPERATING PROCEDURE SOP No. : QMS 034
Revision No.: 00

Title: Assessment and approval of vendors Supersedes : None
Page No. : 9 of 15

manufacturing location of the vendor, the vendor should be audited as per new vendor qualification procedure.
5.6.5 In case of change of Vendor for the same material / same type with same specification, a change control shall be initiated by user. The product stability and material comparability shall be carried out for critical materials. For non-critical materials, only material comparability should be done.
5.7 Disqualification of vendor:
An approved vendor may be disqualified based upon one or more of the following criteria, and following below mentioned procedure:
5.7.1 In case any single consignment of a specific material is rejected, then following an OOS procedure, if applicable, within a week a written communication shall be issued to the vendor through Global sourcing department, as per "Caution Letter" – Annexure 23 for thorough investigation and a detailed investigation report shall be sought from the vendor within the period of maximum 30 days. Global sourcing department shall not purchase same material from the vendor until clearance is given from QA. In case detailed investigation with effective CAPA is received from vendor end, QA shall give clearance for further purchase of the material.
5.7.2 In case any new consignment is received during investigation, it shall be tested as per procedure and shall only be used if material passes full testing parameters as per the specifications and if the consignment(s) get rejected in any of the parameter(s), the vendor shall be put on hold and final approval/rejection shall be made after following the complete requalification procedure.
5.7.3 If qualification of the vendor from WHO/other regulatory authority is cancelled, vendor shall be disqualified and same shall be intimated to corporate QA.
5.7.4 In case of raw materials including culture media, eggs, critical consumables and animals, more than 10% rejection in terms of number of consignments received annually from approved vendor, shall render a vendor unapproved for that specific material and in such case, site audit/visit (as appropriate) for re-approval shall be carried out. Similarly in case of packaging Materials, more than 15% rejections in terms of number of consignments received annually from approved vendor, shall render a vendor unapproved for that specific material
STANDARD OPERATING PROCEDURE SOP No. : QMS 034
Revision No.: 00

Title: Assessment and approval of vendors Supersedes : None
Page No. : 10 of 15

and in such case, site audit/visit (as appropriate) for re-approval shall be carried out.

5.7.5 Three successive rejections of the materials shall render a vendor unapproved for that specific material and in such case, site audit/visit (as appropriate) for re-approval shall be carried out. Vendor shall be approved only after quality results of 3 lots of pre-purchased samples (as applicable). Upon successful evaluation of vendor, vendor should be included in approved vendor list.

5.7.6 If any vendor is disqualified, then CQA shall be informed to evaluate the impact for other sites.

5.7.7 In case, no material / service has been procured / provided respectively from an approved vendor for the last three years, the vendor shall be subjected to reassessment before restart the purchasing of material from the same vendor.

5.8 Quality dispute resolution

5.8.1 If there is any quality dispute related to material, being supplied by vendor, the following resolutions shall be done:

5.8.1.1 QC personnel of Company nameshall perform the quality test at vendor's site.

5.8.1.2 QC personnel of vendor shall perform the quality test at Company Name site.

5.8.1.3 Third party consultation or resolution may be taken into consideration.

5.9 Re-evaluation of vendor:

Each approved vendor, from which the company is procuring materials, shall be re-evaluated every 3rd year + three months. Contractual testing laboratories & service providers, from which the company is taking services, shall be evaluated every year to get updated information of the vendor. The following steps shall be taken for re-evaluation of vendor:

5.9.1 Prepare a schedule of vendor audit every year (preferably in first month) for the vendor's audit due in current year as per "Vendor audit Schedule", Annexure – 24. The audit schedule shall be shared with Global sourcing department for sharing audit information and asking for possible audit dates.

Update the audit schedule on monthly basis to check the actual performance of
STANDARD OPERATING PROCEDURE SOP No. : QMS 034
Revision No.: 00

Title: Assessment and approval of vendors Supersedes : None
Page No. : 11 of 15

the audit.

5.9.2 Send "Vendor pre-audit assessment Questionnaire" to all the vendors before due dates of vendor approval. Send pre-audit questionnaire in two parts i.e. General Questionnaire Annexure – 2 and Specific questionnaire based upon vendor to be qualified. Following specific questionnaire shall be used as required:-

"Pre-audit questionnaire for RM/Critical consumables vendors" – Annexure 3,

"Pre-audit questionnaire for PM vendors" – Annexure 4,

"Pre-audit questionnaire for eggs suppliers" – Annexure 5,

"Pre-audit questionnaire for animals suppliers" – Annexure 6,

"Pre-audit questionnaire for contractual testing laboratories" – Annexure 7, &

"Pre-audit questionnaire for service providers" – Annexure 8.

5.9.3 The vendor whose Valuation Index (VI) is $\geq 90\%$ shall be considered to remain under approved vendor list.

5.9.4 After reviewing all the updated information and analysis of retrospective data, Quality assurance Department shall prepare the Re-evaluation Report of Vendor (Annexure – 26). Based upon the assessment of filled questionnaire and review of three years performance report, vendor shall be re-qualified for next three years.

5.9.5 Vendor, from which the critical material is procured, shall preferably be audited once in three years and asked to submit CAPA report within a period of 4 weeks. If the vendor is an approved DMF holder or approved form WHO for the required material and if the material supplies from a vendor have been consistently meeting the specifications and there are no quality issues, then the vendor re-audit may be exempted and in this case only the vendor assessment questionnaire is considered adequate.

5.9.6 CAPA report submitted for compliance of the audit observations shall be evaluated. If the vendor comply all the recommendations, vendor shall be approved. If the CAPA report is not submitted within defined timeline or it is not effective, vendor shall not be approved.

5.9.7 Upon successful re-approval of vendors, the quality / service agreement shall also be reviewed as per Annexure – 20 and Annexure – 21.

STANDARD OPERATING PROCEDURE SOP No. : QMS 034
Revision No.: 00

Title: Assessment and approval of vendors Supersedes : None
Page No. : 12 of 15

5.10 Performance control of vendors:

5.10.1 The Quality Control Department gives annually, to QA Department, a retrospective report of the test based performance of each vendor, in respect of raw materials, used for production and culture media used for testing and in respect of testing of samples for water or any other outsource testing facility. Similarly for service providers for calibration and validation, Engineering department shall provide the performance of respective calibration/validation agencies. In case of test based performance of animal supplier, Animal house shall provide the performance of approved animal suppliers.

Similarly Warehouse shall also submit a report of the vendor's performance regarding the delivery related issues as per vendor performance report, (Annexure – 25) as follows:-

5.10.1.1 Warehouse

Warehouse shall provide the following information as performance of vendor:-

5.10.1.1.1 Name of the vendor.

5.10.1.1.2 Vendor category.

5.10.1.1.3 Products delivered.

5.10.1.1.4 Performance of vendor.
5.10.1.1.5 Observation.
5.10.1.2 Quality Control
5.10.1.2.1 Name of the vendor.
5.10.1.2.2 Vendor category.
5.10.1.2.3 Products delivered.
5.10.1.2.4 Performance of the vendors.
5.10.1.2.5 Results of tests performed with following information:
a. S. No.
b. Name of the Product.
c. Batch No.
d. Folio No.
e. Date of the test.
f. Total No. of Samples.
STANDARD OPERATING PROCEDURE SOP No. : QMS 034
Revision No.: 00

Title: Assessment and approval of vendors Supersedes : None
Page No. : 13 of 15

g. Results (Pass/Fail).
h. Remarks.
5.10.1.3 Animal House
5.10.1.3.1 Name of Supplier.
5.10.1.3.2 Supplier category.
5.10.1.3.3 Animals delivered.
5.10.1.3.4 Performance of Supplier.
5.10.1.3.5 Observation.
5.10.1.4 Engineering department
5.10.1.4.1 Name of contractual testing facility.
5.10.1.4.2 Testing facility category.
5.10.1.4.3 Performance of the vendor.
5.10.1.4.4 Observation.
5.10.1.5 Quality Assurance
5.10.1.4.1 Name of vendor.
5.10.1.4.2 Vendor category.
5.10.1.4.3 Products delivered.
5.10.1.4.4 Reference reports (all reference report whosever applicable).
5.10.1.4.5 Reference report number and date along with name of concerned department.
5.10.1.4.6 Observations.
5.10.2 The QA Department will prepare Performance Control Report of the vendors every year, irrespective of the material purchased or not in last calendar year. The performance report shall be prepared for all the approved vendors/service providers.
5.10.3 The performance reports shall be assigned identification numbers as follows:
The first two letters correspond to the department which prepares the report e.g. QA for quality assurance department. This is followed by a slash (/) followed by three letters 'VPR' corresponding to the 'Vendor Performance Report' followed by (-) which is followed by a four digit number. The first two digits represent the last two digits of the year to which the report pertains and
STANDARD OPERATING PROCEDURE SOP No. : QMS 034
Revision No.: 00

Title: Assessment and approval of vendors Supersedes : None
Page No. : 14 of 15

the next two digits represent the consecutive number of the vendor performance report in continuation.
For example QA/VPR-1201 represents the first performance report of a vendor pertaining to the year 2023 prepared by QA department.
This numbering system shall remain same for the report from Warehouse, Animal House, Engineering and Quality Control.
5.11 Refer to the vendor approval and assessment chart as per Annexure – 27.
5.12 After approval of vendor send intimation to CQA, Global sourcing department and warehouse departments as per Annexure – 28.
6. Forms and Records:
6.1 Material assessment record. Annexure 1
6.2 General questionnaire. Annexure 2
6.3 Pre-audit questionnaire for RM/Critical consumables vendors. Annexure 3

Assessment of Raw materials and Packaging materials

Material Name:

Material Code: In House Specification No.:

Material Type:

The Material is being used for manufacturing of following products:

ASSESSMENT

Assessment Criticality

Assessment Criteria

(Yes/No/NA) (Critical/Non-critical)

Does this material being used in final bulk product?

If the product has direct contact with final product?

Does it have impact on stability of product?

If the material is a printing packaging material?

Is the material is of biological origin?

Is the material sterile and / or de-pyrogenated?

Conclusion: Based on this criticality assessment the material is classified as Critical/Non-critical.

Pre-audit questionnaire for RM/Critical consumables vendors

Name of the organization

Address of the organization

Name of the material(s) to be approved, attach list if required

Note: Write the information in the assigned space. Put tick (■) in the answer wherever it is applicable and strike out wherever it is not applicable.

1. Name of Raw Materials (starting materials) used :
(Please use separate sheet for different products, if required)
2. Are your suppliers approved? Yes / No / NA
3. Do you have an approved DMF for the products to be approved? If yes Yes / No/ NA then:-
- If it is registered in any regulatory, semi-regulatory country?
- What is the DMF number?
- Please provide open part of DMF.
Note: - Please attach extra sheet if required.
4. Are procedures for controlling documentation in force? Yes / No/ NA
What kind of documents do you use: _____
5. Are Batch no(s) assigned to the products produced? Yes / No / NA
6. Are there any in-process checks in the manufacturing process? Yes / No/ NA
7. Are documented procedures available for cleaning, Yes / No/ NA
disinfection/fumigation of premises?
8. Are regular in-process tests performed for quality control? Yes / No/ NA
9. Are all manufacturing procedures approved, documented and controlled? Yes / No/ NA
10. Is there documented procedure for handling process deviations? Yes / No/ NA
11. Is there a pest control procedure? Yes / No/ NA
12. Is there documented procedure for waste and scrap disposal? Yes / No/ NA
13. Are the equipments used in the manufacturing properly identified and Yes / No/ NA validated, (if required)?
14. Do you have specifications and Standard Operating Procedures for raw Yes / No/ NA

Pre-audit questionnaire for RM/Critical consumables vendors

materials / in-process materials / finished products?

15. Are the batch records reviewed and the batch released before its final Yes / No/ NA dispatch to the indenters?
16. Do you keep records for Production process? Yes / No/ NA

17. Is the system of line clearance followed before a batch change over? Yes / No/ NA
18. Is there a lot recall procedure exists? Yes / No/ NA
19. Are samples from incoming raw materials, in-process and final product Yes / No/ NA properly controlled?
20. Is there any material of Animal Origin used during the manufacturing Yes / No/ NA procedure? If yes, then Please specify:
 - Tissue of the animal used (i.e. brain, lung, blood etc.)
 - Country where the animal originated and tissue was collected
 - Feeding and Slaughtering method
 - Means of controlling cross contamination (i.e. dedicated equipment, recognized cleaning/sanitization process etc.)
 - Please provide declaration of BSE/TSE free products?
21. Do you use organic solvents in manufacturing of products? If yes, please Yes / No/ NA provide declaration of OVI free certificate?
22. Is there a procedure for return of unused material to stores? Yes / No/ NA
23. Is there a procedure for retrieval and subsequent destruction of obsolete Yes / No/ NA documents?
24. Is there a 'Quality system' that addresses the organizational structure, Yes / No/ NA responsibilities, procedures, processes and resources for implementing quality management?
25. Do you perform inspection on incoming raw materials? Yes / No/ NA
26. Are acceptance and rejection criteria established for all raw materials? Yes / No/ NA
27. Do you keep records for such Inspections? Yes / No/ NA
28. Do you issue certificate of analysis for each batch of the product? Yes / No/ NA
29. Do you have calibration program? Yes / No/ NA

Page 2 of 4

Pre-audit questionnaire for RM/Critical consumables vendors

30. Do you perform in-house calibration or it is contracted. Yes / No/ NA
If contracted name the company?
31. Is calibration traceable to appropriate standards? Yes / No/ NA
32. Do you keep records for Calibration? Yes / No/ NA
33. Do you have preventive maintenance program for equipment? Yes / No/ NA
34. Do you keep records for preventive maintenance? Yes / No/ NA
35. Do you perform control of non-conforming products? Yes / No/ NA
36. Do you have adequate storage capacity & are procedures for Yes / No/ NA storage established?
37. Are the environmental conditions of the finished goods storage area Yes / No/ NA controlled w.r.t. temperature and humidity?
38. Do you have training program? Yes / No/ NA
39. Are there physically segregated areas for raw and packaging materials? Yes / No/ NA
40. Do you have a process flow diagram for the manufacturing operations? Yes / No/ NA (If 'Yes', attach copy)
41. Do you perform stability analysis? If yes please provide the result of Yes / No/ NA stability of last one year for the materials to be approved.
42. Do you perform impurity testing? Yes / No/ NA
43. Do you have a procedure for handling of rejection materials Yes / No/ NA
44. Do you have a separate controlled area for rejection materials Yes / No/ NA

Please provide three pre-purchase samples (3 samples from different batches/lots) along with COA and Method of analysis (in case of non-pharmaceutical products).

Checklist of the attachments:

1. DMF (Open Part) : Attached/Not Attached/Not applicable.
2. Declaration of BSE/TSE free material : Attached/Not Attached/Not applicable.
3. Declaration of OVI free material : Attached/Not Attached/Not applicable.
4. Process flow diagram : Attached/Not Attached/Not applicable.
5. 3 pre-purchase samples with COA : Attached/Not Attached/Not applicable.

Name of the material(s) to be approved, attach list if required

Material to be supplied (please tick): SPF eggs / Clean eggs / pre-incubated SPF eggs / pre-incubated clean eggs.

Note: Write the information in the assigned space. Put tick (■) in the answer wherever it is applicable and strike out wherever it is not applicable.

1. Are there enough animal rooms of appropriate design to allow separate Yes / No / NA housing of:

- i. The breeding colony
- ii. Different animal species
- iii. Sick animals

2. Do you have health monitoring system? Yes / No / NA

3. Do you have Filtered-air-positive-pressure (FAPP) poultry housing? Yes / No / NA

4. Do you have Critical biosecurity measures? Yes / No / NA

5. Do you have Careful selection of layer flocks? Yes / No / NA

6. Does your establishment regularly inspected? Yes / No / NA

7. Does your establishment satisfies the following criteria:

■ The country is free from notified avian influenzae (both highly Yes / No / NA

pathogenic and low pathogenic avian influenza)

■ The eggs are drawn from an establishment where: Yes / No / NA

■ New Castle disease (Ranikhet disease)

■ Infectious Bursal disease (Gumboro disease)

■ Marek's disease, Mycoplasmosis (M. gallisepticum)

■ Fowl typhoid (Salmonella gallinarum)

■ Pullorum disease (Salmonella pullorum)

■ Fowl pox

Page 1 of 5

Pre-audit Questionnaire for eggs suppliers

- Avian infectious bronchitis
- Avian infectious laryngotracheitis
- Avian tuberculosis
- Psittacosis-ornithosis (Avian chlamydiosis)
- Fowl cholera (Pasteurellosis)
- Salmonella enteritidis
- West Nile Virus
- Salmonella typhimurium
- Egg drop syndrome (EDS)
- Avian encephalomyelitis
- Avian leucosis J. Virus
- Chicken anaemia
- Inclusion body hepatitis infection (IBH) has not been reported since past 12 months.
- Only clean eggs have been selected and fumigated and the eggs are Yes / No / NA packed from the establishment into new boxes for export and transported directly to the placement of shipment through an area where the diseases mentioned above have not been reported.
- The flocks from which the hatching eggs have been obtained are tested Yes / No / NA regularly and found negative for the diseases as under
- Haemagglutination inhibition (H1) test for New Castle disease.
- Haemagglutination inhibition (H1) / Agar gel immunodiffusion (AGID) test for Avian Influenza.
- Agar gel immunodiffusion (AGID) test for Infectious bursal disease (Gumboro disease).
- Agglutination (Agg)/ Haemagglutination inhibition (H1) test for Mycoplasmosis.
- Agglutination (Agg) test for Fowl Typhoid and Pullorum Disease.
- Haemagglutination inhibition (H1) / Virus Neutralization (VN)

Enzyme linked immunosorbent assay (ELISA) for Avian infectious bronchitis.

- Agar gel immunodiffusion (AGID) test for Marek's disease / avian leucosis J. Virus.
- Agar gel immunodiffusion (AGID) / Virus Neutralization (VN) / Enzyme linked immunosorbent assay (ELISA) for Avian infectious laryngotracheitis.
- Virus Neutralisation test for Chicken Anaemia.
- The birds of the supply flock have never been fed with feed of Yes / No / NA ruminant origin.
- The eggs are shipped in new, fresh, clean and disinfected packages. Yes / No / NA

8. Do you have a certificate indicating non-reporting of 20 specified diseases Yes / No / NA since the last 12 months?
9. Do you have a certificate for monitoring the listed diseases in the flocks on Yes / No / NA fortnight basis on the randomly picked up samples of flocks i.e. 1.25% or 50 birds per week?
10. Do you issue Certificate of Analysis along with the material you supply? Yes / No / NA
11. Is proper veterinary care of animals being taken? Yes / No / NA
12. Are there facilities for collection and disposal of animal waste and of dead Yes / No / NA animals to minimize disease hazards and environmental contamination?
13. Are there facilities for cleaning, sanitizing, sterilizing and maintaining supplies Yes / No / NA and equipments including animal cages and racks?
14. Are there separate storage areas for equipments, animal feed, and bedding Yes / No / NA which are protected from infection/contamination, and with refrigeration where needed?
15. Is there separate space for locker, shower, toilet and washing facilities for staff Yes / No / NA working in the animal facilities?
16. Is there an appropriate functioning environmental control system regarding: Yes / No / NA

Page 3 of 5

- i. Temperature?
- ii. Humidity?
- iii. Adequate air changes /hour?
- iv. Time controlled lighting system?
- v. Appropriate noise control system?
17. Is emergency power available in the event of a power failure? Yes / No / NA
18. Do you have maintenance program for equipment? Yes / No / NA
19. Do you keep records for Calibration? Yes / No / NA
20. Do you perform quality audits? Yes / No / NA
21. Describe in brief the nature and identification of means of transport.
22. What type of containers used for transport?

Please provide three pre-purchase samples, (3 samples from different batches/lots) along with COA, if applicable.

1. Are there enough animal rooms of appropriate design to allow separate housing of:
- i. The breeding colony Yes / No / NA
 - ii. Different animal species Yes / No / NA
 - iii. Sick animals Yes / No / NA
2. Do you have health monitoring system? If yes, What type of tests do you Yes / No / NA perform?
-
-
-
-
3. Do you issue health certificate of animals you supply? If yes please provide a Yes / No / NA specimen copy.
4. Is proper veterinary care of animals being taken? Yes / No / NA
5. Are there facilities for collection and disposal of animal waste and of dead Yes / No / NA animals to minimize disease hazards and environmental contamination?
6. Are there facilities for cleaning, sanitizing, sterilizing and maintaining Yes / No / NA supplies and equipments including animal cages and racks?
7. Are there separate storage areas for equipments, animal feed, and bedding Yes / No / NA which are protected from infection/contamination, and with refrigeration where needed?
8. Is there separate space for locker, shower, toilet and washing facilities for staff Yes / No / NA working in the animal facilities?

Questionnaire for contractual testing laboratory

Name of the organization

Address of the organization

Name of the material(s) to be
approved, attach list if required

Note: Write the information in the assigned space. Put tick (■) in the answer wherever it is applicable
and strike
out wherever it is not applicable.

1. Quality System:

1.1 Are the personnel's responsibilities established in their Yes / No / NA
job descriptions?

1.2 Has the company / organization designated a responsible person Yes / No / NA
with enough authority to assure the established quality system?

1.3 Please mention the nature of your organization:

(Government/ Semi government/Private)

1.4 Are personnel qualified to perform their tasks? Yes / No / NA

Please attach the list of educational qualifications of personnel as a
minimum of those working at key positions.

2. Documentation:

2.1 Is the system of approval of documents established? Yes / No / NA

2.2 Is there an established procedure for approving changes in documents? Yes / No / NA

2.3 Is there a system to keep records of approved documents with their Yes / No / NA
edition/revision number?

2.4 Are procedures in force to assure the identification and traceability of Yes / No / NA
works/ tests carried out?

2.5 Is there a procedure for identifying, coding and archiving of records? Yes / No / NA

3. Calibration, Maintenance and Validation:

3.1 Is there a maintenance program in force for all measuring and test Yes / No / NA
equipments?

3.2 Do you have a calibration program? Yes / No / NA

3.3 Do you have procedures in force for performing Calibrations and Yes / No / NA
Maintenance work?

Page 1 of 3

Questionnaire for contractual testing laboratory

3.4 Does the measuring and test equipments clearly identified with Yes / No / NA
calibration status?

3.5 Are the standards used for Testing / Validation / Calibration traceable to Yes / No / NA
National / International Reference Standards?

3.6 Are the Instruments / Standards used for calibration regularly updated? Yes / No / NA

3.7 Do you have Standard Operating Procedures (SOPs) for carrying out Yes / No / NA
Testing / Validation / Calibration?

If so, can these be made available to the Company name XYZ, on Yes / No / NA
demand?

4. Audit and Inspection:

4.1 Is the facility subjected to quality audits? Yes / No / NA

4.2 Are quality audits performed to verify the efficacy of the Quality Yes / No / NA
System?

4.3 Is there a defined plan for audits? Yes / No / NA

4.4 Is there a follow up of corrective actions taken? Yes / No / NA

5. Training:

5.1 Is there a procedure for training of staff in their respective areas of Yes / No / NA
working?

5.2 Are training programs established? Yes / No / NA

5.3 Are training records maintained? Yes / No / NA

6. Testing:

6.1 Are documented procedures in force for handling samples and testing? Yes / No / NA

6.2 Is there a traceability of the records for a test sample / work carried Yes / No / NA
out? i.e. green sheets/logbooks/record forms etc.

6.3 Do you have required facilities for storage of samples before (and Yes / No / NA
after) testing? Do you have a procedure for destruction of samples
after analysis?

6.4 Are there separate areas for samples requiring special storage Yes / No / NA
conditions?

Page 2 of 3

Questionnaire for contractual testing laboratory

6.5 Do you issue certificate of analysis for the sample/product tested? Yes / No / NA

6.6 Are there adequate facilities for testing of sterile products Including Yes / No / NA
sterility and pyrogen testing?

6.7 Is the sterility testing room classified? Yes / No / NA

Note: Write the information in the assigned space. Put tick (■) in the answer wherever it is applicable and strike out wherever it is not applicable.

1. Nature of the establishment : Private / Private Limited / Public Limited / Govt. Aided body etc

2. Registration Details of the Service Provider : _____

3. Details of nature of service provided : _____
(Attach separate sheets if required)

4. Give brief details of training provided to the
Staff for providing the particular service : _____

5. Give brief details of infrastructure available
for providing the particular service : _____

6. Furnish brief details of quality norms/parameter
followed by your company to provide the service: _____

7. Please attach credential list & list of service contract: _____

8. Has the company / organization adequate resources
in terms of finance and personnel? Yes / No / NA

Annexure - 10

Audit checklist for Raw materials/Critical consumables vendors

A. General Information

1. Name of Organization :

2. Address :

3. Name & Address of Contact Person :

B. Building and Facility

1. Is the Facility easily accessible by suitable means of transport : Yes / No /NA

■ If yes, mention approximate distance and means to reach the facility

2. Is the location free from possible source of air / water / soil, etc. Yes / No /NA

Pollution :

3. Is ac current version of site plan / floor layout available : Yes / No /NA

4. Is the access to the facility restricted and controlled. : Yes / No /NA

5. Are there adequate personnel facilities, like

a) Wash rooms, : Yes / No /NA

b) Change rooms : Yes / No /NA

c) Medical room, available : Yes / No /NA

6. Is there a documented program for pest, rodent and bird control : Yes / No /NA

■ If yes, what is the frequency :

7. Are air curtains installed and functional : Yes / No /NA

8. Are documented procedures available for cleaning, disinfection or fumigation of Yes / No /NA
the premises. :

9. Is rotation of disinfectants followed : Yes / No /NA

10. Is adequate lighting and ventilation provided : Yes / No /NA

11. Do you have a separate Air Handling Unit at least for finished product : Yes / No /NA

12. Is quality of air supplied, especially to manufacturing and packaging areas Yes / No /NA
controlled, monitored and recorded :

13. Is there a documented procedure for waste and scrap disposal : Yes / No /NA

14. ■ Are there adequate utilities available : Yes / No /NA

■ If yes attach their specifications

15. Is there a documented schedule to conduct preventive maintenance of equipments : Yes / No /NA

C Personnel

Page 1 of 5

Audit checklist for Raw materials/Critical consumables vendors

1. Attach qualification and experience record of key personnel : Attach List

2. Is there a documented training program for staff and workers on cGMP, cGLP, Yes / No /NA
SOPs, on-job activities, personnel hygiene etc. :

■ If yes, what is the frequency. Choose 3-4 employees and check record

3. Is there a documented health care program (medical examination) : Yes / No /NA

Choose 3-4 employees and check record

4. Are the personnel provided with clean uniforms : Yes / No /NA

D Stores

1. Are there physically segregated areas for:

■ Raw materials : Yes / No /NA

■ Packaging materials : Yes / No /NA

2. Are there physically segregated areas for:

■ Quarantine material (Under Test) : Yes / No /NA

■ Approved material : Yes / No /NA

■ Rejected material : Yes / No /NA

3. Is the dispensing area separate : Yes / No /NA

4. Is there any excise stores area : Yes / No /NA

5. Do you have separate areas for non – beta lactum / beta – lactum / other potent : Yes / No /NA
drugs (like cytotoxics)

6. Are there separate areas for materials requiring special storage conditions : Yes / No /NA
controlled temperature & humidity with monitoring devices like thermometers /
hygrometers

7. Are the areas adequate for storage of the materials in relation to their quantity : Yes / No /NA

8. Is stock rotation program followed (like FIFO) : Yes / No /NA

E Manufacturing

1. Is a process flow diagram for the manufacturing operations available : Yes / No /NA
■ If yes, attach a copy of process flow diagram Attach Diagram
2. Is there a list of manufacturing equipment with information like name, make : Yes / No /NA capacity, Material of Construction, date of procurement
3. Are the process equipment uniquely coded for identification : Yes / No /NA
■ If No, how are equipment identified during documentation
4. Are the major equipment validated w. r. t. IQ, OQ & PQ : Yes / No /NA
5. Are batches uniquely identified : Yes / No /NA

Page 2 of 5

Audit checklist for Raw materials/Critical consumables vendors

6. Is there a system of line clearance before product or batch change over : Yes / No /NA
 7. Is there any requirement of transportation of semi finished product or material to : Yes / No /NA other site. If Yes, how is integrity of material guaranteed
 8. What is the frequency of in process checks; please exemplify
Process Frequency
i. :
ii. :
iii. :
 9. Are the sequence and timing of manufacturing operations recorded into a batch : Yes / No /NA production record. Check and verify form a current batch record
 10. Is there a documented procedure for reprocessing : Yes / No /NA
 11. What are the packing controls for (mention document name): : Yes / No /NA
■ Printed packaging material reconciliation
■ Destruction of printed packaging material
 12. Do you have procedure for printing of labels or printed material of similar : Yes / No /NA appearance
 13. Is there a documented procedure to monitor, control, record and prevent process : Yes / No /NA deviations
 14. Are the environmental conditions of finished goods storage area controlled w. r. : Yes / No /NA t. temperature and humidity?
 15. Is there a documented procedure for rejection of finished goods : Yes / No /NA
 16. How many rejections have been recorded in the last quarter (for products offered : Yes / No /NA for contract manufacturing). Check a recent rejection record.
 17. Has there been any product recall till date
■ If, yes provide details : Yes / No /NA
- #### F Quality Control
1. Is there a quality control unit : Yes / No /NA
 2. Does Q.C. perform the following functions:
 - a. Sampling of raw and packaging material : Yes / No /NA
 - b. Release of rejection of each batch of raw and packaging material : Yes / No /NA
 - c. Development of specification for raw and packaging material and in- : Yes / No /NA process tests.
 - d. Release or rejection of each batch or lot of in-process bulk material : Yes / No /NA
 - e. Release or rejection of each batch of finished product : Yes / No /NA

Page 3 of 5

Audit checklist for Raw materials/Critical consumables vendors

- f. Issue, control and review of Batch Production Records : Yes / No /NA
- g. Take control samples of raw materials and finished goods : Yes / No /NA
- h. Calibration of Q.C. Equipment : Yes / No /NA
- i. Validation of test methods : Yes / No /NA
- j. Evaluation of stability and quality of finished goods : Yes / No /NA
3. Who performs the functions of Quality Assurance :
4. Are there separate rooms / areas marked for
■ Storage RM Samples : Yes / No /NA
■ Storage Control Samples : Yes / No /NA
■ Stability Testing Equipment : Yes / No /NA
5. Is there a system of Internal Audit : Yes / No /NA
6. Are there any reference books available : Yes / No /NA

G Documentation

1. Are all documents controlled i.e. bear a unique title, number, version number, : Yes / No /NA effective date, etc.
2. Are all documents approved and authorized before distribution : Yes / No /NA
3. Is the documents distribution record maintained : Yes / No /NA
4. Are the following documents available
■ Specifications (RM, PM, In process product, finished product) : Yes / No /NA
■ SOPs (RM, PM, In process product. Finished product) : Yes / No /NA
■ Master Batch Production Record / Master formula record : Yes / No /NA
■ Raw Material Receipt and Issuance Records : Yes / No /NA
■ Packaging Records : Yes / No /NA
■ In-process Testing Records : Yes / No /NA
■ Finished Goods Records : Yes / No /NA
■ Microbiological Records (if applicable) : Yes / No /NA
■ Calibration Records (Manufacturing and Q. C) : Yes / No /NA
■ Operation , Cleaning & Preventive Maintenance Records : Yes / No /NA
■ Complaint Records : Yes / No /NA
■ Rejection Record : Yes / No /NA
■ Product Recalls : Yes / No /NA
5. Are SOPs available for the following operations

Page 4 of 5

Audit checklist for Raw materials/Critical consumables vendors

- Quarantine and storage of material : Yes / No /NA
- Issuance of material : Yes / No /NA
- Quality control for In-process : Yes / No /NA

■ Quality control for Finished Goods : Yes / No /NA
■ Calibration of instruments : Yes / No /NA
■ Product Recalls : Yes / No /NA
■ Microbiological testing : Yes / No /NA
6. Is a Certificate of Analysis issued for a batch released : Yes / No /NA
7. What are the rejection levels :
8. What is the packaging material used for Primary Packaging , Material of :
Construction
Date of Inspection:

Audit Team Representing xxxx Company

Audit checklist - Packaging materials Vendors Annexure - 11

A. General Information

1. Name of Organization :
2. Address :
3. Person(s) contacted at site during audit :

B. Material Receipt, Storage and Handling

1. Is there a procedure for qualification of raw material sourcing : Yes / No / NA
2. Is a current list of approved vendors available and circulated to relevant : Yes / No / NA departments
3. Is adequate precautions taken to properly segregate approved material from : Yes / No / NA material under test of rejected
4. Is entry to storage area restricted : Yes / No / NA
5. Is rejected material adequately controlled to prevent misuse : Yes / No / NA
6. Is there a separate or segregated area for sampling : Yes / No / NA
7. Are there documented sampling procedures : Yes / No / NA
8. Are materials properly identified w. r. t. status, quantity etc. : Yes / No / NA
9. Is there a retesting schedule : Yes / No / NA
10. Where required, are materials stored in controlled environment (e. g. humidity, : Yes / No / NA temperature, etc.)

C Manufacturing Operations, Equipment and Controls

1. Are the items being manufactured identifiable throughout the approval : Yes / No / NA
2. Are the manufacturing operations orderly in flow : Yes / No / NA
3. Are the manufacturing processing and facilities adequate to produce high quality : Yes / No / NA items
4. If gang printing is undertaken, are there adequate controls to prevent mix-ups : Yes / No / NA
5. Is there an adequate system of control of labels with pre-printed lot number and / : Yes / No / NA or expiration dates

Page 1 of 4
Audit checklist - Packaging materials Vendors

6. Is the batch no. or lot no. reflective of homogenous production run. If yes, : Yes / No / NA exemplify
7. Is there a line clearance procedure : Yes / No / NA
8. Are regular in-process tests performed by Quality Control : Yes / No / NA
9. Are manufacturing procedures formalized and controlled : Yes / No / NA
10. Is there a documented procedure for handling process deviations : Yes / No / NA
11. Are there documented procedures for handling reworking or rectification of : Yes / No / NA errors
12. Are standard procedures of working and similar functional documents readily : Yes / No / NA available to employees for reference
13. Is the batch or lot reconciled after end of manufacturing operation : Yes / No / NA
14. Are waste material clearly marked : Yes / No / NA
15. Is there a pest control procedure : Yes / No / NA
16. Are colour standards available, and are they checked on a periodic basis for any : Yes / No / NA change in appearance
17. Is there a system for 100% inspection of labels : Yes / No / NA
18. In the event of in-process rejections, is there proper investigation procedure to : Yes / No / NA prevent recurrence
19. Are the equipment adequately identified : Yes / No / NA
20. During operations, is product information displayed on the equipment : Yes / No / NA
21. Are there adequate procedures for final product inspection, sampling and testing : Yes / No / NA
22. Are the final inspection / test results recorded : Yes / No / NA
23. Are the batch records reviewed before final dispatch of products : Yes / No / NA
24. Are the batch records and other related documents stored for adequate length of : Yes / No / NA time
25. Is the document retrieval system adequate : Yes / No / NA
26. How is non conforming material controlled : Yes / No / NA
27. Are samples of finished product retained : Yes / No / NA
28. How adequate are security systems for drug labels : Yes / No / NA
29. Is there a lot recall procedure : Yes / No / NA

D Laboratories and Calibration

1. Is QC adequately staffed : Yes / No / NA

Page 2 of 4
Audit checklist - Packaging materials Vendors

2. Are sufficient equipment / instruments available for proper functioning of QC : Yes / No / NA

3. Are samples from incoming, in-process and final product materials properly : Yes / No / NA controlled
4. Is each lot checked against customer approved copy for correct printing : Yes / No / NA
5. Is each lot checked against a drawing for correct die cut : Yes / No / NA
6. Are certifications of inspection / test results available to customers : Yes / No / NA
7. Are tests / inspections properly documented : Yes / No / NA
8. Are there acceptable procedures to assure that instruments are calibrated and : calibration recorded Yes / No / NA
- Is calibration traceable to appropriate standards : Yes / No / NA
9. Are the instruments / equipments maintained in proper order : Yes / No / NA

E Document Control

1. Are functional documents like specification, Standard Operating Procedures, etc. : Yes / No / NA comprehensive in content
2. Are the documents in use 'current' : Yes / No / NA
3. Are the documents approved and authorized by competent authority prior to : Yes / No / NA distribution
4. Is there a procedure to ensure retrieval and subsequent destruction of obsolete : Yes / No / NA documents

F Miscellaneous

1. Is there regular training program for employees, in-house or otherwise : Yes / No / NA
If yes, list type of training and frequency : Yes / No / NA
2. Is there a program for training : Yes / No / NA
3. Is there a documented procedure for performing internal audits : Yes / No / NA
4. Are internal audit reports prepared and circulated to concerned department for compliance of observed deficiency : Yes / No / NA
5. Is there a 'Quality system' that addresses the organizational structure, responsibilities, procedures, processes and resources for implementing quality : Yes / No / NA management
6. Are there periodic management reviews of the 'Quality system' : Yes / No / NA

Page 3 of 4

Vendor Site Audit checklist for Animal Suppliers

iv. Time controlled lighting system? Yes / No / NA

v. Appropriate noise control system? Yes / No / NA

11. Is there a documented procedure for waste and scrap disposal : Yes / No /NA

12. Are there adequate utilities available : Yes / No /NA

13. Is there a schedule to conduct preventive maintenance of : Yes / No /NA
equipments

14. Are there enough animal rooms of appropriate design to allow
separate housing of:

vi. The breeding colony Yes / No / NA

vii. Different animal species Yes / No / NA

viii. Sick animals Yes / No / NA

15. Is the Quality System enforced? Yes / No / NA
16. Are there facilities for collection and disposal of animal waste Yes / No / NA and of dead animals to minimize disease hazards and environmental contamination?
17. Are there facilities for cleaning, sanitizing, sterilizing and Yes / No / NA maintaining supplies and equipments including animal cages and racks?

C Personnel

1. Attach qualification and experience record of key personnel : Attach List
2. Is there a documented training program for staff and workers? : Yes / No /NA
3. Is there a documented health care program (medical : Yes / No /NA examination)
4. Are the personnel provided with clean uniforms : Yes / No /NA

D Stores

1. Are there separate storage areas for equipments, animal feed, Yes / No / NA and bedding which are protected from infection/contamination, and with refrigeration where needed?
2. Are the areas adequate for storage of the materials in relation to : Yes / No /NA

Page 2 of 3

Vendor Site Audit checklist for Animal Suppliers
their quantity

3. Is stock rotation program followed (like FIFO) : Yes / No /NA

E Documentation

1. Are all documents controlled : Yes / No /NA
2. Is a Certificate of Analysis issued for the material released : Yes / No /NA
3. What are the rejection levels :

Audit checklist of contractual testing laboratory

A. General Information

1. Name of Organization
2. Address
3. Name & Address of Contact Person

B. Questionnaire

1 Quality System:

- 1.1 Has the management established its quality policy in writing? Yes / No / NA
If yes, please attach a copy.
- 1.2 Is there an Organizational Chart? Yes / No / NA
If yes, please attach a copy.
- 1.3 Are the personnel's responsibilities established in their Yes / No / NA job descriptions?
- 1.4 Has the company / organization adequate resources in terms of finance Yes / No / NA and personnel?
- 1.5 Has the company / organization designated a responsible person Yes / No / NA with enough authority to assure the established quality system?
- 1.6 Is the company / organization approved by government Yes / No / NA (State/Central/UT)
Please mention the nature of your organization:
(Government/ Semi government/Private)
- 1.7 Does your organization carry any recognition or accreditation from Yes / No / NA National / International agency like ISO/WHO or any other agency?
If yes, please attach a copy of the latest certificate.

Page 1 of 4

Audit checklist of contractual testing laboratory

- 1.8 Are personnel qualified to perform their tasks? Yes / No / NA
Please attach the list of educational qualifications of personnel as a minimum of those working at key positions.

2. Documentation:

- 2.1 Is the system of approval of documents established? Yes / No / NA
- 2.2 Is there an established procedure for approving changes in documents? Yes / No / NA
- 2.3 Is there a system to keep records of approved documents with their Yes / No / NA edition/revision number?
- 2.4 Are procedures in force to assure the identification and traceability of Yes / No / NA works/ tests carried out?
- 2.5 Is there a procedure for identifying, coding and archiving of records? Yes / No / NA

3. Calibration, Maintenance and Validation:

- 3.1 Is there a maintenance program in force for all measuring and test Yes / No / NA equipments?
- 3.2 Do you have a calibration program? Yes / No / NA

3.3 Do you have procedures in force for performing Calibrations and Yes / No / NA
Maintenance work?
3.4 Does the measuring and test equipments clearly identified with Yes / No / NA
calibration status?
3.5 Are the standards used for Testing / Validation / Calibration traceable to Yes / No / NA
National / International Reference Standards?
3.6 Are the Instruments / Standards used for calibration regular
Yes / No / NA
3.7 Do you have Standard Operating Procedures (SOPs) for carrying out Yes / No / NA
Testing / Validation / Calibration?
If so, can these be made available to the contracting party on demand? Yes / No / NA

Page 2 of 4
Audit checklist of contractual testing laboratory

4. Audit and Inspection:
4.1 Is the facility subjected to quality audits? Yes / No / NA
4.2 Are quality audits performed to verify the efficacy of the Quality Yes / No / NA
System?
4.3 Is there a defined plan for audits? Yes / No / NA
4.4 Is there a follow up of corrective actions taken? Yes / No / NA
5. Training:
5.1 Is there a procedure for training of staff in their respective areas of Yes / No / NA
working?
5.2 Are training programs established? Yes / No / NA
5.3 Are training records maintained? Yes / No / NA
6. Testing:
6.1 Are documented procedures in force for handling samples and testing? Yes / No / NA
6.2 Is there a traceability of the records for a test sample / work carried out? Yes / No / NA
i.e. green sheets/logbooks/record forms etc.
6.3 Do you have required facilities for storage of samples before (and after) Yes / No / NA
testing?
6.4 Are there separate areas for samples requiring special storage conditions? Yes / No / NA
6.5 Do you issue certificate of analysis for the sample/product tested? Yes / No / NA
6.6 Are there adequate facilities for testing of sterile products Including Yes / No / NA
sterility and pyrogen testing?
6.7 Is the sterility testing room classified? Yes / No / NA
6.8 Do you maintain an animal house? Yes / No / NA
6.9 Does the animal house have adequate area and required facilities? Yes / No / NA
6.10 Is there a qualified veterinarian to look after the animal house? Yes / No / NA
6.11 Is the animal house registered with regulatory authorities? Yes / No / NA

Page 3 of 4
Audit checklist of contractual testing laboratory

6.12 Is permission sought from the regulatory authorities for using animals for Yes / No / NA
various tests?
6.13 Is periodical examination of animals for health status carried out? Yes / No / NA
6.14 Do you have arrangements to quarantine the animals after reception? Yes / No / NA
6.15 Do you have provision for isolation of sick animals as well as animals Yes / No / NA
under test?
6.16 Are qualified and experienced personnel available for carrying out testing Yes / No / NA
in animals?
6.17 Do you have an approval system for suppliers from whom the testing Yes / No / NA
animals are purchased? Please attach the list of institution (s) from where
the animals are procured.

Annexure - 15
Site audit checklist for Service Providers

A. General Information

:
1. Name of the service provider

:
2. Address & Contact No.

3. Nature of the service :
4. Date audit conducted :
5. Brief company profile :
6. - Year of establishment :
7. - Registration of the agency :
8. - No. of employees working :
9. - Certification (if any) :
10. - Any accreditation from :
reputed company
11. Whether credentials of the company are :
impressive

12. Whether the firm was prosecuted by law :

B Building & facility :

1. Is the location suitable for the facility : Yes / No / NA
2. Is the access to the facility restricted and controlled : Yes / No / NA
3. Whether the facility is properly cleaned & maintained : Yes / No / NA
4. Is it devoid of cracks etc. : Yes / No / NA
5. Is it designed to keep it free from birds, pests, vermins & rodent. : Yes / No / NA

Page 1 of 3

Site audit checklist for Service Providers

6. Are there adequate personnel facility like – wash rooms, canteen, medical : Yes / No / NA rooms etc.
7. Is adequate lighting & ventilation provided : Yes / No / NA
8. Are there adequate utilities available : Yes / No / NA
9. Whether the facility is properly cleaned & maintained : Yes / No / NA
10. Are periodic records of cleaning & maintenance kept properly : Yes / No / NA
11. Is there logical placement of equipments : Yes / No / NA
12. Is the warehouse area suitable & sufficient to the facility requirement : Yes / No / NA
13. Are the equipments properly maintained & calibrated : Yes / No / NA
14. Is there adequate facility for housing the laboratory animals : Yes / No / NA (if Yes, please attach separate sheet)
15. Is there any system in place to address the complaint received against the : Yes / No / NA service provider.

C Personnel:

1. Is the organogram available & adequate : Yes / No / NA
2. Is the technical staff competent in qualification & experience : Yes / No / NA
3. Is the number of personnel employed adequate in proportion to the workload : Yes / No / NA
4. Are Personnel also provided with regular in-service training : Yes / No / NA
5. Whether the supervisory staff are whole time employees : Yes / No / NA

D Documentation : : Yes / No / NA

6. Are all documents controlled : Yes / No / NA
7. Are the documents approved signed & dated by authorized person before : Yes / No / NA distribution

Page 2 of 3

Site audit checklist for Service Providers

8. Do the documents specify : Yes / No / NA
 - a) title
 - b) nature
 - c) purpose
9. Is the documentation handled by electronic data processing methods : Yes / No / NA
10. Are the records maintained electronically protected by suitable means. : Yes / No / NA
11. Is record available for calibration & validation of equipments. : Yes / No / NA

1.0 |Objective |
 |To lay down the procedure for assessment and approval of vendors. |

2.0 |Scope |
 |This Standard Operating Procedure is applicable to assess, qualify and |
 |approve the vendors of Raw Materials, culture media for testing, critical |
 |consumables, Packaging Materials, experimental animals, contractual |
 |testing laboratories and various service providers such as calibration |
 |agencies, pest control contractors at Company name. |

3.0 |Responsibility |
 |3.1 |Head, Global sourcing department or his/her designee shall be |
 |responsible for providing information from vendor, procurement, |
 |alternative vendor system, implementation and compliance of the |
 |procedure. |
 |3.2 |Head, Quality Control or his/her designee shall be responsible for |
 |arranging the sampling and testing/analysis of pre-purchase and |
 |commercial supply samples, as applicable |
 |3.3 |Head, Warehouse, Head, Quality Control and Head Animal House or |
 |his/her designee shall be responsible for providing the required |
 |testing data and delivery performance respectively for the raw |
 |material, culture media for testing, experimental animals and |
 |packaging material during performance control of vendors. In case of |
 |Service providers (Calibration and validation/revalidation), |
 |Engineering department shall provide the annual performance. Head – |
 |QC shall provide the annual performance of contractual testing |
 |laboratories. Head Administration shall be responsible for providing |
 |annual performance of Service provider for Pest Control. |
 |3.4 |A team constituted by Head of Quality Assurance department shall be |
 |responsible for evaluation/assessment of the vendors, as applicable. |

4.0 |Abbreviations and Definitions |
4.1	SME	Subject Matter Expert
4.2	cGMP	Current Good Manufacturing Practices
4.3	VMT	Vendor Management Team
4.4	QMS	Quality Management System
4.5	WHO	World Health Organization
4.6	RM	Raw Material
4.7	PM	Packaging Material
4.8	DMF	Drug Master File
4.9	VI	Valuation Index
4.10	CAPA	Corrective Action and Preventive Action
4.11	GPT	Growth Promotion Test
4.12	IOM	Inter Office Memorandum
4.13	OOS	Out of Specification
4.14	VAQ	Vendor Assessment Questionnaire
4.15	NRA	National Regulatory Authority
4.16	Vendor	The term shall include the manufacturer and/or
	supplier of raw and packaging materials, culture	
	media for testing, experimental animals,	
	contractual testing laboratories and service	
	providers.	

4.17 |Approved Vendor |A vendor who has been approved by Company Name as |
 | |per this SOP |

5.0 |Procedure |
 |5.1 |The manufacturers (Raw Materials, Packing Materials, Culture media |
 |and Lab. Chemicals etc.), suppliers (Eggs and animals), Contractual |
 |testing laboratories and service providers (Pest control and |
 |Calibration or validation service providers) shall be assessed and |
 |qualified before start purchasing material or availing services. |

5.2 |Selection of vendors |
 |Vendors should be selected based upon following criteria: |
5.2.1	Market reputation (global/local existence in the same field,
	business turnover and QMS etc.).
5.2.2	Information assess through internet (DMF holder/no. of
	accreditations/no. of clients etc.).
5.2.3	Certification / Qualification from WHO / other reputed
	regulatory authorities.
5.2.4	Easy to contact.
5.2.5	No. of years in business.
5.2.6	Already approval for other site of xxxxx company and
	recommendations from CQA.

5.3 |Preparation of vendor development Team: |
 |The vendor development team shall include representatives from |
 |Global sourcing department and Quality Assurance with support as |
 |appropriate from Production, Quality Control, and Engineering. |
 |Selection of the members of the vendor development team should be |
 |based upon the following criteria: |

		5.3.1	Experience of minimum 3 – 4 years.
		5.3.2	Expertise in concerned activity.
		5.3.3	Good knowledge of cGMP requirements.
		5.3.4	Trainings on Vendor Qualification and training on cGMP.
		5.4	Classification of Materials:
		5.4.1	Critical Materials:
		Criticality is decided on the basis of critical factors such	
		as direct contact of the material with final product (ARM),	
		impact on stability of product, printed packing materials,	
		any material of biological origin, sterile materials and	
		de-pyrogenated materials. Contract testing lab. shall be	
		considered equivalent to critical materials. Define the	
		material for critical or non-critical after evaluation as	
		per Material assessment record (Annexure – 1).	
		5.4.2	Non-Critical Material:
		Any material which is not classified as critical material.	
		5.4.3	Critical consumables:
		Materials/consumables that are used during processing of	
		final product, but are not a part of the finished product.	
		For example:- Silicon tubing, 0.2 µm filters etc.	
		5.4.4	Minimum requisite for critical/non-critical Vendor and
		Service Provider:	
		Following is the minimum requisite for vendor approval of	
		critical/non-critical Vendor:	
		Requirements	
		Non Critical Vendor	
		Critical Vendor	
		Service providers	
		TSE/BSE Assessment	
		(1)√	
		(1)√	
		NA	
		Questionnaire (General and vendor specific)	
		√	
		√	
		√	
		Site Audit

		(2)√	
		(3)√	
		Historical Performance (If Applicable)	
		√	
		√	
		√	
		Quality Agreement	
		-	
		√	
		(4)√	
		Service Agreement	
		NA	
		NA	
		√	
		(1) In case of material of Animal Origin	
		(2) If the vendor is an approved DMF holder or Approved by	
		WHO for the required material, the site audit may not be	
		necessary for approval of critical vendor.	
		(3) Site Audit is mandatory in case of Contractual Testing	
		Laboratories only	
		(4) Quality Agreement shall be prepared in case of	
		Analytical Testing Lab only	
		5.5	Criteria for Evaluation/Assessment of vendors:
		5.5.1	Upon request from Global sourcing department, Quality
		Assurance Department shall provide the "Vendor pre-audit	
		assessment Questionnaire". The pre-audit questionnaire shall	
		be given in two parts i.e. General Questionnaire, Annexure –	
		2 and Specific questionnaire based upon vendor to be	
		qualified. Following specific questionnaire shall be used as	
		required:-	
		"Pre-audit questionnaire for RM/Critical consumables	
		vendors" – Annexure 3,	
		"Pre-audit questionnaire for PM vendors" – Annexure 4,	
		"Pre-audit questionnaire for eggs suppliers" – Annexure 5,	
		"Pre-audit questionnaire for animals suppliers" – Annexure	
		6,	
		"Pre-audit questionnaire for contractual testing	
		laboratories" – Annexure 7, &	
		"Pre-audit questionnaire for service providers – Annexure 8.	
		5.5.2	Send the questionnaire through Global sourcing department
		and ask to provide the filled questionnaire and other	
		supporting documents. Ask the vendor to provide pre-purchase	
		samples (preferably 3 samples from different batches) along	
		with certificate of analysis, as applicable. Quantity of	
		each sample shall be sufficient to conduct at least one	

		complete testing as per specifications. Service providers	
		and analytical testing laboratories shall not be subjected	
		to any pre-purchase samples and only filled questionnaire is	
		sufficient for preliminary evaluation.	
		Note: FAQ (Frequently asked Questions) provided by vendor	
		can be accepted in place of filled checklist for preliminary	
		evaluation if it is able to provide the information which	
		can fulfils the minimum criteria of evaluation i.e. $\geq 90\%$.	
	5.5.3	If required, share the specification of required material(s)	
		with vendor through Global sourcing department.	
	5.5.4	Upon receipt of filled form "Vendor pre-audit assessment	
		Questionnaire" from the vendor, along with the samples,	
		Quality Assurance Department shall evaluate the information	
		furnished by the vendor as per evaluation of valuation	
		index.	
	5.5.5	The filled checklist is scored as per the following	
		criteria.	
		Where the activity mentioned in the Check-list is:	
	5.5.5.1	Followed (Yes)	1 points
	5.5.5.2	Not followed (No)	0 point
	5.5.5.3	Not applicable (NA)	Not considered for
		evaluation.	
		Note: General information and fill in the blanks in	
		the checklist shall not be assigned any point and	
		points in checklist marked as not applicable shall	
		not be considered for valuation index.	
	5.5.6	Valuation Index is calculated as under and is expressed in	
		percentage:	
		Marks obtained	
		Valuation index (VI) = ----- X 100 (%)	
		Total Marks	
	5.5.7	In case VI is < 90% vendor should be rejected and samples	
		should not be sent to QC and returned back to the vendor. If	
		the valuation index (VI) is $\geq 90\%$, then the following steps	
		shall be taken for approval of vendor.	
	5.5.8	Send the samples to QC along with the COA of respective	
		samples along with the request for analysis (Annexure – 9)	
		for vendor approval. The samples of culture media shall be	
		subjected to Growth promotion Testing (GPT), and if	
		required, additional testing should be carried out.	
	5.5.9	QC after testing as per in-house/pharmacopeia	
		specifications, shall give results to QA and only those	
		vendors shall be considered for approval whose all samples	
		passes the testing.	
	5.5.10	After evaluation of the questionnaire and results of the	
		samples analysis, Head – Quality Assurance or his designee	
		or a designated team/trained personnel shall audit the	
		manufacturing location to conduct the site audit of the	
		vendor facility (in case of critical materials, wherever	
		applicable).	
	5.5.11	The audit team visits the site of the vendor for evaluating	
		his Quality Management System & material requirements as per	
		vendor site audit checklist filled. Vendor site audit	
		checklist can be used for reference only; site audit can go	
		beyond the information contained in the checklist. Following	
		specific audit checklist shall be used as required:-	
		"Audit Checklist for RM/Critical consumables vendors" –	
		Annexure 10,	
		"Audit Checklist for Packaging Materials vendors" – Annexure	
		11,	
		"Audit Checklist for eggs suppliers" – Annexure 12,	
		"Audit Checklist for animals suppliers" – Annexure 13,	
		"Audit Checklist for contractual testing laboratories" –	
		Annexure 14, &	
		"Audit Checklist for Service providers – Annexure 15.	
	5.5.12	After site audit, audit team shall prepare the Vendor Site	
		Audit Report (Annexure – 16) and write	
		recommendations/Observations.	
	5.5.13	Based upon observations made by auditors, vendor shall be	
		asked to submit CAPA report within 4 weeks. In such case,	
		vendor shall be approved conditionally for first three	
		commercial consignments.	
	5.5.14	CAPA report submitted for compliance of the audit	
		observations shall be evaluated. If the vendor comply all	
		the recommendations, vendor shall be approved. If the CAPA	
		report is not submitted within defined timeline or it is not	
		effective, a warning letter to vendor shall be issued to	
		vendor for submission of CAPA within one week after receipt	
		of warning letter and if vendor still does not submits CAPA,	
		The vendor shall be delisted and same shall be communicated	
		to CQA, Global Sourcing, WH and other concerned departments.	
	5.5.15	QA shall prepare "Vendor approval report" – Annexure 17	
		after review of satisfactory CAPA. Prepare an addendum to	
		the existing list of approved vendors and send information	
		to warehouse, QC, CQA and global sourcing department.	
		Include the name of the vendor in the list of approved	
		vendors for RM/PM, Annexure – 18, & list of contract testing	
		laboratories/service providers, Annexure – 19 on monthly	
		basis.	
	5.5.16	After approval of vendor, QA department should send a	
		Quality Agreement for manufacturer/Critical materials and	
		contractual testing laboratories Annexure – 20 and Service	

			agreement for service providers, Annexure – 21 to the vendor	
			(preferably through Global sourcing department). The quality	
			agreement shall be valid for three years, however the	
			service agreement shall be prepared annually. The Quality	
			/Service Agreement to be signed in between Company Name. and	
			vendor, shall be prepared. The content of Quality/Service	
			agreement may be prepared on case to case basis depending	
			upon materials/services provided.	
			5.5.17	In case a vendor has its own developed quality agreement the
			same may be accepted if it is having following clauses:	
			Manufacturing compliance as per cGMP, including batch	
			records.	
			Quality control including analysis, stability testing if	
			applicable and OOS handling.	
			Quality assurance including documentation, SOPs, product	
			release, Deviation and Investigations, Change management,	
			complaints and Batch disposition.	
			5.5.18	At least three service providers shall be approved for each
			type of service taken from external agencies (Except	
			services of Pest Control). Similarly for critical Raw	
			materials, Packaging materials and critical consumables at	
			least one alternative vendor shall be approved as	
			applicable.	
			5.5.19	Record of vendor approval:
			The record of vendor approval contains the following	
			documents (but not limited to):	
			5.5.19.	Checklist for the vendor assessment (Pre-audit
			1	questionnaires).
			5.5.19.	Vendor's Quality Management System assessment by
			2	accredited agency for example:- GMP certificate, GLP
			approval, CPCSEA approval, NABL accreditation,	
			WHO-GMP certificate or any other regulatory or semi	
			regulatory certification.	
			5.5.19.	Test reports.
			3	
			5.5.19.	Vendor Site Audit checklist.
			4	
			5.5.19.	Vendor Site Audit Report
			5	
			5.5.19.	Vendor Approval Report.
			6	
			5.5.19.	Quality Agreement.
			7	
			5.5.19.	Any other relevant documents.
			8	
			5.5.20	Updating of vendor approval record :
			5.5.20.	If an approved vendor's Quality Management System
			1	certificate is renewed, the renewed certificate is
			appended to the records.	
			5.5.20.	A list of qualified and approved vendors prepared by
			2	QA Department shall be issued to Warehouse, QC,
			Production Department, Animal House, Global sourcing	
			& list of approved service providers to respective	
			functional departments like	
			Engineering/administration on monthly basis.	
			5.6	When any new material is to be procured from already approved
			vendor, following steps shall be taken:	
			5.6.1	In case, where the already approved vendor has to be
			approved for a new material, Global sourcing department	
			shall send "Pre-audit assessment questionnaire" for the	
			specific questionnaire and procure pre purchase samples	
			(preferably 3 samples from 3 different batches) from vendor.	
			5.6.2	Global sourcing department shall forward the questionnaire
			along with samples to QA. Quality Assurance department shall	
			evaluate the questionnaire and if the valuation index (VI)	
			is $\geq 90\%$, then forward the pre-purchase samples to QC along	
			with the request for analysis (Annexure 9). QC shall give	
			the results of analysis to QA. In case VI is $< 90\%$ samples	
			should not be sent to QC and returned back to the vendor.	
			5.6.3	If pre-purchase samples passes the tests, the material shall
			be considered as approved material to purchase from already	
			approved vendor and Quality Assurance Department shall	
			prepare the Approval Report of additional material (Annexure	
			– 22) which shall be appended to the record of vendor and	
			the material shall be included in Approved vendor list, when	
			the next review is due. An addendum to approved Vendor list	
			for updating of new material shall be circulated to	
			Warehouse, Quality Control and other concerned departments	
			as per Annexure – 28.	
			5.6.4	In case, the vendor is already approved for any type of
			material from any other manufacturing location of the	
			vendor, the vendor should be audited as per new vendor	
			qualification procedure.	
			5.6.5	In case of change of Vendor for the same material / same
			type with same specification, a change control shall be	
			initiated by user. The product stability and material	
			comparability shall be carried out for critical materials.	
			For non-critical materials, only material comparability	
			should be done.	
			5.7	Disqualification of vendor:
			An approved vendor may be disqualified based upon one or more of the	
			following criteria, and following below mentioned procedure:	

	5.7.1	In case any single consignment of a specific material is
		rejected, then following an OOS procedure, if applicable,
		within a week a written communication shall be issued to the
		vendor through Global sourcing department, as per "Caution
		Letter" – Annexure 23 for thorough investigation and a
		detailed investigation report shall be sought from the vendor
		within the period of maximum 30 days. Global sourcing
		department shall not purchase same material from the vendor
		until clearance is given form QA. In case detailed
		investigation with effective CAPA is received from vendor
		end, QA shall give clearance for further purchase of the
		material.
	5.7.2	In case any new consignment is received during investigation,
		it shall be tested as per procedure and shall only be used if
		material passes full testing parameters as per the
		specifications and if the consignment(s) get rejected in any
		of the parameter(s), the vendor shall be put on hold and
		final approval/rejection shall be made after following the
		complete requalification procedure.
	5.7.3	If qualification of the vendor from WHO/other regulatory
		authority is cancelled, vendor shall be disqualified and same
		shall be intimated to corporate QA.
	5.7.4	In case of raw materials including culture media, eggs,
		critical consumables and animals, more than 10% rejection in
		terms of number of consignments received annually from
		approved vendor, shall render a vendor unapproved for that
		specific material and in such case, site audit/visit (as
		appropriate) for re-approval shall be carried out. Similarly
		in case of packaging Materials, more than 15% rejections in
		terms of number of consignments received annually from
		approved vendor, shall render a vendor unapproved for that
		specific material and in such case, site audit/visit (as
		appropriate) for re-approval shall be carried out.
	5.7.5	Three successive rejections of the materials shall render a
		vendor unapproved for that specific material and in such
		case, site audit/visit (as appropriate) for re-approval shall
		be carried out. Vendor shall be approved only after quality
		results of 3 lots of pre-purchased samples (as applicable).
		Upon successful evaluation of vendor, vendor should be
		included in approved vendor list.
	5.7.6	If any vendor is disqualified, then CQA shall be informed to
		evaluate the impact for other sites.
	5.7.7	In case, no material / service has been procured / provided
		respectively from an approved vendor for the last three
		years, the vendor shall be subjected to reassessment before
		restart the purchasing of material from the same vendor.
	5.8	Quality dispute resolution
	5.8.1	If there is any quality dispute related to material, being
		supplied by vendor, the following resolutions shall be done:
	5.8.1.1	QC personnel of Company nameshall perform the
		quality test at vendor's site.
	5.8.1.2	QC personnel of vendor shall perform the quality
		test at Company Name site.
	5.8.1.3	Third party consultation or resolution may be taken
		into consideration.
	5.9	Re-evaluation of vendor:
		Each approved vendor, from which the company is procuring materials,
		shall be re-evaluated every 3rd year + three months. Contractual
		testing laboratories & service providers, from which the company is
		taking services, shall be evaluated every year to get updated
		information of the vendor. The following steps shall be taken for
		re-evaluation of vendor:
	5.9.1	Prepare a schedule of vendor audit every year (preferably in
		first month) for the vendor's audit due in current year as
		per "Vendor audit Schedule", Annexure – 24. The audit
		schedule shall be shared with Global sourcing department for
		sharing audit information and asking for possible audit
		dates. Update the audit schedule on monthly basis to check
		the actual performance of the audit.
	5.9.2	Send "Vendor pre-audit assessment Questionnaire" to all the
		vendors before due dates of vendor approval. Send pre-audit
		questionnaire in two parts i.e. General Questionnaire
		Annexure – 2 and Specific questionnaire based upon vendor to
		be qualified. Following specific questionnaire shall be used
		as required:-
		"Pre-audit questionnaire for RM/Critical consumables
		vendors" – Annexure 3,
		"Pre-audit questionnaire for PM vendors" – Annexure 4,
		"Pre-audit questionnaire for eggs suppliers" – Annexure 5,
		"Pre-audit questionnaire for animals suppliers" – Annexure
		6,
		"Pre-audit questionnaire for contractual testing
		laboratories" – Annexure 7, &
		"Pre-audit questionnaire for service providers" – Annexure
		8.
	5.9.3	The vendor whose Valuation Index (VI) is $\geq 90\%$ shall be
		considered to remain under approved vendor list.
	5.9.4	After reviewing all the updated information and analysis of
		retrospective data, Quality assurance Department shall
		prepare the Re-evaluation Report of Vendor (Annexure – 26).
		Based upon the assessment of filled questionnaire and review
		of three years performance report, vendor shall be

		re-qualified for next three years.		
	5.9.5	Vendor, from which the critical material is procured, shall		
		preferably be audited once in three years and asked to		
		submit CAPA report within a period of 4 weeks. If the vendor		
		is an approved DMF holder or approved form WHO for the		
		required material and if the material supplies from a vendor		
		have been consistently meeting the specifications and there		
		are no quality issues, then the vendor re-audit may be		
		exempted and in this case only the vendor assessment		
		questionnaire is considered adequate.		
	5.9.6	CAPA report submitted for compliance of the audit		
		observations shall be evaluated. If the vendor comply all		
		the recommendations, vendor shall be approved. If the CAPA		
		report is not submitted within defined timeline or it is not		
		effective, vendor shall not be approved.		
	5.9.7	Upon successful re-approval of vendors, the quality /		
		service agreement shall also be reviewed as per Annexure –		
		20 and Annexure – 21.		
	5.10	Performance control of vendors:		
	5.10.1	The Quality Control Department gives annually, to QA		
		Department, a retrospective report of the test based		
		performance of each vendor, in respect of raw materials,		
		used for production and culture media used for testing and		
		in respect of testing of samples for water or any other		
		outsource testing facility. Similarly for service providers		
		for calibration and validation, Engineering department shall		
		provide the performance of respective calibration/validation		
		agencies. In case of test based performance of animal		
		supplier, Animal house shall provide the performance of		
		approved animal suppliers.		
		Similarly Warehouse shall also submit a report of the		
		vendor's performance regarding the delivery related issues		
		as per vendor performance report, (Annexure – 25) as		
		follows:-		
		5.10.1.	Warehouse	
		1		
		Warehouse shall provide the following information as		
		performance of vendor:-		
		5.10.1.1.	Name of the vendor.	
		1		
		5.10.1.1.	Vendor category.	
		2		
		5.10.1.1.	Products delivered.	
		3		
		5.10.1.1.	Performance of vendor.	
		4		
		5.10.1.1.	Observation.	
		5		
		5.10.1.	Quality Control	
		2		
		5.10.1.2.	Name of the vendor.	
		1		
		5.10.1.2.	Vendor category.	
		2		
		5.10.1.2.	Products delivered.	
		3		
		5.10.1.2.	Performance of the vendors.	
		4		
		5.10.1.2.	Results of tests performed with following	
		5	information:	
			a.	S. No.
			b.	Name of the Product.
			c.	Batch No.
			d.	Folio No.
			e.	Date of the test.
			f.	Total No. of Samples.
			g.	Results (Pass/Fail).
			h.	Remarks.
		5.10.1.	Animal House	
		3		
		5.10.1.3.	Name of Supplier.	
		1		
		5.10.1.3.	Supplier category.	
		2		
		5.10.1.3.	Animals delivered.	
		3		
		5.10.1.3.	Performance of Supplier.	
		4		
		5.10.1.3.	Observation.	
		5		
		5.10.1.	Engineering department	
		4		
		5.10.1.4.	Name of contractual testing facility.	
		1		
		5.10.1.4.	Testing facility category.	
		2		
		5.10.1.4.	Performance of the vendor.	
		3		
		5.10.1.4.	Observation.	
		4		
		5.10.1.	Quality Assurance	
		5		

			5.10.1.4.	Name of vendor.
			1	
			5.10.1.4.	Vendor category.
			2	
			5.10.1.4.	Products delivered.
			3	
			5.10.1.4.	Reference reports (all reference report
			4	whosever applicable).
			5.10.1.4.	Reference report number and date along
			5	with name of concerned department.
			5.10.1.4.	Observations.
			6	
	5.10.2	The QA Department will prepare Performance Control Report of		
		the vendors every year, irrespective of the material		
		purchased or not in last calendar year. The performance		
		report shall be prepared for all the approved		
		vendors/service providers.		
	5.10.3	The performance reports shall be assigned identification		
		numbers as follows:		
		The first two letters correspond to the department which		
		prepares the report e.g. QA for quality assurance		
		department. This is followed by a slash (/) followed by		
		three letters 'VPR' corresponding to the 'Vendor Performance		
		Report' followed by (-) which is followed by a four digit		
		number. The first two digits represent the last two digits		
		of the year to which the report pertains and the next two		
		digits represent the consecutive number of the vendor		
		performance report in continuation.		
		For example QA/VPR-1201 represents the first performance		
		report of a vendor pertaining to the year 2023 prepared by		
		QA department.		
		This numbering system shall remain same for the report from		
		Warehouse, Animal House, Engineering and Quality Control.		
	5.11	Refer to the vendor approval and assessment chart as per Annexure –		
	27.			
	5.12	After approval of vendor send intimation to CQA, Global sourcing		
		department and warehouse departments as per Annexure – 28.		
	6.	Forms and Records:		
	6.1	Material assessment record.	Annexure 1	
	6.2	General questionnaire.	Annexure 2	
	6.3	Pre-audit questionnaire for RM/Critical consumables	Annexure 3	
		vendors.		
	6.4	Pre-audit questionnaire for PM vendors.	Annexure 4	
	6.5	Pre-audit questionnaire for eggs suppliers.	Annexure 5	
	6.6	Pre-audit questionnaire for Animal Suppliers.	Annexure 6	
	6.7	Pre-audit questionnaire for contractual testing	Annexure 7	
		laboratories.		
	6.8	Pre-audit questionnaire for Service providers.	Annexure 8	
	6.9	Request for Analysis of pre-purchase samples.	Annexure 9	
	6.10	Audit checklist for Raw materials/Critical consumables	Annexure 10	
		vendors.		
	6.11	Audit checklist for Packaging materials vendors.	Annexure 11	
	6.12	Audit checklist for eggs suppliers.	Annexure 12	
	6.13	Audit checklist for animal suppliers.	Annexure 13	
	6.14	Audit checklist contractual testing laboratories.	Annexure 14	
	6.15	Audit checklist for Service Providers.	Annexure 15	
	6.16	Vendor Site Audit Report.	Annexure 16	
	6.17	Vendor approval report.	Annexure 17	
	6.18	List of approved vendors.	Annexure 18	
	6.19	List of approved contract testing laboratories / Service	Annexure 19	
		providers.		
	6.20	Quality agreement for Manufacturers / Critical Materials	Annexure 20	
		vendors.		
	6.21	Service agreement for Suppliers.	Annexure 21	
	6.22	Approval report of additional material.	Annexure 22	
	6.23	Caution Letter.	Annexure 23	
	6.24	Vendor audit schedule.	Annexure 24	
	6.25	Vendor performance report.	Annexure 25	
	6.26	Re-evaluation report of vendor.	Annexure 26	
	6.27	Vendor evaluation and approval process flow chart.	Annexure 27	
	6.28	Intimation of vendor approval	Annexure 28

report no. assigned by (Sign/Date):

[S. No |DEPARTMENTS / SECTION CHECKPOINTS / CRITERIA |Yes |

| |

|1.0 |MANUFACTURING AREA | | | |

| |EQUIPMENT, MATERIAL / COMPONENT | | | |

|1.1.1 |Does all major equipments bear a unique I.D.? | | | |

|1.1.2 |Does the equipments and the facility have appropriate controls to | | | |

| |maintain required parameters e.g. temperature, relative humidity | | | |

| |pressure differentials etc.? | | | |

|1.1.3 |Is the equipment cleaned promptly after use? | | | |

|1.1.4 |Is the cleaning status of equipments is defined? | | | |

|1.1.5 |Are the rinse water samples sent for QC analysis? | | | |

|1.1.6 |Equipment /Instrument calibration & preventive Maintenance | | | |

|1.1.6.1 |Are written records maintained on equipment cleaning, sanitizing | | | |

| |and maintenance on or near each piece of equipment? | | | |

|1.1.6.2 |Does the facility have approved written procedure for checking | | | |

| |and calibration of each piece of measurement equipment? | | | |

|1.1.7 |MATERIAL /COMPONENT | | | |

|1.1.7.1 |All handling of material and product such as receipt, quarantine, | | | |

| |sample storage, tracking, labeling, dispensing, processing, | | | |

| |packaging and distribution is done in accordance with approved | | | |

| |written procedure, or instruction and recorded? | | | |

|1.1.7.2 |All incoming materials and finished products quarantined | | | |

| |immediately after receipt or processing until they released for | | | |

| |use or distribution? | | | |

|1.1.7.3 |Are all material handled in such a way to prevent contamination? | | | |

|1.2 |RAW MATERIALS | | | |

|1.2.1 |Does the store premise allow storage of raw materials at various | | | |

| |temperatures? | | | |

|1.2.2 |If answer yes to the above what are controls to log any | | | |

| |irregularities? | | | |

|1.2.3 |Are balance used are calibrated? | | | |

|1.2.4 |Are the standard weights used for calibration of balance are | | | |

| |calibrated from NABL? | | | |

|1.2.5 |Is any documentation done at the time of receiving the raw | | | |

| |material? | | | |

|1.2.6 |What is the process of communication with the laboratory for | | | |

| |sampling of the raw material? | | | |

|1.5 |STERILIZER/OVEN LOADING ROOM | | | |

|1.5.1 |Does the sterilizer meet the following criteria: | | | |

| |Is it capable of maintaining an empty chamber temperature | | | |

| |distribution of +/-1° C at a steady state? | | | |

| |Does the VLT passes regularly? | | | |

| |What is the size of vent filter? | | | |

| |Is the minimum and maximum load displayed? | | | |

| |Is the load pattern displayed? | | | |

| |Is the SOP for operation of sterilizer displayed? | | | |

| |Is it equipped with a clean steam? | | | |

| |Does the record of every sterilization cycle maintained? | | | |

|1.5.2 |Does the oven meet the following criteria? | | | |

| |Are the two interlocking doors working properly? | | | |

| |Are the re-circulating fans located upstream of the HEPA filters? | | | |

| |Does it have the resistance temperature device in the return air | | | |

| |duct for control temperature? | | | |

| |Is it equipped with temperature recorder? | | | |

|1.5.3 |Are the sterilizers and ovens calibrated and the results | | | |

| |documented? | | | |

|1.5.4 |Are the results of the testing documents? | | | |

|1.5.5 |Are the garments made of non- shredding material? | | | |

|1.5.6 |Are the garment washed and sterilized after use? | | | |

|1.5.7 |How frequently they sterilized? | | | |

|1.5.8 |Are biological or chemical indicator used? | | | |

|1.5.9 |Are the sterilizer and oven charts reviewed by IPQA prior to the | | | |

| |release of sterile products? | | | |

|1.5.10 |Are the procedures validated for the sterilized/depyrogenated | | | |

| |stoppers and components? | | | |

|1.6 |EQUIPMENT AIRLOCK | | | |

|1.6.1 |Is the air lock door interlock system working properly? | | | |

|1.6.2 |Is the air lock cleaning performed as per predefined procedure | | | |

| |and frequency? | | | |

|1.6.3 |Is the SOP for transfer of materials available? | | | |

|1.8 |MANUFACTURING OF STERILE PRODUCTS | | | |

|1.8.1 |Does the company have adequate sterilizing, depyrogenation, | | | |

| |sterile, filtration, and processing, filling and packaging | | | |

| |equipment available? | | | |

|1.8.2 |Is there an adequate control of viable, non-viable | | | |

| |micro-organisms and effective routine monitoring of sterile area | | | |

| |and aseptic practices through use of reliable equipment? | | | |

|1.8.3 |Do master/Working Cell Banks and Seed Stocks have detailed | | | |

| |records of: | | | |

|1.8.3.1 |History of cells including the number of generation doublings or | | | |

| |passages of virus? Is there a maximum limit? | | | |

|1.8.3.2 |Characterization according to the WHO TRS relevant to the | | | |

| |product? | | | |

1.8.3.3 |demonstration of purity? | | | |
 1.8.3.4 |manufacturing procedures? | | | |
 1.8.3.5 |appropriate storage and security with continuous monitoring of | | | |
 |temperature, alarms and backup power supply? | | | |
 1.8.3.6 |inventory log? | | | |
 1.8.3.7 |adequately segregated storage to avoid mix-up or | | | |
 |cross-contamination with other material? | | | |
 1.8.3.8 |routine monitoring of stability (viability/purity)? | | | |
 1.8.3.9 |Demonstration of identity? | | | |
 1.8.4 |Does the Manufacturing Formulae adequately describe the complete | | | |
 |production process? | | | |
 1.8.5 |Is the Manufacturing Formulae up-to-date and approved by QC/QA? | | | |
 1.8.6 |Is the Batch Production Record form an adequate representation of | | | |
 |the Manufacturing Formulae? | | | |
 1.9 |ENVIRONMENTAL MONITORING | | | |
 1.9.1 |Are laminar flow hood and HVAC system which serve the sterile | | | |
 |operation areas validated? | | | |
 1.9.2 |Is there an environmental monitoring program for the aseptic | | | |
 |batching area, sterile filling room, sterile filling line and | | | |
 |ancillary areas? | | | |
 1.9.3 |Is non-viable particulate sampling performed? | | | |
 1.9.4 |Are the results of environmental monitoring shared with | | | |
 |production department? | | | |
 1.10 |ASEPTIC BATCHING AREA | | | |
 1.10.1 |Are the light fixtures and motors totally sealed and enclosed? | | | |
 1.10.2 |Are the room air pressures, temperature, humidity and filter | | | |
 |pressure drop automatically monitored, alarmed and recorded? | | | |
 1.10.3 |Do personnel sanitize their gloved hands? | | | |
 1.10.4 |Are equipment status labeled? | | | |
 1.10.5 |Are the results documented for the equipments calibrated? | | | |
 1.10.6 |Are sterilization/ clarification filters integrity tested and | | | |
 |result documented? | | | |
 1.10.7 |What is the quality of water used for equipment cleaning? | | | |
 1.10.8 |Are tanks, hoses etc. sterilized prior to use and are these | | | |
 |procedure user validated? | | | |
 1.10.9 |Are tanks labeled during processing indicating status of product? | | | |
 1.10.10 |Are aseptic operations performed using laminar flow hoods? | | | |
 1.10.11 |Are sampling and testing complete prior to or concurrent with the | | | |
 |filling operation? | | | |
 1.11 |FILLING ROOMS | | | |
 1.11.1 |Is the product contact equipment sterilized by hot air or steam? | | | |
 1.11.2 |Are room air pressures, temperature, humidity and filter pressure | | | |
 |drop automatically monitored, alarmed and recorded? | | | |
 1.11.3 |What sanitizing agent is used to sanitize gloved hands? Is it | | | |
 |sterilized by filtration? | | | |
 1.11.4 |Are aseptic operations performed using laminar flow hoods? | | | |
 1.11.5 |Is the sterile filter integrity tested before and/or after use? | | | |
 1.11.6 |Is the porosity and type of filter included with the batch | | | |
 |records? | | | |
 1.11.7 |Are results of filter integrity test included with the batch | | | |
 |records? | | | |
 1.11.8 |What is the quality of water used for equipment cleaning? | | | |
 1.11.9 |Is filling line use record kept? | | | |
 2.0 |FINISHED 'ACTIVE RAW MATERIAL' CONTROL | | | |
 2.1 |Do written procedures indicate how and who verifies that correct | | | |
 |containers and packages are used for finished ARM product during | | | |
 |their finishing operation? | | | |
 2.2 |Are written sampling and testing procedures and acceptance | | | |
 |criteria available for each product to ensure conformance to | | | |
 |finished product specification? | | | |

S. No	CHECKPOINTS/CRITERIA	Yes	No
1.0	WAREHOUSING / DISTRUBUTION		
1.2	Is there adequate space for the orderly storage of material?		
1.3	Is there a segregation of quarantined, approved & rejected materials?		
1.4	Are there separate stores for raw material, packaging material, labels and finished products?		
1.5	Are materials stored on pallets, shelves, or racks, off the floor and off the walls in all stores?		
1.6	Are minimum and maximum temperatures in the store recorded?		
1.7	Are air-conditioned and cold room facilities available?		
1.8	Are flammable and hazardous chemicals stored in safe- conditions?		
1.9	Are there no expired raw materials in the raw material store(s)?		
1.10	Are materials dispensed according to prescribed SOP meeting GMP requirements?		
1.11	After release by quality control, are raw materials and packaging materials released on a FIFO/FEFO (First in First Out / First Expiry First Out) basis?		
1.12	Do distribution records in the finished goods store enable specific batches to be traced?		
1.13	Is there updated list of approved vendors available with warehouse personnel?		
1.14	Is the shipping validation done for all the products?		
1.15	Is the list of approved transporters available with warehouse department and finished products are dispatched through approved transporters only?		
1.16	Is the data loggers sent with all shipments to monitor the temperature during transit?		
1.17	Is the data obtained from data logger downloaded and reported to QA?

[S. No.]DEPARTMENT /SECTIONS CHECKPOINTS/CRITERIA [Yes |
|
1.0 |PERSONNEL | | | |
1.0 A |GENERAL | | | |
1 |Is there an organizational chart? | | | |
2 |Are there job descriptions for key personal? | | | |
|Are they Appropriate to the activities of the | | | |
|department? | | | |
3 |Number of staff _ | | | |
Number sufficient?			
Qualifications adequate?			
Experience sufficient?			
4	Is there a clear separation of job		
responsibilities of personnel?			
1.0 B	KEY PERSONNEL		
1	Are there sufficient key personnel to supervise		
assigned functions?			
2	Are they skilled / trained in their respective		
fields?			
1.0 C	TRAINING		
1	Are there on the job training procedures followed		
for new employees?			
2	Are training and education records available?		
Are they current?			
Are they filed with the supervisor?			
Is training schedule for current year is available			
with the department HOD?			
3	Does a GMP training program exist for annual		
update for all staff?			
4	Is there training in containment procedures?		
By written procedures?			
Are records maintained?			
1.0 D	PERSONAL HYGIENE		
1	Are appropriate protective apparel required?		
Is there a gowning SOP for production staff?			
2	Is staff instructed to report health or medical		
problems that may have an adverse effect on the			
product?			
3	Is there a medical monitoring program to ensure		
protection to ensure protection of staff and			
product?			
Vaccination where applicable?			
For all employees?			
4	Do controlled entry requirements exist?		
Do procedures exist for preventing unauthorized			
entry?			
Are the procedures in writing?			
2.0	PREMISES		
2.0 A	GENERAL		
1	Is there is appropriate cleaning, maintenance and		
proper operation?			
2	Are areas clearly defined and appropriately		
controlled:			
a	for quarantine and storage of starting materials?		
b	for storage of in-process material?		
c	for manufacturing and processing operations?		
d	for control and laboratory operations?		
e	for quarantine and storage of finished products?		
f	for holding of rejected material?		
g	for ancillary usage, e.g. rest rooms, maintenance		
workshops?			
h	for animal housing?		
3	Does the building design prevent the entry of		
insects, vermin and other animals?			
4	Do adequate drainage exist (Wherever required)?		
5	Does the design of the facility achieve a		
unidirectional flow of materials, personnel,			
product and waste so as to avoid cross-over of			
clean and dirty (infectious) material?			
6	Is the lighting provided adequate for the		
conditions necessary for the work being conducted			
in the area?			
7	Are facility layout drawings including mechanical,		
electrical and architectural kept up-to-date			
followings changes? Is revalidation of facilities			
performed following refurbishment?			
8	Are the premises satisfactory with respect to:		
a	neatness and cleanliness?		
b	state of repair, e.g. paint work, cracks in		
floors, ceilings or walls, door seals, etc?			
c	exposed piping or electrical wiring?		
3.0 B |CLEANING AND MAINTENANCE | | | |
1 |Is the equipment(s) suitably located to facilitate | | | |

|its use, cleaning and maintenance? ||||
 2 |Are equipments and utensils cleaned, maintained ||||
 |and sanitized as appropriate to prevent ||||
 |malfunction or cross contamination? ||||
 3 |Are piping systems, valves and vent filters ||||
properly designed to facilitate cleaning and				
sterilization? NOTE: Maintenance closed systems				
through the use of "clean in place" and "sterilize				
in place" is preferable.				
4	Are the valves on primary containment vessels			
(e.g. fermenters) steam sterilized?				
5	Are non-fiber releasing filters used for			
filtration?				
6	Are filters used for sterile filtration integrity			
tested before after use?				
7	Are calibrations and validation being performed			
adequately?				
8	Are autoclave and sterilizing ovens fitted with			
effective, proper air filters and is this				
integrity tested? Are sterilizers validated?				
9	Are supplies and equipment which are exposed to			
pathogens during processing kept separate from				
unused items to prevent cross-contamination?				
3.0 C	STANDARD OPERATING PROCEDURES (SOPs) AND RECORDS			
1	Are there written procedures (SOPs) for cleaning			
and maintenance of equipment and utensils and are				
they followed?				
2	Do these SOPs include:			
a	assignment of responsibility for cleaning?			
b	defined schedules for cleaning and maintenance?			
c	descriptions of methods, equipment and materials			
used?				
d	inspection of equipment for cleanliness			
immediately before use?				
e	assignment of identification number?			
f	documentation in record books?			
3	Are validated and approved cleaning and sanitizing			
agents used?				
4	Is clean equipment identified as such?			
5	Are calibrations and qualifications properly			
recorded?				
6	Are all certification and within date?			
7	Are there preventive maintenance programs and			
consistent record of work performed?				
4.0	DOCUMENTATION OF PROCESSING AND DISTRIBUTION			
4.0 A	GENERAL			
1	Are the records for:			
a	All material used?			
b	All standard operating procedures?			
c	Each lot and/or batch processing and distribution?			
d	All complaints and their investigation?			
e	All equipment, including cleaning, maintenance and			
validation?				
f	Cleaning, maintenance and environmental control of			
the premises?				
2	Are all records:			
a	Up dated?			
b	Signed by the person performing the task and for			
all critical steps by the person checking it?				
c	Kept at the work station during the entire			
operation?				
d	Retained and available for inspection at least 2			
years after the expiry date of the lot batch?				
4.0 B	DOCUMENTATION OF EQUIPMENT USED			
1	Are records on the use, cleaning, sterilization			
and maintenance of equipment kept in individual				
logs for each piece of equipment?				
2	Are these records dated and signed in			
chronological order?				
3	Do the records include information of the			
lot/batch including identification numbers and				
dates?				
5	Are standard procedures available for warehousing?			
6	Are standard procedures available that describe			
the shipping, final transit conditions and				
instruction for storage through the distribution				
chain, especially the cold chain?				
7	Are the shipping methods, especially the cold			
chain, validated and routinely monitored?				
8	Are records detailed and retrievable so that a			
rapid recall of any particular lot is achievable?				
Is the recall process delegated to the responsible				
person?				
9	Are records maintained for 2 years after the			
expiry date?				
5.0 C	OPERATIONAL PRACTICES AND PROCEDURES			
1	Are there standard operating procedures for			
decontamination of process equipment and				
facilities? Have these procedures been validated				
and is the performance monitored?				
2	Are standard operating procedures available and			
displayed outlining emergency procedures in the				

	event of a spill or accidental release of			
	contaminant?			
6.0	Any other observation			
6.1				
6.2				
6.3

1.0	QUALITY CONTROL DEPARTMENT				
1.2	Are adequate facilities and equipment available for the physical,				
	chemical & microbiological testing?				
1.3	Are approved written procedures available for sampling, inspecting				
	and testing raw materials, packaging materials, in process and				
	finished products?				
1.4	Are samples of starting material , packaging material,				
	Intermediate products , bulk products and finished products taken				
	by methods and personnel's approved by QC department?				
1.5	Are in-process materials tested at appropriate phases for				
	identity, strengths quality, purity and are they approved or				
	rejected by Quality Control?				
1.6	Are records of in-process controls maintained?				
1.7	Does each batch of drug product prior to release confirms				
	compliance of finished product specification?				
1.8	Are validated & stability indicating assay methods used?				
1.9	Are reference standards used for the assay?				
1.10	Are accurate, clear & neat records maintained along with the raw				
	data for the entire analytical work?				
1.11	Are any deviations from these specifications, standard, etc.				
	recorded and justified?				
1.12	Do Laboratory controls include the establishment of scientifically				
	sound and appropriate,				
	- Specifications,				
	- Standards,				
	- Sampling plans,				
	- Test procedures				
	- Reference substances,				
	Are they designed to assure that tested materials conform to				
	appropriate standards of identity, strength, quality and purity?				
1.13	Do these laboratory controls include:				
1.13.1	Determination of compliance with written specifications for				
	acceptance of each lot within each shipment of materials or				
	holding of products?				
1.13.2	Description of sampling and testing procedure for in-process				
	materials?				
1.13.3	Retest policy, identifying the rationale and criteria for retests,				
	number of samples and the documentation required?				
1.13.4	A comprehensive calibration program that includes calibration /				
	certification intervals, acceptance criteria and provisions for				
	remedial action?				
1.13.5	Are reagents, culture media, etc. properly labeled, preparation				
	recorded in lab books with expiry dates given?				
1.13.6	Is appropriate testing done on each batch of product required to				
	be free of objectionable microorganisms?				
1.14	Are all reference reagents kept secure, properly stored,				
	identified and their integrity maintained?				
1.15	Are the tests results of all references and standard analyzed at				
	appropriate intervals for statistical variation from the expected				
	value?				
1.16	Is every sterilized lot of media is tested for Growth Promotion				
	Test (GPT)?				
1.17	Is the autoclave validated for maximum and minimum loading				
	pattern?				
1.18	Are the validated load pattern displayed near to the autoclaves?				
1.19	Are all the analysts performing microbiological analysis qualified				
	to perform analysis?				
1.20	Is the environmental monitoring performed every time along with				
	sterility test?				
1.21	Is a separate autoclave used for media decontamination? Are the				
	records maintained?				
1.22	Are the culture media plates used for environmental monitoring				
	pre-incubated prior to use?				
1.23	Is an approved sampling plan available for water sampling?				
1.24	Are environmental isolates are identified and used for Growth				
	Promotion Test? Are records maintained?				
1.25	Are the inventory records maintained for all dehydrated culture				
	media?				
1.26	Are the chemicals and media stored under controlled condition of				
	temperature and humidity?				
1.27	Is the pH meter calibrated on daily basis and records are				
	maintained?				
1.28	Is the analytical balance calibrated on daily basis and records				
	are maintained?				
1.29	Are the standard weights used for calibration of balance certified				
	from NABL?				
1.30	Is the inventory records of LAL reagent maintained?				
1.31	Is all the analysis results signed the analyst performing the				
	analysis and cross checked by another senior person?				
1.32	Is the temperature of Cell Bank maintained and recorded?				

1.33	Is the record of issuance of WCB (Working Cell Bank) maintained?					
	Does it matches with physical quantities?					
1.34	Is the WCB issued after QA approval and in presence of QA					
	personnel?					
1.35	Is the entry to Cell Bank is restricted to authorized personnel?					
2.0	Other Observations, if any (Apart from the checklist).

Department: Auditee:

Audit report No.:- Audit

report no. assigned by (Sign/Date):

[S. No. |CHECKPOINTS/CRITERIA |Yes |
 ||
 1.0 |QUALITY ASSURANCE DEPARTMENT | || ||
 1.1 |Is the company's quality policy statement available with all the || || ||
 | departments? || || ||
 1.2 |Is an updated organization chart available? || || ||
 1.3 |Are the previously audited records maintained? || || ||
 1.4 |Is the job responsibility is defined and made available to all || || ||
 | personnel? Are responsibilities clearly specified in job || || ||
 | description? || || ||
 1.5 |Are the designee defined in the job responsibility in absence of || || ||
 | concerned person? || || ||
 1.6 |Are the SOPs available for all operation carried out? || || ||
 1.7 |Are all necessary controls on starting materials, intermediate || || ||
 | products and other in-process control, calibrations and validation || || ||
 | carried out in supervision of QA? || || ||
 1.8 |Are finished products correctly processed and checked (In-Process || || ||
 | & Final document check) according to the written procedures? || || ||
 2.0 |VALIDATION || || ||
 2.1 |Is validation properly documented and include Validation Master || || ||
 | Plan? Is an approved validation Master Plan available? Is there || || ||
 | Validation/Calibration planner is available for current year? || || ||
 2.2 |Are validation studies conducted in accordance with pre-defined || || ||
 | protocols (VMP) and validation planner? || || ||
 2.3 |Are the traceability certificates of master instruments used for || || ||
 | validation area verified and archived? Are they cross checked by || || ||
 | QA person for their accuracy and suitability? || || ||
 2.4 |Are the personnel involved in validation trained prior to || || ||
 | execution of validation? || || ||
 2.5 |Validation of New Master Formula: || || ||
Is new master formula or method of preparation adopted and steps						
taken to demonstrate its suitability for routine processing,						
process defined materials and equipment specified?						
2.6	Is the validation report contains a summary and conclusion of					
validation activity?						
2.7	Are pre-qualified external agencies hired for validation					
activities?						
2.8	Are the validation reports cross checked by QA person to verify					
the results?						
3.0	DOCUMENTATION / RECORDS					
3.1	Are documentation meticulously maintained as per rules and					
regularly reviewed and kept up to date?						
3.2	Is documentation maintained in proper segregated area and easily					
available?						
3.3	Is master list of documentation maintained?					
3.4	Is documentation accurate, clear & neat? Does it define					
specifications and procedures for all materials & methods of						
manufacture & control?						
3.5	Are all the specifications, testing, procedures, master formulae,					
packing instructions and standard operating procedures (SOPs)						
available , current & being followed?						
3.6	Do the records provide existence of documented evidence,					
traceability, and an audit trail that will permit investigation?						
3.7	Does the record provide batch processing & packaging details					
including receiving sample, processing equipment, analytical						
testing and laboratory instrument records?						
3.8	Are the completed log books and formats retrieved in QA?					
3.9	Are the obsolete (Not in force) copies of controlled copies of SOP					
and other documents retrieved back in QA? Are the records						
available?						
3.10	Are the retrieved documents archived in document storage room? Is					
the entry to document storage room restricted to authorized						
personnel only?						
3.11	Are the uncontrolled documents issued after QA approval only?					
3.12	Are the documents stored as per defined time period and are					
destroyed after that as per established procedures?						
4.0	STANDARD OPERATING PROCEDURES (SOPs)					
4.1	Is the master list of all SOPs available with QA?					
4.2	Is the list of controlled copies of SOPs issued to concerned					
department maintained?						
4.3	Are all of the controlled copies of superseded SOPs retrieved					
before issuance of next version of SOPs?						
4.4	Is training provided before implementation of new version of any					
SOP?						
4.5	Are the Master copies of superseded version stamped "Not in force"					
and control copies of superseded version destroyed by shredding?						
Is the record maintained?						
4.6	Are all master copies of SOPs from all department is kept with QA					
department?						
 6.0 |VENDOR QUALIFICATION || || ||
 6.1 |Is the list of approved vendors updated? || || ||

6.2	Are the vendors supplying raw material (both active & inactive
	ingredients), primary packaging & printed components audited &
	found to be satisfactory?
7.0	CHANGE CONTROL PROGRAM
7.1	Is the change control procedure properly followed as per
	established Standard Operating Procedure?
7.2	Are all change controls approved by Head Quality Assurance
	department?
7.3	If proper justification given for proposed changes?
7.4	Are approved changes, assessed after implementation, to monitor
	their effectiveness/impact?
7.5	Are change controls closed within defined timelines?
8.0	DEVIATIONS
8.1	Is the deviation procedure properly followed as per established
	Standard Operating Procedure?
8.2	Are all deviations (planned and un-planned), approved by Head
	Quality Assurance department?
8.3	If proper justification given for deviations?
8.4	If investigation performed for all deviations?
8.5	Are approved deviations, assessed after implementation, to monitor
	their effectiveness/impact?
8.6	Is impact analysis performed for all deviations?
9.0	INCIDENTS
9.1	Are all incidents signed and logged by QA?
9.2	Is root cause analysis performed and proper corrective action(s)
	taken?
9.3	Is corrective action taken for all logged incidents?
10.0	ANNUAL PRODUCT REVIEW
10.1	Is the annual product review performed for all the products
	manufacture during the year?
11.2	Are all necessary parameters included as per SOP for Annual
	Product Review?
11.3	Does the APR identify the number of deviations and Change controls
	taken during the period of product review?
11.4	Does the APR identify number of product complaints received during
	the review period for the concerned products?
11.0	AUDIT / COMPLAINTS
11.1	INTERNAL GMP AUDITS
11.2	Is the internal audit/self inspection performed as per pre-defined
	schedule?
11.3	Is the report of self inspection circulated to concerned
	department heads to take necessary corrective actions found in
	internal audit?
11.4	Is there an audit planner available for all departments for the
	current year?
11.5	Does the compliance of all discrepancies found during audits, done
	and necessary CAPA taken as per requirement?
11.6	Are the lead auditor and support auditors qualified as per the
	defined SOP?
12.0	Other Observations, if any (Apart from the checklist).
12.1	
12.2	
12.3	
12.4	

Remarks:

|Auditee's Sign/Date |Auditor's Sign/Date |
 | |

Each point of the checklist shall be filled as applicable and comments or remarks in addition shall be given under the remarks column in the checklist.

Note: Attach additional sheet if required for other observations.

STANDARD OPERATING PROCEDURE SOP No. : QMS 037
Revision No.: 00

Title: Self Inspection Supersedes : None
Page No. : 1 of 13

1.0 Objective

To lay down the procedure for performing Self Inspections.

2.0 Scope

This Standard Operating Procedure is applicable to all facilities pertaining to vaccine bulk manufacturing and testing including support facilities of Company name.

3.0 Responsibility

3.1 Head, Quality Assurance (QA) / his or her designee shall be responsible for selection of audit team personnel from other departments.

3.2 Designated QA personnel shall prepare the Audit program based on the risk assessment.

3.3 Head, QA shall approve the Audit program.

3.4 Lead Auditor to execute the Audit as per Audit plan with support from support Auditors.

3.5 Lead Auditor to prepare & issue the Audit Report to all concerned departments.

3.6 Respective department HODs shall be responsible of Corrective Action And Preventive Action (CAPA) for audit findings (as applicable).

4.0 Abbreviations and Definitions

4.1 RM Raw Materials

4.2 PM Packing Materials

4.3 FG Finished Goods

4.4 HR Human Resources

4.5 EMP Environmental Monitoring Program

Self – inspection:- Self – inspection is an examination and assessment of all processes and procedures with respect to quality system with specific purpose of evaluating the compliance to established quality systems and cGMP requirements as well as continually improving the quality system.

5.0 Procedure

5.1 General principles:

5.1.1 Self Inspections are performed:

5.1.1.1 To determine conformity with Quality System with respect to Good Manufacturing Practices.

5.1.1.2 To ensure effective and on time corrective actions.

5.1.1.3 To prevent delivery of non-conforming products.

5.1.1.4 To address/check the deficiencies in the audited areas.

5.2 Scope of Audit

STANDARD OPERATING PROCEDURE SOP No. : QMS 037

Revision No.: 00

Title: Self Inspection Supersedes : None
Page No. : 2 of 13

The scope of the audit extends depending upon the criticality of the activity and events of nonconformance, deviations, change controls, product complaints, product rejection and pre & post external audits etc.

5.3 Self Inspections can be categorized into following:

5.3.1 Announced Audit:

Announced audit is planned and scheduled audit which is performed or conducted on regular frequency by giving prior intimation to respective department.

5.3.2 Unannounced Audit:

Unannounced audit is conducted as a surprise audit at any time to check the effective implementation and compliance of the quality system without prior intimation to the department under audit.

5.3.3 Unscheduled Announced Audit:

Unscheduled announced audits are need based audits, planned as the outcome of non-conformance such as complaints, incidents, deviation, external audit observations etc.

5.4 Following is the list of areas (but not limited to) to be inspected as a part of self-inspection:

5.4.1 Manufacturing, (Production, Packing, Process controls).

5.4.2 Warehouse (RM, PM), Sampling & Dispensing Areas and release product(FG)

5.4.3 Quality Control (Chemical and Biological area).

5.4.4 Animal House (Breeding and Experimentation).

5.4.5 Quality Assurance.

5.4.6 Engineering.

5.4.7 HR & Administration.

5.4.8 EOHS (Environment Occupation Health and Safety).

5.5 The general aspects for compliance (but not limited to) to be taken in consideration are:

5.5.1 Personnel and their training status.

5.5.2 Facilities.

5.5.3 Maintenance of buildings and equipment.

5.5.4 Storage of raw materials and final products.

5.5.5 Equipment.

STANDARD OPERATING PROCEDURE SOP No. : QMS 037

Revision No.: 00

Title: Self Inspection Supersedes : None
Page No. : 3 of 13

5.5.6 Manufacturing and process controls.

5.5.7 Quality Control.

5.5.8 Documentation.

5.5.9 Health and Hygiene (Medical).

5.5.10 Validation and Revalidation Programs.

5.5.11 Calibration of Measuring Instruments.

5.5.12 Complaints & Product Recall.

5.5.13 General upkeep of the surrounding open areas.

5.5.14 Label Control.

5.5.15 Pest Control.

5.5.16 Shipping validations.

5.5.17 Changes made like pertaining to Facility/Approved document/ Equipment/ Process/ Validations/EMP.

5.6 Audit Program:

5.6.1 The designated QA personnel shall prepare the audit program in the beginning of the year based upon risk analysis as per Annexure 1 (Form No.). Assign a folio number to the audit program as: XX/001, Where XX is the last two digits of the year, / is a separator and 001 is the first version of the audit program.

Risk analysis be carried out taking into account the below mentioned factors but not limited:

■ Existing requirements for Regulatory registration.

■ Overall compliance status with respect to observations made in External/Internal audit.

■ Consistency in the manufacturing process.

■ Number and significance of the quality defects (e.g. complaints, recalls)

■ Changes with respect to the facility, equipment, manufacturing process and key personnel.

■ Complexity of the process, product.

Each factor shall be assigned a number from 1 to 5 based on the risk as per following parameters :-

Assessment of the risk Risk Number

STANDARD OPERATING PROCEDURE SOP No. : QMS 037

Revision No.: 00

Title: Self Inspection Supersedes : None

Page No. : 4 of 13

Very Slight 1

Slight 2

Minor 3

Moderate 4

Major 5

The numbers assigned to each factor shall be averaged to get the final risk number for each block/department. The block getting the highest risk number shall be audited first and more than twice in the year. All the blocks/Departments shall be audited month by month in descending order of risk number; however all the departments shall be audited at least twice in a year.

Prepare audit program based upon risk analysis as per Annexure – 2. Mention the type of audit and the month during which audit is to be carried. The second page is for writing deviations from the program, if any. Distribute the approved audit plan to all departments head.

To elaborate the Audit Program, consideration to the following aspects is given:-

5.6.1.1 Quality System.

5.6.1.2 Facilities & Equipment System.

5.6.1.3 Materials System.

5.6.1.4 Production System.

5.6.1.5 Packaging & Labeling System.

5.6.1.6 Laboratory Control System.

5.6.2 Audit program shall be executed as per Form No. "Audit Program" (Annexure 2) and record the audit performance as per Form No. "Record of Audit Performance" (Annexure 3).

5.7 The designated QA personnel informs in writing to concerned departments to be audited about the date and scope of the audit at least 15 days before its beginning for Announced Audits. The duration of intimation can be lesser than 15 days in certain cases like sudden announcement of external audit, critical noncompliance's and product complaints etc.

5.8 Audits out of the program may be performed in special cases, as for example; repetitive rejections, any incident, non-compliance with GMP, before & after National Regulatory Authority audits/External audits, etc. to assess the completeness. Such audits shall be

STANDARD OPERATING PROCEDURE SOP No. : QMS 037

Revision No.: 00

Title: Self Inspection Supersedes : None

Page No. : 5 of 13

categorized as unscheduled announced audits.

5.9 Audit Team:

5.9.1 An audit team shall be formed by auditors selected from cross functional departments e.g. Quality Assurance, Quality Control, Production, Warehouse and Maintenance department etc. to perform the audit.

5.9.2 Head, Quality Assurance department or his / her designee shall select qualified and trained lead auditor and support auditors from various departments/sections based on the department to be audited. A minimum of 3 including the lead auditor will be part of the team for each area to be audited.

Lead Auditor shall not be from the department being audited. Selection of audit team shall be based upon their competency, knowledge, expertise and experience in the area to be audited.

5.9.3 A Lead auditor is one who leads the audit as per the scope of the audit and guides the support auditors.

5.9.4 Support auditors are those who are the members of the audit team.

5.10 Independence of Auditors:

5.10.1 Auditors should free from preferences or influences, which might affect the objectivity of audits. In specific, personnel routinely connected with the work in an area cannot participate in audits performed to that area.

5.11 Criteria for selection & Responsibilities of Lead Auditor:

5.11.1 All the Lead auditors shall be qualified based on selection criteria of Lead Auditor as per SOP and any qualified lead auditor may play role as support

auditor under guidance of another qualified lead auditor based on requirement.

5.11.2 Responsibilities of Lead Auditor:

5.11.2.1 Has authority to make final decisions in the management of the audit and audit findings.

5.11.2.2 To plan the audit, prepare work documents and give instructions to the audit team.

5.11.2.3 To represent the audit team before the Head of the audited area, as well as other levels of Company Name.

5.11.2.4 To perform the audit according to the approved plan.

5.11.2.5 To report immediately to the Head of Quality Assurance

STANDARD OPERATING PROCEDURE SOP No. : QMS 037

Revision No.: 00

Title: Self Inspection Supersedes : None

Page No. : 6 of 13

Department in case of any difficulty that might affect the performance of the audit.

5.11.2.6 To guide in preparation and finalization of the final audit report.

5.11.2.7 To keep confidentiality of information.

5.12 Criteria for selection & Responsibilities of support auditors of Audit Team:

5.12.1 All the support auditors shall be qualified based on selection criteria of support auditor as per SOP. Support auditor can be lead auditor only after if he/she qualify the selection criteria of lead auditor as per SOP.

5.12.2 Responsibilities of Support Auditors:

5.12.2.1 To participate in audit planning and in the preparation of work documents.

5.12.2.2 To perform assigned audit tasks in an objective way.

5.12.2.3 To collect and analyze objective evidences that is the base of audit results.

5.12.2.4 To report Leader Auditor of any difficulty found while performing the audit.

5.12.2.5 To verify the effectiveness of the corrective actions taken to solve deficiencies.

5.12.2.6 To keep confidentiality of information.

5.12.2.7 To keep custody of audit documentation.

5.12.2.8 To coordinate in the preparation of the final audit report.

5.13 Responsibilities of Auditee:

5.13.1 To inform the area personnel, about the objectives and scope of the audit.

5.13.2 To designate personnel who will accompany the auditors during the performance of an audit.

5.13.3 To allow access of auditors to facilities, documentation, etc.

5.13.4 To supply information and necessary resources to the auditors for efficient auditing.

5.13.5 To co-operate with auditors so as to obtain audit objectives.

5.13.6 To determine the causes of deficiencies found and to take corrective actions to eliminate them.

5.13.7 To ensure that all area personnel give due respect and support to the auditing

STANDARD OPERATING PROCEDURE SOP No. : QMS 037

Revision No.: 00

Title: Self Inspection Supersedes : None

Page No. : 7 of 13

team.

5.14 Performance of Announced Audit:

Announced audit shall be conducted as per approved Audit program by following three steps as below:

5.14.1 Preparation of the Audit Plan.

5.14.2 Execution of audit as per audit plan.

5.14.3 Work documents preparation during the audit.

5.15 Preparation of the Audit Plan.

5.15.1 The audit plan shall be established in Form No. "Audit Plan" (Annexure 4).

5.15.2 Audit planning typically consists of:

5.15.2.1 Opening discussion:

Opening Discussion shall include:

5.15.2.1.1 Roles of the Auditor.

5.15.2.1.2 Introduction and apportionment of tasks to auditors.

5.15.2.1.3 To define the reason, purpose and scope of the inspection.

5.15.2.1.4 To evaluate the list of documents to be seen and area

to be visited based on risk evaluation e.g. changes

made to facility/documents/process, any critical

observation during the last audit, changes in the key

personnel of the area, any abandoned batches, any

complaint from customer etc.

5.15.2.2 Site Inspection (Key areas to be focused).

5.15.2.3 Documentation to be checked.

5.15.2.4 Concluding Discussion.

5.15.3 Audit plan is prepared by Lead Auditor/designee of Lead auditor, approved by

Head of Quality Assurance and received by Head/designee of the area being audited.

5.15.4 Audit plan shall be circulated to auditee department at least 4 working days before the beginning of the self-inspection.

5.16 Execution of audit as per audit plan

5.16.1 During the site inspection, the auditors shall follow the flow of components

STANDARD OPERATING PROCEDURE SOP No. : QMS 037

Revision No.: 00

Title: Self Inspection Supersedes : None

Page No. : 8 of 13

from receipt, through the corresponding manufacturing steps, to the packaging, to storage and delivery. The quality control areas, critical system areas, e.g. water, steam and air etc. and other auxiliary areas (locks, change rooms etc.) must also be taken into consideration.

5.16.2 The scope of the site inspection is dependent on the objective and type of the inspection and can be adapted during the inspection at any time.

5.16.3 Documentation Check : The documentation check can include but not limited to the following:

5.16.3.1 Organization chart, job descriptions & its execution.

5.16.3.2 History of changes & Change control procedures.

5.16.3.3 Evaluation of personnel health & Hygiene status.

5.16.3.4 Evidence of training planning and execution.

5.16.3.5 Manufacturing instructions and records.

5.16.3.6 Test procedures and records.

5.16.3.7 Evidence of calibration, qualification and validation.

5.16.3.8 Records of maintenance and repair.

5.16.3.9 Records of environmental monitoring.

5.16.3.10 Batch release documentation.

5.16.3.11 Evidence for procurement of starting materials and packaging materials including their specifications.

5.16.3.12 Procedure for deviations from specifications.

5.16.3.13 Handling of OOS.

5.16.3.14 Handling complaints.

5.16.3.15 Records about recalls.

5.16.4 Concluding Discussion.

All auditors involved in the audit shall meet before the concluding discussion to coordinate results.

5.17 Work documents preparation during the audit.

5.17.1 The documents needed for auditing are:

5.17.1.1 Checklists

The checklist shall used during audit in such a way, as not to limit audit activities to the checklist only.

STANDARD OPERATING PROCEDURE SOP No. : QMS 037

Revision No.: 00

Title: Self Inspection Supersedes : None

Page No. : 9 of 13

A general checklist shall be considered for all the departments as per form no. QA/024/F5-10 (Annexure 5).

Department Specific Checklist shall be used along with general checklist for auditing concerned department as established in Form No. QA/024/F6-10 "Audit Checklist for Quality Control" (Annexure 6),

- Form No. 0 "Audit Checklist for Quality Assurance" (Annexure 7),

- Form No. QA/000/00 "Audit Checklist for Engineering" (Annexure 8),

- Form No. QA/000/00 "Audit Checklist for Human Resource and Administration" (Annexure 9),

- Form No. QA/000/00 "Audit Checklist for Production" (Annexure 10),

- Form No. QA/000/00 "Audit Checklist for Warehouse" (Annexure 11),

- Form No. QA/000/00 "Audit Checklist for Animal House" (Annexure 12) and

- Form No. QA/000/00 "Audit Checklist for EOHS" (Annexure 13).

5.18 Final Report of the Audit:

5.18.1 Preparing the final report:

5.18.1.1 The lead auditor along with other auditors shall summarize the observations/Recommendations in wrap-up meeting with all the auditees along with the Heads of the Audited area.

5.18.1.2 While demonstrating the deficiencies, these should be classified as Critical/ Major/ Minor according to their severity as defined:-

5.18.1.2.1 Critical: Non-conformance which have a direct impact on the quality of the product.

5.18.1.2.2 Major: Non-conformance which have an in-direct impact on the quality of the product.

5.18.1.2.3 Minor: Non-conformance which do not have an

STANDARD OPERATING PROCEDURE SOP No. : QMS 037

Revision No.: 00

Title: Self Inspection Supersedes : None

Page No. : 10 of 13

impact on the quality of the product.

5.18.1.2.4 Recommendations: Are the observations suggested for better understanding / clarity of any procedure or process, however does not reflects any non – conformance of the said procedure or process.

5.18.1.3 It is vital in all cases that the auditee shall understand all conclusions and deficiencies submitted.

5.18.1.4 The audit report must state clearly the deficiencies found/ recommendations as per Form No. QA/000/00 "Audit Report" (Annexure 14).

5.18.1.5 The Lead Auditor shall prepare & issue the final audit report to all concerned departments within 10 working days after completion of audit.

5.18.1.6 Numbers of deficiencies observed during an audit shall be clearly stated in the conclusions of the audit report.

5.18.2 Assigning Audit Report Number
5.19.1.5 5.18.2.1 For Announced Audit : WW/XX/YY/ZZ
Where, WW : Shall define the type of Audit i.e.
AN for Announced Audit.
UN for Unannounced Audit.
UA for Unscheduled Announced Audit
'/' : Separator.
XX : Last two digits of the year.
YY : Serial Number of the Audit i.e. 01 for first audit,
02 for second audit and so on.
ZZ : Department Code i.e.
VBI for Vaccine Block I
VB II for Vaccine Block II
VB III for Vaccine Block III
VB IV for Vaccine Block IV.
QC for Quality Control.
QA for Quality Assurance.
STANDARD OPERATING PROCEDURE SOP No. : QMS 037
Revision No.: 00

Title: Self Inspection Supersedes : None
Page No. : 11 of 13

EN for Engineering.
WH for Warehouse.
AH for Animal House.
ES for EOHS.
HR for Human Resource.
AD for Administration department.
5.18.3 The final audit report shall be kept with Audits and Inspection section of Quality Assurance department.
5.18.4 The final audit report (QA/000/00), filled checklist of the audit (QA/000/00 to QA/ QA/000/00) and audit compliance plan (QA/000/00) are confidential document and is not shown to any external personnel or auditing/inspecting agency.
5.19 Performance of Unannounced Audit:
Unannounced audit shall be conducted as per approved schedule for unannounced audit without prior intimation to auditee department. QA shall prepare audit schedule as per "Schedule for unannounced audit" – Annexure 15.
5.19.1 Head QA shall depute any internal Auditor(s) for execution of unannounced audit as per schedule and no audit team formation is required for the same.
5.19.2 The Auditor(s) selection for unannounced audit should not be from auditee department.
5.19.3 The auditor(s) shall plan and perform the audit by focusing any particular area/section of auditee department. During performance of un-announced audits, usage of audit checklists (as mentioned under section 5.17.1.1) is not applicable due to limited scope of the audit.
5.19.5 After Completion of unannounced audit the auditor(s) shall discuss the observations/non-compliances discussed with auditee and send the Audit Report as per Annexure – 14 (Audit Report) to Head of Auditee department and Head of QA within ten working days. In case of delay in issue audit report within ten days, a justification shall be given and audit report shall be issued not later than next ten working days.
5.20 Performance of Unscheduled Announced Audit:
5.20.1 Unscheduled announced audits are need based audits, planned as the outcome
STANDARD OPERATING PROCEDURE SOP No. : QMS 037
Revision No.: 00

Title: Self Inspection Supersedes : None
Page No. : 12 of 13

of non-conformance such as complaints, incidents, deviation, external audit observations etc.
5.20.2 Unscheduled announced audits shall be performed by following the same procedure as described for Announced Audits.
5.21 Corrective Actions:
5.21.1 The concerned department Head/designee of the audited area shall prepare an audit compliance report as per Annexure – 16 and submit it to QA within 10 (ten) working days after receipt of the audit report.
5.21.2 For all audit observations classified as Critical, investigation shall be performed as per SOP QA/000. In case of Major observations investigation shall be performed on case to case basis wherever required. In case of minor observations investigations are not required.
5.21.3 Designated person of QA shall verify the compliance as per Audit compliance report.
5.21.4 The concerned department Head/designee of the audited area shall take necessary corrective and preventive actions as per SOP for CAPA, SOP QA/025.

(To be filled by Auditor)

1.0 PERSONNEL
1.0 A GENERAL
1 Is there an organizational chart?
2 Are there job descriptions for key personnel?
Are they Appropriate to the activities of the department?
3 Number of staff _
Number sufficient?
Qualifications adequate?
Experience sufficient?
4 Is there a clear separation of job responsibilities of personnel?
1.0 B KEY PERSONNEL
1 Are there sufficient key personnel to supervise assigned
functions?
2 Are they skilled / trained in their respective fields?
1.0 C TRAINING
1 Are there on the job training procedures followed for new
employees?
2 Are training and education records available?
Are they current?
Are they filed with the supervisor?
Is training schedule for current year is available with the
department HOD?
3 Does a GMP training program exist for annual update for all
staff?

steam sterilized?
 5 Are non-fiber releasing filters used for filtration?
 6 Are filters used for sterile filtration integrity tested before after use?
 7 Are calibrations and validation being performed adequately?
 8 Are autoclave and sterilizing ovens fitted with effective, proper air filters and is this integrity tested? Are sterilizers validated?
 9 Are supplies and equipment which are exposed to pathogens during processing kept separate from unused items to prevent cross-contamination?
 3.0 C STANDARD OPERATING PROCEDURES (SOPs) AND RECORDS
 1 Are there written procedures (SOPs) for cleaning and maintenance of equipment and utensils and are they followed?
 2 Do these SOPs include:
 a assignment of responsibility for cleaning?
 b defined schedules for cleaning and maintenance?
 c descriptions of methods, equipment and materials used?
 d inspection of equipment for cleanliness immediately before use?
 e assignment of identification number?
 f documentation in record books?
 3 Are validated and approved cleaning and sanitizing agents used?
 4 Is clean equipment identified as such?
 5 Are calibrations and qualifications properly recorded?
 6 Are all certification and within date?
 7 Are there preventive maintenance programs and consistent record of work performed?

Yes No NA REMARKS

4.0 DOCUMENTATION OF PROCESSING AND
DISTRIBUTION

4.0 A GENERAL

1 Are the records for:

- a All material used?
- b All standard operating procedures?
- c Each lot and/or batch processing and distribution?
- d All complaints and their investigation?
- e All equipment, including cleaning, maintenance and validation?
- f Cleaning, maintenance and environmental control of the premises?

2 Are all records:

- a Up dated?
- b Signed by the person performing the task and for all critical steps by the person checking it?
- c Kept at the work station during the entire operation?
- d Retained and available for inspection at least 2 years after the expiry date of the lot batch?

4.0 B DOCUMENTATION OF EQUIPMENT USED

- 1 Are records on the use, cleaning, sterilization and maintenance of equipment kept in individual logs for each piece of equipment?
- 2 Are these records dated and signed in chronological order?
- 3 Do the records include information of the lot/batch including identification numbers and dates?
- 5 Are standard procedures available for warehousing?
- 6 Are standard procedures available that describe the shipping, final transit conditions and instruction for storage through the

Audit Check List for Quality Control

Yes No NA REMARKS

S. No CHECKPOINTS/CRITERIA

(To be filled by Auditor)

Does each batch of drug product prior to release confirms compliance of finished

1.7

product specification?

1.8 Are validated & stability indicating assay methods used?

1.9 Are reference standards used for the assay?

Are accurate, clear & neat records maintained along with the raw data for the entire

1.10

analytical work?

1.11 Are any deviations from these specifications, standard, etc. recorded and justified?

Do Laboratory controls include the establishment of scientifically sound and

appropriate,

- Specifications,

- Standards,

1.12 - Sampling plans,

- Test procedures

- Reference substances,

Are they designed to assure that tested materials conform to appropriate standards of identity, strength, quality and purity?

Do these laboratory controls include:

1.13

Page 2 of 6

Audit Check List for Quality Control

Yes No NA REMARKS

S. No CHECKPOINTS/CRITERIA

(To be filled by Auditor)

Determination of compliance with written specifications for acceptance of each lot

1.13.1

within each shipment of materials or holding of products?

1.13.2 Description of sampling and testing procedure for in-process materials?

1.13.3 Retest policy, identifying the rationale and criteria for retests, number of samples and the documentation required?

1.13.4 A comprehensive calibration program that includes calibration / certification intervals, acceptance criteria and provisions for remedial action?

1.13.5 Are reagents, culture media, etc. properly labeled, preparation recorded in lab books with expiry dates given?

1.13.6 Is appropriate testing done on each batch of product required to be free of objectionable microorganisms?

Are all reference reagents kept secure, properly stored, identified and their integrity

1.14

maintained?

Are the tests results of all references and standard analyzed at appropriate intervals for

1.15

statistical variation from the expected value?

1.16 Is every sterilized lot of media is tested for Growth Promotion Test (GPT)?

1.17 Is the autoclave validated for maximum and minimum loading pattern?

Page 3 of 6

Audit Check List for Quality Control

Yes No NA REMARKS

S. No CHECKPOINTS/CRITERIA

(To be filled by Auditor)

1.18 Are the validated load pattern displayed near to the autoclaves?

Are all the analysts performing microbiological analysis qualified to perform analysis?

1.19

1.20 Is the environmental monitoring performed every time along with sterility test?

1.21 Is a separate autoclave used for media decontamination? Are the records maintained?

Are the culture media plates used for environmental monitoring pre-incubated prior to

1.22

use?

1.23 Is an approved sampling plan available for water sampling?

Are environmental isolates are identified and used for Growth Promotion Test? Are

1.24

records maintained?

1.25 Are the inventory records maintained for all dehydrated culture media?

Are the chemicals and media stored under controlled condition of temperature and

1.26

humidity?

1.27 Is the pH meter calibrated on daily basis and records are maintained?

1.28 Is the analytical balance calibrated on daily basis and records are maintained?

Page 4 of 6

Audit Check List for Quality Control

Yes No NA REMARKS

S. No CHECKPOINTS/CRITERIA

(To be filled by Auditor)

1.29 Are the standard weights used for calibration of balance certified from NABL?

1.30 Is the inventory records of LAL reagent maintained?

Is all the analysis results signed the analyst performing the analysis and cross checked

1.31

by another senior person?

1.32 Is the temperature of Cell Bank maintained and recorded?

Is the record of issuance of WCB (Working Cell Bank) maintained? Does it matches

1.33

with physical quantities?

1.34 Is the WCB issued after QA approval and in presence of QA personnel?

1.35 Is the entry to Cell Bank is restricted to authorized personnel?

2.0 Other Observations, if any (Apart from the checklist).

S. No. CHECKPOINTS/CRITERIA

(To be filled by Auditor)

1.0 QUALITY ASSURANCE DEPARTMENT

1.1 Is the company's quality policy statement available with all the departments?

1.2 Is an updated organization chart available?

1.3 Are the previously audited records maintained?

Is the job responsibility is defined and made available to all personnel? Are

1.4

responsibilities clearly specified in job description?

1.5 Are the designee defined in the job responsibility in absence of concerned person?

1.6 Are the SOPs available for all operation carried out?

Page 1 of 9

Audit Check List for Quality Assurance

Yes No NA REMARKS

S. No. CHECKPOINTS/CRITERIA

(To be filled by Auditor)

Are all necessary controls on starting materials, intermediate products and other in-

1.7
process control, calibrations and validation carried out in supervision of QA?
Are finished products correctly processed and checked (In-Process & Final document
1.8
check) according to the written procedures?
2.0 VALIDATION
Is validation properly documented and include Validation Master Plan? Is an approved
2.1 validation Master Plan available? Is there Validation/Calibration planner is available
for current year?
Are validation studies conducted in accordance with pre-defined protocols (VMP) and
2.2
validation planner?
Are the traceability certificates of master instruments used for validation area verified
2.3
and archived? Are they cross checked by QA person for their accuracy and suitability?
2.4 Are the personnel involved in validation trained prior to execution of validation?
Validation of New Master Formula:
Is new master formula or method of preparation adopted and steps taken to
2.5
demonstrate its suitability for routine processing, process defined materials and
equipment specified?
2.6 Is the validation report contains a summary and conclusion of validation activity?

Page 2 of 9

Audit Check List for Quality Assurance

Yes No NA REMARKS

S. No. CHECKPOINTS/CRITERIA

(To be filled by Auditor)

2.7 Are pre-qualified external agencies hired for validation activities?
2.8 Are the validation reports cross checked by QA person to verify the results?
3.0 DOCUMENTATION / RECORDS
Are documentation meticulously maintained as per rules and regularly reviewed and
3.1
kept up to date?
3.2 Is documentation maintained in proper segregated area and easily available?
3.3 Is master list of documentation maintained?
Is documentation accurate, clear & neat? Does it define specifications and procedures
3.4
for all materials & methods of manufacture & control?
Are all the specifications, testing, procedures, master formulae, packing instructions
3.5
and standard operating procedures (SOPs) available , current & being followed?
Do the records provide existence of documented evidence, traceability, and an audit
3.6
trial that will permit investigation?
Does the record provide batch processing & packaging details including receiving
3.7
sample, processing equipment, analytical testing and laboratory instrument records?

Page 3 of 9

Audit Check List for Quality Assurance

Yes No NA REMARKS

S. No. CHECKPOINTS/CRITERIA

(To be filled by Auditor)

3.8 Are the completed log books and formats retrieved in QA?

Are the obsolete (Not in force) copies of controlled copies of SOP and other
3.9
documents retrieved back in QA? Are the records available?
Are the retrieved documents archived in document storage room? Is the entry to
3.10
document storage room restricted to authorized personnel only?
3.11 Are the uncontrolled documents issued after QA approval only?
Are the documents stored as per defined time period and are destroyed after that as per
3.12
established procedures?

4.0 STANDARD OPERATING PROCEDURES (SOPs)

4.1 Is the master list of all SOPs available with QA?
4.2 Is the list of controlled copies of SOPs issued to concerned department maintained?
Are all of the controlled copies of superseded SOPs retrieved before issuance of next
4.3
version of SOPs?
4.4 Is training provided before implementation of new version of any SOP?

Page 4 of 9

Audit Check List for Quality Assurance

Yes No NA REMARKS

S. No. CHECKPOINTS/CRITERIA

(To be filled by Auditor)

Are the Master copies of superseded version stamped "Not in force" and control
4.5
copies of superseded version destroyed by shredding? Is the record maintained?
4.6 Are all master copies of SOPs from all department is kept with QA department?
6.0 VENDOR QUALIFICATION
6.1 Is the list of approved vendors updated?
Are the vendors supplying raw material (both active & inactive ingredients), primary
6.2

packaging & printed components audited & found to be satisfactory?
7.0 CHANGE CONTROL PROGRAM
Is the change control procedure properly followed as per established Standard
7.1
Operating Procedure?
7.2 Are all change controls approved by Head Quality Assurance department?
7.3 If proper justification given for proposed changes?
Are approved changes, assessed after implementation, to monitor their
7.4
effectiveness/impact?
7.5 Are change controls closed within defined timelines?
8.0 DEVIATIONS

Page 5 of 9
Audit Check List for Quality Assurance
Yes No NA REMARKS
S. No. CHECKPOINTS/CRITERIA
(To be filled by Auditor)

Is the deviation procedure properly followed as per established Standard Operating
8.1
Procedure?
Are all deviations (planned and un-planned), approved by Head Quality Assurance
8.2
department?
8.3 If proper justification given for deviations?

8.4 If investigation performed for all deviations?
Are approved deviations, assessed after implementation, to monitor their
8.5
effectiveness/impact?
8.6 Is impact analysis performed for all deviations?
9.0 INCIDENTS
9.1 Are all incidents signed and logged by QA?
9.2 Is root cause analysis performed and proper corrective action(s) taken?
9.3 Is corrective action taken for all logged incidents?
10.0 ANNUAL PRODUCT REVIEW
Is the annual product review performed for all the products manufacture during the
10.1
year?

Page 6 of 9
Audit Check List for Quality Assurance
Yes No NA REMARKS
S. No. CHECKPOINTS/CRITERIA
(To be filled by Auditor)

11.2 Are all necessary parameters included as per SOP for Annual Product Review?
Does the APR identify the number of deviations and Change controls taken during the
11.3
period of product review?
Does the APR identify number of product complaints received during the review
11.4
period for the concerned products?

11.0 AUDIT / COMPLAINTS

11.1 INTERNAL GMP AUDITS

11.2 Is the internal audit/self inspection performed as per pre-defined schedule?
Is the report of self inspection circulated to concerned department heads to take
11.3
necessary corrective actions found in internal audit?
11.4 Is there an audit planner available for all departments for the current year?
Does the compliance of all discrepancies found during audits, done and necessary
11.5
CAPA taken as per requirement?
11.6 Are the lead auditor and support auditors qualified as per the defined SOP?

1.0 SUPPORT SYSTEMS

1.2 HVAC SYSTEM

Are pre-filters present in heating, ventilation and air-conditioning (HVAC) systems

1.1.1

cleaned/replaced on a routine basis? Is the record maintained?

1.1.2 Is the log books for operation of HVAC systems maintained?

1.1.3 Are the records of temp. / RH maintained?

1.1.4 Is the schedule of preventive maintenance of HVAC system available?

Is the preventive maintenance of HVAC done as per schedule? Are records

1.1.5

maintained?

Yes No NA REMARKS

S. No DEPARTMENT /SECTIONS CHECKPOINTS/CRITERIA
(To be filled by Auditor)

1.1.6 Is the differential pressure of clean room areas recorded?

In case of any major modification or change or maintenance work, if all related

1.1.7

parameters reassessed and approved before starting production?

1.1.8 Are the temperature / RH of returned air monitored and recorded?

1.2 COMPRESSED AIR

1.2.1 Is compressed air checked for presence of any oil? Are records maintained?

1.2.2 Is the air supply filtered through a sterilizing grade air filter?

1.2.3 Is humidity controlled?

1.3 WATER AND PURE STEAM

1.3.1 Is there a schedule available for sanitation of water and pure steam systems?

Is the sanitation of water and pure steam system done as per schedule? Are records

1.3.2

maintained?

Yes No NA REMARKS

S. No DEPARTMENT /SECTIONS CHECKPOINTS/CRITERIA
(To be filled by Auditor)

1.3.3 Is the area for water system clean and dry?

1.3.4 Is there a schematic drawing available

1.3.5 Is conductivity, pH and TOC monitored & recorded on routinely basis?

1.3.6 Is the water for injection is stored at above 80 0C?

1.3.7 Are water storage tanks cleaned / sanitized routinely?

1.3.8 Are the vent filters of water storage tanks checked for integrity on routinely basis?

1.3.9 Is the U.V. usage records maintained?

Are U.V. tubes changed after consumption of usage hours? Are the records

1.3.10

maintained?

Audit Check List for Production Department

Date of audit: Auditor:

Department: Auditee:

Audit report No.:- Audit report no. assigned by (Sign/Date):

Yes No NA REMARKS

S. No DEPARTMENTS / SECTION CHECKPOINTS / CRITERIA

(To be filled by Auditor)

1.0 MANUFACTURING AREA

EQUIPMENT, MATERIAL / COMPONENT

1.1 EQUIPMENTS

1.1.1 Does all major equipments bear a unique I.D.?

1.1.2 Does the equipments and the facility have appropriate controls to maintain required parameters e.g. temperature, relative humidity pressure differentials etc.?

1.1.3 Is the equipment cleaned promptly after use?

1.1.4 Is the cleaning status of equipments is defined?

1.1.5 Are the rinse water samples sent for QC analysis?

1.1.6 Equipment /Instrument calibration & preventive Maintenance

Page 1 of 11

Audit Check List for Production Department

Yes No NA REMARKS

S. No DEPARTMENTS / SECTION CHECKPOINTS / CRITERIA

(To be filled by Auditor)

1.1.6.1 Are written records maintained on equipment cleaning, sanitizing and maintenance on or near each piece of equipment?

1.1.6.2 Does the facility have approved written procedure for checking and calibration of each piece of measurement equipment?

1.1.7 MATERIAL /COMPONENT

1.1.7.1 All handling of material and product such as receipt, quarantine, sample storage, tracking, labeling, dispensing, processing, packaging and distribution is done in accordance with approved written procedure, or instruction and recorded?

1.1.7.2 All incoming materials and finished products quarantined immediately after receipt or processing until they released for use or distribution?

1.1.7.3 Are all material handled in such a way to prevent contamination?

1.2 RAW MATERIALS

1.2.1 Does the store premise allow storage of raw materials at various temperatures?

Page 2 of 11

Audit Check List for Production Department

Yes No NA REMARKS

S. No DEPARTMENTS / SECTION CHECKPOINTS / CRITERIA

(To be filled by Auditor)

1.2.2 If answer yes to the above what are controls to log any irregularities?

1.2.3 Are balance used are calibrated?

1.2.4 Are the standard weights used for calibration of balance are calibrated from NABL?

1.2.5 Is any documentation done at the time of receiving the raw material?

1.2.6 What is the process of communication with the laboratory for sampling of the raw material?

1.5 STERILIZER/OVEN LOADING ROOM

1.5.1 Does the sterilizer meet the following criteria:

a. Is it capable of maintaining an empty chamber temperature distribution of +/- 1° C at a steady state?

b. Does the VLT passes regularly?

c. What is the size of vent filter?

d. Is the minimum and maximum load displayed?

Page 3 of 11

Audit Check List for Production Department

Yes No NA REMARKS

S. No DEPARTMENTS / SECTION CHECKPOINTS / CRITERIA

(To be filled by Auditor)

e. Is the load pattern displayed?

f. Is the SOP for operation of sterilizer displayed?

g. Is it equipped with a clean steam?

h. Does the record of every sterilization cycle maintained?

1.5.2 Does the oven meet the following criteria?

a. Are the two interlocking doors working properly?

b. Are the re-circulating fans located upstream of the HEPA filters?

c. Does it have the resistance temperature device in the return air duct for control temperature?

d. Is it equipped with temperature recorder?

1.5.3 Are the sterilizers and ovens calibrated and the results documented?

1.5.4 Are the results of the testing documents?

15.5 Are the garments made of non- shredding material?

Page 4 of 11

Audit Check List for Production Department

Yes No NA REMARKS

S. No DEPARTMENTS / SECTION CHECKPOINTS / CRITERIA

(To be filled by Auditor)

1.5.6 Are the garment washed and sterilized after use?

1.5.7 How frequently they sterilized?

1.5.8 Are biological or chemical indicator used?

1.5.9 Are the sterilizer and oven charts reviewed by IPQA prior to the release of sterile products?

1.5.10 Are the procedures validated for the sterilized/depyrogenated stoppers and components?

1.6 EQUIPMENT AIRLOCK

1.6.1 Is the air lock door interlock system working properly?

1.6.2 Is the air lock cleaning performed as per predefined procedure and frequency?

1.6.3 Is the SOP for transfer of materials available?

1.8 MANUFACTURING OF STERILE PRODUCTS

1.8.1 Does the company have adequate sterilizing, depyrogenation, sterile, filtration, and processing, filling and packaging equipment available?

Page 5 of 11

Audit Check List for Production Department

Yes No NA REMARKS

S. No DEPARTMENTS / SECTION CHECKPOINTS / CRITERIA

(To be filled by Auditor)

1.8.2 Is there an adequate control of viable, non-viable micro-organisms and effective routine monitoring of sterile area and aseptic practices through use of reliable equipment?

1.8.3 Do master/Working Cell Banks and Seed Stocks have detailed records of:

1.8.3.1 history of cells including the number of generation doublings or passages of virus? Is there a maximum limit?

1.8.3.2 characterization according to the WHO TRS relevant to the product?

1.8.3.3 demonstration of purity?

1.8.3.4 manufacturing procedures?

1.8.3.5 appropriate storage and security with continuous monitoring of temperature, alarms and backup power supply?

1.8.3.6 inventory log?

1.8.3.7 adequately segregated storage to avoid mix-up or cross-contamination with other material?

1.8.3.8 routine monitoring of stability (viability/purity)?

Page 6 of 11

Audit Check List for Production Department

Yes No NA REMARKS

S. No DEPARTMENTS / SECTION CHECKPOINTS / CRITERIA

(To be filled by Auditor)

1.8.3.9 Demonstration of identity?

1.8.4 Does the Manufacturing Formulae adequately describe the complete production process?

1.8.5 Is the Manufacturing Formulae up-to-date and approved by QC/QA?

1.8.6 Is the Batch Production Record form an adequate representation of the Manufacturing Formulae?

1.9 ENVIRONMENTAL MONITORING

1.9.1 Are laminar flow hood and HVAC system which serve the sterile operation areas validated?

1.9.2 Is there an environmental monitoring program for the aseptic batching area, sterile filling room, sterile filling line and ancillary areas?

1.9.3 Is non-viable particulate sampling performed?

1.9.4 Are the results of environmental monitoring shared with production department?

1.10 ASEPTIC BATCHING AREA

1.10.1 Are the light fixtures and motors totally sealed and enclosed?

Page 7 of 11

Audit Check List for Production Department

Yes No NA REMARKS

S. No DEPARTMENTS / SECTION CHECKPOINTS / CRITERIA

(To be filled by Auditor)

1.10.2 Are the room air pressures, temperature, humidity and filter pressure drop automatically monitored, alarmed and recorded?

1.10.3 Do personnel sanitize their gloved hands?

1.10.4 Are equipment status labeled?

1.10.5 Are the results documented for the equipments calibrated?

1.10.6 Are sterilization/ clarification filters integrity tested and result documented?

1.10.7 What is the quality of water used for equipment cleaning?

1.10.8 Are tanks, hoses etc. sterilized prior to use and are these procedure user validated?

1.10.9 Are tanks labeled during processing indicating status of product?

1.10.10 Are aseptic operations performed using laminar flow hoods?

1.10.11 Are sampling and testing complete prior to or concurrent with the filling operation?

1.11 FILLING ROOMS

Authorized by/date:-

1.0	Objective		
	To lay down the procedure for performing Self Inspections.		
2.0	Scope		
	This Standard Operating Procedure is applicable to all facilities		
	pertaining to vaccine bulk manufacturing and testing including support		
	facilities of Company name.		
3.0	Responsibility		
	3.1	Head, Quality Assurance (QA) / his or her designee shall be	
	responsible for selection of audit team personnel from other		
	departments.		
	3.2	Designated QA personnel shall prepare the Audit program based on the	
	risk assessment.		
	3.3	Head, QA shall approve the Audit program.	
	3.4	Lead Auditor to execute the Audit as per Audit plan with support	
	from support Auditors.		
	3.5	Lead Auditor to prepare & issue the Audit Report to all concerned	
	departments.		
	3.6	Respective department HODs shall be responsible of Corrective Action	
	And Preventive Action (CAPA) for audit findings (as applicable).		
4.0	Abbreviations and Definitions		
	4.1	RM	Raw Materials
	4.2	PM	Packing Materials
	4.3	FG	Finished Goods
	4.4	HR	Human Resources
	4.5	EMP	Environmental Monitoring Program
Self –	Self – inspection is an examination and assessment of all		
inspection:-	processes and procedures with respect to quality system with		
	specific purpose of evaluating the compliance to established		
	quality systems and cGMP requirements as well as continually		
	improving the quality system.		
5.0	Procedure		
	5.1	General principles:	
	5.1.1	Self Inspections are performed:	
		5.1.1.1	To determine conformity with Quality System with
			respect to Good Manufacturing Practices.
		5.1.1.2	To ensure effective and on time corrective actions.
		5.1.1.3	To prevent delivery of non-conforming products.
		5.1.1.4	To address/check the deficiencies in the audited
		areas.	
	5.2	Scope of Audit	
	The scope of the audit extends depending upon the criticality of the		
	activity and events of nonconformance, deviations, change controls,		
	product complaints, product rejection and pre & post external audits		
	etc.		
	5.3	Self Inspections can be categorized into following:	
	5.3.1	Announced Audit:	
		Announced audit is planned and scheduled audit which is	
		performed or conducted on regular frequency by giving prior	
		intimation to respective department.	
	5.3.2	Unannounced Audit:	
		Unannounced audit is conducted as a surprise audit at any	
		time to check the effective implementation and compliance of	
		the quality system without prior intimation to the	
		department under audit.	
	5.3.3	Unscheduled Announced Audit:	
		Unscheduled announced audits are need based audits, planned	
		as the outcome of non-conformance such as complaints,	
		incidents, deviation, external audit observations etc.	
	5.4	Following is the list of areas (but not limited to) to be inspected	
	as a part of self-inspection:		
	5.4.1	Manufacturing, (Production, Packing, Process controls).	
	5.4.2	Warehouse (RM, PM), Sampling & Dispensing Areas and release	
		product(FG)	
	5.4.3	Quality Control (Chemical and Biological area).	
	5.4.4	Animal House (Breeding and Experimentation).	
	5.4.5	Quality Assurance.	
	5.4.6	Engineering.	
	5.4.7	HR & Administration.	
	5.4.8	EOHS (Environment Occupation Health and Safety).	
	5.5	The general aspects for compliance (but not limited to) to be taken	
	in consideration are:		
	5.5.1	Personnel and their training status.	
	5.5.2	Facilities.	
	5.5.3	Maintenance of buildings and equipment.	
	5.5.4	Storage of raw materials and final products.	
	5.5.5	Equipment.	
	5.5.6	Manufacturing and process controls.	
	5.5.7	Quality Control.	
	5.5.8	Documentation.	
	5.5.9	Health and Hygiene (Medical).	
	5.5.10	Validation and Revalidation Programs.	
	5.5.11	Calibration of Measuring Instruments.	
	5.5.12	Complaints & Product Recall.	
	5.5.13	General upkeep of the surrounding open areas.	
	5.5.14	Label Control.	
	5.5.15	Pest Control.	
	5.5.16	Shipping validations.	
	5.5.17	Changes made like pertaining to Facility/Approved document/	
		Equipment/ Process/ Validations/EMP.	

	5.6	Audit Program:	
	5.6.1	The designated QA personnel shall prepare the audit program	
		in the beginning of the year based upon risk analysis as per	
		Annexure 1 (Form No.). Assign a folio number to the audit	
		program as: XX/001,	
		Where XX is the last two digits of the year, / is a	
		separator and 001 is the first version of the audit program.	
		Risk analysis be carried out taking into account the below	
		mentioned factors but not limited:	
		Existing requirements for Regulatory registration.	
		Overall compliance status with respect to observations made	
		in External/Internal audit.	
		Consistency in the manufacturing process.	
		Number and significance of the quality defects (e.g.	
		complaints, recalls)	
		Changes with respect to the facility, equipment,	
		manufacturing process and key personnel.	
		Complexity of the process, product.	
		Each factor shall be assigned a number from 1 to 5 based on	
		the risk as per following parameters :-	
		Assessment of the risk	
		Risk Number	
		Very Slight	
		1	
		Slight	
		2	
		Minor	
		3	
		Moderate	
		4	
		Major	
		5	
		The numbers assigned to each factor shall be averaged to get	
		the final risk number for each block/department. The block	
		getting the highest risk number shall be audited first and	
		more than twice in the year. All the blocks/Departments	
		shall be audited month by month in descending order of risk	
		number; however all the departments shall be audited at	
		least twice in a year.	
		Prepare audit program based upon risk analysis as per	
		Annexure – 2. Mention the type of audit and the month during	
		which audit is to be carried. The second page is for writing	
		deviations from the program, if any. Distribute the approved	
		audit plan to all departments head.	
		To elaborate the Audit Program, consideration to the	
		following aspects is given:-	
		5.6.1.1	Quality System.
		5.6.1.2	Facilities & Equipment System.
		5.6.1.3	Materials System.
		5.6.1.4	Production System.
		5.6.1.5	Packaging & Labeling System.
		5.6.1.6	Laboratory Control System.
		5.6.2	Audit program shall be executed as per Form No. "Audit
		Program" (Annexure 2) and record the audit performance as	
		per Form No. "Record of Audit Performance" (Annexure 3).	
	5.7	The designated QA personnel informs in writing to concerned	
		departments to be audited about the date and scope of the audit at	
		least 15 days before its beginning for Announced Audits. The	
		duration of intimation can be lesser than 15 days in certain cases	
		like sudden announcement of external audit, critical noncompliance's	
		and product complaints etc.	
	5.8	Audits out of the program may be performed in special cases, as for	
		example; repetitive rejections, any incident, non-compliance with	
		GMP, before & after National Regulatory Authority audits/External	
		audits, etc. to assess the completeness. Such audits shall be	
		categorized as unscheduled announced audits.	
	5.9	Audit Team:	
	5.9.1	An audit team shall be formed by auditors selected from	
		cross functional departments e.g. Quality Assurance, Quality	
		Control, Production, Warehouse and Maintenance department	
		etc. to perform the audit.	
	5.9.2	Head, Quality Assurance department or his / her designee	
		shall select qualified and trained lead auditor and support	
		auditors from various departments/sections based on the	
		department to be audited. A minimum of 3 including the lead	
		auditor will be part of the team for each area to be	
		audited. Lead Auditor shall not be from the department being	
		audited. Selection of audit team shall be based upon their	
		competency, knowledge, expertise and experience in the area	
		to be audited.	
	5.9.3	A Lead auditor is one who leads the audit as per the scope	
		of the audit and guides the support auditors.	
	5.9.4	Support auditors are those who are the members of the audit	
		team.	
	5.10	Independence of Auditors:	
	5.10.1	Auditors should free from preferences or influences, which	

			might affect the objectivity of audits. In specific,	
			personnel routinely connected with the work in an area	
			cannot participate in audits performed to that area.	
		5.11	Criteria for selection & Responsibilities of Lead Auditor:	
		5.11.1	All the Lead auditors shall be qualified based on selection	
		criteria of Lead Auditor as per SOP and any qualified lead		
		auditor may play role as support auditor under guidance of		
		another qualified lead auditor based on requirement.		
		5.11.2	Responsibilities of Lead Auditor:	
		5.11.2.1	Has authority to make final decisions in the	
		management of the audit and audit findings.		
		5.11.2.2	To plan the audit, prepare work documents and give	
		instructions to the audit team.		
		5.11.2.3	To represent the audit team before the Head of the	
		audited area, as well as other levels of Company		
		Name.		
		5.11.2.4	To perform the audit according to the approved	
		plan.		
		5.11.2.5	To report immediately to the Head of Quality	
		Assurance Department in case of any difficulty that		
		might affect the performance of the audit.		
		5.11.2.6	To guide in preparation and finalization of the	
		final audit report.		
		5.11.2.7	To keep confidentiality of information.	
		5.12	Criteria for selection & Responsibilities of support auditors of	
		Audit Team:		
		5.12.1	All the support auditors shall be qualified based on	
		selection criteria of support auditor as per SOP. Support		
		auditor can be lead auditor only after if he/she qualify the		
		selection criteria of lead auditor as per SOP.		
		5.12.2	Responsibilities of Support Auditors:	
		5.12.2.1	To participate in audit planning and in the	
		preparation of work documents.		
		5.12.2.2	To perform assigned audit tasks in an objective	
		way.		
		5.12.2.3	To collect and analyze objective evidences that is	
		the base of audit results.		
		5.12.2.4	To report Leader Auditor of any difficulty found	
		while performing the audit.		
		5.12.2.5	To verify the effectiveness of the corrective	
		actions taken to solve deficiencies.		
		5.12.2.6	To keep confidentiality of information.	
		5.12.2.7	To keep custody of audit documentation.	
		5.12.2.8	To coordinate in the preparation of the final audit	
		report.		
		5.13	Responsibilities of Auditee:	
		5.13.1	To inform the area personnel, about the objectives and scope	
		of the audit.		
		5.13.2	To designate personnel who will accompany the auditors	
		during the performance of an audit.		
		5.13.3	To allow access of auditors to facilities, documentation,	
		etc.		
		5.13.4	To supply information and necessary resources to the	
		auditors for efficient auditing.		
		5.13.5	To co-operate with auditors so as to obtain audit	
		objectives.		
		5.13.6	To determine the causes of deficiencies found and to take	
		corrective actions to eliminate them.		
		5.13.7	To ensure that all area personnel give due respect and	
		support to the auditing team.		
		5.14	Performance of Announced Audit:	
		Announced audit shall be conducted as per approved Audit program by		
		following three steps as below:		
		5.14.1	Preparation of the Audit Plan.	
		5.14.2	Execution of audit as per audit plan.	
		5.14.3	Work documents preparation during the audit.	
		5.15	Preparation of the Audit Plan.	
		5.15.1	The audit plan shall be established in Form No. "Audit Plan"	
		(Annexure 4).		
		5.15.2	Audit planning typically consists of:	
		5.15.2.1	Opening discussion:	
			Opening Discussion shall include:	
			5.15.2.1.	Roles of the Auditor.
			1	
			5.15.2.1.	Introduction and apportionment of tasks
			2	to auditors.
			5.15.2.1.	To define the reason, purpose and scope
			3	of the inspection.
			5.15.2.1.	To evaluate the list of documents to be
			4	seen and area to be visited based on risk
			evaluation e.g. changes made to	
			facility/documents/process, any critical	
			observation during the last audit,	
			changes in the key personnel of the area,	
			any abandoned batches, any complaint from	
			customer etc.	
			5.15.2.2	Site Inspection (Key areas to be focused).
			5.15.2.3	Documentation to be checked.
			5.15.2.4	Concluding Discussion.
		5.15.3	Audit plan is prepared by Lead Auditor/designee of Lead	
		auditor, approved by Head of Quality Assurance and received		
		by Head/designee of the area being audited.		

	5.15.4	Audit plan shall be circulated to auditee department at	
		least 4 working days before the beginning of the	
		self-inspection.	
	5.16	Execution of audit as per audit plan	
	5.16.1	During the site inspection, the auditors shall follow the	
		flow of components from receipt, through the corresponding	
		manufacturing steps, to the packaging, to storage and	
		delivery. The quality control areas, critical system areas,	
		e.g. water, steam and air etc. and other auxiliary areas	
		(locks, change rooms etc.) must also be taken into	
		consideration.	
	5.16.2	The scope of the site inspection is dependent on the	
		objective and type of the inspection and can be adapted	
		during the inspection at any time.	
	5.16.3	Documentation Check : The documentation check can include	
		but not limited to the following:	
		5.16.3.1	Organization chart, job descriptions & its
		execution.	
		5.16.3.2	History of changes & Change control procedures.
		5.16.3.3	Evaluation of personnel health & Hygiene status.
		5.16.3.4	Evidence of training planning and execution.
		5.16.3.5	Manufacturing instructions and records.
		5.16.3.6	Test procedures and records.
		5.16.3.7	Evidence of calibration, qualification and
		validation.	
		5.16.3.8	Records of maintenance and repair.
		5.16.3.9	Records of environmental monitoring.
		5.16.3.1	Batch release documentation.
		0	
		5.16.3.1	Evidence for procurement of starting materials and
		1	packaging materials including their specifications.
		5.16.3.1	Procedure for deviations from specifications.
		2	
		5.16.3.1	Handling of OOS.
		3	
		5.16.3.1	Handling complaints.
		4	
		5.16.3.1	Records about recalls.
		5	
	5.16.4	Concluding Discussion.	
		All auditors involved in the audit shall meet before the	
		concluding discussion to coordinate results.	
	5.17	Work documents preparation during the audit.	
	5.17.1	The documents needed for auditing are:	
		5.17.1.1	Checklists
		The checklist shall used during audit in such a	
		way, as not to limit audit activities to the	
		checklist only.	
		A general checklist shall be considered for all the	
		departments as per form no. QA/024/F5-10 (Annexure	
		5).	
		Department Specific Checklist shall be used along	
		with general checklist for auditing concerned	
		department as established in Form No. QA/024/F6-10	
		"Audit Checklist for Quality Control" (Annexure 6),	
		- Form No. 0 "Audit Checklist for Quality	
		Assurance" (Annexure 7),	
		- Form No.QA/000/00"Audit Checklist for	
		Engineering" (Annexure 8),	
		- Form No. QA/000/00 "Audit Checklist for Human	
		Resource and Administration" (Annexure 9),	
		- Form No. QA/000/00 "Audit Checklist for	
		Production" (Annexure 10),	
		- Form No. QA/000/00 "Audit Checklist for	
		Warehouse" (Annexure 11),	
		- Form No. QA/000/00 "Audit Checklist for Animal	
		House" (Annexure 12) and	
		- Form No. QA/000/00 "Audit Checklist for EOHS"	
		(Annexure 13).	
	5.18	Final Report of the Audit:	
	5.18.1	Preparing the final report:	
	5.18.1.1	The lead auditor along with other auditors shall	
		summarize the observations/Recommendations in	
		wrap-up meeting with all the auditees along with	
		the Heads of the Audited area.	
	5.18.1.2	While demonstrating the deficiencies, theses should	
		be classified as Critical/ Major/ Minor according	
		to their severity as defined:-	
	5.18.1.2.	Critical: Non-conformance which have a	
		1	direct impact on the quality of the
		product.	
	5.18.1.2.	Major: Non-conformance which have an	
		2	in-direct impact on the quality of the
		product.	
	5.18.1.2.	Minor: Non-conformance which do not have	
		3	an impact on the quality of the product.
	5.18.1.2.	Recommendations: Are the observations	
		4	suggested for better understanding /
		clarity of any procedure or process,	
		however does not reflects any non –	
		conformance of the said procedure or	
		process.	

		5.18.1.3	It is vital in all cases that the auditee shall
			understand all conclusions and deficiencies
			submitted.
		5.18.1.4	The audit report must state clearly the
			deficiencies found/ recommendations as per Form No.
			QA/000/00 "Audit Report" (Annexure 14).
		5.18.1.5	The Lead Auditor shall prepare & issue the final
			audit report to all concerned departments within 10
			working days after completion of audit.
		5.18.1.6	Numbers of deficiencies observed during an audit
			shall be clearly stated in the conclusions of the
			audit report.
	5.18.2	Assigning Audit Report Number	
		5.19.1.5 5.18.2.1	
			For Announced Audit : WW/XX/YY/ZZ
			Where, WW : Shall define the type of Audit i.e.
			AN for Announced Audit.
			UN for Unannounced Audit.
			UA for Unscheduled Announced Audit
			"/" : Separator.
			XX : Last two digits of the year.
			YY : Serial Number of the Audit i.e. 01 for first audit,
			02 for second audit and so on.
			ZZ : Department Code i.e.
			VBI for Vaccine Block I
			VB II for Vaccine Block II
			VB III for Vaccine Block III
			VB IV for Vaccine Block IV.
			QC for Quality Control.
			QA for Quality Assurance.
			EN for Engineering.
			WH for Warehouse.
			AH for Animal House.
			ES for EOHS.
			HR for Human Resource.
			AD for Administration department.
	5.18.3	The final audit report shall be kept with Audits and	
		Inspection section of Quality Assurance department.	
	5.18.4	The final audit report (QA/000/00), filled checklist of the	
		audit (QA/000/00 to QA/ QA/000/00) and audit compliance plan	
		(QA/000/00) are confidential document and is not shown to	
		any external personnel or auditing/inspecting agency.	
	5.19	Performance of Unannounced Audit:	
		Unannounced audit shall be conducted as per approved schedule for	
		unannounced audit without prior intimation to auditee department. QA	
		shall prepare audit schedule as per "Schedule for unannounced audit"	
		– Annexure 15.	
	5.19.1	Head QA shall depute any internal Auditor(s) for execution	
		of unannounced audit as per schedule and no audit team	
		information is required for the same.	
	5.19.2	The Auditor(s) selection for unannounced audit should not be	
		from auditee department.	
	5.19.3	The auditor(s) shall plan and perform the audit by focusing	
		any particular area/section of auditee department. During	
		performance of un-announced audits, usage of audit	
		checklists (as mentioned under section 5.17.1.1) is not	
		applicable due to limited scope of the audit.	
	5.19.5	After Completion of unannounced audit the auditor(s) shall	
		discuss the observations/non-compliances discussed with	
		auditee and send the Audit Report as per Annexure – 14	
		(Audit Report) to Head of Auditee department and Head of QA	
		within ten working days. In case of delay in issue audit	
		report within ten days, a justification shall be given and	
		audit report shall be issued not later than next ten working	
		days.	
	5.20	Performance of Unscheduled Announced Audit:	
	5.20.1	Unscheduled announced audits are need based audits, planned	
		as the outcome of non-conformance such as complaints,	
		incidents, deviation, external audit observations etc.	
	5.20.2	Unscheduled announced audits shall be performed by following	
		the same procedure as described for Announced Audits.	
	5.21	Corrective Actions:	
	5.21.1	The concerned department Head/designee of the audited area	
		shall prepare an audit compliance report as per Annexure –	
		16 and submit it to QA within 10 (ten) working days after	
		receipt of the audit report.	
	5.21.2	For all audit observations classified as Critical,	
		investigation shall be performed as per SOP QA/000. In case	
		of Major observations investigation shall be performed on	
		case to case basis wherever required. In case of minor	
		observations investigations are not required.	
	5.21.3	Designated person of QA shall verify the compliance as per	
		Audit compliance report.	
	5.21.4	The concerned department Head/designee of the audited area	
		shall take necessary corrective and preventive actions as	
		per SOP for CAPA, SOP QA/025.	
	6.0	Forms and Records	
	6.1	Risk analysis for audit program - Annexure 1	
	6.2	Audit program - Annexure 2	

	6.3		Record of audit performance - Annexure 3	
	6.4		Audit plan - Annexure 4	
	6.5		General Audit checklist - Annexure 5	
	6.6		Audit Checklist for Quality Control - Annexure 6	
	6.7		Audit Checklist for Quality Assurance - Annexure 7	
	6.8		Audit Checklist for Engineering - Annexure 8	
	6.9		Audit Checklist for Human Resource and Administration - Annexure 9	
	6.10		Audit Checklist for Production department - Annexure 10	
	6.11		Audit Checklist for Warehouse - Annexure 11	
	6.12		Audit Checklist for Animal House - Annexure 12	
	6.13		Audit Checklist for EOHS - Annexure 13	
	6.14		Audit Report - Annexure 14	
	6.15		Schedule for unannounced audit - Annexure 15	
	6.16		Audit compliance report - Annexure 16

1.0	Objective	
	To lay down procedure for waste disposal management.	
2.0	Scope	
	This Standard Operating Procedure is applicable to Handling and Disposal	
	waste in PanEra Biotec Pvt Ltd.	
3.0	Responsibility	
	3.1	Head of the concern department or their designees shall be responsible
	for implementation of this SOP.	
	3.2	EOHS is responsible for disposal of waste whereas Admin is responsible
	for Handling and storage of waste.	
	3.3	Concerned department personnel shall be responsible for collection and
	transportation of waste at generation site.	
	3.4	Concerned department personnel shall be responsible for ensuring that
	the labels of empty containers are defaced before leaving their	
	department.	
	3.5	Concerned department personnel shall be responsible for collecting and
	transferring the waste to their earmarked storage location by Admin.	
	3.6	Administration department shall ensure the safe storage of waste in
	their earmarked storage location prior to its disposal to authorized	
	external party.	
	3.7	It is the responsibility of the Head of the production Department to
	bring to the notice of the Director (Operations & Projects) in case of	
	rejection of non-conforming intermediate product. He shall also bring	
	the same to the notice of Head QC, QA and EOHS Executive.	
	3.8	The Head, QC or his/her designee shall be responsible to bring the
	non-conformity to the notice of the Director (Operation & Project),	
	Head Production Department (if applicable) and Head QA & EOHS	
	Executive.	

4.0	Abbreviations and Definitions	
	ETP	: Effluent Treatment Plant.
	TERM	: Transport Emergency.
	SPCB	: State Pollution Control Board.
	PPE	: Personal Protective Equipment.
	EOHS	: Environment Occupational Health & Safety.
	Admin	: Administration
	HW	: Hazardous Waste.
	PCC	: Plain Cement Concrete
	Waste:	Any garbage, refuse, reject, sludge from a waste
	treatment plant, water supply treatment plant, or air	
	pollution control facility and other discarded material,	
	including solid, liquid, semisolid, or contained gaseous	
	material resulting from industrial, commercial, mining,	
	and agricultural operations, and from community	
	activities.	
	Hazardous waste:	Solid waste, or combination of solid wastes, which
	because of its quantity, concentration, or physical,	
	chemical, or infectious characteristics may - (A) cause,	
	or significantly contribute to an increase in mortality	
	or an increase in serious irreversible, or	
	incapacitating reversible illness or (B) pose a	
	substantial present or potential hazard to human health	
	or the environment when improperly treated, stored,	
	transported, or disposed of, or otherwise managed.	
	Biomedical waste:	Biomedical waste means any solid waste which is
	generated in the diagnosis, treatment, or immunization	
	of human beings or animals, in research pertaining	
	thereto, or in the production or testing of biological.	
	E-waste:	E-waste means waste electrical and electrical equipment,
	whole or in part or rejected from their manufacturing	
	and repair process, which in intended to be discarded.	

5.0	Procedure:	
	5.1	Various categories and type of waste procedure in our facilities.
	5.1.1	Categorization of the Hazardous waste as per Schedule :
		Sr. No
		Category of waste
		Type of Waste
		Schedule –1
		(HW Rule 2008)
		1.
		Hazardous Waste (Solid Waste)
		ETP Sludge
		34.3
		Incinerator Ash
		36.2
		Boiler Ash

			36.1
			Used Empty container
			33.3
			Herbal (Hexane Residue)
			36.4
			Oily Filters
			35.1
			Process Waste Powder
			28.1
			HVAC Filter
			Polystyrene Resins, Epoxy Silica Sand
			Fluorescent Tube / CFL's
			2.
			Acid Batteries
			Lead Acid Batteries/ Dry Acid Batteries
			3.
			Hazardous Waste
			(Liquid Waste)
			Used Oil/ Waste Oil
			5.1/5.2
			4.
			Biomedical waste
			Egg Waste
			Dead Animal
			Solid Culture waste coming out of Tubular centrifuges
			Sharp waste like needle, Syringe, blades
			Animal House waste, Bedding, faecal material, waste food ,Corn
			Cob
			Solid waste like Silicon tubing, Elisa plate, Tips, Rubber
			gloves, waste cotton/paper used in QC
			5.
			E-waste
			Electrical & Electronics components
			6.
			Solid waste
			Glass Wool
			Gutta Waste / paper waste / polythene waste

				Broken Glass
	5.1.2	Types of waste generated at different department		
			S. No.	
			Generator / Department / Location	
			Type of Waste	
			01.	
			Production	
			Solid: Powder, tablet, capsule, gelatin, container, packing	
			material, cassette, ultra-membrane, HVAC filters, oily Filters	
			paper, label, culture waste coming out of tubular centrifuges,	
			E-waste.	
			Semi-solid: Process paste, egg waste etc.	
			Liquid: Syrup, liquid process waste, waste water after	
			equipment washing, R.O. Rejected.	
			02.	
			Ware house	
			Solid: Expired raw material, paper, packing material, label,	
			E-waste, contaminated container, E-waste.	
			Semi-solid: N.A.	
			Liquid: N.A.	
			03.	
			Q.C.	
			Solid: Needle, syringe, blades, silicon tubing, Elisa plate,	
			Tips, Rubber gloves, waste cotton/ paper, E-waste, P.S.	
			dishes, , E-waste	
			Semi-solid: Culture medium.	
			Liquid: Waste water after equipment washing, expired reagent	
			solution.	
			04.	
			Animal House	
			Solid: Bedding (corn cob), dead animal, faecal material, waste	
			food, E-waste.	
			Semi-solid: N.A.	
			Liquid: N.A.	
			05.	
			Engineering	
			Solid: Paper, scrap, oil-rags, filters, resin, boiler chimney	
			shoot, CFL tubes, Acid/Dry batteries, E-waste, Epoxy Silica	
			Sand.	
			Semi-solid: Grease, oil sludge,	
			Liquid: Waste oil, used oil, waste water(high TDS)	
			06.	
			Office	
			Solid: Paper, packing waste, E-waste.	
			Semi-solid: N.A.	
			Liquid: N.A.	
			07.	
			Canteen	
			Solid: Waste food, packing waste.	
			Semi-solid: Waste food	
			Liquid: Waste food	
			08.	
			Toilet, hand, feet wash etc	
			Solid: Paper	
			Liquid: Sewage water, Effluent.	
			09.	
			Other	
			Solid: ETP Sludge, Incinerator ash	
			Semi-solid: N.A.	
			Liquid: Sewage water, Effluent.	
	5.1.3	Collection & Segregation:		
			5.1.3.1	Collection of different type of waste in segregated
			manner:	
			5.1.3.1.	Scrap: All the scrap material like Papers
			1	/Aluminum foil, Packaging material/ company
			related printed material, Gutta, Glass,	
			packing material Glass Bottle, Thermocol,	
			Glass wool, polythene generated from	
			different department should be placed at	
			specific location on temporary base/temporary	
			storages earmarked for same	
			5.1.3.1.	Biomedical waste: Biomedical waste like Dead
			2	Animal, Egg Waste, Animal House waste,
			Bedding, faecal material, Corn Curb, Organic	
			Waste, Solid Culture waste coming out of	
			Tubular Centrifuges, Elisa plate, Tips,	
			Rubber gloves, waste cotton/paper used in	

				QC, should be stored in yellow color polybags
				with biomedical hazard sign.
				5.1.3.1. Hazardous waste: The Hazardous waste like ETP
				3 Sludge, Incinerator ash, Boiler shoot should
				be packed in polybag with proper hazardous
				waste labeling and used oil/ waste oil should
				be stored in container with hazardous waste
				labeling. Used empty container should be
				collected and segregated at specific location
				earmarked in the facility.
				5.1.3.2 Sign of Segregation:
				5.1.3.2. The Sign of Labeling for different type of
				1 waste as follow:
				[pic] [pic]
				Biomedical waste
				Radioactive Waste
	5.2 Color coding and different type of waste:			
	Types of waste			
	Color code of polybag/ container			
	The paper, Gutta, Glass, packing material Glass Bottle			
	Grey			
	Solid waste like Silicon tubing, Elisa plate, Tips, Rubber gloves,			
	waste cotton/paper used in QC, Egg Waste, Dead Animal, Solid Culture			
	waste coming out of Tubular Centrifuges, Animal House waste, Bedding,			
	faecal material, Corn Cob, Organic Waste			
	Yellow with Biohazard Sign			
	[pic]			
	Sharp waste like needle, Syringe, blades.			
	Blue/White translucent with Biohazard Sign			
	Papers /Aluminium foil, Packaging material/ company related printed			
	material			
	Blue			
	Radioactive waste			
	Black with Radiation hazard sign			
	[pic]			
	5.3 Movement:			
	5.3.1 All the scrap material like Papers /Aluminum foil, Packaging			
	material/ company related printed material, Gutta, Glass,			
	packing material Glass Bottle, Thermocol, Glass wool,			
	polythene should be transported by Admin Dept. to dedicated			
	storage place.			
	5.3.2 Solid waste like Dead Animal, Egg Waste, Animal House waste,			
	Bedding, faecal material, Raw material, intermediate			
	product Corn Curb, Organic Waste, Solid Culture waste coming			
	out of Tubular Centrifuges, Elisa plate, Tips, Rubber			
	gloves, waste cotton/paper used in QC, waste should be			
	transported / producer to incineration area. Admin dept.			
	would provide transport facility upon request.			
	5.3.3 The Hazardous waste like ETP Sludge, Incinerator ash, Boiler			
	shoot should be transported to Hazardous storage place .Used			
	oil/ waste oil should be stored in container and transported			
	to storage place. Used empty container should be should be			
	transported to used container scrap yard. All the labels on			
	the container shall be defaced by crossing out with			
	permanent red color marker.			
	5.3.4 A request shall be filled by concerned department for			
	disposal of waste material generated in department as per			
	annexure- 1 in form no. ES/002/F1-00.			
	5.4 Storage of waste:			
	5.4.1 Hazardous waste must be in hazardous storage place for			
	period of ninety days only.			
	5.4.2 Biomedical waste must be stored only 48 hrs.			
	5.4.3 Egg waste must be stored only 24 hrs.			
	5.4.4 Scrap waste must be stored in Scrap yard.			
	5.4.5 Used container must be stored in used container scrap yard.			
	5.4.6 The storage facility must be such that it shall not allow			
	any leaching of the hazardous waste into the ground or spill			
	over into other areas or the storm water drains.			
	5.5 Treatment/disposal:			
	5.5.1 In-house Treatment:			
	5.5.1.1 Production, QC, QA should have all MSDS in their			
	possession for materials they are using such as			
	chemicals, reagents biological materials, cells,			
	antigens, cultures etc and inactivation should be			
	done as per respective MSDS/SOP.			
	5.5.1.2 The Biomedical Solid Culture waste coming out of			
	Tubular centrifuges, Animal House waste, Bedding,			
	faecal material ,Corn Cob, Egg Waste, Dead Animal,			
	powder, tablet, capsule, gelatin, container, packing			
	material, cassette, ultra-membrane, HVAC filters,			
	Joily Filters paper, label, culture waste coming out			

			of tubular centrifuges, packing material ,are
			disposed through incineration process. The waste
			water & sewage water are treated through ETP & STP
			respectively.
		5.5.2	To Contractor/authorized vendor:
		5.5.2.1	ETP Sludge, Incinerator ash, Boiler shoot & empty
			container are disposed to authorized vendor of SPCB.
		5.5.2.2	All printed packaging material to be disposed off
			should be defaced /shredded before disposal.
		5.5.2.3	The paper, Gutta, Glass, packing material after
			proper defacing, shredding is disposed to scrap
			dealers.
		5.5.3	Treatment and disposal of ETP Sludge/ Incineration ash/ Process
			waste/Boiler Shoot/Used oil/waste oil and Empty Container.
		5.5.3.1	This type of waste disposed through authorized party
			of State pollution Control Board.
		5.5.3.2	Used appropriate PPE like suitable PVC hand gloves,
			gum boots or safety shoes, general dust nose masks,
			and safety goggles while collecting and transporting
			hazardous waste.
		5.5.3.3	Clear boards indicate hazardous waste and quantity
			must be displayed.
		5.5.3.4	Administration department shall ensure the safe
			storage of empty containers in scrap yard before its
			disposal to authorized external party.
		5.5.3.5	EOHS department shall ensure the disposal of empty
			containers to the authorized external party.
		5.5.3.6	All HW should be packed in non-permeable material /
			leak proof containers or plastic bags.
		5.5.4	Regulatory requirement for ETP Sludge/ Incineration ash/
			Process waste/Boiler Shoot/Used oil/waste oil and Empty
			Container
		5.5.4.1	The Storage of ETP Sludge/Incineration ash in
			Hazardous waste store.
		5.5.4.2	The Disposal of ETP Sludge/Incineration ash should be
			within ninety Days.
		5.5.4.3	Authorization / Renewal of Authorization under
			sub-rule (3) of Rule 5 of the Hazardous Waste
			(Management, Handling and Trans-boundary Movement)
			Rules, 2008 for Collection / Reception / Treatment /
			Transport / Storage / Disposal of Hazardous waste
			from State Pollution Control Board.
		5.5.4.4	All Complies should be in accordance to State
			Pollution.
		5.5.5	Treatment and disposal of Dead Animal, Animal House Bedding/
			Corn Cob and Faecal Material
		5.5.5.1	For Microbiological, Biotechnological solid waste
			contaminated with biological fluids & Animal house
			waste use yellow colored plastic bags for collection.
		5.5.5.2	Secure the bags by properly closing the mouth with a
			string so that waste materials do not spill off even
			by accident.
		5.5.5.3	Label the poly bags properly with non-washable ink
			and dispose off by incineration.
		5.5.6	Regulatory requirement for Dead Animal, Animal House Bedding/
			Corn Cob and Faecal Material
		5.5.6.1	No untreated bio-medical waste shell be kept or
			stored beyond 48 hours.
		5.5.6.2	Use yellow colored plastic bags with Biohazard sign
			for collection.
		5.5.7	Procedure for Handling and disposal of Solid waste like silicon
			tubing, Elisa plate, Tips, Rubber gloves, waste cotton and
			Solid Culture waste coming out of Tubular centrifuges
		5.5.7.1	For solid waste like silicon tubing, rubber gloves,
			rubber stoppers and waste cotton article, pack the
			article in blue/ white translucent plastic bags
			securely by closing the month of the bag. Label them
			properly with non –washable ink. Autoclave at 121 OC
			for one hour. Dispose of by incineration.
		5.5.7.2	Solid waste coming out from tubular centrifuge is
			required to be securely collected in yellow colored
			poly bags and disposed off by incineration.
		5.5.8	Regulatory requirement for Solid waste like silicon tubing,
			Elisa plate, Tips, Rubber gloves, waste cotton/ paper etc and
			Solid Culture waste coming out of Tubular centrifuge
		5.5.8.1	No untreated bio-medical waste shell be kept or
			stored beyond 48 hours
		5.5.8.2	Use yellow colored plastic bags for collection.
		5.5.9	Treatment and disposal of Egg Waste :
		5.5.9.1	Transfer egg waste in poly-lined containers to
			incinerator room and dispose of by incineration.
		5.5.9.2	Dispose all packing materials off egg waste by
			incineration.
		5.5.9.3	Collect ash from the incinerator, after cooling to
			room temperature in Plastic Bag.
		5.5.10	Regulatory requirement for of Egg Waste:
		5.5.10.1	No egg waste shall be kept or stored beyond 24 hours.
		5.5.10.2	Use yellow colored plastic bags for collection.
		5.5.11	Treatment and disposal of Sharp waste like needle, Syringe,
			blades etc.
		5.5.11.1	For sharp waste like needle, syringes, scalpels,
			blades and glass etc disinfect with disinfectant,

			pack it in blue/ white translucent plastic bags/	
			puncture proof containers.	
			5.5.11.2	Autoclave the sharp waste like needle, syringes,
			scalpels, blades and glass etc at 121 OC.	
			5.5.11.3	Dispose of by deep burial after shredding.
			5.5.12	Regulatory requirement for Sharp waste like needle, Syringe,
			blades etc.	
			5.5.12.1	Pack it in blue/ white translucent plastic puncture
			proof containers	
			5.5.13	Treatment and disposal of Oily Filters:
			5.5.13.1	The oily filter placed in the identified location of
			storage oily filter.	
			5.5.13.2	Use required PPE's like Nose mask, Hand gloves and
			Safety Goggles during handling filter.	
			5.5.13.3	Dispose them through incineration.
			5.5.14	Treatment and disposal of Hexane Residue:
			5.5.14.1	The Hexane residue placed in the identified location
			of storage of Hexane residue.	
			5.5.14.2	Use required PPE's like Nose mask, Hand gloves
			(solvent Resistant) and Safety Goggles during	
			handling of Hexane Residue	
			5.5.14.3	Dispose them through incineration.
			5.5.15	Treatment and disposal of Lead Acid Batteries/ Dry Acid
			Batteries:	
			5.5.15.1	Lead Acid Batteries/ Dry Acid Batteries Contribute to
			heavy metals that potentially may leach slowly into	
			soil, groundwater or surface water.	
			5.5.15.2	Lead Acid Batteries/ Dry Acid Batteries placed in the
			identified location of storage of Lead Acid	
			Batteries/ Dry Acid Batteries.	
			5.5.15.3	Use required PPE's like Nose mask, Acid Resistance
			Hand gloves and Safety Goggles during handling of	
			Lead Acid Batteries/ Dry Acid Batteries.	
			5.5.15.4	These Lead Acid Batteries/ Dry Acid Batteries should
			be returned to supplier after use.	
			5.5.16	Treatment and disposal of Electrical & Electronics components:
			5.5.16.1	It Comes under E- Waste (electronic Waste) Category.
			5.5.16.2	Electrical & electronic component waste store in
			identified location of storage of electrical and	
			electronic component.	
			5.5.16.3	Electrical & electronic component waste should be
			disposed off to the SPCB authorized disposal sites.	
			5.5.17	Procedure for Handling and disposal of Thermocol, Glass Wool,
			Gutta waste, Broken Glass and Scrap:	
			5.5.17.1	Thermocol, Glass Wool, Gutta waste, Broken Glass and
			Scrap store in identified location of storage of	
			Scrap yard.	
			5.5.17.2	Thermocol, Glass Wool, Gutta waste, Broken Glass and
			Scrap dispose of through selling them to scrap	
			dealer.	
			5.5.18	Destruction of Product / Intermediate Product /Raw Material/
			Expired Material	
			5.5.18.1	Check all the relevant information with regard to the
			incoming material, labeling or packing material,	
			intermediate product, final ARM and final formulation	
			Bulk Vaccine that is meant for destruction. Verify	
			and be very clear that it needs destruction.	
			5.5.18.2	In case of final ARM, Intermediate Product and
			Formulated Bulk Vaccines the EOHS personnel shall	
			check Destruction order Form No.: QA/023/F1-04.	
			5.5.18.3	Request for destruction of products (Form No.:
			ES/002/F2-00) shall be filled, signed and forwarded	
			by the Head of the concerned area to EOHS Department.	
			5.5.18.4	The EOHS Department shall be responsible for
			destruction and disposal of product.	
			5.5.18.5	In Case vaccine filled vials, autoclave at 121 OC for
			30 minutes. Crush the vials and dispose by deep	
			burial.	
			5.5.18.6	In case of intermediate product, autoclave at 121 OC
			and dispose off same through drain or by incineration	
			whichever is applicable.	
			5.5.19	Treatment and disposal of Effluent and Sewage:
			5.5.19.1	Take all effluent from live area through biological
			drain pipe to the storage tank and Inactivate by	
			heating at 96 OC for 20 minutes. After cooling drain	
			the inactivated liquid through conventional drain to	
			the effluent treatment.	
			5.5.19.2	Drain all effluent from dead area through
			conventional drain system to effluent treatment plant	
			5.5.19.3	The entire waste water gathered from plant then
			collected at collection tank from collection tank	
			pump to Effluent Treatment plant/ sewage treatment	
			plant.	
			5.5.19.4	Treated waste can be used for Irrigation purposes.
			5.5.20	Regulatory requirement for Effluent and sewage.
			5.5.20.1	Consent to Establish/operate/renewal under
			section-25/26 of water (Prevention & control of	
			Pollution) act 1974 from State Pollution Control	
			Board.	
			5.5.20.2	All Complies should be in accordance to State
			Pollution Control Board as well Central Pollution	
			Control Board.

Registration of Pharmaceutical Product for General Sale
About the Service

This service enables the customers to submit applications to register simple pharmaceutical products with limited medicinal usage, which cannot be considered medicines and are intended for general sale. These include products such as dietary supplements, medical cosmetics and medical disinfectants.

Service Process

- Login to the MoHAP website or smart app using the UAE PASS
- Submit the request through the electronic service and complete the payment to meet all conditions
- The competent technical committees will deliberate the registration of products and recommendations will be submitted to the competent ministerial committee
- Declarations shall be addressed to the concerned companies stating the committee's decisions via the e-system
- The customer will follow up with the Pharmacological Analysis Section of at the Drug Department
- The company should complete the requirements and submit them online
- The relevant technical and ministerial committees will re-deliberate the registration of products that have been deferred in advance as soon as companies complete the requirements
- Issuing certificates of registration of products that have been approved for registration following fulfilling all conditions and requirements. Registration certificates are valid for five years effective the date of committee approval
- Issuing pharmaceutical certificates (for locally manufactured pharmaceutical products) valid for one year effective the date of issuance

Required Documents

- Certificate of pharmaceutical product in accordance with the WHO (World Health Organization) system or a certificate of free sale of the product issued by the competent authorities in the country of origin and certified by the Embassy of the United Arab Emirates. It should contain the following information: Product Brand Name: If the brand name required to be registered in UAE is different from the name in the country of origin, this shall be made clear in the certificate, besides stating the reason for that and making both names clear with an emphasis on their conformity in terms of formulation and other specificationsThe detailed formulation of the product contains active and inactive substances with their quantities and functions of inactive substancesName of the company entitled to marketing/ manufacturing/ manufacturing sites/ subcontract manufacturers along with their addresses
 - One samples of the product.
 - A valid registration certificate of the manufacturing company issued by MOHAP-UAE with intended production line.
 - Halal certificate issued by certified authorities and organizations.
 - A statement issued by the company confirming that the product to be registered is free of hormones, heavy metals, antibiotics, steroids, pig derivatives and any other natural or chemical substances that have a harmful impact on human beings biologically and behaviorally
 - If the product contains animal derived substances, the animal type and the part extracted from it should be mentioned with the percentage of alcohol used "if any and why it is used"
 - A copy of the certified contract signed between the marketing company and local agent indicating the products for which the agent will be responsible
 - A certified certificate from the competent authorities of the country of origin stating that the materials used in manufacturing the product is free from mad cow disease and its causes (if the product contains substances classified as potential substances for transmitting the disease) (Bovine Spongiform Encephalopathy (BSE)/ Transmissible Spongiform Encephalopathies (TSE) free certificate)
 - A copy of the outer and inner cover and the leaflet printed on letterhead paper stamped by the company and signed by the authorized person
 - Detailed Composition Certificate (active & inactive ingredients with their quantities).
 - Summary of Product Characteristics (SPC).
- Conditions & Requirements

1. Marketing Authorization Holder companies must be registered by MOHAP before they could register their products.
 2. The applicant must be a medical warehouse licensed by the Ministry of Health and have a valid license.
- FAQ's

Service completion duration

- 45 working days

Marketing Authorization Holder companies must be registered by MOHAP before they could register their products.

Sustainable Goals

Good Health And Well-Being

In the United Arab Emirates (UAE), the General Sale List (GSL) includes Dietary Supplements, Medicated Cosmetics, Antiseptic and Disinfectants and Miscellaneous products which contains pharmaceutical ingredients and/or a medical claim and cannot be classified as medicines.

The application can be made in English or Arabic. Marketing authorization for GSL products in the United Arab Emirates (UAE) can only be given to companies (Manufacturer) who are registered in the UAE ministry of health. Below is a list of the GSL product registration requirements followed by the requirements for registering a company in the UAE ministry of health. Applicants in the UAE should have Medical stores licensed by the Ministry of Health.

Registration of the GSL Product requires:

1. Application and document receiving form for the Registration of new GSL product (typed). Available from the Technical Affairs Section.
 2. Certificate of Pharmaceutical Product (CPP) as per the WHO Certification Scheme or Free Sale Certificate (FSC) for the product.
- To be issued by Competent Authorities in Country of Origin, it must be authenticated by the foreign affairs section of the UAE or any GCC embassy in the country of origin.

■The CPP must contain:

■ Trade Name of the Product.

If the Trade Name of the product intended for registration in UAE is different from that in the Country of Origin, difference should be explained clearly in the CPP/FSC and both Trade Names should be mentioned with confirmation of similarity in composition and other specifications.

■ Composition of the product in details (Active and inactive ingredients with their quantities).

■ Name of the Manufacturer/Marketing Authorization Holder/ Manufacturing Site(s)/ Contract Manufacturer(s) with address.

■ Shelf-life of the product with Storage conditions.

■ Declaration that the product is freely sold in country of Origin for less that 2 years.

2. Declaration that the product is newly sold in Canada for English and/or French language.
3. Package Insert for the product authenticated from Competent Authorities (if applicable).
4. Three (3) samples of the product in its final package.
5. Certificate of Analysis of the same batch of the samples submitted for registration.

The following information must be submitted on company letterhead with logo, signature and stamp:

6. Statement issued from the Principal Company showing that the product is devoid from hormones, heavy metals, antibiotics, steroids, derivatives of pork and any natural and chemical ingredients having harmful effects on human biological and behavioural functions. If the product contains an ingredient from animal source, the kind of animal and part extracted from it must be specified percentage of alcohol if any must be mentioned together with reasons thereof.

□ □ □ □ □ □ □ □ □ □ □ □ □ □

Adopted from MOH Circular No. 20 for 2001 issued by the Director of Drug Control Department

7. Halal certificate issued by recognizable organizations and authorities.

8 Authenticated contract between MAH & agent mentioning the products for which the agent is going to be responsible for.

9 The applicant should have a medical store licensed by the Ministry of Health. (as per the Circular No.
1
for year 2006)

10 valid company registration certificate issued by UAE / MOH drug control department

11 Submit BSE / TSE free certificate from competent authority in Country of origin (wherever applicable)

12 outer label, inner label and insert of the product on stamped company letterhead.

13 CD of artwork (outer, inner label and insert) of the product in JPEG format.

If the product marketing authorization holder (MAH) & manufacturer has not been registered in the UAE ministry of health, then this must be done before a product can be submitted for registration.

Documents required for GSL Company registration

Application is collected from Technical Affairs Section Secretary or downloaded from the MOH website, the forms are PART ONE (for MAH) & PART TWO (for manufacturing site), at the end of each form there is a list of required documents to be attached along with the form, applications are to be filled and stamped by the MAH & manufacturer, documents are to be attached along with each form.

N.B.: The GSL registration committee may request QCL analysis of the submitted products and the applicant will have to provide necessary samples and other analysis requirements requested by the drug control laboratory.

N.B:- All forms and complete copy of guidelines for company and product registration can be requested from the technical affairs section secretary, telephone 02- 6117325 or downloaded from the MOH website at the following link:

http://www.moh.gov.ae/moh_site/phar_med/moh_p_m.htm

UAE MOH Guidelines in Good Vigilance Practice (GVP) For Marketing Authorization Holders / Pharmaceutical Manufacturers In UAE

All pharmaceutical companies/ Marketing Authorization Holder (MAH) whose products are registered and marketed in UAE must have a system in place for documenting following Objectives:

Pharmacovigilance systems and their quality systems

Pharmacovigilance System Master File (PSMF)

Pharmacovigilance Inspections

Pharmacovigilance audits

Risk management systems

Management and reporting adverse reactions to medicinal

Products Periodic safety update reports (PSURs)

Post authorization safety studies

Signal management

Safety communication

Risk minimization measure

When submitting an application for new Pharmaceutical Product registration, the Applicant, should submit a description of the pharmacovigilance System and submit proof that the services of a Qualified Person Responsible for Pharmacovigilance (QPPV), hereafter referred to as the QPPV, are in place.

The MAH shall have permanently and continuously at its disposal an appropriately QPPV resident in UAE.

For multinational MAHs a local safety responsible (LSR) may be accepted Based in UAE. For local MAHs there should be a dedicated QPPV and he/she should be resident in UAE. The names and 24 hours contact details of the nominated QPPV and his alternate during absence should be submitted to PV section /Drug Department.

The QPPVs should have a minimum of bachelor degree in pharmacy or medicine, a basic training in epidemiology and biostatistics UAE MOH Guidelines in Good Vigilance Practice (GVP) For Marketing Authorization Holders / Pharmaceutical Manufacturers In UAE.

The QPPV shall be responsible for the establishment and maintenance of the marketing authorization holder's Pharmacovigilance System and therefore shall have sufficient authority to influence the performance of the quality system and the pharmacovigilance activities and to promote, maintain and improve compliance with the legal requirements. The applicant/MAH should provide the following requirements in order to get QPPV approval:

Letter of appointment from the company not the agent

Training certificate in PV

Experience certificate in PV

List of products covered by the company

ADR case reports submitted in UAE. (Local companies to report ADR cases of their products to the department within one year of the appointment)

SOP of the PV officer

Graduation certificate (minimum Bachelor Degree in Pharmacy or Medicine)

For the Multinational MAH/Applicant the following two documents are required to have

1. The PSMF (according to European Good Pharmacovigilance Practice) and/ or,
2. National pharmacovigilance system file (national PVSF) which describes the key elements of pharmacovigilance activities in the UAE. The content of National PVSF is as follow: Roles and Responsibilities of the Marketing Authorization Holder Monitoring of Compliance and Pharmacovigilance Inspections Qualified Person Responsible for Pharmacovigilance (QPPV) Pharmacovigilance Plan Organizational chart Quality Management System Requirements for Risk Management Systems: Clinical & Non-clinical Part of the Safety Specification Adverse Events/Adverse Reactions Identified and Potential Interactions including Food-Drug and Drug-Drug interactions Epidemiology The Risk Minimization Plan. Requirements for Expedited Reporting of Individual Case Safety Reports Requirements for Reporting in Special Situation Requirements for Periodic Safety Update Reports Training Documentation Overview of the parts and modules of the RMP The RMP is divided into several parts, with the safety specifications of the RMP organized into modules to increase flexibility. Part I Product(s) Overview Part II Safety Specification Module SI: Epidemiology of the indication(s) and target population(s) Module SII: Non-clinical part of the Safety Specification Module SIII: Clinical trial exposure Module SIV: Populations not studied in clinical trials Module SV: Post-Authorization Experience Module SVII: Identified and potential risks Module SVI: Additional requirements for the Safety Specification in UAE Module SVIII: Summary of the safety concerns Part III Pharmacovigilance Plan Part IV Plans for post-Authorization efficacy studies Part V Risk minimization measures (including evaluation of the effectiveness of risk minimization measures) Part VI Summary of the RMP Part VII Annexes Submission and updates for the RMP UAE MOH Guidelines in Good Vigilance Practice (GVP) For Marketing Authorization Holders / Pharmaceutical Manufacturers In UAE RMP for new molecules should be submitted with the registration application. RMP for new innovator, biological, and biosimilar should be submitted with the registration application. RMP for other registration status may be requested upon registration application.

It will be placed in the clean and closed utility area.

4.0 | Component details | Component details

| Quality Requirements for Purified water

It must ensure compliance with quality requirements

The quality of water will be according to current USP, EP and IP specifications.

Purified water USP 40 (current USP)

Conductivity $\leq 1.1 \mu\text{S}/\text{cm}$ (20° C)

TOC $\leq 0.5 \text{ mg}/\text{mL}$ (500 ppb)

Total Aerobic $\leq 100 \text{ cfu}/\text{mL}$

Purified water EP 9th (current EP)

Conductivity $\leq 4.3 \mu\text{S}/\text{cm}$ (20° C)

TOC $\leq 0.5 \text{ mg}/\text{mL}$ (500 ppb)

Total Aerobic $\leq 100 \text{ cfu}/\text{mL}$

Nitrates: $\leq 0.2 \text{ ppm}$

Heavy metals: $\leq 0.1 \text{ ppm}$

Traceability of all process information of pretreatment and osmosis plant.

Flexibility: All the information must be easy to process for qualified personnel.

Purified Water Generation

Design basis for Purified Water generation: Maximum Demand : 500 LPH

Purified water is produced from raw water from supply water network, based on the water analysis report provided by the client

Raw water from supply water network will be pre-treated to eliminate insoluble materials and calcium salts using filtration and ion exchange columns.

The equipment, piping and ducting must be designed to perform maintenance and cleaning activities in an easy way.

The equipment must be modular equipped with extension capacity.

After the EDI step of the pretreatment and osmosis skid the quality of Purified Water must be according to quality standards and requirements of monograph.

Pretreated water is treated through a two stage Reverse Osmosis system collected in a stainless-steel tank.

RO is equipped with a concentrate recovery membrane to get a water yield rate of at least 70%.

The pumps are able to vary their flow rate as a function of the tank level.

Pipes diameter, quality of materials and valves will be included in the P&ID.

All piping lines must be identified with product, direction flow and color codes (according to DIN 2403 standard).

All hydraulic elements must be labeled with their identifier tag attached to the element. P&ID must correspond with the real installation and the elements must be labeled accordingly.

Sampling points between all the operations must be defined on the design specification and installed for quality periodical monitoring.

Only after First step RO Membrane:

Pipe connections: Orbital welding wherever possible.

Welding must be performed by qualified welder.

Certificates of welding must be able.

Welding inspection: 100% of manual welds and 15% of the orbital welds.

All pipes must be treated before use. Installation of pretreatment and osmosis will be cleaned (caustic soda) and passivated (Nitric Acid).

Piping pressure leak test will be performed in Start-up

Temperature of operation in generation of water plant must be monitored.

Installed sensors must be easy to access and replace.

Conductivity sensor for each step of generation of water plant must be installed.

Critical parameters to be monitored:

Conductivity before the storage tank (at the end of the skid)

Temperature (normal operation)

The Level transmitter in the buffer tank should start and stop the RO plant for maximum level.

First step RO Membrane System should reduce Total dissolved solids below 70 .

Second step RO Membrane System should reduce Total dissolved solids below 5 .

EQUIPMENT AND MATERIALS OF PRETREATMENT AND OSMOSIS

EQUIPMENT AND MATERIALS

All metallic components in contact with purified water (piping, fittings...) must be stainless steel AISI 316L and end of surfaces must be polished Ra<0.5 µm. Supplier must provide the certificates of stainless steel (Ferrite content must be specified).

Valves and pumps must meet sanitary design, only after First step Reverse Osmosis Membrane.

Temperature and conductivity sensors must be installed.

Pressure, flow and level sensors must be installed.

Feed Water Tank

Feeding water tank xxxx L capacity, like PVC or similar. The Storage tank must be designed to prevent or minimize the development of biofilm, to minimize corrosion, to aid in the use of chemical sanitization of the tanks, and to safeguard mechanical integrity.

Pretreatment And Osmosis-Purified Water Generation

NaCl Dosage system is required to eliminate the bacteria contamination in the water and prevent any microbial growth.

A feed pump is required to feed the RO and the rest of the treatment with the proper pressure and flow.

Multimedia Filter is required to reduce the turbidity in the water by more than 99% giving a maximum particle size of 50 µm.

Before Reverse Osmosis Treatment, cartridge filter to prevent any particle ≥5 µm left by the multimedia filter to pass through the RO.

Before RO treatment Sodium Metabisulphite system for the reduction of free chlorine.

A redox control System is required to measure and display redox in water before the RO First step.

Before RO First a high-pressure pump.

Between first step and second step reverse osmosis membrane

Caustic soda (NaOH) with online pH measure system to ensure the feed water enters the 2nd step of RO with CO2 levels.

Electro-deionization module after the buffer tank should be able to reduce total dissolved solids and conductivity to below 1.1 micro-siemens (20 °C)

Control System of Pretreatment and Osmosis

Hardware:-

A PLC must be installed to control and monitor the system.

A touch screen should be installed as a human machine communication interface.

Software:-

In the Software the following aspects must be visualized, as a minimum:

- ✓ Set point values.
- ✓ Control panel setup screen.
- ✓ Alarm history.
- ✓ Manual operation most of automatic device.
- ✓ Automatic system activation.
- ✓ Washing mode automatic.
- ✓ Access and configuration of user accounts of the system.

The system must record and monitor critical parameters. | Quality Requirements for Purified water

It must ensure compliance with quality requirements

The quality of water will be according to current USP, EP and IP specifications.

Purified water USP 40 (current USP)

| Quality Requirements for Water For Injection and Pure Steam

It must be comply to the quality requirements

The quality of water will be according current USP, EP and IP specifications.

Water for injection USP & amendments thereof

Conductivity $\leq 1.1 \mu\text{S}/\text{cm}$ at 20°C

TOC $\leq 0.5 \text{ mg}/\text{mL}$ (500 ppb)

Endotoxins $\leq 0.25 \text{ EU}/\text{mL}$

Water for injection EP & amendments thereof

Conductivity $\leq 1.1 \mu\text{S}/\text{cm}$ (20°C)

TOC $\leq 0.5 \text{ mg}/\text{mL}$ (500 ppb)

Endotoxins $\leq 0.25 \text{ EU}/\text{mL}$

Total Aerobic $\leq 10 \text{ CFU}/100 \text{ mL}$

Nitrates $< 0.2 \text{ ppm}$

Pure Steam USP & amendments thereof

Conductivity $\leq 1.1 \mu\text{S}/\text{cm}$ (20°C)

TOC $\leq 0.5 \text{ mg}/\text{mL}$ (500 ppb)

Endotoxins $\leq 0.25 \text{ EU}/\text{mL}$

Supply steam must have a dryness value of no less than 0.95. Obtain no more than 3.5 ml of gases per 100

ml of condensate. Superheat to be less than 25°C when expanded to atmospheric pressure.

Traceability of all the process information of distiller plant

Flexibility: All the information must be easy to process for qualified personnel.

WATER FOR INJECTION AND PURE STEAM GENERATOR

Requirement:-

Water for Injection generation occurs from Purified Water.

Water for injection must be generated by Multi effect Distiller.

The quality of water for injection must be according quality standards and requirements of International monograph (IP, USP, Ph Eu and ISPE).

The equipment, piping and ducting must be designed to perform maintenance and cleaning activities in an easy way.

The equipment must be modular equipped with extension capacity.

Drain ability where necessary (pipe lines as well as equipment). Especially in between all the operations.

100% pipe line drainability for connection lines between generation plant and storage tank. Pipe slope minimum 1% of inclination to the drainable point.

Pipe connections: Orbital welding wherever possible.

Welding must be performed by qualified welder.

Certificates of welding must be able.

Valves and pumps must meet sanitary design.

All piping lines must be identified with product, direction flow and color codes (according DIN 2403 standard).

All hydraulic elements must be labeled with its identifier tag by a resistant plate attached to the element. P&ID must correspond with the real installation and elements must be labeled accordingly.

Sanitation at $\geq 100^\circ\text{C}$ in service mode and at every start.

Self-regulation of heating steam, feed- and cooling water.

EQUIPMENT AND MATERIALS OF DISTILLER

Distiller type three columns, steam heated, with increased capacity of column 1 for simultaneous production of WFI and Pure Steam. Columns designed for average velocity <1 m/sec.
Condenser coils with seamless tubes, sanitary connection and externally electro polished.
Built in 316L or equal according to GMP-lines. Mounted in stainless steel frame.
System to operate without moving parts and low sound level.
System must be with NCGR column.
Columns must be equipped with:
Sight glass
Steam temperature sensor, sanitary
Bottom flange.
Manual bottom drain valve
Internal surfaces of column and heat exchangers should be cleanable (caustic soda) and passivated (Nitric Acid) with $Ra < 0.8\mu m$.
Column heat Exchangers must withstand thermal stresses, high heat exchange efficiency and drainable.
Heating steam system with heating steam pressure reduction valve and ON/OFF valve, pneumatic. pressure sensor for heat steam regulation, pressure gauge and vacuum break.
Condensate returns system with float steam trap.
Cooling water system with cooling water proportional regulating and ON/OFF valve, Temperature sensor to cooling water regulation and pressure control water inlet.
Feed water inlet system with proportional regulating and ON/OFF valve, sanitary valve.
WFI Condensation system with tubes electro polished inside and outside.
A WFI sampling point and user points as per the requirements.

CONTROL SYSTEM OF DISTILLER

Hardware

A PLC must be installed for control and monitoring of the system.
A touch screen should be installed as a human machine communication interface.

Software

In the Software the following aspects must be visualized, as a minimum:

- ✓ Setpoint values.
- ✓ Screen for equipment calibration.
- ✓ Control panel setup screen.
- ✓ Alarm history.
- ✓ Manual operation of any automatic device.
- ✓ Automatic system activation.
- ✓ Powered from washing mode.
- ✓ Access and configuration of user accounts of the system.

Manual start & service from HMI panel
Auto WFI Start/Stop from tank float switches and / or
Auto PS Start/Stop on external signal.
Automatic shifting between the modes: WFI with Pure steam, Only WFI, Only Pure steam.
Operation modes: STOP & SERVICE /Manual .OP /Auto .Selected with the operation switch.

Stop alarms with text indication on the display:

A red alarm lamp will also light up.
HIGH CONDUCT WFI.

LOW PRESSURE FW.
LOW PRESSURE C.AIR
NO FW PUMP 1.
HIGH TEMP COL 3

The system must record and monitor critical parameters.
The system must generate reports of all processes, especially the sanitation process. | Quality Requirements for Water For Injection and Pure Steam

It must be comply to the quality requirements

The quality of water will be according current USP, EP and IP specifications.

Water for injection USP & amendments thereof
Conductivity $\leq 1.1\mu S/cm$ a $20^{\circ}C$
TOC $\leq 0.5 mg/mL$ (500 ppb)
Endotoxins $\leq 0.25 EU/mL$

Water for injection EP & amendments thereof
Conductivity $\leq 1.1\mu S/cm$ ($20^{\circ}C$)
TOC $\leq 0.5 mg/mL$ (500 ppb)
Endotoxins $\leq 0.25 EU/mL$
Total Aerobic $\leq 10 CFU/100 mL$
Nitrates $< 0.2 ppm$

Pure Steam USP & amendments thereof
Conductivity $\leq 1.1\mu S/cm$ ($20^{\circ}C$)
TOC $\leq 0.5 mg/mL$ (500 ppb)

Endotoxins ≤ 0.25 EU/mL

Supply steam must have a dryness value of no less than 0.95. Obtain no more than 3.5 ml of gases per 100 ml of condensate. Superheat to be less than 25°C when expanded to atmospheric pressure.

Traceability of all the process information of distiller plant

Flexibility: All the information must be easy to process for qualified personnel.

WATER FOR INJECTION AND PURE STEAM GENERATOR

Requirement:-

Water for Injection generation occurs from Purified Water.

Water for injection must be generated by Multi effect Distiller.

The quality of water for injection must be according quality standards and requirements of International monograph (IP, USP, Ph Eu and ISPE).

The equipment, piping and ducting must be designed to perform maintenance and cleaning activities in an easy way.

The equipment must be modular equipped with extension capacity.

Drain ability where necessary (pipe lines as well as equipment). Especially in between all the operations.

100% pipe line drainability for connection lines between generation plant and storage tank. Pipe slope minimum 1% of inclination to the drainable point.

Pipe connections: Orbital welding wherever possible.

Welding must be performed by qualified welder.

Certificates of welding must be able.

Valves and pumps must meet sanitary design.

All piping lines must be identified with product, direction flow and color codes (according DIN 2403 standard).

All hydraulic elements must be labeled with its identifier tag by a resistant plate attached to the element. P&ID must correspond with the real installation and elements must be labeled accordingly.

Sanitation at $\geq 100^\circ\text{C}$ in service mode and at every start.

Self-regulation of heating steam, feed- and cooling water.

EQUIPMENT AND MATERIALS OF DISTILLER

Distiller type three columns, steam heated, with increased capacity of column 1 for simultaneous production of WFI and Pure Steam. Columns designed for average velocity <1 m/sec.

Condenser coils with seamless tubes, sanitary connection and externally electro polished.

Built in 316L or equal according to GMP-lines. Mounted in stainless steel frame.

System to operate without moving parts and low sound level.

System must be with NCGR column.

Columns must be equipped with:

Sight glass

Steam temperature sensor, sanitary

Bottom flange.

Manual bottom drain valve

Internal surfaces of column and heat exchangers should be cleanable (caustic soda) and passivated (Nitric Acid) with $R_a < 0.8\mu\text{m}$.

Column heat Exchangers must withstand thermal stresses, high heat exchange efficiency and drainable.

Heating steam system with heating steam pressure reduction valve and ON/OFF valve, pneumatic. pressure sensor for heat steam regulation, pressure gauge and vacuum break.

Condensate returns system with float steam trap.

Cooling water system with cooling water proportional regulating and ON/OFF valve, Temperature sensor to cooling water regulation and pressure control water inlet.

Feed water inlet system with proportional regulating and ON/OFF valve, sanitary valve.

WFI Condensation system with tubes electro polished inside and outside.

A WFI sampling point and user points as per the requirements.

CONTROL SYSTEM OF DISTILLER

Hardware

A PLC must be installed for control and monitoring of the system.

A touch screen should be installed as a human machine communication interface.

Software

In the Software the following aspects must be visualized, as a minimum:

- ✓ Setpoint values.
- ✓ Screen for equipment calibration.
- ✓ Control panel setup screen.
- ✓ Alarm history.
- ✓ Manual operation of any automatic device.

It will be placed in the clean and closed utility area.

4.0 | Component details | Component details

| Purified water Storage and Distribution System

The tank is designed to have the minimum weld as possible.

The tank have level sensors to stop the entry of product, when there is maximum level, and to stop pumps, for minimum level.

The tank must keep the product stored at the same temperature as the loop.

The temperature of the tank is measured at the outlet.

There will be a venting system to keep the inside at atmospheric pressure. Using filters that prevent the entry of bacteria and nonviable particles into the tank.

Product entry in tank by spray balls. No clip. Clamp connection

All piping lines must be identified with product, direction flow and color codes (according to DIN 2403 standards).

All hydraulic elements must be labeled with its identifier tag attached to the element. P&ID must correspond with the real installation and elements must be labeled accordingly.

Both pipes and accessories will be provided with its quality certificate, identifying each of them individually. As far as possible, mixing different brand's materials will be avoided.

Pipe connections: Orbital welding wherever possible.

Welding must be performed by qualified welder.

Certificates of welding, must be available

Welding inspection: 100% of manual welds and 15% of the orbital welds.

Every time that a new clamp or a new connection is made in the purified water's distribution network, it will be tested at 150% working pressure. During 2 hours of such test , it has to resist hydrostatic pressure without any leaks

Pipe connections must be the minimum: only those which are completely necessary should be made similar.

Those surfaces which are in contact with the purified water system and with the distribution loop must have the slope necessary for a complete drainage of the installation. A maximum slope should be 1/100 or 1%.

Pipes diameters will be made according to the discharge.

Water will be maintained in constant movement to ensure a turbulent flow, with a Reynolds value equal or higher 10,000 in the lowest point. Water speed in event of lack of use should not be higher than 1 m/s

Instrumentation must be suitable for "in situ" sanitization by pure steam.

Loop's design must maintain purified water at room temperature

The Loop of purified water must be able to keep a minimum temperature of 121.1°C for 10 minutes to ensure a successful sanitization.

The temperature and time of sanitization must be adjustable by the personnel

Those loop sections located inside the clean rooms will be installed in a way that avoid creating hidden corners or non-sealed apertures, or surfaces that are difficult to clean.

Build and orientation of the valves will be made to ensure complete drainage of the system

Pick-up sampling valves will be located close to the tank returning and to the impulsion (after the pump).

Pick-up valves location must facilitate easy sampling and the complete drainage of the water.

Mechanical locks will be designed to prevent migration of lubricant fluids and particles towards the pump chamber. If refrigeration is made by water, the quality of this water must be equal to the quality of the water impelled and will be finally removed

The pump must be designed to allow the SIP with Pure Steam at 140°C. Also, a bypass is designed to allow the sterilization without interrupting the loop.

Pumps must be controlled by a frequency shifter in order to guarantee a suitable speed for the distribution loop'

Construction materials which are prone to maintaining and/or calibration (gaskets, valves, instruments, steam traps, etc.) must be easy-access and preferably in the technical area.

Those pipes which go through above the sterile area should be continuous, with no clamps or threads, since it can generate leak.

Pipes paths towards classified zones must be completely sealed in order to avoid particles entry.

All pipes must be treated before use. Installation of purified water generation will be cleaned (caustic

soda) and passivated (Nitric Acid).

Pipe's supports must be installed by dynamic supports in order to tolerate possible dilations.

The loop circuit and the pumping capacity should be designed for a circulation speed greater than 1 m/s and Reynolds number greater than 10,000 (measured at the end of the loop).

During recirculation without demand, the circulation speed could be dropped to about 0.5 to 0.8 m/s in order to avoid excessive increase of loop temperature.

Water must be permanently in recirculation. Turbulent flow in the re-circulating loop is required.

Recirculation return with spray ball at the top of storage tank to ensure that all inner surfaces are wet

Backflows must be avoided.

The following parameters must be monitored:

- Conductivity (return of the loop)

- Pressure and speed / flow of return of the loop

- Temperature of the loop (return of loop, during normal operation and sanitization)

Sampling points at the beginning of the loop and in the return of loop must be installed.

Equipment and Material

Water Tank

Material: Stainless-steel AISI 316L

Roughness: Ra ■ 0,5 µm

Volume: 3500 L.

Design Pressure: -1 to 3 bar

Design Temperature: 145 °C

Vent filter: Present

Pressure level transmitter: Present.

Plant loop connection: Present

(No Jacket / No Cladding required)

Manhole ø 500mm to access a tank.

The breathing of the tank is via 0,2 µm sub-micron hydrophobic vent filter in a stainless steel housing to reduce bio-burden and particles with clamp connection to the tank. Certificate of the filter quality and MOC must be provided by supplier.

The tank must have clamp connections for the installation of the necessary accessories. These accessories are, at a minimum:

- ✓ Rupture Disc

- ✓ Pressure transmitter

- ✓ Venting filter

- ✓ Spray ball / Loop return / PW inlet

Depressurizing mechanism, i.e. safety valve or rupture disc.

Water Storage tank must be constructed in stainless steel AISI 316L with an interior roughness Ra <0.8.

Centrifugal Sanitary Pump AISI 316L polished inside Ra<0,8 µm with Clamp Connection.

Instrumentation in contact with the product will have clamp connections, made of sanitary material (AISI 316L or similar) with Ra<0.8 µm.

Gaskets related to sanitary connections will be made of silicone/platinum

All pipes in contact with purified water must be stainless steel AISI 316L and surfaces finishes must be 180 grit or better, with a Ra<0.8 µm and whenever possible, electro-polished. Supplier must provide the certificates of stainless steel. Specifying Ferrite content,

Impulsion pumps will be made of Stainless steel, sanitary-type and centrifugal pump, designed to allow a complete drainage.

CONTROL SYSTEM STORAGE AND DISTRIBUTION FOR PURIFIED WATER

Hardware:-

A PLC must be installed for control and monitoring of the system.

A touch screen should be installed as a human machine communication interface.

Software:-

In the Software the following aspects must be visualized, as a minimum:

- ✓ Setpoint values.

- ✓ Control panel setup screen.

- ✓ Alarm history.

- ✓ Manual operation of any automatic device.

- ✓ Automatic system activation.

- ✓ Access and configuration of user accounts of the system.

The system must record and monitor critical parameters.

The system must generate reports of all processes, especially the sanitation process. | Purified water

Storage and Distribution System

The tank is designed to have the minimum weld as possible.

The tank have level sensors to stop the entry of product, when there is maximum level, and to stop pumps, for minimum level.

The tank must keep the product stored at the same temperature as the loop.

The temperature of the tank is measured at the outlet.

There will be a venting system to keep the inside at atmospheric pressure. Using filters that prevent the entry of bacteria and nonviable particles into the tank.

Product entry in tank by spray balls. No clip. Clamp connection

All piping lines must be identified with product, direction flow and color codes (according to DIN 2403 standards).

All hydraulic elements must be labeled with its identifier tag attached to the element. P&ID must correspond with the real installation and elements must be labeled accordingly.

Both pipes and accessories will be provided with its quality certificate, identifying each of them individually. As far as possible, mixing different brand's materials will be avoided.

Pipe connections: Orbital welding wherever possible.

Welding must be performed by qualified welder.

Certificates of welding, must be available

Welding inspection: 100% of manual welds and 15% of the orbital welds.

Every time that a new clamp or a new connection is made in the purified water's distribution network, it will be tested at 150% working pressure. During 2 hours of such test , it has to resist hydrostatic pressure without any leaks

Pipe connections must be the minimum: only those which are completely necessary should be made similar.

Those surfaces which are in contact with the purified water system and with the distribution loop must have the slope necessary for a complete drainage of the installation. A maximum slope should be 1/100 or 1%.

Pipes diameters will be made according to the discharge.

Water will be maintained in constant movement to ensure a turbulent flow, with a Reynolds value equal or

higher 10,000 in the lowest point. Water speed in event of lack of use should not be higher than 1 m/s
Instrumentation must be suitable for "in situ" sanitization by pure steam.
Loop's design must maintain purified water at room temperature
The Loop of purified water must be able to keep a minimum temperature of 121.1°C for 10 minutes to ensure a successful sanitization.
The temperature and time of sanitization must be adjustable by the personnel
Those loop sections located inside the clean rooms will be installed in a way that avoid creating hidden corners or non-sealed apertures, or surfaces that are difficult to clean.
Build and orientation of the valves will be made to ensure complete drainage of the system
Pick-up sampling valves will be located close to the tank returning and to the impulsion (after the pump).
Pick-up valves location must facilitate easy sampling and the complete drainage of the water.
Mechanical locks will be designed to prevent migration of lubricant fluids and particles towards the pump chamber. If refrigeration is made by water, the quality of this water must be equal to the quality of the water impelled and will be finally removed
The pump must be designed to allow the SIP with Pure Steam at 140°C. Also, a bypass is designed to allow the sterilization without interrupting the loop.
Pumps must be controlled by a frequency shifter in order to guarantee a suitable speed for the distribution loop'
Construction materials which are prone to maintaining and/or calibration (gaskets, valves, instruments, steam traps, etc.) must be easy-access and preferably in the technical area.
Those pipes which go through above the sterile area should be continuous, with no clamps or threads, since it can generate leak.

| Quality Requirements for Purified water

It must ensure compliance with the quality requirements.

The quality of water will be according current USP, EP and IP specifications.

Traceability of all the process information of purified water distribution .

Flexibility: All the information must be easily to process for qualified personnel.

Purified water Storage and Distribution System

The tank is designed to have the minimum weld as possible.

The tank have level o stop the entry of product, when there is maximum level, and to stop pumps, for minimum level.

The tank must keep the product stored at the same temperature as the loop.

The temperature of the tank is measured at the outlet.

There will be a venting system to keep the inside at atmospheric pressure. Using filters that prevent the entry of bacteria and nonviable particles into the tank.

Product entry in tank by spray balls. No clip. Clamp connection

All piping lines must be identified with product, direction flow and color codes (according to DIN 2403 standards).

All hydraulic elements must be labeled with its identifier tag attached to the element. P&ID must correspond with the real installation and elements must be labeled accordingly.

Both pipes and accessories will be provided with its quality certificate, identifying each of them individually. As far as possible, mixing different brand's materials will be avoided.

Pipe connections: Orbital welding wherever possible.

Welding must be performed by qualified welder.

Certificates of welding, must be

Welding inspection: 100% of manual welds and 15% of the orbital welds.

Every time that a new clamp or a new connection is made in the purified water's distribution network, it will be tested at 150% work pressure. During a 2 hours , it has to resist hydrostatic pressure without any leaks

Pipe connections must be the minimum: only those which are completely necessary be made similar.

Those surfaces which are in contact with the purified water system and with the distribution loop must have the slope necessary for a complete drainage of the installation. A 1%

Pipes diameters will be made according to the discharge.

Water will be maintained in constant movement to ensure a turbulent flow, with a Reynolds value equal or higher 10,000 in the lowest point. Water speed in event of lack of use should not be higher than 1 m/s

Instrumentation must be suitable for "in situ" sanitization by pure steam.

Loop's design must maintain purified water at room temperature

The Loop of purified water must be able to keep a minimum temperature of 121.1°C for 10 minutes to ensure a successful sanitization.

The temperature and time of sanitization must be adjustable by the personnel

Those loop sections located inside the clean rooms will be installed in a way that avoid creating hidden corners or non-sealed apertures, or surfaces that are difficult to clean.

Build and orientation of the valves will be made to ensure complete drainage of the system

Pick-up sampling valves will be located close to the tank returning and to the impulsion (after the pump).

Pick-up valves location must facilitate the complete drainage of the

Mechanical locks will be designed to prevent migration of lubricant fluids and particles towards the pump chamber. If refrigeration is made by water, the quality of this water must be equal to the quality of the water impelled and will be finally removed

The pump must be designed to allow the SIP with Pure Steam at 140°C. Also, a bypass is designed to allow

the sterilization without interrupting the loop.

Pumps must be controlled by a frequency shifter in order to guarantee a suitable speed for the distribution loop.

Construction materials which are prone to maintaining and/or calibration (gaskets, valves, instruments, steam traps, etc.) must be easy-access and preferably in the technical area.

Those pipes which go through above the sterile area should be continuous, with no clamps or threads, since it can generate leak.

Pipes paths towards classified zones must be completely sealed in order to avoid particles entry.

All pipes must be treated before use. Installation of purified water generation will be cleaned (caustic soda) and passivated (Nitric Acid).

Pipe's supports must be installed by dynamic supports in order to tolerate possible dilations.

The loop circuit and the pumping capacity should be designed for a circulation speed greater than 1 m/s and Reynolds number greater than 10,000 (measured at the end of the loop).

During recirculation without demand, the circulation speed could be dropped to about 0.5 to 0.8 m/s in order to avoid excessive increase of loop temperature.

Water must be permanently in recirculation. Turbulent flow in the re-circulating loop is required.

Recirculation return with spray ball at the top of storage tank to ensure that all inner surfaces are wet. Backflows must be avoided.

The following parameters must be monitored:

- Conductivity (return of the loop)

- Pressure and speed / flow of return of the loop

- Temperature of the loop (return of loop, during normal operation and sanitization)

Sampling points at the beginning of the loop and in the return of loop must be installed.

Operational manual (2 Sets)

Spare part list

The following is a generic list of the documentation to be delivered by the supplier(s) before Design qualification DQ:

- ✓ Technical Memory
- ✓ Electrical wiring/Schematic diagrams.
- ✓ Technical specifications.
- ✓ Installation drawings (layout, P&IDs).

The following is a generic list of the documentation to be delivery by the supplier(s) before Factory Acceptance Test (FAT):

- ✓ Materials and Equipment certifications.
- ✓ Welder's qualification.
- ✓ Passivation reports.
- ✓ Cleaning and flushing reports.
- ✓ Reports of pressure testing to check leaks in equipment or piping.
- ✓ Operation and maintenance manuals
- ✓ Updated backup copies of the software/configuration of programmable control systems (HMIs, PLCs, frequency drives

The operator and maintenance manuals must be in English. The manuals must be available in paper and in electronic format.

Training of personnel must be performed and documented by the supplier before the start up. | Complete documentation Package with following documents should be delivered with the system

| WFI Storage and Distribution System

The tank is designed to have the minimum weld as possible.

The tank will have a level transmitter.

The tank must keep the product stored at the same temperature as the loop.

The temperature of the tank is measured at the outlet of it

There will be a venting system to keep the inside at atmospheric pressure. Using filters that prevent the entry of bacteria and nonviable particles into the tank.

All piping lines must be identified with product, direction flow and colour codes (according DIN 2403 standards).

All hydraulic elements must be labelled with its identifier tag attached to the element. P&ID must correspond with the real installation and elements must be labelled accordingly.

Both pipes and accessories will be provided with its quality certificate, identifying each of them individually. As far as possible, mixing different brand's materials will be avoided.

Pipe connections: Orbital welding wherever possible.

Welding must be performed by qualified welder.

Certificates of welding must be able.

Welding inspection: 100% of manual welds and 15% of the orbital welds.

Every time that a new clamp or a new connection is made in the water for injection's distribution network, it will be tested at 150% work ordinary pressure. During a 2 hours period of time, it has to resist hydrostatic pressure without any leaks

Pipe connections must be the minimum: only those which are completely necessary will be made. For details such as building, maintenance or inspection, it will be used accessories of sanitary design "Tri-Clamp" type or similar.

Those surfaces which are in contact with the water for injection system and with the distribution loop must have the slope necessary for a complete drainage of the installation. A minimum 1% slope will be considered.

Pipes diameters will be made according to the discharge brought.

Water will be maintained in constant movement to ensure a turbulent flow, with a Reynolds value equal or higher 10.000 in the lowest point. Water speed in event of lack of use should not be higher than 1 m/s

Instrumentation must be suitable for "in situ" sanitization by pure steam (max. Temp. 140°C).

Loop's design must maintain WFI in a temperature range of 80 – 90°C and must avoid lower or higher temperatures.

The Loop of water for injection must be able to keep a minimum temperature of 123°C for a one-hour period to ensure a successful sanitization.

Those loop sections located inside the clean rooms will be installed in a way that avoid creating hidden corners or non-sealed apertures, or surfaces that are difficult to clean.

Build and orientation of the valves will be made to ensure complete drainage of the system

Pick-up sampling valves will be located after the points of use and close to the tank returning and to the impulsion (after the pump).

Sampling valves location must facilitate the complete drainage of the installation while the valve is closed

Mechanical locks will be designed to prevent migration of lubricant fluids and particles towards de pump chamber. If refrigeration is made by water, the quality of this water must be equal to the quality of the water impelled and will be finally removed

Pumps must be designed to allow the SIP with Pure Steam (sterilization temperature of 140°C, P=2.5 bar).

Also, pumps have to allow sterilizing each one independently without interrupting the loop

Pumps must be controlled by a frequency shifter in order to guarantee a suitable speed for the distribution loop'

Heat exchangers must be internally made of stainless steel and it will have tri-clamp type connections.

Those parts which are in direct contact with purified water must be made of stainless steel AISI 316L and must have a maximum of 0.625µm Ra (25 µ-inch). A mean Ra of 0.5 µm is recommended.

Heat exchangers will be designed in order to prevent purified water contamination and corrosion, and also to allow the complete drainage and cleaning of it.

Heat exchangers must be made of double tube to avoid mixing cooling liquids with the water for injection.

Heat exchangers will be installed in technical areas in order to make its maintenance easier.

Construction materials which are prone to maintaining and/or calibration (gaskets, valves, instruments, steam traps, etc.) must be easy-access and preferably in the technical area.

Those pipes which go through above the sterile area should be continuous, with no clamps or threads, since it can generate leak.

Pipes paths towards classified zones must be completely sealed in order to avoid particles entry.

Those pipes which transport hot fluids will be installed with thermal insulation. The use of insulating with asbestos or chlorides contents is not allowed.

Those pipes and elements which contain low temperature fluids above production or office area will be completely lagged in order to avoid condensates

All pipes must be treated before use. Installation of purified water generation will be cleaned (caustic soda) and passivated (Nitric Acid).

The loop circuit and the pumping capacity should be designed for a circulation speed greater than 1 m/s and Reynolds number greater than 10,000 (measured at the end of the loop).

Water must be permanently in recirculation. Turbulent flow in the re-circulating loop is required.

Recirculation return with spray ball at the top of storage tank to ensure that all inner surfaces are wet

Backflows must be avoided.

The following parameters must be monitored:

- Conductivity (return of the loop)
- Pressure and speed / flow of return of the loop
- Temperature of the loop (return of loop, during normal operation and sanitization)

Sampling points at the beginning of the loop and in the return of loop must be installed.

EQUIPMENT AND MATERIALS

WFI STORAGE TANK

Material: Stainless-steel AISI 316L

Roughness: Ra $\leq$ 0.5 μ m

Volume: 4000 L.

Design Pressure: -1/3 bar

Design Temperature: 140 °C

Vent filter: Present

Pressure level transmitter: Present.

Plant loop connection: Present

(Partial Limpet jacket with steam & electrical heating and full cladding required)

WFI Storage tank must be constructed in stainless steel AISI 316L with an interior roughness Ra $<$ 0.5

Manhole $\varnothing$ 500mm to access a tank.

The breathing of the tank is via 0.2 μ m sub-micron hydrophobic vent filter in a stainless steel housing to reduce bio-burden and particles with clamp connection to the tank. Certificate of the filter quality and MOC must be provided by supplier.

The tank must have several clamp connections for the installation of the necessary accessories.

These accessories are, at a minimum:

✓ Rupture Disc

✓ Pressure transmitter

✓ Venting filter

✓ Spray ball / Loop return / WFI inlet

Depressurizing mechanism, i.e. safety valve or rupture disc.

Loop

All pipes in contact with water for injection must be stainless steel AISI 316L and surfaces finishes must be 180 grit or better, with a Ra $<$ 0.8 μ m and whenever possible, electro-polished. Supplier must provide the certificates of stainless steel. Ferrite content must be specified.

Centrifugal Sanitary Pump AISI 316L polished inside Ra $<$ 0.8 μ m with Clamp Connection.

Exchanger Double Tube in of stainless Steel.

Gaskets related to sanitary connections will be made of Silicone/platinum.

Impulsion pumps will be made of Stainless steel, sanitary-type and centrifugal pump, designed to allow a complete drainage.

CONTROL SYSTEM STORAGE AND DISTRIBUTION FOR WFI

Hardware:-

A PLC must be installed for control and monitoring of the system.

A touch screen should be installed as a human machine communication interface.

Software:-

In the Software the following aspects must be visualized, as a minimum:

✓ Setpoint values.

✓ Control panel setup screen.

✓ Alarm history.

✓ Manual operation of any automatic device.

✓ Automatic system activation.

✓ Access and configuration of user accounts of the system.

The system must record and monitor critical parameters.

The system must generate reports of all processes, especially the sanitation process. | WFI Storage and Distribution System

4.0 | Component details | Component details

| Quality Requirements for WFI

It must ensure compliance with the quality requirements.

The quality of water will be according current USP, EP and IP specifications.

Water for Injection USP 40 (current USP)

Conductivity $\leq 1.1 \mu\text{S/cm}$ (20° C)

TOC $\leq 0.5 \text{ mg/mL}$ (500 ppb)

Endotoxins $\leq 0.25 \text{ EU/mL}$

Water for Injection EP 9th (current EP)

Conductivity $\leq 1.1 \mu\text{S/cm}$ (20° C)

TOC $\leq 0.5 \text{ mg/mL}$ (500 ppb)

Endotoxins $\leq 0.25 \text{ EU/mL}$

Nitrates: $\leq 0.2 \text{ ppm}$

Total Aerobic: $\leq 10 \text{ CFU} / 100\text{ml}$

Traceability of all the process information of WFI distribution plant.

Flexibility: All the information must be easily to process for qualified personnel.

WFI Storage and Distribution System

The tank is designed to have the minimum weld as possible.

- Pressure and speed / flow of return of the loop
- Temperature of the loop (return of loop, during normal operation and sanitization)

Sampling points at the beginning of the loop and in the return of loop must be installed.

EQUIPMENT AND MATERIALS

WATER TANK

Material: Stainless-steel AISI 316L

Roughness: Ra ■ 0.5 µm

Useful Volume: 1000 L.

Design Pressure: -1/3 bar

Design Temperature: 140 °C

Vent filter: Present

Pressure level transmitter: Present.

Plant loop connection: Present

Water Storage tank must be constructed in stainless steel AISI 316L with an interior roughness Ra <0.5

Manhole ø 500mm to access a tank.

The breathing of the tank is via 0.2 µm sub-micron hydrophobic vent filter in a stainless steel housing to reduce bio-burden and particles with Clamp Connection to the tank. Certificate of the filter must be provided by supplier.

The tank must have several Clamp Connections for the installation of the necessary accessories.

These accessories are, at a minimum:

- ✓ Rupture Disc
- ✓ Pressure transmitter
- ✓ Venting filter
- ✓ Spray ball / Loop return / WFI inlet

Depressurizing mechanism, i.e. safety valve or rupture disc.

Loop

All pipes in contact with water for injection must be stainless steel AISI 316L and surfaces finishes must be 180 grit or better, with a Ra<0.8 µm and whenever possible, electro-polished. Supplier must provide the certificates of stainless steel. Ferrite content must be specified.

Centrifugal Sanitary Pump AISI 316L polished inside Ra<0.8 µm with Clamp Connection.

Exchange Double Tube in of stainless Steel.

Gaskets related to sanitary connections will be made of Silicone/platinum.

Impulsion pumps will be made of Stainless steel, sanitary-type and centrifugal pump, designed to allow a complete drainage.

CONTROL SYSTEM STORAGE AND DISTRIBUTION FOR WFI

Hardware:-

A PLC must be installed for control and monitoring of the system.

A touch screen should be installed as a human machine communication interface.

Software:-

In the Software the following aspects must be visualized, as a minimum:

- ✓ Setpoint values.
- ✓ Control panel setup screen.
- ✓ Alarm history.
- ✓ Manual operation of any automatic device.
- ✓ Automatic system activation.
- ✓ Access and configuration of user accounts of the system.

The system must record and monitor critical parameters.

The system must generate reports of all processes, especially the sanitation process. | Quality Requirements for WFI

It must ensure compliance with the quality requirements.

The quality of water will be according current USP, EP and IP specifications.

Water for Injection USP 40 (current USP)

Conductivity $\leq 1.1 \mu\text{S/cm}$ (20° C)

TOC $\leq 0.5 \text{ mg/mL}$ (500 ppb)

Endotoxins $\leq 0.25 \text{ EU/mL}$

Water for Injection EP 9th (current EP)

Conductivity $\leq 1.1 \mu\text{S/cm}$ (20° C)

TOC $\leq 0.5 \text{ mg/mL}$ (500 ppb)

Endotoxins $\leq 0.25 \text{ EU/mL}$

Nitrates: $\leq 0.2 \text{ ppm}$

Total Aerobic: $\leq 10 \text{ CFU} / 100\text{ml}$

Traceability of all the process information of WFI distribution plant.

Flexibility: All the information must be easily to process for qualified personnel.

WFI Storage and Distribution System

The tank is designed to have the minimum weld as possible.

The tank will have a level transmitter.

The tank must keep the product stored at the same temperature as the loop.

The temperature of the tank is measured at the outlet of it

There will be a venting system to keep the inside at atmospheric pressure. Using filters that prevent the entry of bacteria and nonviable particles into the tank.

Product entry in tank by spray balls. No clip. Clamp connection

All piping lines must be identified with product, direction flow and colour codes (according DIN 2403 standards).

All hydraulic elements must be labelled with its identifier tag attached to the element. P&ID must correspond with the real installation and elements must be labelled accordingly.

Both pipes and accessories will be provided with its quality certificate, identifying each of them individually. As far as possible, mixing different brand's materials will be avoided.

Pipe connections: Orbital welding wherever possible.

Welding must be performed by qualified welder.

Certificates of welding must be able.

Welding inspection: 100% of manual welds and 15% of the orbital welds.

Every time that a new clamp or a new connection is made in the water for injection's distribution network, it will be tested at 150% work ordinary pressure. During a 2 hours period of time, it has to resist hydrostatic pressure without any leaks

Pipe connections must be the minimum: only those which are completely necessary will be made. For details such as building, maintenance or inspection, it will be used accessories of sanitary design "Tri-Clamp" type or similar.

Those surfaces which are in contact with the water for injection system and with the distribution loop must have the slope necessary for a complete drainage of the installation. A minimum 1% slope will be considered.

Pipes diameters will be made according to the discharge brought.

Water will be maintained in constant movement to ensure a turbulent flow, with a Reynolds value equal or higher 10.000 in the lowest point. Water speed in event of lack of use should not be higher than 1 m/s

Instrumentation must be suitable for "in situ" sanitization by pure steam (max. Temp. 140°C).

Loop's design must maintain WFI in a temperature range of 80 – 90°C and must avoid lower or higher temperatures.

The Loop of water for injection must be able to keep a minimum temperature of 123°C for a one-hour period to ensure a successful sanitization.

Those loop sections located inside the clean rooms will be installed in a way that avoid creating hidden corners or non-sealed apertures, or surfaces that are difficult to clean.

Build and orientation of the valves will be made to ensure complete drainage of the system

Pick-up sampling valves will be located after the points of use and close to the tank returning and to the impulsion (after the pump).

Sampling valves location must facilitate the complete drainage of the installation while the valve is closed

Mechanical locks will be designed to prevent migration of lubricant fluids and particles towards de pump chamber. If refrigeration is made by water, the quality of this water must be equal to the quality of the water impelled and will be finally removed

Pumps must be designed to allow the SIP with Pure Steam (sterilization temperature of 140°C, P=2.5 bar). Also, pumps have to allow sterilizing each one independently without interrupting the loop

Pumps must be controlled by a frequency shifter in order to guarantee a suitable speed for the distribution loop'

Heat exchangers must be internally made of stainless steel and it will have tri-clamp type connections.

Those parts which are in direct contact with purified water must be made of stainless steel AISI 316L and must have a maximum of 0.625µm Ra (25 µ-inch). A mean Ra of 0.5 µm is recommended.

Heat exchangers will be designed in order to prevent purified water contamination and corrosion, and also to allow the complete drainage and cleaning of it.

Heat exchangers must be made of double tube to avoid mixing cooling liquids with the water for injection.

Heat exchangers will be installed in technical areas in order to make its maintenance easier.

Construction materials which are prone to maintaining and/or calibration (gaskets, valves, instruments, steam traps, etc.) must be easy-access and preferably in the technical area.

Those pipes which go through above the sterile area should be continuous, with no clamps or threads, since it can generate leak.

Pipes paths towards classified zones must be completely sealed in order to avoid particles entry. Those pipes which transport hot fluids will be installed with thermal insulation. The use of insulating with asbestos or chlorides contents is not allowed. Those pipes and elements which contain low temperature fluids above production or office area will be completely lagged in order to avoid condensates. All pipes must be treated before use. Installation of purified water generation will be cleaned (caustic soda) and passivated (Nitric Acid). The loop circuit and the pumping capacity should be designed for a circulation speed greater than 1 m/s and Reynolds number greater than 10,000 (measured at the end of the loop). Water must be permanently in recirculation. Turbulent flow in the re-circulating loop is required. Recirculation return with spray ball at the top of storage tank to ensure that all inner surfaces are wet. Backflows must be avoided.

The following parameters must be monitored:

- Conductivity (return of the loop)
- Pressure and speed / flow of return of the loop
- Temperature of the loop (return of loop, during normal operation and sanitization)

Sampling points at the beginning of the loop and in the return of loop must be installed.

It will be placed in the clean and closed utility area.

4.0 | Component details | Component details

| Quality Requirements for Pure Steam

The quality of pure steam will be according current USP, EP and IP specifications.

Pure Steam USP 40 (current USP)

Conductivity $\leq 1.1 \mu\text{S/cm}$ (20° C)

TOC $\leq 0.5 \text{ mg/mL}$ (500 ppb)

Endotoxins $\leq 0.25 \text{ EU/mL}$

Pure Steam Distribution System

The condensate of the pure steam will not be recovered and will be lead towards the drainage greywater network

The finishing of metallic surface which are in direct contact with pure steam must be 180 grit or better, with a Ra lower or equal to $0.625\mu\text{m}$ (25 $\mu\text{-inch}$) and whenever possible, electropolished.

Both pipes and accessories will be provided with its quality certificate, identifying each of them individually. As far as possible, mixing different brand's materials will be avoided.

Pipe connections: Orbital welding wherever possible.

Welding must be performed by qualified welder.

Certificates of welding, must be able.

Welding inspection: 100% of manual welds and 15% of the orbital welds.

Every time that a new clamp or a new connection is made in the steam distribution network, it will be tested at 150% work ordinary pressure. During a 2 hours period of time, it has to resist hydrostatic pressure without any leaks

Pipe connections must be the minimum: only those which are completely necessary will be made.

For details such as building, maintenance or inspection, it will be used accessories of sanitary design "Tri-Clamp" type or similar.

Both distribution lines and points of use must have the slope necessary to allow successfully the drainage of the condensate towards the steam traps. Minimum slope of 1% must be considered. This slope must be according to the steam flow direction

The line will have steam traps before both low points, last lengths of the line, regulatory elements and points of use.

As far as possible, installation will be made with an only collector.

All pipes in contact with steam must be stainless steel AISI 316L and surfaces finishes must be 180 grit or better, with a Ra lower or equal of $0.625\mu\text{m}$ (25 $\mu\text{-inch}$) and whenever possible, electro-polished.

Supplier must provide the certificates of stainless steel. Ferrite content must be specified.

All piping lines must be identified with product, direction flow and color codes (according DIN 2403 standards).

All hydraulic elements must be labeled with its identifier tag attached to the element. P&ID must correspond with the real installation and elements must be labeled accordingly.

Both pipes and accessories will be provided with its quality certificate, identifying each of them individually. As far as possible, mixing different brand's materials will be avoided.

EQUIPMENT AND MATERIALS

Loop

Both pipes and auxiliary metallic materials must be made of stainless steel and those which are in contact with pure steam must be made of stainless steel under carbon, AISI 316L-type

Diaphragm Valve manual actuator, gaskets TEFLON/EPDM SS 316L Clamp Connection. Ra<0.5 must be installed.

Diagram Valve pneumatic actuator simple effect, gaskets TEFLON/EPDM. SS 316L .Clamp Connection. Ra<0.5 must be installed

The following points of use are needed in the loop: production tank 1, production tank 2, Filling Machine, WFI tank, PW tank.

Steam Trap. Clamp Connection must be installed.

CONTROL SYSTEM PURE STEAM DISTRIBUTION

Hardware:-

The control and monitoring of the system is done by the same PLC that rules the PW and WFI loops.

A touch screen should be installed as a human machine communication interface.

Software:-

In the Software the following aspects must be visualized, as a minimum:

- ✓ Setpoint values.
- ✓ Screen for Equipment Calibration.
- ✓ Control panel setup screen.
- ✓ Alarm history.
- ✓ Manual operation of any automatic device.
- ✓ Automatic system activation.

| This URS detail the requirement of GMP Lab Refrigerator (2-8°C), which will be used to store the solutions, chemicals and samples in the quality control Department.

2.0 | Scope

| This URS is applicable mainly for Lab Refrigerator (2-8°C), which will be installed in quality control department.

3.0 | Equipment description

| Lab Refrigerator (2-8°C) will be used to store the solutions, chemicals and samples. Lab Refrigerator (2-8°C) should have the LED digital display, Temperature controlling Safety control, and alarm system.

4.0 | Component details

| Technical Specification:

| Temperature working range: 2-8°C

Temperature Setting and display: Microprocessor Control with LED Digital display to 0.1°C

Temperature Fluctuation: ±0.5°C

Controls panel: Touch-pad icon-based controls & display

Alarm system: Audible and Visual alarms with battery back-up. With remote alarm contact

Alarm conditions: High & Low alarm, Door open, Power failure

Air Circulation: Forced air circulation fan

Defrost: Automatic cycle defrost

Indicating lamp: Fluorescent lamp

Capacity: 300 liters

Stainless steel outer body with 4 SS(304) Trays: 4

Full length inner glass door magnetic gasket.

Wheels for easy movement.

High quality PT-100 temperature sensor.

Validation port.

On line recording of real time temperature.

5.0 | Construction material

| SS 304 interior and exterior.

1.0 | Objective

| This URS detail the requirement of pH and conductivity meter, which will be used to measure the pH and conductivity of the solution.

2.0 | Scope

| This URS is applicable mainly for the pH and conductivity meter, will be installed in different areas of manufacturing facilities where solution or reagents are prepared.

3.0 | Equipment description

| A pH meter is an analytical instrument that measures the acidity or basicity of a solution, a key parameter for many applications in various industries. It should provide intuitive, easy-to-use meters that accurately measure pH, as well as conductivity.

The pH and conductivity meter should have the multi-data screen that should display as well as print the pH, conductivity, Temperature, electrode status, calibrations, date and time of analysis.

4.0 | Component details

| Technical Specification:

| Parameter: pH and conductivity

Channel: Dual channel

pH measuring range: 1 to 14

pH resolution: 0.001, 0.01 and 0.1

pH accuracy (±): 0.002

pH calibration points: up to 5

Conductivity measurement range: 0.001µS/cm-500mS/cm

Conductivity resolution: 0.001 to 2

Conductivity accuracy (±): 1%

Conductivity calibration points: up to 5

Temperature Range: 0.0 to 100.0°C

Temperature Resolution: 0.1°C

Temperature accuracy: (±) 0.3°C

Temperature Normalization: 15.0 to 30°C

Temperature Compensation: ATC/MTC

Large, easy-to-read display

Printer

This specification is intended to cover the minimum requirements to be met by the Vendor in the design, manufacture and supply of double door autoclave (dimensional/ functional) specification provided in this document are as a minimum and can be subjected to amendment after discussion with vendor and representative of Client for achieving higher degree of operational ease. | Technical and GMP features This specification is intended to cover the minimum requirements to be met by the Vendor in the design, manufacture and supply of double door autoclave (dimensional/ functional) specification provided in this document are as a minimum and can be subjected to amendment after discussion with vendor and representative of Client for achieving higher degree of operational ease.

| Technical Description:

Chamber Size: 400L

Door should be Sliding vertical and pneumatically operated

5" SIP able Vacuum break filter

Adjustable operating temperature up to 135 °C. Error $\pm$ 0.5 °C with empty chamber.

Programs required

Vacuum Leak Test

Bowie & Dick Process

Standard Cycle

H.P.H.V.

SIP of filter

Automatic F0 value calculation for each cycle.

PLC control with data recording facility for temperature and pressure.

Software should have three level access controls.

Indicator for Steam pressure in chamber and jacket. | Technical Description:

1.0 | Objective

| This URS detail the requirement of Laminar air flow, which will be used to separate room air from the working space air, and prevent airborne contaminants in the sterile activity.

2.0 | Scope

| This URS is applicable mainly for the Laminar air flow(Vertical) which will be installed in microbiology area of the quality control department.

3.0 | Equipment description

| The Laminar air flow should have the features such as high quality construction, quit operation ,ULPA/HEPA filter, Magnehelic gauge, energy efficient microprocessor control.

4.0 | Component details

| Technical Specification:

| Type: Vertical

Air Flow Velocity: Average of 0.3~0.5m/s

ULPA/HEPA filter: 99.995% efficiency at particle size between 0.1 to 0.3 µm

Pre filter: Polyester fiber, washable

Front Window: Tempered Glass, ,colorless and transparent

UV Lamp: 20W*1 Emission of 253.7 nanometers

Display: LCD display

Noise level: <65dB

Air flow sensor

Microprocessor control

Standards Compliance: Air quality: ISO 14644.1, Class 3, Worldwide, Filtration: EST-RP-CC001.3,

Worldwide, Electrical Safety: IEC61010-1, Worldwide

5.0 | Construction material

| Main body: 18-gauge electro-galvanized steel with white oven-baked epoxy-polyster powder-coated finish.

Work zone: stainless steel, grade 304, with 4B finish.

Side walls: stainless steel, grade 304, with 4B finish.

Sash window: Manual Sliding Sash: 5 mm (0.2") UV Resistant Tempered Glass with counter-balance system and ergonomic handle.

All parts to be designed and manufactured in line with the current standards.

MOC must be resistant to chemical decontamination.

6.0 | Utility Requirements

| Power Rating: 220-240 VAC, 50 / 60 Hz, 1 phase or as recommended by manufacturer or supplier.

7.0 | Accessories

| LED lamp, UV lamp x2, Base stand.

1.0 | Objective

| This URS detail the requirement of Biosafety cabinet used to protect personnel, products and the environment from exposure to biohazards and cross contamination during routine microbiological procedures.

2.0 | Scope

| This URS is applicable to Biosafety Cabinet, to be installed in microbiology area of the quality control department.

3.0 | Equipment description

| The Biosafety cabinet should comply with one or more of the following international standards, and the manufacturer shall provide a certified copy of containment and performance tests as specified in the independent international standards for biological safety, electrical and other functional characteristics The BSC should have high quality construction in line with GXP expectations, NSF 49, EN 12469 certified , quit operation, high efficiency HEPA filter, energy efficient microprocessor control.

4.0 | Component details

| Technical Specification:

| Type: Class II, Type A2 Bio Safety Cabinet

Size: 4 feet

HEPA filter: 99.995% efficiency

Front Window: Tempered Glass, anti-UV, colorless and transparent

UV light with set timer, safer and high efficiency.

Display: Color LED screen, show the air velocity, time, pressure and alarm in real time.

Noise level: <65dB

Two anti-splash spare sockets and four service port in the cabinet.

Audio and visual alarm (Abnormal air velocity; Filter replacement; Front window at unsafe height etc.

Inflow Velocity: 0.53±0.025 m/s

Downflow Velocity: 0.33±0.025 m/s

Airflow System: 70% air recirculation, 30% air exhaust.

Certified to NSF 49, EN 12469

Airflow sensor to alert the user if airflow is insufficient for safety of the operator.

Light intensity:>1000 lux

5.0 | Construction material

| Main body: 18-gauge electro-galvanized steel with white oven-baked epoxy-polyester powder-coated finish.

Work zone: stainless steel, grade 304, with 4B finish.

Side walls: stainless steel, grade 304, with 4B finish.

Sash window: Manual Sliding Sash: 5 mm (0.2") UV Resistant Tempered Glass with counter-balance system and ergonomic handle.

All parts to be designed and manufactured in line with the current standards.

To resist laboratory working conditions

6.0 | Utility Requirements

| Gas connection with manual control valve.

Vacuum connection with manual control valve.

Changeable main HEPA filter from cabinet front, without having to dismount motors, power connections and ducts..

7.0 | Accessories

| LED lamp, UV lamp x2, Base stand.

| This URS detail the requirement of Fume Hood (Table Top), which will be used to separate volumes of air, or prevent air contamination due to acid or alkali fumes in lab.

2.0 | Scope

| This URS is applicable for the Fume Hood, will be installed in chemical area of the quality control department.

3.0 | Equipment description

| The fume hood should have the features such as Durable and chemical-resistant construction, High performance centrifugal blower, Energy saving blowers and CE & ISO certified.

4.0 | Component details

| Technical Specification:

| Working Size in feet: 4' x 2' x 2'

Air Flow Velocity: > 0.5m/s

Door / Sash: Door vertical Folding Type

Noise level: <65dB

Glass Window: Two layer toughen glass, 5mm thickness, Motor Control, height adjustable.

Make-up Air: Air needed to replace the air exhausted from a room by the fume hood and other ventilation devices.

Face Velocity: The velocity of the air passing through the work opening of the fume hood measured in the plane of the sash. Measured in feet per minute (fpm), or liters per minute.

Illumination: Fluorescent Lamp.

Exhaust System: Motor Blower Assembly Covered with G.I Sheet.

Optional:

HEPA Filter

Caster wheels

SS 314 / SS 316 MOC

Temperature indicator

Face Velocity Meter

Airflow Indicator

Audio / Visual alarm

5.0 | Construction material

This specification is intended to cover the minimum requirements to be met by the Vendor in the design, manufacture and supply of Mobile Recirculation CIP Skid (dimensional/ functional) specifications provided in this document are as a minimum and can be subjected to amendment after discussion with vendor and representative of Client for achieving higher degree of operational ease. | Technical and GMP features This specification is intended to cover the minimum requirements to be met by the Vendor in the design, manufacture and supply of Mobile Recirculation CIP Skid (dimensional/ functional) specifications provided in this document are as a minimum and can be subjected to amendment after discussion with vendor and representative of Client for achieving higher degree of operational ease.

| Technical Specification:

CIP Skid should be compatible to Integrate with tank systems

Outlet of CIP Skid connectable to the spray ball line of process tank / unit to be cleaned

Pump to re-circulate the sanitizing solution through spray ball, transfer lines, sample valve of the connected process unit to be cleaned

System must be designed with flow meter

CIP System program integration with respective vessels in the PLC

Conductivity sensor at inlet line.

Piping must be designed for self-draining with a continuous slope of $\geq 1\%$ and zero dead legs.

Automation and Control

PLC Control System

1.0 | Objective

| This URS detail the requirement of Akta pure 150 purification system used to carrying out separation of bio-molecule in QC department.

2.0 | Scope

| This URS is applicable mainly for the Akta pure 150 purification system, will be installed in the quality Control department.

3.0 | Equipment description

| ÄKTA pure is intended for purification of bio-molecules, in particular proteins, for quality control purposes .

4.0 | Component details

| Technical Specification:

Control system UNICORN, version 7.6 or later

System pump

Pump type Piston pump, metering type

Flow rate Setting: 0.01 to 150 mL/min(up to 300 mL/min during column packing)

Flow rate specifications:

Accuracy: $\pm 1.5\%$

Precision: RSD < 0.5% (conditions: 1.0 to150 mL/min, < 3 MPa, 0.8 to 2 cP)

Pressure range :0 to 5 MPa

Viscosity range:0.35 to 5 cP

Sample pump

Pump type :Piston pump, metering type

Flow rate: 0.01 to 150 mL/min

Accuracy: $\pm 2\%$

Precision: RSD < 0.5% (conditions: 1.0 to150 mL/min, < 3 MPa, 0.8 to 3 cP)

Pressure range: 0 to 5 MPa

Viscosity range 0.7 to 10 cP

Mixer

Mixing principle Chamber with a magnetic stirrer

Mixer volume: 1.4 (mounted on system),5 mL (included with system), or 15 mL

Gradient flow rate range : 0.5 to 150 mL/min

Gradient composition and accuracy: $\pm 0.8\%$ (conditions: 5 to 95%)

2 to 150 mL/min, 0.2 to 2 MPa, 0.8 to 2 cP)

Valves

Type Rotary valves

Number of valves :Up to 12

Functions Standard: injection valve

Options: inlet selection, mixer by-pass, loop selection, column selection, pH, outlet etc.

Pressure sensors

Placement of sensors Standard: after system pump

Options: after sample pump, pre-column, post-column

Range: 0 to 20 MPa

Accuracy : ± 0.02 MPa or $\pm 2\%$, whichever is greater

Inlet valves

Inlet A :1, 2, or 7 inlets

Inlet B :1, 2, or 7 inlets

Sample inlet: 0, 1, or 7 inlets

Additional inlets Up to 16

UV monitors

Wavelength range:280 nm

Flow cells Standard: Optical path length 2 mm; illuminated cell, volume 2 μ L

Options: Optical path length 5 mm,illuminated cell, volume 6 ML.Optical path

length 0.4 mm; illuminated, cell volume 0.3 μ L

Resolution :0.001 mAU

Linearity: $\pm 5\%$ within 0–2 AU.

Drift : ≤ 0.2 mAU; AU/h,2 mm cell

Noise :< 0.1 mAU

Lamp operating time:> 10 000 h

Conductivity monitor

Conductivity reading range :0.01 mS/cm to 999.99 mS/cm

Accuracy ± 0.01 mS/cm or $\pm 2\%$, whichever is greater(within 0.3 to 300 mS/cm)

Operating pressure 0 to 5 MPa

Flow cell volume Standard: 22 μ L

Temperature monitor

Range :0°C to 99°C
 Temperature monitor accuracy: $\pm 1.5^{\circ}\text{C}$ within 4°C to 45°C
 pH monitor
 pH reading range :0 to 14
 Accuracy : ± 0.1 pH unit within pH 2 to 12
 Operating pressure: 0 to 0.5 MPa
 Flow cell volume: 129 μL
 Round fraction collector
 Number of F9-R :Up to 2 (two Round fraction collector F9-R or oneF9-R and one Flexible fraction collector, F9-C)
 Number of fractions: Up to 175 per fraction collector
 Vessels :175 (3 mL tubes),95 (8 or 15 mL tubes) and 40 (50 mL tubes)
 Fraction volumes: 0.1 to 50 mL
 Spillage-free mode: Drop Sync
 Delay volume: 473 μL (278 μL with optional, tubing kit, i.d. 0.5 mm)
 Outlet valves
 Number of outlets Valve V9-Os or V9H-Os: 3 (waste, fraction, collector, 1 outlet position)
 Valve V9-O or V9H-O: 12 (waste, fraction, collector, 10 outlet positions)
 Fraction volumes :2 mL to 10 000 mL
 Delay volume(UV – outlet valve): 296 μL (245 μL with optional tubing kit, i.d. 0.5 mm)
 Air sensors
 Number of sensors: Up to 7
 Placement of built-in sensors: Inlet valve V9-IA, Inlet valve V9-IB, Sample inlet valve V9-IS
 Placement of additional sensors: After the injection valve sensors, Before the system pumps, Before the sample pump
 Sensing principle: Ultrasonic
 5.0 | Construction material
 | All parts to be designed and manufactured in line with the current GMP standards. Inner chamber and external finishing powder coated.
 6.0 | Utility Requirements

1.0 | Objective

| This URS detail the requirement of UV-VIS spectrophotometer, which will be used to measure the optical density of samples .

2.0 | Scope

| This URS is applicable for the UV-Vis spectrophotometer, will be installed in quality control department.

3.0 | Equipment description

| Ultraviolet-visible (UV-Vis) spectrophotometers use a light source to illuminate a sample with light across the UV to the visible wavelength range. The instruments then measure the light absorbed, transmitted, or reflected by the sample at each wavelength. should have the features high resolution, low stray light, high reproducibility, an ultra-fast scan function and easy-to-use interface on a color touch-screen display

4.0 | Component details

| Technical Specification:

| Wavelength range: 190-1100nm

Spectral bandwidth: 1nm (190-1100nm)

Wavelength repeatability: (± 0.025)

Lamp interchange wavelength: Automatic interchange linked to wavelength

Photometric system: Double beam optics

Light source: halogen lamp and deuterium lamp Built-in light source auto position adjustment.

Detector: Silicon photodiode

Environmental requirements: Temperature: 15°C to 35°C, Humidity: 35% to 80%

Output device: USB memory (optional) Extended memory (optional) Data files saved in text format.

PC compatibility. (optional)

Display: color touch screen

Photometric range: Absorbance: 0.3 to 3.0 Abs Transmittance: 0% to 200%

Photometric accuracy: $\leq 0.3\%$ T

Wavelength accuracy: ± 0.3 nm

Stray light: $\leq 0.05\%$ T

Scanning speed: 100 - 3000 nm/min.

UV-Vis Analyst software for more powerful data processing and expanded data collecting.

5.0 | Construction material

| All parts to be designed and manufactured in line with the current standards.

To resist laboratory working conditions

6.0 | Utility Requirements

| 110/220 V, 50/60 Hz or recommended by manufacturer or supplier.

7.0 | Accessories

| four optical glass cells, two quartz cells, dust cover, USB cable, UV-VIS Analyst software for PC control, cell holders for sample and reference, power cables and all accessories required for the normal operation of the equipment.

| Technical Specification

Automatic changeable frequency system to monitors the air velocity to ensure its stability in the work area.

Differential pressure gauge to real-time monitor the filters.

Uniform air flow design to protects the operators and prevent environmental pollution and cross contamination of products.

Alarm system for operation failure / fault alarms

Fitted with UV Lamp and hour meter

Curtains required

Port for validation activities

Fully automatic recording of parameters

Dimensions (W x D x H) : As per requirement

Clean Level : ISO 5 (Class 100), Class A

HEPA Filters : 99.99% efficiency at 0.3µm

Air Volume : Supply air Volume : ≤ 7500m³/h

Exhaust air volume : ≤ 2250m³/h ; Adjustable

Air Velocity : 0.35 – 0.65m/s, adjustable

Noise : ≤ 75db

Illumination : ≥ 800 lux | Technical Specification

| Deep freezer (-20°C), which will be used to store the standard culture, chemicals and reference standard and any other material which is heat sensitive.

Deep freezer (-20°C) should have the LED digital display, Temperature controlling, Safety control, and alarm system.

4.0 | Component details

| Technical Specification:

| Temperature working range: -15°C to -25°C

Design configuration: Vertical / Horizontal

Outer cabinet: Powder coated MS

Inner chamber: Stainless steel 304

Door: Solid insulated door with lock & key

Insulation: Polyurethane Foam (PUF) insulation

Controller: Digital temperature controller with LED display

Alarm system: Audiovisual alarm for high / low set points

Sensor: NTC

Direct Cooling Type

Capacity: 500 liters

Shelves: SS wire mesh removable type

Full length inner glass door with magnetic gasket.

Mounting: Caster wheels with brakes.

CFC- free refrigerant.

On line recording system with software CFR 21 complied.

Optional:

Door open alarm

Data logger with USB port

Temperature chart recorder

Voltage stabilizer

Specification of TFF System: | Technical Specification of TFF System:

| List of Major Instruments and Components required in TFF System:

Mechanical Components

Following components in the feed line:

Diaphragm pressure sensor

Level Switch

Retentate Line

Following components in retentate line:

Diaphragm pressure sensor

Diaphragm pressure control valve, pneumatically actuated

Flow meter

Permeate Line

Following components in the permeate line:

Diaphragm pressure sensor

Diaphragm pressure control valve, pneumatically actuated

Flow meter

Conductivity Sensor

pH Sensor

Recirculation Pump

Material : SS316L,

Surface : Ra U< U 0,6 µm e-polished

Performance : approx. 9 m³/hr @ 4 bar

Rotor type : Multilobe

Mechanical seal: Single-mechanical seal

SIC/SIC/EPDM

Static sealings : EPDM, FDA CFR 21, 177.2600

& USP Class VI

Addition Pump

Watson Marlow peristaltic pump

Performance: up to 900 LPH

Max. pressure: N/A

SIP: No

Process connection: Endless tubing

Power: 230V, 50Hz, 1 ph

CIP-Philosophy

Cross flow filtration skid should include the recirculation pump for an integrated CIP operation.

SIP Concept

The system and the associated piping must be sterilized in place by clean steam. SIP of the cross-flow system should be assisted by the cross-flow vessel.

All sterilization processes shall be executed from the PLC / IPC SCADA Control System. Sterilization temperature is monitored by temperature sensor at the cold spot.

The following process phases/steps will be applied for SIP of the system

SIP of the system without cassette holder

SIP of the system with cassette holder

Instrumentation and Controls

PLC Hardware (CPU)

PLC I/O Modules

Transmitters

Variable Frequency Drives

Emergency-stop buttons

Measurement

Pressure (Feed, Permeate, Retentate, Vessel)

Retentate flow rate

Permeate flow rate

Conductivity _ Permeate

pH Permeate

Control

Pressure (Feed, Permeate, Retentate, Vessel)

TMP

Flow control

Pump speed

Cabling

Cabling and pneumatic tubing should be routed via stainless steel protective pipes

Automation

The application software for the PLC and local HMIs 21 CFR Part 11 compliance should be provided with following measures:

WinCC standard functionality for access control

Audit trail

Additional SCADA functionality should be provided as below:

Storage of process data

Generation of batch reports

Audit trail function

User inputs

User messages

Process parameters

Calibration parameters of probes, totalizers and balances

Alarm parameters of process values and digital inputs

User Authorization

3 level password protection

Separate password for each operator

Activation / deactivation via administrator

Process Requirements:

The equipment should be designed such that 6.0 m²- 12m² of membrane can be used in processing.

The equipment should be designed to allow complete drainage and product removal after use.

Sampling Requirements

The equipment should be designed to permit sterile sampling of permeate, retentate, and drain during operation.

Technical Specification of Recirculation Vessel :

Vessel ports and connection as per listed below: | List of Major Instruments and Components required in TFF System:

Mechanical Components

Following components in the feed line:

Diaphragm pressure sensor

Level Switch

Retentate Line

Following components in retentate line:

Diaphragm pressure sensor

Diaphragm pressure control valve, pneumatically actuated

Flow meter

Permeate Line

1.0 | Objective

| This URS detail the requirement of High-Quality Laboratory water generation system (10 L /hr) Milli -Q water in the quality control system.

2.0 | Scope

| This URS is applicable for the High-Quality Laboratory water generation system (10 L /hr.) Milli -Q water, will be installed in the quality control department.

3.0 | Equipment description

| Milli water system generate high quality water for lab work. water passes through a long-life dual wavelength UV lamp, which ensures organic molecule degradation by photooxidation. The Quantum® polishing cartridge then removes the remaining ionic and organic contaminants below trace levels. The

4.0 | Component details

| Technical Specification:

| Schedule-I: Water Purification System

The system should be designed to handle soft water having feed water Conductivity up to 2000 micro-S/cm, Free chlorine- 2 – 3 ppm & Fouling Index up to 20 or better.

There should be separate Pre-filtration unit with 5-micron filter to remove the particulate matter with inbuilt booster pump to maintain feed pressure of system should be provided from the same OEM.

The unit should have the following purification stages:

System should have pre-treatment with activated carbon, 0.5-micron filter and anti-scaling agent to enhance the life of downstream RO cartridge.

Reverse osmosis should be able to reject 95-99% of ions and organics having pre and post conductivity meter of RO cartridge.

RO should have capillary tube to minimize the RO wastewater by partial recirculation.

Self-regenerating electro-deionization module (EDI) to eliminate the requirement of frequent replacement of DI cartridge & Softener cartridge

EDI must have carbon bead at cathode to eliminate the requirement of any softener cartridge.

Water quality: Flow rate: 5 L/hr, Type 2 water (Ion's organics removal up to 99%, Resistivity: > 5-15 Mohm.cm, TOC < 30 ppb)

The Flow rate should be temperature independent resulting constant flow rate throughout the year due to Temperature feedback mechanism.

Type 2 water Reservoir minimum 50 Liters Tank with auto cut-off Tank level sensor.

System must have option to see the total throughput of the cartridge online.

Display: Water quality after every purification step (Feed water, RO feed water, RO product water, EDI water); Tank Level; Alarm and alert on water quality, No feed water alarm etc.

2nd stage system for Type 1 water analytical applications:

Ultrapure water machine producing water of: -

Resistivity: 18.2 MΩ.cm at 25 °C, TOC < 10 ppb (µg/L), Bacteria < 0.1 CFU/mL Endotoxin < 0.001 EU/mL, RNases < 0.01 ng/mL, DNases < 4 pg./µl

Automatic recirculation feature.

The polishing cartridge should contain mixture of activated carbon and mixed ion exchange beads to reduce Ionic and organic level,

System must have accurate online Resistivity (temperature compensated and nor compensated) for the dispensing water on system display.

System must have easy water delivery: Manual water delivery and Volumetric water delivery.

System should be delivered with an ultrafiltration final filter.

To guarantee compliance with minimum laboratory safety requirements, and to ensure that the water purification system meets internationally recognized safety norms, the Both the Type 1 & 2 water purification system shall be listed with Underwriters Laboratories (both UL and ULC), and will carry the CE mark, indicating compliance with EC Directives.

Both the polishing cartridge and final filter must be supplied with Quality certificate from the OEM.

Range: 4 ppb to 50 ppm

Precision: < 1% RSD

Accuracy: ± 2% or ± 0.5 ppb, whichever is greater

Display Readout: 3 significant digits

Sample Type: Autosampler or discrete grab sample

Calibration: Typically, stable for 12 months

Analysis Time: 2 minutes

Sample Temperature: 5–95 °C (41–203 °F)

Ambient Temperature: 5–40 °C (41–104 °F)

Instrument Sample Flow Rate: 0.5 mL/min

Outputs: USB device port (1), USB host ports (3); Ethernet

1.0 | Objective

| This URS detail the requirement of Ice flak machine used to producing ice flakes. The ice flakes are used to transport and store during testing of heat labile samples and material

2.0 | Scope

| This URS is applicable to the Ice flak machine, will be installed in the quality control department.

3.0 | Equipment description

| Laboratory ice flaking machines are known for their precise and controlled ice production. they are equipped with advanced technology to ensure consistent ice quality and uniform flake size. This makes them suitable for applications such as sample preservation, medical research, and temperature-controlled environments.

4.0 | Component details

| Technical Specification:

| Ice storage: 15kg

Capacity/24hrs:40kg

controlled by an auto microcomputer, making the machine easy to use and operate.

Water consumption (L/H) :1.6

Operating temperature:25±2°C

Ice type: small granular snow ice

Protection and display: Machine should be equipped with various protective features, including ice full display, lack of water detection, and too-cold protection. A fault warning display prompts protective shutdown when necessary. The machine should also have an automatic memory and recovery function.

Start/Stop switch

5.0 | Construction material

| All parts to be designed and manufactured in line with the current GMP standards. The outer body of the machine is made from high-quality stainless steel, ensuring durability and resistance to corrosion.

6.0 | Utility Requirements

1.0 | Objective

| This URS detail the requirement of Air sampler, which will be used in controlled area. Where microbial contamination needs to be strictly monitored.

2.0 | Scope

| This URS is applicable for Air sampler, which will be used in controlled areas of production and quality control department.

3.0 | Equipment description

| This microbial air sampler works based on Andersen collision principle. Air is aspirated (at a fixed speed for variable times) through small holes in the instrument's head. The resulting laminar air flow is directed onto the surface of an agar plate. At the end of the sampling cycle, the plate is removed & incubated and the visible colonies are then counted for an assessment of the level of contamination in the controlled area

4.0 | Component details

| Technical Specification:

| Air flow :100 liter/min

Impactor nozzle number: 300

Air sample volume: 10~6000 liter

Air flow sensor: Automatically compensate

Data transfer: No/Sampler software

Applicable: Petri dish Φ 90mm

Error range: $\pm 2.5\%$

Cover material Silvery, bright blue aluminum alloy

Screen LCD

Battery: Rechargeable polymeric lithium battery

Charger 110~240V, 50~60HZ (Universal voltage lithium battery charger).

1.0 | Objective

| This URS explain the details of equipment required to measure the cleanliness level of air inside the different clean areas especially in grade A/B by monitoring the particles/cubic ft of air.

2.0 | Scope

| This URS is applicable mainly for the potable particle counter, which will be used to monitor the air quality(particles,) during critical operations for example sterile filtration/filling operations.

3.0 | Equipment description

| Optical particle counters (OPC) or spectrometers employ a small sensing volume, of air by a laser source. Generally, commercial instruments handle concentrations of up to -10⁶ particles/liter. Beyond this concentration limit, sample dilution is usually used, which decreases the accuracy of the determination of the concentration. The range of particle diameter that single-particle instruments are capable of handling is -0.1 µm. The particle size distribution in single-particle counters is determined by comparing the detected pulse heights of the optical signals that correspond to the single particle flowthrough a small illuminated zone with a standard calibration curve, obtained from a set of uniform particles of known diameter.

For determination of the concentration, the flow rate (the volume of air tested) is also measured simultaneously. The different light detection geometries applied in different particle counters yield a wide range of instrument designs and constructions. In most airborne particle counters perpendicular scattering geometry is implement.

4.0 | Component details

| Technical Specification:

| Size Channels: 0.3 µm, 0.5 µm, 1.0 µm, 3.0 µm, 5.0 µm, 10.0 µm

Zero Count: 1 count or less in 5 minutes.

Coincidence Loss: Less than 5% at 400000 particles/ft

Flow Rate: 1.0 CFM

Counting Efficiency: 50 % for 0.3 µm

Light Source: Long Life Laser™ diode with 10-year Mean Time to Failure (MTTF)

Count display: LCD

Maximum Count: 9999999 display

Pump Type: Air vacuum, rated for continuous use

Sample /Hold Times: 1 second to 24 hours

Count Alarm: 1 to 9999999 counts

Count Cycles: Up to 100 while in automatic mode

Location label: 0 to 999, appears on printout

Data Storage: 5,000 samples, scrollable on Historical Data review

Screen.

Battery: Rechargeable Li

Operating Time (Battery): up to 6 hours

Battery Recharge Time: 7 hours minimum

5.0 | Construction material

1.0 | Objective

| This URS detail the requirement of flame photometer, which will be used to test Sodium, Potassium, Calcium and Lithium elements.

2.0 | Scope

| This URS is applicable to the flame photometer, installed in quality control department.

3.0 | Equipment description

| Flame photometer is used for the determination of Sodium, Potassium, Calcium and Lithium. It uses the latest Microcontroller technology and advanced engineering techniques so as to give the reproducibility results. It has soft touch membrane key for ease of operations. the solution is aspirated through an atomizer, atomized sample and the fuel are mixed in the mixing chamber which is then sprayed as a very fine mist into the flame. The color of the flame is changed depending upon the concentration of elements present. Radiations from the flame passes through the sensing system and specific narrow band interference filter which permits only the characteristic radiation to pass to the photo-detector. The output of the photo-detector is then processed by the microcontroller and the final results are displayed on the digital display.

4.0 | Component details

| Technical Specification:

| Auto Gas Cutoff

Auto Flame Failure Detection

Four Measurements in Single Aspiration

Setup Storage Facility

Sample Data Storage Facility

Curve Calibration Programmability Using Maximum of 5 Standards

Multiple Calibration Curve Saving Facility

Data Processing Through Curve Fitting

Techniques, Least Square, Quadratic

Online Help Key

Direct Results in ppm.

Microprocessor Based with Printer Interface.

Gas Control: Adjustable With Knob

Display: Alphanumeric Backlit Display

Flame System: LPG and dry oil free air

Ignition System: Auto ignition

Atomizer: Axial flow type

Printer: Provision for attachment of dot matrix printer or LaserJet/ inkjet (non-windows) printers with Centronics parallel interface

PC & software.

1.0 | Objective

| This URS detail the requirement of Thermostatic water bath, which will be used to heat and/or keep samples and solutions of substances at a certain temperature.

2.0 | Scope

| This URS is applicable for the Thermostatic water bath, will be installed in quality control department.

3.0 | Equipment description

| The Water bath should have Digital LED display with high brightness Effective, prevention of steam leakage, Controlled high precision temperature.

4.0 | Component details

| Technical Specification:

| Capacity:20L

Temperature range: RT to 100°C

Temperature fluctuation: 0.5°C

Temperature accuracy: $\leq \pm 1^\circ\text{C}$

Digital temp. indicator-cum-controller

View glass on both sides

Light source to see the incubated tubes for reaction/ flocculation.

Attached water circulation device for achieving the uniformity in water temperature.

5.0 | Construction material

| All parts to be designed and manufactured in line with the current standards preferably SS 304L.

To resist laboratory working conditions

6.0 | Utility Requirements

| AC 110/220 V $\pm 10\%$, 50/60 Hz or recommended by manufacturer or supplier.

1.0 | Objective

| This URS detail the requirement of Water Sonicator used to agitate the particles in the solutions

2.0 | Scope

| This URS is applicable for the Water sonicator, will be installed in the quality control department.

3.0 | Equipment description

| Sonication is defined as the process in which sound waves are used to agitate the particles in the solutions. These disruptions are used for mixing of the solutions, to increase the speed of dissolution of a solid into a liquid, and for the removal of dissolved gases from the liquids.

4.0 | Component details

| Technical Specification:

| Capacity: 6-10 Ltr.

Operating frequency: 40 ± 3 kHz

Temperature range: Ambient + 5°C to 65° C

Timer Range: 1 to 15 mins.

Stainless steel outer construction

Includes stainless steel tanks with lid, drain outlet and immersion basket.

Microcontroller based digital ultrasonic control circuit.

High quality transducers ensure high electro-acoustical efficiency and low heat generation.

Includes heater for thermostatic heating

Digital timer

Simple to use interface

Easy to read digital display

With non-slip rubber feet

3.0 | Equipment description

| HPLC system used for testing of in process and finished product of vaccine in the QC lab.

4.0 | Component details

| Flow rate setting range :0.0001 to ml/min

Flow rate precision: < 0.006% RSD to < 0.02% RSD

Maximum pressure: 44 mPa

Degassing unit: 5 lines (mobile phase 4 + Rinse solution 1)

Pumping method: Parallel type double plunger

Injection volume setting range: 0.1 to 100 µl

Injection volume accuracy: ±1%

Sample Vials capacity: approx. 300 (1mLVial)

Injection cycle time :15sec

Injection linearity :>0.9999

Sampler cooler: 5-45°C

Column size: 6 columns of 10cm and 3 columns of 30cm

Heating cooling method: Forced air circulation method

Wavelength range: 200-700nm

Wavelength reproducibility: < ±1 mm

1.0 | Objective

| This URS detail the requirement of Volumetric Karl Fischer used in the chemical testing lab for water content testing.

2.0 | Scope

| This URS is applicable mainly for the KF which will be placed in the quality control labs.

3.0 | Equipment description

| This equipment is used to determine the water content of a sample. The fundamental principle behind it is based on the Bunsen Reaction between iodine and sulfur dioxide in an aqueous medium.

$\text{ROH} + \text{SO}_2 + \text{R}'\text{N} = [\text{R}'\text{NH}]\text{SO}_3\text{R} + \text{H}_2\text{O} + \text{I}_2 + 2\text{R}'\text{N} = 2[\text{R}'\text{NH}]\text{I} + [\text{R}'\text{NH}]\text{SO}_4\text{R}$

[alcohol] [base] [alkylsulfite salt] [water] [iodine] [hydroiodic acid salt] [alkylsulfate salt]

The alcohol reacts with sulfur dioxide (SO₂) and base to form an intermediate alkylsulfite salt, which is then oxidized by iodine to an alkylsulfate salt. This oxidation reaction consumes water. The reactive alcohol is typically methanol or 2-(2-Ethoxyethoxy)ethanol, also known as diethylene glycol monoethyl ether (DEGEE), or another suitable alcohol. Classic Karl Fisher reagents contained pyridine, a noxious carcinogen, as the base. The reagents most frequently used today are pyridine-free and contain imidazole or primary amines instead.

The volumetric titrator performs the following three key functions: 1) It dispenses KF titrating reagent containing iodine into the cell using the burette 2) It detects the endpoint of the titration using the double platinum pin indicator electrode 3) It calculates the end result based on the volume of KF reagent dispensed using the onboard microprocessor

4.0 | Component details

| Technical Specification:

| Ration Range :100 ppm to 100%

Titration Resolution :1 ppm to 0.0001%

Measurement Units: %, ppm, mg/g, µg/g, mg, µg, mg/mL, µg/mL, mg/pc, µg/pc

Sample Type: liquid or solid

Pre-Titration Conditioning: automatic

Background Drift Correction: automatic or user-selectable value

Endpoint Criteria: fixed mV persistence, relative drift stop or absolute drift stop

Dosing Type: dynamic with optional pre-dispensing

Result Statistics: mean, standard deviation

Dosing Accuracy: ±0.1% of full burette volume

Syringe:5 mL precision ground glass with PTFE plunger

Valve: motor-driven 3-way, PTFE liquid contact material

Tubing:PTFE with light block and thermal jacketing

Dispensing Tip glass, fixed position, anti-diffusing

Titration Vessel conical with operation volume between 50 and 150 mL

Solvent Handling System sealed system, integrated diaphragm air pump

Connection Type BNC

Polarization Current 1, 2, 5, 10, 15, 20, 30 or 40 uA

mV Range 2 mV to 1000 mV

mV Resolution 0.1 mV

mV Accuracy ±0.1%

Burette 5 mL burette

Dosing Pump Resolution 1/40000 of the burette volume (0.125 µL per dose) with 5 mL burette

Stirrer Type magnetic, optically regulated, digital stirrer

Stirrer Speed 200 - 2000 RPM

Stirrer Resolution 100 RPM

Titration Methods up to 100 standard and user defined

Reports-up to 100 complete titration reports and drift rate reports

Connectivity- USB

Built-in Magnetic Stirrer magnetic, optically regulated, digital stirrer; 200 to 2000 rpm; resolution 100 rpm

Display- 5.7" graphical color display with backlight

Keypad- polyester

Languages English

Power Supply 100-240 Vac, 50/60 Hz / 0.5 Amps

1.0 | Objective

| This URS detail the requirement of ELISA Microplate reader used to read the color reaction in microplate by various type of ELISA test.

2.0 | Scope

| This URS is applicable for the ELISA reader which will be installed in the quality control department.

3.0 | Equipment description

| The ELISA reader is a specialized spectrophotometer an apparatus for measuring the intensity of light throughout a part of the spectrum and used to measure the color reactions of antigens and antibodies in a solution at specific wave length of ligt spectrum.

4.0 | Component details

| Technical Specification:

| Wavelength range: 400-750 nm.

Photometric range: 0.000-3.500 OD

Linearity: $\pm 1.0\%$ from 0.000 to 2.000 OD, $\pm 2.0\%$ from 0.000 to 3.000 OD

Accuracy: $\pm 1.0\%$ or 0.010 from 0.000 to 3.000 OD at 490 nm

Precision: 1.0% or 0.005 OD.

Resolution: 0.001 OD

Filter wheel capacity: 8

Read time: 6 sec. at single wavelength, 10 sec. at dual wavelengths.

Factory options: Temperature control (5°C above ambient, up to 45°C, in 0.1°C increments), onboard graphical thermal printer.

1.0 | Objective

| The objective of the document is to prepare URS for stability chambers used in the stability testing of various Biologics.

2.0 | Scope

| This document is applicable for stability chambers, which will be installed in the stability testing labs.

3.0 | Equipment description

| The stability chambers must be designed in such a manner that it allows precise, standard compliant simulation of all climatic conditions under a constant atmosphere for carrying out all long duration storage for stability tests according to the internationally valid EN standards and current pharmaceutical ICH guidelines Q1A & Q1B. The must deliver accurate and reliably temperature and must avoids any condensation inside the chamber. The equipment must be easy to clean. Machine should meet all cGMP and GEP standards, and comply CE safety and electrical standards. Machine needs to run continuously in fully automatic mode.

4.0 | Component details

| Technical Specification:

| Temperature range: 10-60°C

Set temperature: Knob

Capacity :200/500 L

Temperature Setting and display: Microprocessor Control with LED Digital

Temperature accuracy: ±0.5°C

Temperature uniformity: ±1°C

Controls panel: Touch-pad icon-based controls & display

Alarm system: Audible and Visual alarms with battery back-up. With remote alarm contact

Alarm conditions: High & Low alarm, Door open, Power failure

Air Circulation: Forced air circulation fan for uniform temperature

LED light for illumination and observation

Stainless steel Trays

Full length inner glass door magnetic gasket.

Wheels for easy movement.

High quality PT-100 temperature sensor.

Online temperature monitoring with MKT.

Automatic daily data backup.

Safety devices: Low and high temperature Cut-Off with thermostats

Door shall be provided with lock and key.

Safety devices including mobile messages. Internal lighting Water level sensor with audio/visual alarm

Proper Internal lighting.

Validation port.

5.0 | Construction material

| Interior made of stainless-steel SS 304

Exterior made of stainless steel SS304

Perforated stainless steel shelves (SS304)

Proper insulation with non-shedding material.

All parts to be designed and manufactured in line with the current standards.

1.0 | Objective

| The objective of this User Requirement Specifications (URS) is to define and document User Requirement Specification of cold room maintained at 2-8 degrees C.

2.0 | Scope

| This document is applicable for the cold room specified in this document.

3.0 | Equipment description

| This cold room shall be used for storing all the heat labile materials.

4.0 | Component details

| Furnish and install walk-in controlled environmental rooms (CER). Include all insulated walls, ceilings, floors, doors, hardware, refrigeration systems, mechanical systems, internal electrical systems, controls, gages, internal lighting, and other ancillary items required for a completely fabricated and operational CER.

Thermostat must be calibrated to ITS-90 (International Temperature Scale) and should be accurate to +/- 0.5°C;

There should be provision for temperature recording through following means- Digital Display (LED), graphically and on line recording in PC.

In case temperature is beyond the set limits there must be a provision of Alarm and Hooter.

Lighting must be ceiling mounted tungsten filament light fitted with external switch.

CFC Free refrigerant gas must be used;

All compressors to be fitted with hour meter to record the running duration for each unit.

5.0 | Construction material

| Wall and ceiling panels.

Insulated panels shall be minimum 4" thick, be of modular construction incorporating wall and ceiling panels should be of "woodless" type construction. Panels shall consist of insulation sandwiched between interior and exterior metal skin. Panel edges to have tongues and grooves that lock together assuring an air tight vapour proof joint. Construction shall allow disassembly for possible relocation or refurbishment at a later date.

All panel insulation shall be Class 1 "foamed-in-place" 2.2 lb density, polyurethane foam insulation expanded with "Ozone Safe" 245a and UL certified as having a flame spread rating of 25 or less and smoke density not greater than 450 per ASTM E84.

The sheet metal finish shall have Interior surface = 26 GA stucco embossed galvanized steel with a baked polyester white finish.

Exposed exterior surfaces = 26 GA stucco embossed galvanized steel with a baked polyester white finish.

Unexposed surfaces = 26 GA stucco embossed mill galvanized steel.

Door construction.

Door construction shall match the insulated panels. Each entrance to have a clear opening of 36" wide by 78" H. Doors shall be flush mounted, in-fitting and have a replaceable magnetic gasket on three sides and a neoprene adjustable gasket on all the sides of wall in which door fits in. Door hardware shall include three hinges, door closer and a latch/release. In addition, each door shall be equipped with a 14" x 14" heated viewing window. There should be a provision to lock the cold room

Floor panels.

Cold rooms not located on a concrete slab-on-grade will require sprayed-on insulation applied to the underside of the building deck below each cold room or insulated floor panels. If insulated floor panel are to be provided, the floor panels shall be capable of withstanding loads of up to 500 PSF. Wearing surface to be 18 GA type 304 #4 stainless steel over ½" non-wood underlayment. An ADA compliant transition ramp to be built into the insulated floor panel at each door.

6.0 | Utility Requirements

| The power supply can either be 220-240V single phase or 380-400V 3-phase, 50/60 Hz or recommended by manufacturer or supplier.

7.0 | Documents Required

| Complete documentation package with following documents should be delivered.

| General Requirements:
All parts shall be made of non-oxidizing material as per FDA requirements
All internal corners and edges inside the chamber and condenser must have rounded and smooth finishing.
And accessible for easy cleaning
The Control cabinet shall be integrated on the machine frame. And the cabinets shall be equipped with
proper ventilators
Chamber shelves design shall allow minimum and maximum loading of the product and useable 90% out of
total shelves area available.
Remote access feature shall be available for providing technical support of the feature
Machine shall have feature to have control the speed increase / decrease the speed through frequency
control drive and shall be available to operate on HMI & SCADA
The machine shall be designed to be able to operate and maintain the temperature during the one
compressor failure

Redundancy Fluid pump shall be provided
Vacuum pump redundancy, shall be able to operate with one pump and maintain the set vacuum at any point of operation
All Hot surfaces shall be insulated with mineral wool and cladding with SS304 sheet.
The bellows used in the entire system shall be leak proof.

Chamber:

The chamber shall have the automatic Locking / Un-locking system
The Geometrical construction of the chamber shall be rectangular structure
The type of door support shall be operated with Hinged
Operating design pressure of the chamber shall be 2.0 Bar G
The slot door shall be installed at Loading /Unloading side and additional main door shall be installed at technical area for maintenance purpose and the door can be completely open-able up to 180 Deg direction.
Chamber shall have the jacket for cooling water circulation provision to do the jacket cooling after SIP and other heating operations.
The material of construction of the chamber shall be made SS316 material with surface finish Ra < 0.5 µs internally with mirror polish. And chamber body shall be insulated and clad with SS304 material
Chamber shall have the sight glass possible locations with light illumination

Shelves configuration:

Basic inter distance between the shelves : To be decided
Shelf dimensions (LxWxD) : To be decided
Total surface area : 18 Sq Mtr
Shelves heating rate : NLT 1.0 deg C/ Min
Shelves Minimum temperature : -65.0 Deg C
Shelves cooling source : Silicon Oil
Shelves moment for loading : Included
Shelves position control : Closed loop (Automatic)

The shelves shall allow the constant loading at fixed operating position/ height.
The shelves shall be made of SS316 L material and the surface finish shall be less than < 0.5 µm electro polished.
The shelves shall be designed to allowed minimum 2 formats for inter-distance for loading / Unloading
The Shelves loading should be from top to bottom direction and un-loading from bottom to top at constant height
Shelves shall be movable during CIP to ensure the 100% cleaning efficiency
Each shelf should have a temperature probe to measure the individual shelf temperature
The surface slope of the shelf maximum 0.5 mm/ Mtr

Refrigeration Compressors:

Total no. of compressors : To be defined
Compressors type : Screw type
Refrigerant : Non-CFC, Eco friendly

Vacuum System:

Vacuum pumps shall be dry pumps
The Pump capacity shall be design inline to the Chamber and condenser capacity
The ultimate vacuum shall be achieved with in 20 Min in ideal condition
The booster vacuum pump shall be dry type

Condenser:

Type of condenser : Close integrated
Number of condensers : 01 Nos
Design Pressure : 2.0 Bar G
Capacity of Ice thickness : To be defined
Minimum Temperature : >-75 Deg C

The construction of the condenser shall be cylindrical and should be suitable for vacuum applications during the lyophilization cycles
The condenser body and tubes shall be made of SS316 L and are mechanically polished and passivated
The ice condensing capacity shall be calculated on the basis of 24 Hr cycle
The suitable isolation valve shall be designed between the Chamber and condenser, and this shall be made up of SS316 L material.
The condenser cooling shall be done either with Gas/ Fluid
Sight glass with illumination shall be provided on body of the condenser for viewing purpose
The condenser shall be CIP and SIP able, and withstand with respect to the temperature and pressure

Functional Specification:

The Lyophilizer shall have interface with slot door with fixed loading/un-loading system
All Loading/ Unloading activities shall be from Grade A- Area
The Loading/ unloading system shall be designed as per the details and drawings provided by client
The loading / unloading operation shall be synchronized with lyophilizer operation

The system shall have the provision to back fill the equipment with sterile gases like Nitrogen/ Air and vacuum.
The vacuum control set point should be allowed from 1000 to 0.001 mbar absolute
SIP: The Sterilization cycle the temperature reference shall be measured at drain thermocouple, and all other temperature sensors shall be remains above the drain.
During SIP Automatic movement of shelves required from top to bottom to ensure the sterility of all components contained in the chamber
Vacuum pumps shall have the provision to provide the gas ballast to avoid the moisture and toxics impact during the process.

Integration of ISOLATOR for Loading/ Un-loading system:

The isolator unit shall be integrated with Lyophilizer as to meet the process requirements and current

good manufacturing practice

The design and integration of Isolator shall be in line to the Lyo loading and unloading chamber interface and dimensions

Tamper proof glass door shall be provided to allow a clear visibility into the entire space of the isolator.

The interior and all corners of the isolator must be easily accessible and cleanable when isolator is closed through glove ports

The surface in and outside side of the isolator shouldn't have any cracks, crevices and sharp edges. All corners and edges must be rounded

All HEPA Filters installed in the isolator must be accessible for maintenance and cleaning

Glare-free light, sealed edges of the lamps inside of isolator shall be provided

Calibration of all sensors must easily accessible and shall be removable for calibration and maintenance

Maximum expected operation of the equipment 24 Hrs./ Day

Technical Specification:

The temperature control maintained within the isolator in the range of 20 to 25 Deg C in all conditions.

Beginning of the batch

While continuous running of the batch

Fluctuation of outside environment shall be within tolerance

Relative Humidity control during production is maintained within the full humidity range of 2-5 % with aid of Nitrogen purge

HEPA filters are 99.99% efficient for removing particles greater than 0.3 Micron in size.

The room conditions of isolator installed is classified as grade B

Environment conditions surrounding room

Temp : NMT 26 Deg C

% RH : NMT 60%

The isolator unit is required to design to meet the cleanliness under the area to meet Grade 'A' requirement

The MOC of the isolator shall be compactable for VHP sterilization/ Nitrogen gas .and all product contact parts shall be made with SS316 L and surface finish will be $> 0.5 \mu$ RA.

Integrity test port shall be provided at upstream of HEPA Filters

Blower shall statically and dynamically balance to the supply air flow with sufficient capacity and static pressure

Viable/ non-viable particle count shall meet grade A requirements

The air velocity shall be 90 ± 20 FPM at 6 inches from the filter face

Initial and final pressure drop limits to be provided

During the VHP cycle, Gloves shall not be wrinkled or folded on surface

There shall be automatic leak test option available for isolator leak test and within the acceptance range; Leak test will be performed before start of the VHP cycle.

Interlocks/ Alarms:

Emergency Stop

Control power fault

Barrier open door

Glove port light curtain interrupted

Isolator contamination/ fault

Filter differential pressure alarm

Barrier high pressure alarm

Barrier low pressure alarm

Barrier differential pressure alarm

RH above 5% alarm

All machine surfaces must come in contact with H2O2, a minimum accessible area for H2O2 on the machine for example moving parts shall move slowly during VHP Cycle.

The whole decontamination cycle including aeration shall be completed within the specified operation time mentioned.

The isolator doors shall not open before the H2O2 concentration reaches to the neutral level.

Interface:

The Lyophilizer shall be provided with Siemens or Allen Bradley control logic platform. PLC, security, Recipe management process. Data logging shall be under taken Lyophilized dedicated SCADA.

Control system shall be accessible to authorized users only. It shall have individual login ID and Passwords to access the system.

All set parameters ranges are to be defined access shall be restricted as per user level

Alarm management shall be available

Programmed backup for PLC/HMI SCADA shall be provided

Generated data shall be saved by the software and storage path shall be defined through software only

Control system clock synchronization shall be available

11.8 Electronic records and signatures shall be available wherever applicable on the reports | General Requirements:

All parts shall be made of non-oxidizing material as per FDA requirements

All internal corners and edges inside the chamber and condenser must have rounded and smooth finishing. And accessible for easy cleaning

The Control cabinet shall be integrated on the machine frame. And the cabinets shall be equipped with proper ventilators

The Lyophilizer shall have interface with slot door with fixed loading/un-loading system

All Loading/ Unloading activities shall be from Grade A- Area

The Loading/ unloading system shall be designed as per the details and drawings provided by client

The loading / unloading operation shall be synchronized with lyophilizer operation

The system shall have the provision to back fill the equipment with sterile gases like Nitrogen/ Air and vacuum.

The vacuum control set point should be allowed from 1000 to 0.001 mbar absolute

SIP: The Sterilization cycle the temperature reference shall be measured at drain thermocouple, and all other temperature sensors shall be remains above the drain.

During SIP Automatic movement of shelves required from top to bottom to ensure the sterility of all components contained in the chamber

Vacuum pumps shall have the provision to provide the gas ballast to avoid the moisture and toxics impact during the process.

Integration of ISOLATOR for Loading/ Un-loading system:

The isolator unit shall be integrated with Lyophilizer as to meet the process requirements and current good manufacturing practice

The design and integration of Isolator shall be in line to the Lyo loading and unloading chamber interface and dimensions

Tamper proof glass door shall be provided to allow a clear visibility into the entire space of the isolator.

The interior and all corners of the isolator must be easily accessible and cleanable when isolator is closed through glove ports

The surface in and outside side of the isolator shouldn't have any cracks, crevices and sharp edges. All corners and edges must be rounded

All HEPA Filters installed in the isolator must be accessible for maintenance and cleaning

Glare-free light, sealed edges of the lamps inside of isolator shall be provided

Calibration of all sensors must easily accessible and shall be removable for calibration and maintenance

Maximum expected operation of the equipment 24 Hrs./ Day

Technical Specification:

The temperature control maintained within the isolator in the range of 20 to 25 Deg C in all conditions.

Beginning of the batch

While continuous running of the batch

Fluctuation of outside environment shall be within tolerance

Relative Humidity control during production is maintained within the full humidity range of 2-5 % with aid of Nitrogen purge

HEPA filters are 99.99% efficient for removing particles greater than 0.3 Micron in size.

The room conditions of isolator installed is classified as grade B

Environment conditions surrounding room

Temp : NMT 26 Deg C

% RH : NMT 60%

The isolator unit is required to design to meet the cleanliness under the area to meet Grade 'A' requirement

The MOC of the isolator shall be compactable for VHP sterilization/ Nitrogen gas .and all product contact parts shall be made with SS316 L and surface finish will be $> 0.5 \mu$ RA.

Integrity test port shall be provided at upstream of HEPA Filters

Blower shall statically and dynamically balance to the supply air flow with sufficient capacity and static pressure

Viable/ non-viable particle count shall meet grade A requirements

The air velocity shall be 90 ± 20 FPM at 6 inches from the filter face

Initial and final pressure drop limits to be provided

During the VHP cycle, Gloves shall not be wrinkled or folded on surface

There shall be automatic leak test option available for isolator leak test and within the acceptance range; Leak test will be performed before start of the VHP cycle.

Interlocks/ Alarms:

Emergency Stop

Control power fault

Barrier open door

Glove port light curtain interrupted

Isolator contamination/ fault

Filter differential pressure alarm

Barrier high pressure alarm

Barrier low pressure alarm

Barrier differential pressure alarm

RH above 5% alarm

All machine surfaces must come in contact with H₂O₂, a minimum accessible area for H₂O₂ on the machine for example moving parts shall move slowly during VHP Cycle.

The whole decontamination cycle including aeration shall be completed within the specified operation time mentioned.

The isolator doors shall not open before the H₂O₂ concentration reaches to the neutral level.

Interface:

The Lyophilizer shall be provided with Siemens or Allen Bradley control logic platform. PLC, security, Recipe management process. Data logging shall be under taken Lyophilized dedicated SCADA.

Control system shall be accessible to authorized users only. It shall have individual login ID and Passwords to access the system.

All set parameters ranges are to be defined access shall be restricted as per user level

Alarm management shall be available

Programmed backup for PLC/HMI SCADA shall be provided

Generated data shall be saved by the software and storage path shall be defined through software only

Control system clock synchronization shall be available

11.8 Electronic records and signatures shall be available wherever applicable on the reports | General Requirements:

All parts shall be made of non-oxidizing material as per FDA requirements

All internal corners and edges inside the chamber and condenser must have rounded and smooth finishing.

And accessible for easy cleaning

The Control cabinet shall be integrated on the machine frame. And the cabinets shall be equipped with proper ventilators

Chamber shelves design shall allow minimum and maximum loading of the product and useable 90% out of total shelves area available.

Remote access feature shall be available for providing technical support of the feature

Machine shall have feature to have control the speed increase / decrease the speed through frequency control drive and shall be available to operate on HMI & SCADA

The machine shall be designed to be able to operate and maintain the temperature during the one compressor failure

Redundancy Fluid pump shall be provided

Vacuum pump redundancy, shall be able to operate with one pump and maintain the set vacuum at any point of operation

All Hot surfaces shall be insulated with mineral wool and cladding with SS304 sheet.

The bellows used in the entire system shall be leak proof.

Chamber:

The chamber shall have the automatic Locking / Un-locking system

The Geometrical construction of the chamber shall be rectangular structure

The type of door support shall be operated with Hinged

Operating design pressure of the chamber shall be 2.0 Bar G

The slot door shall be installed at Loading /Unloading side and additional main door shall be installed at technical area for maintenance purpose and the door can be completely open-able up to 180 Deg direction.

Chamber shall have the jacket for cooling water circulation provision to do the jacket cooling after SIP and other heating operations.

The material of constriction of the chamber shall be made SS316 material with surface finish $Ra < 0.5 \mu$ s internally with mirror polish. And chamber body shall be insulated and cladded with SS304 material

Chamber shall have the sight glass possible locations with light illumination

Shelves configuration:

Basic inter distance between the shelves : To be decided
Shelf dimensions (LxWxD) : To be decided
Total surface area : 18 Sq Mtr
Shelves heating rate : NLT 1.0 deg C/ Min
Shelves Minimum temperature : -65.0 Deg C
Shelves cooling source : Silicon Oil
Shelves moment for loading : Included
Shelves position control : Closed loop (Automatic)

The shelves shall allow the constant loading at fixed operating position/ height.
The shelves shall be made of SS316 L material and the surface finish shall be less than $< 0.5 \mu\text{m}$ electro polished.
The shelves shall be designed to allowed minimum 2 formats for inter-distance for loading / Unloading
The Shelves loading should be from top to bottom direction and un-loading from bottom to top at constant height
Shelves shall be movable during CIP to ensure the 100% cleaning efficiency
Each shelf should have a temperature probe to measure the individual shelf temperature
The surface slope of the shelf maximum 0.5 mm/ Mtr

Refrigeration Compressors:

Total no. of compressors : To be defined
Compressors type : Screw type
Refrigerant : Non-CFC, Eco friendly

Vacuum System:

Vacuum pumps shall be dry pumps
The Pump capacity shall be design inline to the Chamber and condenser capacity
The ultimate vacuum shall be achieved with in 20 Min in ideal condition
The booster vacuum pump shall be dry type

Condenser:

Type of condenser : Close integrated
Number of condensers : 01 Nos
Design Pressure : 2.0 Bar G
Capacity of Ice thickness : To be defined
Minimum Temperature : >-75 Deg C

The construction of the condenser shall be cylindrical and should be suitable for vacuum applications during the lyophilization cycles
The condenser body and tubes shall be made of SS316 L and are mechanically polished and passivated
The ice condensing capacity shall be calculated on the basis of 24 Hr cycle
The suitable isolation valve shall be designed between the Chamber and condenser, and this shall be made up of SS316 L material.
The condenser cooling shall be done either with Gas/ Fluid
Sight glass with illumination shall be provided on body of the condenser for viewing purpose
The condenser shall be CIP and SIP able, and withstand with respect to the temperature and pressure

Functional Specification:

The Lyophilizer shall have interface with slot door with fixed loading/un-loading system
All Loading/ Unloading activities shall be from Grade A- Area
The Loading/ unloading system shall be designed as per the details and drawings provided by client
The loading / unloading operation shall be synchronized with lyophilizer operation

The system shall have the provision to back fill the equipment with sterile gases like Nitrogen/ Air and vacuum.

The Lyophilizer shall have interface with slot door with fixed loading/un-loading system
All Loading/ Unloading activities shall be from Grade A- Area
The Loading/ unloading system shall be designed as per the details and drawings provided by client
The loading / unloading operation shall be synchronized with lyophilizer operation

The system shall have the provision to back fill the equipment with sterile gases like Nitrogen/ Air and vacuum.
The vacuum control set point should be allowed from 1000 to 0.001 mbar absolute
SIP: The Sterilization cycle the temperature reference shall be measured at drain thermocouple, and all other temperature sensors shall be remains above the drain.
During SIP Automatic movement of shelves required from top to bottom to ensure the sterility of all components contained in the chamber
Vacuum pumps shall have the provision to provide the gas ballast to avoid the moisture and toxics impact during the process.

Integration of ISOLATOR for Loading/ Un-loading system:

The isolator unit shall be integrated with Lyophilizer as to meet the process requirements and current good manufacturing practice
The design and integration of Isolator shall be in line to the Lyo loading and unloading chamber interface and dimensions
Tamper proof glass door shall be provided to allow a clear visibility into the entire space of the isolator.
The interior and all corners of the isolator must be easily accessible and cleanable when isolator is closed through glove ports
The surface in and outside side of the isolator shouldn't have any cracks, crevices and sharp edges. All corners and edges must be rounded
All HEPA Filters installed in the isolator must be accessible for maintenance and cleaning
Glare-free light, sealed edges of the lamps inside of isolator shall be provided
Calibration of all sensors must easily accessible and shall be removable for calibration and maintenance
Maximum expected operation of the equipment 24 Hrs./ Day

Technical Specification:

The temperature control maintained within the isolator in the range of 20 to 25 Deg C in all conditions.
Beginning of the batch
While continuous running of the batch
Fluctuation of outside environment shall be within tolerance
Relative Humidity control during production is maintained within the full humidity range of 2-5 % with aid of Nitrogen purge
HEPA filters are 99.99% efficient for removing particles greater than 0.3 Micron in size.
The room conditions of isolator installed is classified as grade B
Environment conditions surrounding room
Temp : NMT 26 Deg C
% RH : NMT 60%
The isolator unit is required to design to meet the cleanliness under the area to meet Grade 'A' requirement
The MOC of the isolator shall be compactable for VHP sterilization/ Nitrogen gas .and all product contact parts shall be made with SS316 L and surface finish will be > 0.5 µ RA.
Integrity test port shall be provided at upstream of HEPA Filters
Blower shall statically and dynamically balance to the supply air flow with sufficient capacity and static pressure
Viable/ non-viable particle count shall meet grade A requirements
The air velocity shall be 90 ±20 FPM at 6 inches from the filter face
Initial and final pressure drop limits to be provided
During the VHP cycle, Gloves shall not be wrinkled or folded on surface
There shall be automatic leak test option available for isolator leak test and within the acceptance range; Leak test will be performed before start of the VHP cycle.

Interlocks/ Alarms:

Emergency Stop
Control power fault
Barrier open door
Glove port light curtain interrupted
Isolator contamination/ fault
Filter differential pressure alarm
Barrier high pressure alarm
Barrier low pressure alarm
Barrier differential pressure alarm
RH above 5% alarm

All machine surfaces must come in contact with H₂O₂, a minimum accessible area for H₂O₂ on the machine for example moving parts shall move slowly during VHP Cycle.

The whole decontamination cycle including aeration shall be completed within the specified operation time mentioned.

The isolator doors shall not open before the H₂O₂ concentration reaches to the neutral level.

Interface:

The Lyophilizer shall be provided with Siemens or Allen Bradley control logic platform. PLC, security, Recipe management process. Data logging shall be under taken Lyophilized dedicated SCADA. Control system shall be accessible to authorized users only. It shall have individual login ID and Passwords to access the system.

All set parameters ranges are to be defined access shall be restricted as per user level

Alarm management shall be available

Programmed backup for PLC/HMI SCADA shall be provided

Generated data shall be saved by the software and storage path shall be defined through software only

Control system clock synchronization shall be available

11.8 Electronic records and signatures shall be available wherever applicable on the reports | General Requirements:

All parts shall be made of non-oxidizing material as per FDA requirements

All internal corners and edges inside the chamber and condenser must have rounded and smooth finishing.

And accessible for easy cleaning

The Control cabinet shall be integrated on the machine frame. And the cabinets shall be equipped with proper ventilators

Chamber shelves design shall allow minimum and maximum loading of the product and useable 90% out of total shelves area available.

Remote access feature shall be available for providing technical support of the feature

Machine shall have feature to have control the speed increase / decrease the speed through frequency

control drive and shall be available to operate on HMI & SCADA

The machine shall be designed to be able to operate and maintain the temperature during the one compressor failure

Redundancy Fluid pump shall be provided

Vacuum pump redundancy, shall be able to operate with one pump and maintain the set vacuum at any point of operation

All Hot surfaces shall be insulated with mineral wool and cladding with SS304 sheet.

The bellows used in the entire system shall be leak proof.

Chamber:

The chamber shall have the automatic Locking / Un-locking system

The Geometrical construction of the chamber shall be rectangular structure

The type of door support shall be operated with Hinged

Operating design pressure of the chamber shall be 2.0 Bar G

The slot door shall be installed at Loading /Unloading side and additional main door shall be installed at technical area for maintenance purpose and the door can be completely open-able up to 180 Deg direction.

Chamber shall have the jacket for cooling water circulation provision to do the jacket cooling after SIP and other heating operations.

The material of constriction of the chamber shall be made SS316 material with surface finish Ra < 0.5 µm internally with mirror polish. And chamber body shall be insulated and cladded with SS304 material

Chamber shall have the sight glass possible locations with light illumination

Shelves configuration:

Basic inter distance between the shelves : To be decided

Shelf dimensions (LxWxD) : To be decided

Total surface area : 18 Sq Mtr

Shelves heating rate : NLT 1.0 deg C/ Min

Shelves Minimum temperature : -65.0 Deg C

Shelves cooling source : Silicon Oil

Shelves moment for loading : Included

Shelves position control : Closed loop (Automatic)

The shelves shall allow the constant loading at fixed operating position/ height.

The shelves shall be made of SS316 L material and the surface finish shall be less than < 0.5 µm electro polished.

The shelves shall be designed to allowed minimum 2 formats for inter-distance for loading / Unloading

The Shelves loading should be from top to bottom direction and un-loading from bottom to top at constant height

Shelves shall be movable during CIP to ensure the 100% cleaning efficiency

Each shelf should have a temperature probe to measure the individual shelf temperature

The surface slope of the shelf maximum 0.5 mm/ Mtr

Refrigeration Compressors:

Total no. of compressors : To be defined

Compressors type : Screw type

Refrigerant : Non-CFC, Eco friendly

Vacuum System:

Vacuum pumps shall be dry pumps
The Pump capacity shall be design inline to the Chamber and condenser capacity
The ultimate vacuum shall be achieved within 20 Min in ideal condition
The booster vacuum pump shall be dry type

Condenser:
Type of condenser : Close integrated
Number of condensers : 01 Nos
Design Pressure : 2.0 Bar G
Capacity of Ice thickness : To be defined
Minimum Temperature : >-75 Deg C

The construction of the condenser shall be cylindrical and should be suitable for vacuum applications during the lyophilization cycles
The condenser body and tubes shall be made of SS316 L and are mechanically polished and passivated
The ice condensing capacity shall be calculated on the basis of 24 Hr cycle
The suitable isolation valve shall be designed between the Chamber and condenser, and this shall be made up of SS316 L material.
The condenser cooling shall be done either with Gas/ Fluid
Sight glass with illumination shall be provided on body of the condenser for viewing purpose
The condenser shall be CIP and SIP able, and withstand with respect to the temperature and pressure

Functional Specification:

The Lyophilizer shall have interface with slot door with fixed loading/un-loading system
All Loading/ Unloading activities shall be from Grade A- Area
The Loading/ unloading system shall be designed as per the details and drawings provided by client
The loading / unloading operation shall be synchronized with lyophilizer operation

The system shall have the provision to back fill the equipment with sterile gases like Nitrogen/ Air and vacuum.

All Loading/ Unloading activities shall be from Grade A- Area

The Loading/ unloading system shall be designed as per the details and drawings provided by client

The loading / unloading operation shall be synchronized with lyophilizer operation

The system shall have the provision to back fill the equipment with sterile gases like Nitrogen/ Air and vacuum.

The vacuum control set point should be allowed from 1000 to 0.001 mbar absolute

SIP: The Sterilization cycle the temperature reference shall be measured at drain thermocouple, and all other temperature sensors shall be remains above the drain.

During SIP Automatic movement of shelves required from top to bottom to ensure the sterility of all components contained in the chamber

Vacuum pumps shall have the provision to provide the gas ballast to avoid the moisture and toxics impact during the process.

Integration of ISOLATOR for Loading/ Un-loading system:

The isolator unit shall be integrated with Lyophilizer as to meet the process requirements and current good manufacturing practice

The design and integration of Isolator shall be in line to the Lyo loading and unloading chamber interface and dimensions

Tamper proof glass door shall be provided to allow a clear visibility into the entire space of the isolator.

The interior and all corners of the isolator must be easily accessible and cleanable when isolator is closed through glove ports

The surface in and outside side of the isolator shouldn't have any cracks, crevices and sharp edges. All corners and edges must be rounded

All HEPA Filters installed in the isolator must be accessible for maintenance and cleaning

Glare-free light, sealed edges of the lamps inside of isolator shall be provided

Calibration of all sensors must easily accessible and shall be removable for calibration and maintenance

Maximum expected operation of the equipment 24 Hrs./ Day

Technical Specification:

The temperature control maintained within the isolator in the range of 20 to 25 Deg C in all conditions.

Beginning of the batch

While continuous running of the batch

Fluctuation of outside environment shall be within tolerance

Relative Humidity control during production is maintained within the full humidity range of 2-5 % with aid of Nitrogen purge

HEPA filters are 99.99% efficient for removing particles greater than 0.3 Micron in size.

The room conditions of isolator installed is classified as grade B

Environment conditions surrounding room

Temp : NMT 26 Deg C

% RH : NMT 60%

The isolator unit is required to design to meet the cleanliness under the area to meet Grade 'A' requirement

The MOC of the isolator shall be compactable for VHP sterilization/ Nitrogen gas .and all product contact parts shall be made with SS316 L and surface finish will be $> 0.5 \mu\text{RA}$.

Integrity test port shall be provided at upstream of HEPA Filters

Blower shall statically and dynamically balance to the supply air flow with sufficient capacity and static pressure

Viable/ non-viable particle count shall meet grade A requirements

The air velocity shall be 90 ± 20 FPM at 6 inches from the filter face

Initial and final pressure drop limits to be provided

During the VHP cycle, Gloves shall not be wrinkled or folded on surface

There shall be automatic leak test option available for isolator leak test and within the acceptance range; Leak test will be performed before start of the VHP cycle.

Interlocks/ Alarms:

Emergency Stop

Control power fault

Barrier open door

Glove port light curtain interrupted

Isolator contamination/ fault

Filter differential pressure alarm

Barrier high pressure alarm

Barrier low pressure alarm

Barrier differential pressure alarm

RH above 5% alarm

All machine surfaces must come in contact with H₂O₂, a minimum accessible area for H₂O₂ on the machine for example moving parts shall move slowly during VHP Cycle.

The whole decontamination cycle including aeration shall be completed within the specified operation time mentioned.

The isolator doors shall not open before the H₂O₂ concentration reaches to the neutral level.

Interface:

The Lyophilizer shall be provided with Siemens or Allen Bradley control logic platform. PLC, security,

Recipe management process. Data logging shall be under taken Lyophilized dedicated SCADA.

Control system shall be accessible to authorized users only. It shall have individual login ID and Passwords to access the system.

All set parameters ranges are to be defined access shall be restricted as per user level

Alarm management shall be available

Programmed backup for PLC/HMI SCADA shall be provided

Generated data shall be saved by the software and storage path shall be defined through software only

Control system clock synchronization shall be available

11.8 Electronic records and signatures shall be available wherever applicable on the reports | General Requirements:

All parts shall be made of non-oxidizing material as per FDA requirements

All internal corners and edges inside the chamber and condenser must have rounded and smooth finishing.

And accessible for easy cleaning

The Control cabinet shall be integrated on the machine frame. And the cabinets shall be equipped with proper ventilators

Chamber shelves design shall allow minimum and maximum loading of the product and useable 90% out of total shelves area available.

Remote access feature shall be available for providing technical support of the feature

Machine shall have feature to have control the speed increase / decrease the speed through frequency

control drive and shall be available to operate on HMI & SCADA

The machine shall be designed to be able to operate and maintain the temperature during the one compressor failure

Redundancy Fluid pump shall be provided

Vacuum pump redundancy, shall be able to operate with one pump and maintain the set vacuum at any point of operation

All Hot surfaces shall be insulated with mineral wool and cladding with SS304 sheet.

The bellows used in the entire system shall be leak proof.

Chamber:

The chamber shall have the automatic Locking / Un-locking system

The Geometrical construction of the chamber shall be rectangular structure

The type of door support shall be operated with Hinged

Operating design pressure of the chamber shall be 2.0 Bar G

The slot door shall be installed at Loading /Unloading side and additional main door shall be installed at technical area for maintenance purpose and the door can be completely open-able up to 180 Deg direction.

Chamber shall have the jacket for cooling water circulation provision to do the jacket cooling after SIP and other heating operations.

The material of construction of the chamber shall be made SS316 material with surface finish Ra < 0.5 µm

internally with mirror polish. And chamber body shall be insulated and cladded with SS304 material

Chamber shall have the sight glass possible locations with light illumination

Shelves configuration:

Basic inter distance between the shelves : To be decided

Shelf dimensions (LxWxD) : To be decided

Total surface area : 18 Sq Mtr

Shelves heating rate : NLT 1.0 deg C/ Min

Shelves Minimum temperature : -65.0 Deg C

Shelves cooling source : Silicon Oil

Shelves moment for loading : Included

Shelves position control : Closed loop (Automatic)

The shelves shall allow the constant loading at fixed operating position/ height.

The shelves shall be made of SS316 L material and the surface finish shall be less than < 0.5 µm electro polished.

The shelves shall be designed to allowed minimum 2 formats for inter-distance for loading / Unloading

The Shelves loading should be from top to bottom direction and un-loading from bottom to top at constant height

Shelves shall be movable during CIP to ensure the 100% cleaning efficiency

Each shelf should have a temperature probe to measure the individual shelf temperature

The surface slope of the shelf maximum 0.5 mm/ Mtr

Refrigeration Compressors:

Total no. of compressors : To be defined

Compressors type : Screw type

Refrigerant : Non-CFC, Eco friendly

Vacuum System:

Vacuum pumps shall be dry pumps

The Pump capacity shall be design inline to the Chamber and condenser capacity

The ultimate vacuum shall be achieved within 20 Min in ideal condition

The booster vacuum pump shall be dry type

Condenser:

Type of condenser : Close integrated

Number of condensers : 01 Nos

Design Pressure : 2.0 Bar G

Capacity of Ice thickness : To be defined

Minimum Temperature : >-75 Deg C

The construction of the condenser shall be cylindrical and should be suitable for vacuum applications during the lyophilization cycles

The condenser body and tubes shall be made of SS316 L and are mechanically polished and passivated

The ice condensing capacity shall be calculated on the basis of 24 Hr cycle

The suitable isolation valve shall be designed between the Chamber and condenser, and this shall be made up of SS316 L material.

The condenser cooling shall be done either with Gas/ Fluid

Sight glass with illumination shall be provided on body of the condenser for viewing purpose

The condenser shall be CIP and SIP able, and withstand with respect to the temperature and pressure

Functional Specification:

The Lyophilizer shall have interface with slot door with fixed loading/un-loading system

All Loading/ Unloading activities shall be from Grade A- Area

The Loading/ unloading system shall be designed as per the details and drawings provided by client

The loading / unloading operation shall be synchronized with lyophilizer operation

The system shall have the provision to back fill the equipment with sterile gases like Nitrogen/ Air and vacuum.

All Loading/ Unloading activities shall be from Grade A- Area

The Loading/ unloading system shall be designed as per the details and drawings provided by client

The loading / unloading operation shall be synchronized with lyophilizer operation

The system shall have the provision to back fill the equipment with sterile gases like Nitrogen/ Air and vacuum.

The vacuum control set point should be allowed from 1000 to 0.001 mbar absolute

SIP: The Sterilization cycle the temperature reference shall be measured at drain thermocouple, and all other temperature sensors shall be remains above the drain.

During SIP Automatic movement of shelves required from top to bottom to ensure the sterility of all components contained in the chamber

Vacuum pumps shall have the provision to provide the gas ballast to avoid the moisture and toxics impact during the process.

Integration of ISOLATOR for Loading/ Un-loading system:

The isolator unit shall be integrated with Lyophilizer as to meet the process requirements and current good manufacturing practice

The design and integration of Isolator shall be in line to the Lyo loading and unloading chamber interface and dimensions

Tamper proof glass door shall be provided to allow a clear visibility into the entire space of the isolator.

The interior and all corners of the isolator must be easily accessible and cleanable when isolator is

closed through glove ports

The surface in and outside side of the isolator shouldn't have any cracks, crevices and sharp edges. All corners and edges must be rounded

All HEPA Filters installed in the isolator must be accessible for maintenance and cleaning

Glare-free light, sealed edges of the lamps inside of isolator shall be provided

Calibration of all sensors must easily accessible and shall be removable for calibration and maintenance

Maximum expected operation of the equipment 24 Hrs./ Day

Technical Specification:

The temperature control maintained within the isolator in the range of 20 to 25 Deg C in all conditions.

Beginning of the batch

While continuous running of the batch

Fluctuation of outside environment shall be within tolerance

Relative Humidity control during production is maintained within the full humidity range of 2-5 % with aid of Nitrogen purge

HEPA filters are 99.99% efficient for removing particles greater than 0.3 Micron in size.

The room conditions of isolator installed is classified as grade B

Environment conditions surrounding room

Temp : NMT 26 Deg C

% RH : NMT 60%

The isolator unit is required to design to meet the cleanliness under the area to meet Grade 'A' requirement

The MOC of the isolator shall be compactable for VHP sterilization/ Nitrogen gas .and all product contact parts shall be made with SS316 L and surface finish will be $> 0.5 \mu$ RA.

Integrity test port shall be provided at upstream of HEPA Filters

Blower shall statically and dynamically balance to the supply air flow with sufficient capacity and static pressure

Viable/ non-viable particle count shall meet grade A requirements

The air velocity shall be 90 ± 20 FPM at 6 inches from the filter face

Initial and final pressure drop limits to be provided

During the VHP cycle, Gloves shall not be wrinkled or folded on surface

There shall be automatic leak test option available for isolator leak test and within the acceptance range; Leak test will be performed before start of the VHP cycle.

Interlocks/ Alarms:

Emergency Stop

Control power fault

Barrier open door

Glove port light curtain interrupted

Isolator contamination/ fault

Filter differential pressure alarm

Barrier high pressure alarm

Barrier low pressure alarm

Barrier differential pressure alarm

RH above 5% alarm

All machine surfaces must come in contact with H2O2, a minimum accessible area for H2O2 on the machine for example moving parts shall move slowly during VHP Cycle.

The whole decontamination cycle including aeration shall be completed within the specified operation time mentioned.

The isolator doors shall not open before the H2O2 concentration reaches to the neutral level.

Interface:

The Lyophilizer shall be provided with Siemens or Allen Bradley control logic platform. PLC, security,

Recipe management process. Data logging shall be under taken Lyophilized dedicated SCADA.

Control system shall be accessible to authorized users only. It shall have individual login ID and Passwords to access the system.

All set parameters ranges are to be defined access shall be restricted as per user level

Alarm management shall be available

Programmed backup for PLC/HMI SCADA shall be provided

Generated data shall be saved by the software and storage path shall be defined through software only

Control system clock synchronization shall be available

11.8 Electronic records and signatures shall be available wherever applicable on the reports | General Requirements:

All parts shall be made of non-oxidizing material as per FDA requirements

All internal corners and edges inside the chamber and condenser must have rounded and smooth finishing.

And accessible for easy cleaning

The Control cabinet shall be integrated on the machine frame. And the cabinets shall be equipped with proper ventilators

Chamber shelves design shall allow minimum and maximum loading of the product and useable 90% out of total shelves area available.

Remote access feature shall be available for providing technical support of the feature

Machine shall have feature to have control the speed increase / decrease the speed through frequency control drive and shall be available to operate on HMI & SCADA

The machine shall be designed to be able to operate and maintain the temperature during the one compressor failure

Redundancy Fluid pump shall be provided

Vacuum pump redundancy, shall be able to operate with one pump and maintain the set vacuum at any point of operation

All Hot surfaces shall be insulated with mineral wool and cladding with SS304 sheet.

The bellows used in the entire system shall be leak proof.

Chamber:

The chamber shall have the automatic Locking / Un-locking system

The Geometrical construction of the chamber shall be rectangular structure

The type of door support shall be operated with Hinged

Operating design pressure of the chamber shall be 2.0 Bar G

The slot door shall be installed at Loading /Unloading side and additional main door shall be installed

at technical area for maintenance purpose and the door can be completely open-able up to 180 Deg direction.

Chamber shall have the jacket for cooling water circulation provision to do the jacket cooling after SIP and other heating operations.

The material of construction of the chamber shall be made SS316 material with surface finish $Ra < 0.5 \mu s$ internally with mirror polish. And chamber body shall be insulated and cladded with SS304 material
Chamber shall have the sight glass possible locations with light illumination

Shelves configuration:

Basic inter distance between the shelves : To be decided

Shelf dimensions (LxWxD) : To be decided

Total surface area : 18 Sq Mtr

Shelves heating rate : NLT 1.0 deg C/ Min

Shelves Minimum temperature : -65.0 Deg C

Shelves cooling source : Silicon Oil

Shelves moment for loading : Included

Shelves position control : Closed loop (Automatic)

The shelves shall allow the constant loading at fixed operating position/ height.

The shelves shall be made of SS316 L material and the surface finish shall be less than $< 0.5 \mu m$ electro polished.

The shelves shall be designed to allowed minimum 2 formats for inter-distance for loading / Unloading

The Shelves loading should be from top to bottom direction and un-loading from bottom to top at constant height

Shelves shall be movable during CIP to ensure the 100% cleaning efficiency

Each shelf should have a temperature probe to measure the individual shelf temperature

The surface slope of the shelf maximum 0.5 mm/ Mtr

Refrigeration Compressors:

Total no. of compressors : To be defined

Compressors type : Screw type

Refrigerant : Non-CFC, Eco friendly

Vacuum System:

Vacuum pumps shall be dry pumps

The Pump capacity shall be design inline to the Chamber and condenser capacity

The ultimate vacuum shall be achieved with in 20 Min in ideal condition

The booster vacuum pump shall be dry type

Condenser:

Type of condenser : Close integrated

Number of condensers : 01 Nos

Design Pressure : 2.0 Bar G

Capacity of Ice thickness : To be defined

Minimum Temperature : >-75 Deg C

The construction of the condenser shall be cylindrical and should be suitable for vacuum applications during the lyophilization cycles

The condenser body and tubes shall be made of SS316 L and are mechanically polished and passivated

The ice condensing capacity shall be calculated on the basis of 24 Hr cycle

The suitable isolation valve shall be designed between the Chamber and condenser, and this shall be made up of SS316 L material.

The condenser cooling shall be done either with Gas/ Fluid

Sight glass with illumination shall be provided on body of the condenser for viewing purpose

The condenser shall be CIP and SIP able, and withstand with respect to the temperature and pressure

Functional Specification:

The Lyophilizer shall have interface with slot door with fixed loading/un-loading system

All Loading/ Unloading activities shall be from Grade A- Area

The Loading/ unloading system shall be designed as per the details and drawings provided by client

The loading / unloading operation shall be synchronized with lyophilizer operation

The system shall have the provision to back fill the equipment with sterile gases like Nitrogen/ Air and vacuum.

The vacuum control set point should be allowed from 1000 to 0.001 mbar absolute

SIP: The Sterilization cycle the temperature reference shall be measured at drain thermocouple, and all other temperature sensors shall be remains above the drain.

During SIP Automatic movement of shelves required from top to bottom to ensure the sterility of all components contained in the chamber

Vacuum pumps shall have the provision to provide the gas ballast to avoid the moisture and toxics impact during the process.

Integration of ISOLATOR for Loading/ Un-loading system:

The isolator unit shall be integrated with Lyophilizer as to meet the process requirements and current good manufacturing practice

The design and integration of Isolator shall be in line to the Lyo loading and unloading chamber interface and dimensions

1.0 | Objective

| This URS detail the requirement of Power pack used to provides constant voltage or constant current to instruments used in electrophoresis

2.0 | Scope

| This URS is applicable mainly for the Power pack, which will be placed in the quality control department.

3.0 | Equipment description

| The Power Pack provides constant voltage or constant current to instruments used in electrophoresis. The power supply operates at the values specified for the constant parameter, to prevent damage to the electrophoresis cell.

4.0 | Component details

| Technical Specification:

| Voltage: Adjustable from 10 to 300 Volts, in 1-volt increments.

Current: Adjustable from 4 to 400 milliamperes (mA) in 1 mA increments.

Power: 75 watts (maximum).

Programmable constant voltage or constant current with automatic crossover.

Timer control from 0 to 999 minutes.

3-digit LED display.

Pause mode for editing running parameters.

Automatic detection of no-load conditions and rapid changes in resistance.

Power failure detection in timed modes allowing completion of run.

Operating Temperature 0–40°C.

Humidity 10–95%

| IN FEED TURN TABLE

Technical details:

In feed turntable should have SST finish, in feed pusher plate and connected to the sealing machine. Should have independent variable speed drive.

AUTOMATIC CLOSING MACHINE

Technical details:

This should be able to place the flip off seals on the vials and tighten them properly to make it tamper proof @ 220 vials/Min. (6R-Vial) It must meet the following requirements:

Aluminium plate type construction with stainless steel gladding,

Should have counters for vial number, running hour and output/min.
with variable drive motors
Suitable size parts consisting of infeed scroll, star wheel and guides.
Suitable automatic closing station for the mentioned seal.
For guarding purpose, it should have protection covers
It should have stainless steel conveying belt of.
No stopper- no seal control

Other features:

Should include switches for minimum and maximum accumulation at machine, at Infeed and at discharge, maintenance –free roller and ball bearings
Should have alarm for" tray full" | IN FEED TURN TABLE

| Instrumentation and automation

The system should have the necessary automation elements to ensure correct operation, as well as equipment and operator protection.

The following minimum requirements should be met: | Instrumentation and automation

The system should have the necessary automation elements to ensure correct operation, as well as equipment and operator protection.

The following minimum requirements should be met: | Instrumentation and automation

The system should have the necessary automation elements to ensure correct operation, as well as equipment and operator protection.

The following minimum requirements should be met:

| Interaction with other systems

The vial sealing machine control system must be able to communicate with a local PC-based monitoring system. The monitoring system will request the current values of all measured variables and will set the set points of all control points. The PC standard RS-232 is the preferred channel. If any other hardware is required, it must be supplied or fully specified (if it is commercially available)

Containment

The vial sealing machine should be designed so as to prevent the possibility generating and releasing aerosols into the environment without compromising the hygiene or integrity of the medium being filled and preferably within the enclosure of user friendly.

Alarms and signals

Low seal availability audiovisual signal | Interaction with other systems

| Other requirements and design characteristics

It should preferably include all the system interconnections.

It should include the required pumps: the pumps needed within the Vial washing machine to perform the required functions.

All the system must be capable of regular visual inspection and manual cleaning. The solution to this requirement in each case will depend on the size, geometry and placement of the machine and the proposal of the supplier.

The design and operation of the system and the degree of finish of its external surfaces must be compatible with the classification of the area in which they are to be installed and the chemicals commonly employed for cleaning and disinfecting in the biopharmaceutical industry.

The electrical system of the equipment shall comply with the requirements established by the following standard of the International Electrotechnical Commission: IEC 204 - Electrical equipment of industrial machines.

Part 1. General Requirements (This standard has been adopted and modified by the European Standard EN 60204-1:1992),

Part 2. Item designation and examples of drawings, diagrams, tables and instructions, and also with the applicable requirements of the attached document "Requirements for Engineered Equipment Wiring".

SWIVEL TYPE CONVEYER

Should be able to transfer filled vials to the capping machines infeed turntable. | Other requirements and design characteristics

| Pre-Delivery Qualifications (PDQ)

Pre-Installation at the Vendor's Shop. The system or its parts as provided for in the scope of supply shall be pre-installed at the Vendor's shop prior to delivery to Customer's site. Installation will be completed and documented including mechanical parts as well as electrical connections of all parts to facilitate taking-over tests at Vendor's shop prior to delivery.

After the installation of the system at the Vendor's shop, Factory Acceptance Tests (FAT) shall be performed and accurately documented.

FAT tests shall be performed and documented according to a main protocol agreement between the Vendor and the Customer. At least two months before FAT test are scheduled to be performed; the documents where the results of such test will be recorded should be delivered to the Customer for approval.

General test to be performed during FAT:

Surface smoothness tests of metal surfaces.

Visual inspection for compliance with the cGMP, in accordance with the approved drawings.

Leakage Integrity test

CIP performance tests.

Alarms checkouts.

I/O Checks

Functional tests for all control loops.

Documents to be delivered by the Vendor

Two copies of the following documents must be provided, in the English language:

P&ID diagrams.

Operation Instruction Manual(s), including operating panel and safety operation warnings.

Maintenance Instruction Manual(s).

Assembly and Installation Manual(s).

Instrumentation and Calibration Manual(s).

Troubleshooting list.

Electrical and Wiring Manuals (including electrical drawing list, circuit diagrams, connection diagrams, cabinet layout, interconnection diagrams, etc.).

Component list.

Calibration certificate for each instrument installed in the equipment, including the description for re-calibration.

Certificate of materials used for constructing those parts in contact with the product stream(s).

Official approval document and manufacturing inspection protocol.

Welding procedures and visual inspection reports.

Mill test reports for those parts in contact with the product streams, which will be sanitary welded.

Qualification certificates of the technical personnel who have worked in welding and assembling of equipment shall be available on request.

Biological compatibility certificates of all non-metallic materials in contact with process streams (like diaphragms, gaskets, O-rings, seals, couplings, etc.).

Software and hardware validation documents for all computerized systems (microprocessor, PLC and computer-based systems).

Safety. Vendor should deliver to the Customer all legal documents relating to safety issues regulated by the National Official agencies where the equipment is built. The scope of these documents will be clearly defined during the contract negotiation.

Validation

All documents specified should be delivered at the Customer site at least two months before the installation of the equipment, in order to be used for the preparation of the Validation Protocols.

After installation of the equipment at Customer's site, complementary Installation and Operational Qualification (IQ, OQ) tests will be performed by the Customer and may be supervised (if it is of interest) by a member of Vendor's technical staff.

SPARES:

Vendor should provide as part of the tender a list of proposed spare parts for at least two years of operations. | Pre-Delivery Qualifications (PDQ)

| This specification is intended to cover the minimum requirements to be met by the Vendor in the design, manufacture and supply of Vial filling machine provided in this document are at minimum and can be subjected to amendment after discussion with vendor and representative of Client for achieving higher degree of standards and operational ease

Technical and GMP features

Vial filling machine 6R (180 Vials/ minute Multidose)

The vial filling machine will be used for the filling of liquid vaccines containing adjuvant (preferably Aluminum salts compounds) in the vials of 6R sizes and in volumes ranging from 5 ml to 6 ml. The presterilized tubular glass 6R vials shall be used in the process

Once filled, the preparation will be used parenterally in humans.

Filling Machine should include:

Fully automatic filling and stoppering machine 1 no.

Swivel conveyor 1 no.

Rejection Station 1 no.

Spares

Process description

Vial filling machine shall be used for the filling of vaccine to be used parenterally in humans. This machine shall be placed in class 100 (A) with class 1000 (A/B) as background.

The material to be filled shall be placed in a sterilized vessel and after making the necessary connections, filling shall be carried out.

On line stoppering of the vials will be done for applying the pre sterilized chloro butylated rubber stoppers for injectable products. In case of injectable, these shall be fixed in place by pressing.

In each case, after filling is concluded, the delivery needles will be subjected to a CIP process followed by SIP. | This specification is intended to cover the minimum requirements to be met by the Vendor in the design, manufacture and supply of Vial filling machine provided in this document are at minimum and can be subjected to amendment after discussion with vendor and representative of Client for achieving higher degree of standards and operational ease

4.0 | Component details | Component details

| Technological standards

VIAL FILLING MACHINE

Vial filling machine should include maintenance free roller and ball bearings, electrical installations, PLC, graphical touch operating panel, variable speed drive, central pump adjustment facility and designed to be used under laminar air flow.

The equipment should be able to fill and apply stoppers on vials up to a speed of 180 vials per minute for MD 6R vials.

Arrangement for filling of volumes ranging from 5 to 6 ml with high accuracy.

Provision of motor-controlled movement for pump stroke and rotation, needles stoppering turret and main drive.

Possibility of CIP and SIP for the vessel and all interconnections.

Volume based dosing facility

Possibility of having the break tank with stirring/magnetic stirring system for a homogenous solution delivery.

Break tank should be double jacketed and insulated with the provisions to keep the material at the required temperature.

Provisions for automatic insertion turret to apply rubber stoppers for injectable products on 6R vials.

Arrangement of hopper to feed the stoppers into the vibratory bowl.

VFL should have sanitary high-pressure safety devices to ensure product and system integrity, and meet established biosafety.

The closure feeding and sorting unit to be placed on the operator's side in order to be totally and easily accessible.

An on line non-destructive in process control of the filled volume based on weight for fast and easy control on the filled volumes.

Technical description

The treatment to the vials should be very gentle to avoid splashing of the product.

The operations should be very quiet.

Good accessibility to all machine components.

Good synchronization of movements of all working station

Fast and easy size changeover.

Vial filling lines should have a sanitary design that will ensure operation under aseptic conditions in line with the requirements established in the cGMP for the biopharmaceutical industry.

All contact parts must be CIP/SIP compatible.

Interconnections and access ports

The connection within the machine should preferably by flexible connection.

Pipes, fittings, traps, and other accessories for all system lines, within VFM limits (outlets and in- and outflow ports) shall be of sanitary design.

Connection to drainage for CIP/SIP must comply with the sanitary requirements established by cGMP.

Containment

The vial filling machine should be designed so as to prevent the possibility generating and releasing aerosols into the environment without compromising the hygiene or integrity of the medium being filled within the encloser with ease of operation.

CIP/SIP requirements (Optional)

The VFM should allow automatic CIP and SIP.

During the CIP cycle, the following agents may be used:

2% sodium hydroxide solution at 70°C

1% nitric acid solution at 70°C

c. VFM and all process lines should allow for sterilization with saturated steam, by a totally automatic procedure.

Instrumentation and automation

The system should have the necessary automation elements to ensure correct operation, as well as equipment and operator protection. The following minimum requirements should be met:

Indications:

Continuous Filling medium temperature indication

Records

Vials filled record (Cumulative)

Automatic sequences and operation modes

Standby

Filling (normal filling operation)

CIP of all lines and systems

SIP of all lines and systems

Sampling

Filling @ for 180 vials/min for 6R Vials

On line IPQC (statistical) preferably @2%

Interaction with other systems

The VFM control system must be able to communicate with a local PC-based monitoring system. The monitoring system will request the current values of all measured variables and will set the set points of all control points. The PC standard RS-232 is the preferred channel. If any other hardware is required, it must be supplied or fully specified (if it is commercially available)

Alarms and signals

Low vial availability audiovisual signal

Low stopper availability audiovisual signal

Operator actions

Activation/deactivation and modification of parameters for all sequences or operation modes

Establishment of set point, control loop mode (AUTOMATIC/MANUAL) and other parameters of control loops for all controlled variables

Manual activation/deactivation of all actuating elements, such as valves, pumps, etc. To this purpose, all these elements should be activated by the control system (AUT.) or manually by the operator (MAN.).

Other requirements and design characteristics

It should preferably include all the system interconnections.

It should include the required pumps: the pumps needed within the VFM to perform the required functions.

In the Break tank with agitation/stirring, the motor and electrical devices should be designed for working in normal operating conditions. Grade of protection IP 54 should be satisfactory.

All the system must be capable of regular visual inspection and manual cleaning. The solution to this requirement in each case will depend on the size, geometry and placement of the machine and the proposal of the supplier.

Corrosive or dangerous substances in the process streams: those specified for CIP

The design and operation of the system and the degree of finish of its external surfaces must be compatible with the classification of the area in which they are to be installed and the chemicals commonly employed for cleaning and disinfecting in the biopharmaceutical industry.

The electrical system of the equipment shall comply with the requirements established by the following standard of the International Electrotechnical Commission: IEC 204 - Electrical equipment of industrial machines. Part 1. General Requirements (This standard has been adopted and modified by the European Standard EN 60204-1:1992), Part 2. Item designation and examples of drawings, diagrams, tables and instructions, and also with the applicable requirements of the attached document "Requirements for Engineered Equipment Wiring".

SWIVEL TYPE CONVEYER

Should be able to transfer filled vials to the bung processing infeed turntable.

REJECTION STATION

Required for vials without stopper

This should have accumulation control | Technological standards

VIAL FILLING MACHINE

Vial filling machine should include maintenance free roller and ball bearings, electrical installations, PLC, graphical touch operating panel, variable speed drive, central pump adjustment facility and designed to be used under laminar air flow.

The equipment should be able to fill and apply stoppers on vials up to a speed of 180 vials per minute for MD 6R vials.

Arrangement for filling of volumes ranging from 5 to 6 ml with high accuracy.

Provision of motor-controlled movement for pump stroke and rotation, needles stoppering turret and main drive.

Possibility of CIP and SIP for the vessel and all interconnections.

Volume based dosing facility

Possibility of having the break tank with stirring/magnetic stirring system for a homogenous solution delivery.

Break tank should be double jacketed and insulated with the provisions to keep the material at the required temperature.

Provisions for automatic insertion turret to apply rubber stoppers for injectable products on 6R vials.

Arrangement of hopper to feed the stoppers into the vibratory bowl.

VFL should have sanitary high-pressure safety devices to ensure product and system integrity, and meet established biosafety.

The closure feeding and sorting unit to be placed on the operator's side in order to be totally and easily accessible.

An on line non-destructive in process control of the filled volume based on weight for fast and easy control on the filled volumes.

Technical description

The treatment to the vials should be very gentle to avoid splashing of the product.

The operations should be very quiet.

Good accessibility to all machine components.

Good synchronization of movements of all working station

Fast and easy size changeover.

Vial filling lines should have a sanitary design that will ensure operation under aseptic conditions in line with the requirements established in the cGMP for the biopharmaceutical industry.

All contact parts must be CIP/SIP compatible.

Interconnections and access ports

The connection within the machine should preferably by flexible connection.

Pipes, fittings, traps, and other accessories for all system lines, within VFM limits (outlets and in- and outflow ports) shall be of sanitary design.

Connection to drainage for CIP/SIP must comply with the sanitary requirements established by cGMP.

Containment

The vial filling machine should be designed so as to prevent the possibility generating and releasing aerosols into the environment without compromising the hygiene or integrity of the medium being filled within the enclosure with ease of operation.

| Pre-Delivery Qualifications (PDQ)
Pre-Installation at the Vendor's Shop. The system or its parts as provided for in the scope of supply shall be pre-installed at the Vendor's shop prior to delivery to Customer's site. Installation will be completed and documented including mechanical parts as well as electrical connections of all parts to facilitate taking-over tests at Vendor's shop prior to delivery.
After the installation of the system at the Vendor's shop, Factory Acceptance Tests (FAT) shall be performed and accurately documented.
FAT tests shall be performed and documented according to a main protocol agreement between the Vendor and the Customer. At least two months before FAT test are scheduled to be performed; the documents where the results of such test will be recorded should be delivered to the Customer for approval.
General test to be performed during FAT:
Surface smoothness tests of metal surfaces.
Visual inspection for compliance with the cGMP, in accordance with the approved drawings.
Leakage Integrity test
CIP performance tests.
Alarms checkouts.
I/O Checks
Functional tests for all control loops.
Documents to be delivered by the Vendor

Two copies of the following documents must be provided, in the English language:

P&ID diagrams.

Operation Instruction Manual(s), including operating panel and safety operation warnings.

Maintenance Instruction Manual(s).

Assembly and Installation Manual(s).

Instrumentation and Calibration Manual(s).

Troubleshooting list.

Electrical and Wiring Manuals (including electrical drawing list, circuit diagrams, connection diagrams, cabinet layout, interconnection diagrams, etc.).

Component list.

Calibration certificate for each instrument installed in the equipment, including the description for re-calibration.

Certificate of materials used for constructing those parts in contact with the product stream(s).

Official approval document and manufacturing inspection protocol.

Welding procedures and visual inspection reports.

Mill test reports for those parts in contact with the product streams, which will be sanitary welded.

Qualification certificates of the technical personnel who have worked in welding and assembling of equipment shall be available on request.

Biological compatibility certificates of all non-metallic materials in contact with process streams (like diaphragms, gaskets, O-rings, seals, couplings, etc.).

Passivation methods used.

Pressure tests reports or equivalent.

Software and hardware validation documents for all computerized systems (microprocessor, PLC and computer-based systems).

Safety. Vendor should deliver to the Customer all legal documents relating to safety issues regulated by the National Official agencies where the equipment is built. The scope of these documents will be clearly defined during the contract negotiation.

Validation

All documents specified should be delivered at the Customer site at least two months before the installation of the equipment, in order to be used for the preparation of the Validation Protocols.

After installation of the equipment at Customer's site, complementary Installation and Operational

Qualification (IQ, OQ) tests will be performed by the Customer and may be supervised (if it is of

interest) by a member of Vendor's technical staff. | Pre-Delivery Qualifications (PDQ)

			second flocculation.	
			5.4.4.8	If flocculation occurs in the first tube increase the
			dilution fold or it occurs in the last tube decrease	
			the dilution fold of the sample.	
			5.4.4.9	Observe for first and second flocculation. The tube
			in which first flocculation occurs is the Lf value of	
			the sample. Record the time taken (Kf) for first and	
			second flocculation.	
			5.4.4.10	Multiply this by the dilution factor to get the Lf/ml
			of the original sample. Example:-	
			Tube No	
			5.4.4.12	If the first or the last tube flocculates most rapidly
			then the test has to be repeated in such a way that	
			the middle tube flocculates most rapidly.	
			5.4.4.13	After determining the broad range test perform narrow
			range test/ confirmatory test.	
	5.4.5	Narrow range test (Applicable for purified bulk)		
			For narrow range test keep 2 Lf difference between	
			subsequent tubes and perform the assay as described	
			above.	
	5.4.6	Confirmatory test		
			For confirmation, perform with 2 or 1 Lf difference	
			between the tubes as shown in Table above. Record the	
			results.	
	5.5	Calculation/Formula:		
	Limes floccules (Lf/mL)= DATF unit of tube which flocculate first X			
	dilution fold of sample.

	5.1.2	Biosafety Cabinet	
	5.1.3	Disposable syringes with needle	
	5.1.4	Sterile glass vials/tubes	
	5.1.5	Water Bath (85°C)	
	5.1.6	Micropipette	
	5.2	Sample Preparation:	
	5.2.1	Take two glass vials and mark them as “H” and “UH”	
	respectively.		
	5.2.2	Aliquot 5 mL of the diphtheria toxoid in to these two glass	
	vials. This activity shall be carried out in biosafety		
	cabinet.		
	5.2.3	Set the water bath to 85°C. After temperature is attained,	
	incubate the tube marked as “H” (Heated) for 30 minutes at		
	85°C.		
	5.2.4	After 30 minutes, remove the “H” i.e., “Heated” sample from	
	the water bath and allow it to cool to room temperature. “H”		
	sample acts as a control sample.		
	5.2.5	The “UH” ie., “Unheated” sample is the test sample	
	5.3	Preparation of test animals:	
	5.3.1	Take one healthy Guinea Pigs weighing 250 to 350g.	
	5.3.2	Apply soap solution to the abdominal area of guinea pigs and	
	use wet cotton to produce lather for shaving.		
	5.3.3	Shave the hairs by using razor. Care should be taken to avoid	
	bruises over the skin. Clean the body by using cloth/cotton.		
	5.3.4	Use the animal for inoculation after body gets dried.	
	5.3.5	Mark Guinea pig with appropriate color scheme.	
	5.4	Animal Inoculation:	
	5.4.1	Inject intradermally 0.2 mL of the sample “UH” –“Unheated”	
	sample in the depilated skin of the guinea pig. Encircle the		
	site of inoculation using a permanent marker and mark it as		
	“UH”.		
	5.4.2	Inject intradermally 0.2 mL of the sample “H” – “Heated” near	
	the site of inoculation of unheated sample. Encircle the site		
	of inoculation using a permanent marker and mark it as “H”.		
	5.6	Observations:	
	5.6.1	Observe the injection site after 24 hours. Look for reactions	
	such as redness, inflammation and thickening of skin		
	5.6.2	Again observe injection site after 48 hours and look for any	
	increase or decrease in the reactions as compared to 24 hour		
	observations. Note any necrotic reactions at the injection		
	site.		
	5.6.3	If there is any inflammatory reaction, use a scale to measure	
	the redness and inflammation at the spot of injection.		
	5.7	Validity criteria	
	The test is valid if:		
	5.7.1	The control (Heated) sample shows no specific Diphtheria	
	erythema, necrosis and indurations.		
	5.7.2	If the test is invalid repeat the test.	
	5.8	Acceptance Criteria:	
	5.8.1	The sample complies with the test if no specific Diphtheria	
	erythema, necrosis and indurations are observed in case of		
	unheated samples.

[1.0]Objective: |
 ||To determine the organoleptic characteristics / physical appearance of |
 | active raw material, adjuvanted and formulated bulk of vaccines. |
 [2.0]Scope: |
 ||This standard operating procedure is applicable to the active raw |
 | material, adjuvanted and formulated bulk of vaccines |
 [3.0]Abbreviations and Definitions: |
 ||3.1 |ARM |: Active Raw Material |
 ||3.2 |NA |: Not applicable |
 [4.0]Procedure: |
	4.1	Equipment, Materials and Reagents	
		Not applicable	
	4.2	Organoleptic characteristics / physical appearance testing of Active	
		Raw Material.	
		4.2.1	The sample quantity of ARM required for the test is 10 ml in
			glass vial.
		4.2.2	Clean the work bench thoroughly with non lint shedding cloth
			before examining the sample.
		4.2.3	Clean the glass vial containing the test ARM with a lint
			free sterile cloth and keep on clean working bench.
		4.2.4	Carefully observe the ARM in glass vial for colour,
			turbidity and for the presence of suspended particles.
		4.2.5	The observations are made against white light.
		4.2.6	Check the characteristics of the sample by comparing the
			results with the established in house specifications for
			ARM.
	4.3	Organoleptic characteristics / physical appearance testing of	
	adjuvanted and formulated bulk of vaccine:		
		4.3.1	The sample quantity of vaccine required for the test is 10
			ml in glass vial.
		4.3.2	Clean the work bench thoroughly with non lint shedding cloth
			before examining the sample
		4.3.3	Clean the glass vial containing the test vaccine sample with
			a lint free sterile cloth and keep on clean working bench.
		4.3.4	Carefully observe the vaccine sample in vial for its colour,
			turbidity and for the presence of suspended particles. The
			observations are made with the naked eye. After observing
			the above characteristics, the vial is placed on the
			workbench undisturbed to observe if the gel layer separates
			from the clear liquid.
		4.3.5	Check the characteristics of the sample by comparing the
			results with the established in house specifications.
	4.4	Acceptance Criterion:	
		4.4.1	The ARM passes the organoleptic characteristics / physical
			appearance test, if the observations are as per the
			established specification.
		4.4.2	The sample passes, if the observations are as per the
			established in-house specifications.
	Note: Once the Organoleptic characteristics / Physical appearance of the		
sample have been determined, the same sample vial can be used to perform			
other test(s).			
[5.0]Forms and Records:			
	Fill the appropriate records		
[6.0]Reference:			
	NA		

1.0	Objective		
	To lay the procedure for specific toxicity test on bulk purified diphtheria		
	toxoid.		
2.0	Scope		
	This Standard Operating Procedure is applicable to all batches of bulk		
	purified diphtheria toxoid tested in quality control department.		
3.0	Responsibility		
	3.1	The QC analysts shall be responsible to carry out the described	
	procedure.		
	3.2	The supervisor shall be responsible for ensuring that the same is	
	carried out correctly.		
	3.3	Head Animal House/Veterinarian/supervisor shall be responsible for	
	supply of quality animals and their maintenance.		
	3.4	Head QC or his designee shall be responsible for overall compliance	
	of the SOP.		
4.0	Abbreviations and Definitions		
	4.1	SOP	: Standard Operating Procedure
	4.2	QC	: Quality Control
	4.3	mL	: Millilitre
	4.4	QA	: Quality Assurance
	4.5	AH	: Animal House
	4.6	W/V	: Weight / Volume
5.0	Procedure:		
	5.1	Equipment, Materials and Reagents	
		5.1.1	Weighing balance
		5.1.2	Biosafety cabinet
		5.1.3	Vortex mixer
		5.1.4	Micropipette
		5.1.5	Cotton
		5.1.6	Disposable syringes with needle
		5.1.7	Guinea pig
		5.1.8	Sterilized Glass Vials/ bottles
		5.1.9	Sterile micropipette tips
		5.1.10	70% Isopropyl alcohol
		5.1.11	Sodium chloride
		5.1.12	2- phenoxyethanol
	5.2	Preparation of solutions	
		5.2.1	Physiological saline (0.9% w/v) :
			Weigh 0.9 g of sodium chloride and dissolve in 60 ml of the
			purified water. Make up the volume up to 100 ml with purified
			water.
		5.2.2	50% w/v 2- phenoxyethanol Solution:
			Weigh 12.5 g of 2- phenoxyethanol and dissolve in 10 ml of the
			purified water. Make up the volume up to 25 ml with purified
			water.
	5.3	Diluent Preparation:	
		5.3.1	Prepare required quantity of diluent (Physiological Saline
			with 0.5% w/v 2- phenoxyethanol) by using Physiological saline
			and 50 % w/v 2- phenoxyethanol.
		5.3.2	For Example:
			Take 1.0 mL of 50% w/v 2- phenoxyethanol solution and transfer
			it in to a glass bottle containing 99.0 mL of 0.9 w/v
			Physiological Saline.
	5.4	Sample Preparation:	
		5.4.1	Prepare the biosafety cabinet for aseptic operation.
		5.4.2	Dilute the sample (of known Lf/mL) to contain 500 Lf/mL using
			the diluent Physiological Saline containing 2- phenoxyethanol
			(0.5% w/v)
	5.5	Preparation of test animals and inoculation:	
		5.5.1	Place request for Dunkin Hartley Guinea Pigs (250 – 350g) to
			the Head Animal House. After health status evaluation of
			animals by Veterinary Officer, receive the animals.
		5.5.2	Take 5 healthy Guinea Pigs weighing 250 to 350g, as per the
			set procedure
		5.5.3	Mark Guinea pig with appropriate color scheme.
		5.5.4	Inject 1.0 mL of diluted sample per guinea pig through
			subcutaneous route using disposable syringe and needle.
	5.6	Observation:	
		5.6.1	Observe the guinea pigs daily for symptoms of Diphtheria
			intoxication and weigh the animals at weekly interval for a
			period of 6 weeks (42 days).
		5.6.2	Animals that show symptoms like dullness, loss of appetite,
			loss of weight, sluggish movement, respiratory distress,
			abdominal respiration followed with death of the animal shall
			be examined by autopsy for symptoms of Diphtheria intoxication
			(Red adrenals).
		5.6.3	If death is not due to any of the symptoms above and there is
			no evidence of Red adrenals on autopsy then the death can be
			considered as Non Specific Death.
		5.6.4	Observe the health condition of the animals twice daily and
			record the observations.
	5.6.6	Percentage of survival is calculated by the following formula:	
			% Survival = A / B x 100
			A = Number of animal survive the test period.
			B = Number of animal injected with test sample.
	5.7	Acceptance Criteria:	
		The Sample complies with the test if:	
		5.7.1	No Guinea pig shows symptoms of specific Diphtheria
			intoxication or dies due to Diphtheria within 42 days or loses
			weight at the end of the test.

		5.7.2	At least 80 % of the animals survive the test period.
		5.7.3	If more than one animal dies from nonspecific causes, or loses
		weight repeat the test. If an animal dies or loses weight in	
		the second test the toxoid fails the test.	
6.0	Forms and Records		
	6.1	Test for Specific Toxicity on Bulk purified Diphtheria Toxoid	
7.0	References

[1. |Purpose: |
 |To lay down the procedure for quantifying the protein concentration by BCA|
 |method. |
 [2. |Applicable to: |
 |This Standard Operating Procedure is applicable to the samples of Active |
 |raw material of CRM, Active Raw Material of Pneumococcal protein conjugate|
 |vaccine in which protein concentration is to be determined. |
 [3. |Responsibility: |
 |3.1 |The analyst is responsible for executing the described procedure |
 |correctly. |
 |3.2 |Supervisor is responsible for verifying that the procedure is |
 |complied with and the results are checked. HOD shall be responsible |
 |for overall compliance of this SOP. |
 |3.3 |Departmental head shall ensure that the SOP is reviewed every two |
 |years or if required earlier. |
 [4. |Safety considerations: |
4.1	Wear laboratory coat while working in the laboratory.
4.2	Handle the quartz cuvette and glassware carefully.
4.3	Work in a fume hood while handling the acids.
[5.	Equipments:
5.1	UV-Visible Spectrophotometer
5.2	Analytical balance Sensitivity 0.01mg
5.3	Fume hood
5.4	Water bath (100 °C)
5.5	Vortex Mixer
5.6	Refrigerator
[6.	Materials and reagents:
6.1	Materials:
	6.1.1
	6.1.2
	6.1.3
	6.1.4
	6.1.5
	6.1.6
	6.1.7
	6.1.8
	6.1.9
	6.1.10
	6.1.11
6.2	Reagents:
	6.2.1
	6.2.2
	6.2.3
	6.2.4
[7.	Preparation of solutions:
7.1	Preparation of diluted Bovine Serum Albumin (BSA) standards: Each 1
ml ampule of 2.0 mg/ml (stock) albumin standard is used to prepare	
the curve as follows in microcentrifuge tube:	
Vial	Volume of
	Diluent
	A
	B
	C
	D
	E
	F
7.2	Preparation of BCA working Reagent (WR):
7.2.1	Use the following formula to determine total volume of WR
	required:
	sample) = Total volume of WR required
7.2.2	Prepare fresh working reagent by mixing 50 parts of BCA
	reagent A and 1 part of BCA reagent B.
	Note: when reagent B is initially added to reagent A,
	turbidity is observed that quickly disappears upon mixing to
	yield a clear-green Working Reagent.
[8.	Procedure:
8.1.	Pipette 0.1 ml of each standard, purified water (as standard blank),
and sample (diluted in case the concentration falls outside the	
calibration curve) into an appropriately labeled test tube in	
duplicates.	
8.2	Add 2.0 ml of Working reagent to each tube and vortex well.
8.3	Cover the tubes with Aluminium foil and incubate at 60°C in a water
bath for 30 minutes.	
8.4	Cool all the tubes to Room temperature.
8.5	Set the wavelength in spectrophotometer at 562 nm, Zero the
absorbance of standard blank and measure the absorbance of	
calibration curve and finally measure the absorbance of test	
samples.	
8.6	Note that all the readings of the assay tubes should be taken within
30 mins. of completion of the assay and maximum 10 samples should be	
analysed in one single assay.	
8.6	Calculations:
8.6.1	Proceed for calculations starting from the Calibration curve
	prepared The calculations are made according to the equation
	of minimum squares.

			Y = mX + b
			Where: m = slope
			b = intercept
			Y = absorbance
			X = concentration
			(Multiply by dilution factor)
		8.6.2	Use EXCEL programme for the preparation of calibration curve
		and Calculation of the results (Multiply by the dilution	
		factor).	
		8.7	Acceptance criteria:
		8.7.1	The coefficient of variation (CV) between the replicates of
		the standards should be $\leq 10\%$.	
		The Calibration curve is accepted if it is meeting the	
		parameters of Regression of ≥ 0.99 .

	9.9	RD	: Research and Development
	9.10	QA	: Quality Assurance

1.0 Purpose:

To lay down the procedure for the detection and identification of CRM197 protein by Western Blot method.

2.0 Scope:

This standard testing procedure is applicable to the purified protein samples of CRM197.

3.0 Responsibility:

3.1 Qualified Analysts shall be responsible for the preparation and execution of this STP.

3.2 Group leader shall supervise and check that the STP is followed properly.

3.3 Head, QC and Incharge, QA shall be responsible for the implementation and compliance of this STP.

4.0 Materials and Equipments:

4.1 Methanol

4.2 Glycine

4.3 Tris

4.4 Tween 20

4.5 NaCl

4.6 Skimmed Milk

4.7 Immobilon-P PVDF membrane

4.8 Mini Trans-Blot Electrophoretic Transfer Cell (BIORAD).

4.9 Gel who's SDS-PAGE has been run as per SOP No. BB/QC/CRM/001

4.10 Milli Q water.

4.11 Anti-Diphtheria Toxin Polyclonal Antibody, HRP conjugate (Ray Biotech, USA, Cat. No. DS-PB-00646).

4.12 DAB Tablets (Amresco, Biotechnology Grade, Cat. no. E733).

4.13 Powder free nitrile gloves.

4.14 Sodium dihydrogen orthophosphate, dihydrate, $\text{NaH}_2\text{PO}_4 \cdot 2\text{H}_2\text{O}$

4.15 Disodium hydrogen orthophosphate anhydrous, Na_2HPO_4

4.16 Plastic trough

4.17 Hydrogen peroxide

4.18 Gel Rocker

4.19 Densitometer (BIORAD).

4.20 Powerpack (Biorad, Model-Basic).

4.21 Weighing Balance (Mettler Toledo).

4.22 Single channel adjustable volume micropipette, 2-20 μl , 20-200 μl and 100-1000 μl .

4.23 Falcon tubes 15 ml

5.0 Definitions/ Abbreviations:

5.1 SM : Skimmed Milk

5.2 PBS : Phosphate Buffer Saline

5.3 PVDF : Poly Vinyl Di-fluoride

5.4 DAB : Diaminobenzidine

5.5 CRM : Cross Reacting Material

5.6 HRP : Horseradish peroxidase

5.7 NaCl : Sodium Chloride

5.8 Na_2HPO_4 : Disodium hydrogen Orthophosphate anhydrous

5.9 $\text{NaH}_2\text{PO}_4 \cdot 2\text{H}_2\text{O}$: Sodium dihydrogen orthophosphate dehydrate

5.10 H_2O_2 : Hydrogen Peroxide

6.0 Procedure:

6.1 Preparation of reagents:

6.1.1. Transfer buffer (pH 8.3): Dissolve 3.0285 g Tris base and 11.25 g of Glycine in 500 ml of milli Q water. To this, add 100 ml of methanol and make up the volume to 1000 ml with milli Q water. Store this buffer at 2-8°C. Transfer buffer can be re-used 4-5 times.

6.1.2. 0.05M Phosphate Buffer Saline (PBS), pH 7.2±0.2: Dissolve 8.5 of NaCl, 6.36g of $\text{NaH}_2\text{PO}_4 \cdot 2\text{H}_2\text{O}$ and 2.28g of Na_2HPO_4 in 900 ml milli Q water and make up to 1000 ml after checking pH. Adjust pH to 7.2± 0.2 with HCl.

6.1.3 Phosphate Buffer Saline with Tween 20 (PBST). To 1 litre of PBS 0.05M as prepared above, add 500 μl of tween 20 to it. Mix and can be stored at room temperature for one month.

6.1.4 Blocking buffer (3% skimmed milk in PBST): Dissolve 3gm of SM in PBST and make up the volume to 100ml. Make fresh every time.

6.1.5 Preparation of DAB substrate: Dissolve one DAB tablet in 10ml of milli-Q water. Just before use add 0.1% H_2O_2 . Prepare fresh during blot development and use within one hour.

6.2 Method:

6.2.1 Cut the Immobilon-P PVDF membrane of appropriate size and then immerse it in absolute methanol for 15 seconds and then into milli Q-water for two minutes. Equilibrate the membrane for at least 5 minutes in the transfer buffer.

6.2.2 Dip the sponges in Transfer Buffer.

6.2.3 Remove the gel from SDS-PAGE assembly and immerse it in

transfer buffer for 15 minutes to equilibrate.

6.2.4 Sandwich the gel & PVDF membrane in the gel cassette as follows:

6.2.5 Black cassette cover (Cathode)

Pre-wet sponge

Equilibrated gel

Pre-wet membrane

Pre-wet sponge

Red cassette cover (Anode)

6.2.6 Dip the gel cassette in the transfer buffer in the tank completely and cover the trans blot apparatus with the lid.

6.2.7 Blot the protein using the setting: 1.6V for 1.5 to 2 hours.

6.2.8 Remove the blot from the apparatus.

6.2.9 Immerse the protein transferred PVDF membrane in blocking buffer (i.e. 3% SMPBST on gel rocker for half hour and then keep the blot at 2-8oC for overnight).

6.2.10 Wash the membrane three times for 10 minutes each with PBST and one time with PBS on gel rocker.

6.2.11 Treat the blot with 1:200 dilution of anti-diphtheria toxin polyclonal antibody (50 µl of antibody in 10ml of PBST) for 2 hours on gel rocker.

6.2.12 Wash the membrane thrice for 10 minutes each with PBST and one time with PBS on gel rocker.

6.2.13 Add freshly prepared DAB substrate to the blot.

6.2.14 Observe for the appearance of CRM197 protein band along with two fragments A and B if any. Dry the blot by pressing between the layers of the filter paper.

6.3 Analysis of developed western blot:

6.3.1 Photograph and scan the developed blot in BIORAD densitometer and save for record. Make western blot report mentioning CRM197 protein sample, standard and marker details in Annexure 1.

6.3.2 Look for the presence of the intact CRM197 protein (major band, 59kD), two smaller more lighter bands as fragment A (21kD) and fragment B (37 kD) if any when compared with CRM 197 standard and maker. Detection of these bands also confirms the identity of CRM197 protein.

8.0 Annexures:

8.1 Format for "Detection of CRM197 by Western Blot" – Annexure 1.

S. No. | Tests | Acceptance limits

1 | Physical Appearance | Transparent Liquid of light yellow color, without suspended particles

2 | pH | 7.00 ± 0.20

3 | HBsAg (antigen) content*(ELISA) | 0.20 mg/ml

4 | Total Protein content (Lowry) | 0.22 mg/ml

5 | Protein content (OD @ 280 nm) | 0.30 mg/ml

6 | Specific Activity of HBsAg | 90.00%

7 | Antigen Purity (SDS-PAGE) | 95.00 % (Monomeric and dimer band)

8 | Purity by Chromatography | 95.00 % (Area under the Major peak)

9 | Host Cell Protein content | $< 100 \text{ ng} / \text{mg}$ of protein

10 | Host Cell DNA content | $< 100 \text{ pg} / 20 \text{ }\mu\text{g}$ of protein

11 | Carbohydrate Content | $< 10 \text{ }\mu\text{g} / 20 \text{ }\mu\text{g}$ of protein

12 | Cesium Content | $< 1 \text{ }\mu\text{g} / 20 \text{ }\mu\text{g}$ of protein

13 | Lipid Content | $20.00 \text{ }\mu\text{g} / 20 \text{ }\mu\text{g}$ HBsAg

14 | Potassium Thiocyanate Content | $1.00 \text{ }\mu\text{g} / 20 \text{ }\mu\text{g}$ HBsAg

15 | Endotoxin content | 30 EU / 20 μg HBsAg

16 | Sterility | There should be no evidence of microbial growth within 14 days of incubation.

* Test for antigen content also serves as test for identity. | * Test for antigen content also serves as test for identity. | * Test for antigen content also serves as test for identity.

1.0 |Objective |
 |To lay down the procedure for irreversibility test on bulk purified |
 |Diphtheria toxoid. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to the batches of bulk |
 |purified Diphtheria toxoids. |

5.1.12	Incubator at 37 0 + 20 C	
5.1.13	Cold room at 2 – 8 0 C	
5.2	Preparation of solutions	
5.2.1	Physiological saline (0.9% w/v)	
Add 0.9 gm of weighed Sodium Chloride to 50ml of purified		
water, mix well and make up it to 100ml.		
5.2.2	50% w/v 2- phenoxyethanol Solution	
Add 50mg of weighed 2- phenoxyethanol to 50ml of purified		
water, mix well and make up it to 100ml.		
5.3	Diluent Preparation:	
Take 1.0 mL of 2- phenoxyethanol solution and transfer it in to a		
glass bottle containing 99.0 mL of Physiological Saline.		
5.4	Sample preparation and incubation:	
5.4.1	Prepare the biosafety cabinet for aseptic operation.	
5.4.2	Calculate the required quantity of bulk and diluent solution	
for the preparation of 100 mL sample containing 80 Lf/ml from		
its estimated Lf/mL.		
5.4.3	Dilute the sample (of known Lf/mL) to contain 80 Lf/mL using	
the diluent. Prepare 100 mL of diluted test sample. The		
dilution shall be done in two steps ensuring usage of at least		
1 mL of sample in the first step.		
5.4.4	Distribute the diluted sample in to two sterile vials labeled	
as "A" and "B", in two equal parts i.e. 50 mL in each bottle.		
5.4.5	Incubate Bottle "A" having 50 mL diluted sample at 37 + 20 C	
in incubator for 42 days (6 weeks).		
5.4.6	Expose the Bottle "B" having 50 mL of diluted sample at 2-80C	
in cold room for 42 Days (6 weeks).		
5.4.7	Label the each bottles appropriately before incubation.	
5.5	Preparation of test animals:	
5.5.1	Take one healthy Guinea Pigs weighing 250 to 350g.	
5.5.2	Apply soap solution to the abdominal area of guinea pigs and	
use wet cotton to produce lather for shaving.		
5.5.3	Shave the hairs by using razor. Care should be taken to avoid	
bruises over the skin. Clean the body by using cloth/cotton.		
5.5.4	Use the animal for inoculation after body gets dried.	
5.5.5	Mark Guinea pig with appropriate color scheme.	
5.6	Inoculation and observation:	
5.6.1	Inject 0.2 mL of the sample from Bottle "B" incubated at 2-8°C	
in the depilated skin of the flank region through intra-dermal		
route.		
5.6.2	Mark the site of inoculation by encircling using a permanent	
marker and label it as "B".		
5.6.3	Similarly inject 0.2 mL of the sample from Bottle "A"	
incubated at 37 + 20 C and mark the encircled area as "A".		
5.6.4	Inject similarly on the other side of the abdomen in the	
depilated skin of the animal and do the same procedures as		
mentioned above.		
5.6.5	Observe the injection site after 24 hours. Look for reactions	
like redness, inflammation and thickening of skin.		
5.6.6	Again observe injection site after 48 hours and look for any	
increase or decrease in the reactions as compared to 24 hour		
observations. Note any necrotic reactions at the injection		
site.		
5.6.7	If there is any inflammatory reaction, use a scale to measure	
the redness and inflammation at the spot of injection.		
5.6.8	Perform autopsy on dead animal if any during the test and	

		examine for symptoms of diphtheria intoxication (red adrenals)
		and record the observation.
5.7	Validity Criteria:	
	5.7.1	The test is valid if, the control sample (incubated at 2-8°C)
	shows no intradermal reaction i.e., redness, inflammation and	
	erythema.	
5.8	Acceptance criteria	
	5.8.1	The bulk purified Diphtheria toxoid passes the
	irreversibility test if there is no	
	Intradermal reaction i.e., redness, inflammation and	
	thickening of skin is observed in both the control sample and	
	the test sample.

	use.
	5.3.1
	5.3.2
	5.3.3

||| |5 |

||| |Note: Each dilution should be vortexed for at least 30 seconds |

||| |prior to proceeding to the next dilution. |

|| |5.3.4 |Preparation of samples: |

|| |5.3.4.|For this, calculate the Maximum Valid Dilution (MVD) of |

|| |1 |the sample in which endotoxin has to be detected. The |

|| |formula for calculating the MVD value is given below: |

|| |where: |

|| | = Endotoxin limit of sample |

|| | = Potency (concentration) of sample in 1 ml |

|| | = Sensitivity of LAL |

|| |Then the sample is diluted to its MVD value using LAL |

|| |Reagent water. |

|| |5.3.4.|Preparation of Product Positive Control (PPC): |

|| |2 |For this, dilute the samples according to MVD/2 value |

|| |with LAL Reagent Water. Then take 0.2 ml of this |

|| |dilution and add 0.2 ml of 4 λ standard endotoxin. |

|| |5.3.4.|Mark the reaction tubes for different dilutions of |

|| |3 |standard endotoxin, all product positive controls, |

|| |samples and negative controls in duplicates. |

|| |5.3.4.|Carefully transfer 0.1 ml of different dilutions of |

|| |4 |standard endotoxin, sample (appropriately diluted to MVD|

|| |value), PPCs and negative control into the appropriately|

|| |marked reaction tubes. |

|| |5.3.4.|Then add 0.1 ml of the reconstituted lysate to each tube|

|| |5 |beginning with the highest concentration of standard |

|| |endotoxin followed by negative control, test samples and|

|| |PPCs. |

|| |5.3.4.|Following the addition of lysate, incubate the tubes at |

|| |6 |37°C for 1 hour in a tube heating block. |

|| |Note: Assay tubes should not be disturbed prior to the |

|| |specified time of 1 hour. |

|| |5.3.4.|After 1 hour of incubation examine each reaction tube |

|| |7 |for gelation. |

|| |5.3.4.|A positive reaction is indicated by a firm gel that |

|| |8 |remains intact momentarily when tube is inverted at |

|| |180°. |

|| |5.3.5 |Results: |

|| |Gel Clot Method: The results are expressed as endpoint (the |

|| |endpoint dilution is the last dilution of endotoxin which still|

|| |yields a positive result). |

|| |Example for reporting results with Lysate of sensitivity 0.06 |

|| |EU/ml |

|| |Rep. |Endotoxin Dilutions (EU/ml)| | PPC |Endpoint|

|| | |LRW |Sample| EU/ml |

1.0 |Objective |
 |To lay down the procedure for determining the Opacity (Cell concentration) |
 |of Bordetella Pertussis cell suspension by comparing with 5th International|
 |Reference Preparation. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to all the samples of Cell |
 |bank, In process, ARM and other samples of Bordetella Pertussis used during|
 |analysis wherever opacity has to be determined. |
 3.0 |Responsibility |
 |3.1 |The Analyst shall be responsible for carrying out the procedure as |
 |established in this SOP. |
 |3.2 |Supervisor shall be responsible for verifying that the same has been |
 |carried out correctly. |
 |3.3 |Head QC or his designee shall be responsible for overall compliance |
 |of the SOP. |
 4.0 |Abbreviations and Definitions |
4.1	SOP	: Standard Operating Procedure
4.2	QA	: Quality Assurance
4.3	QC	: Quality control
4.4	I.O.U	: International Opacity Units
4.5	mL	: milliliter
5.0	Procedure:	
5.1	Equipment, Materials and Reagents	
5.1.1	5th International Reference Preparation of Opacity tube (10	
	IOU/ mL) (NIBSC code: 76/522)	
5.1.2	Auto pipettes	
5.1.3	Test tubes	
5.1.4	Test tube rack	
5.1.5	Vortex mixture	
5.1.6	Physiological saline (0.9% w/v)	
5.2	Preparation of solutions	
5.2.1	Physiological saline (0.9% w/v)	
	Add 0.9 gm of weighed Sodium Chloride to 50ml of purified	
	water, mix well and make up it to 100ml.	
5.3	Test procedure	
5.3.1	For fermenter cultures take neat sample and perform the test.(	
	As per Table 1)	
	S. No.	Volume of the
	sample	Physiological
		(mL)
		(mL)
	1	Neat sample
	2	5.0
	3	5.0
	4	5.0
	5	5.0
	6	5.0
	7	5.0
	Opacity (IOU/mL) = Final dilution which matches with the	
	opacity reference tube x 10	
	= 2.4 X 10 = 24 opacity units / mL	
5.3.2	In case of harvest culture and bulk dilute the sample with 10	
	fold difference and compare with the standard opacity tube. (	
	As per Table 2)	
	S.No.	Volume of the
	sample	Physiological
		(mL)
		(mL)
	1	1.0
	2	1.0
	3	1.0
	4	1.0
	5	1.0
	Details of further dilutions of the dilution showing turbidity	
	greater than opacity standard, Dilution fold selected for	
	further dilutions 30 Fold	
	S.No.	Volume of the
	sample	Physiological
		(mL)
		(mL)
	1	1.0
	2	1.0
	3	1.0
	4	1.0
	Opacity (IOU/mL) = Final dilution which matches with the	

		opacity reference	
		tube x 10	
		= 33 X 10 = 330 opacity units / mL	
	5.3.3	Select the highest dilution which is showing more turbidity	
		than the standard tube and perform further dilutions to obtain	
		the exact opacity units.	
	5.3.4	Compare the above dilutions with 5th International reference	
		standard opacity tube against a dark background or a written	
		page.	
	5.3.5	Compare the dilutions with standard tube until the opacity of	
		the sample matches and consider that particular dilution fold	
		multiplied by 10 IOU of the opacity standard tube as the	
		opacity of the sample.	
	5.3.6	Even though the final opacity of the sample is assigned the	
		successive dilution should be done and compare with the opacity	
		standard tube in order to prove the dilution is less turbid	
		than standard opacity tube and hence the previous dilution made	
		can be taken as the final dilution.	
	5.3.7	Record the results.	
	5.3.8	Calculation/ Formula:	
		5.3.8.1	Opacity (IOU/mL) = Final dilution which matches with
		the opacity	
		reference tube x 10	
		Note: 10 is the Opacity units of the International	
		reference Standard Opacity tube	
		IOU = International Opacity Units, 1 IOU = 1 x 10⁹	
		organisms/mL	
	5.3.8.2	For example:	
		For harvest sample at 30 fold the sample is matching	
		with the standard opacity tube the opacity of the	
		sample is considered as the following.	
		Opacity of the harvest sample = 30 x 10 = 300 IOU/ mL

S. No | Test/Assay | Acceptance Criteria

1 | Physical appearance | White or almost white translucent suspension, settles into a clear liquid and gel phase on sedimentation.

2 | pH | 6.40 – 7.20

3 | In-vivo potency test of Hepatitis B surface antigen (In vivo potency and ELISA) | Upper confidence limit of relative potency should be > 1.0

4 | In-vitro potency* test of Hepatitis B surface antigen (ELISA method) | Upper confidence limit of relative potency should be > 1.0

5 | Adsorbed Antigen content | % adsorption of HBsAg > 80

6 | Aluminum content | Not more than 1.25mg/Single human dose

7 | Thiomersal Content (if applicable) | ≤ 0.1 mg/ml

8 | Endotoxin Content | ≤ 5 EU/Single human dose

9 | Abnormal toxicity | No signs of necrosis, illness or death should be observed in any of the animals during the 7 days incubation period

10 | Sterility | There should be no evidence of microbial growth within 14 days of incubation.

* Test for In vitro potency also serves as test for identity. | * Test for In vitro potency also serves as test for identity. | * Test for In vitro potency also serves as test for identity.

Date : 05-May-2016

CERTIFICATE OF ANALYSIS

Product: Bulk of Diphtheria Toxoid

Product code no.: B/DT 003

Appearance: Clear, Light yellowish brown solution without suspended particles

Form: Liquid

Buffer: Physiological saline

Manufacturing Date: April 2015

Expiry Date: Mar 2020

Antigen Content: 2000 Lf/ml

Antigenic Purity: 1800 Lf/mg of Protein Nitrogen

Sterility: Sterile Product

pH: 6.7

Specific Toxicity: Complied

Identity: Positive

Free formaldehyde: 0.06g/ L

Irreversibility of toxoid: Complied (No irreversibility observed)

Storage: 5±3°C (Do not freeze)

Note: To be used for research or in-vitro testing purpose only

5.0	Procedure:
5.1	Preparation of solutions:
	5.1.1
	5.1.2
	5.1.3
	5.1.4
	5.1.5

	5.1.6	Gel running buffer (10X)
		Weigh 30.2 g Tris, 144 g Glycine and 10 g SDS & dissolve in
		800ml of Milli-Q water. Adjust the pH to 8.3 with HCl & make
		up the volume to 1000 ml.
	5.1.7	Sample Solubilising Buffer (6X)
		Mix 2.4 ml of 0.5M Tris (pH 6.8), 3 ml of Glycerol, 3 ml of
		20% SDS. 6 mg of Bromophenol blue. 1.6 ml of
		β-mercaptoethanol and make up the volume to 10 ml. Make
		aliquots of 1ml each and store at -20°C. For running samples
		in non reducing condition, do not add β-mercaptoethanol in
		sample solubilizing buffer.
	5.1.8	Coomassie Brilliant Blue stain:
		Weigh 1 g of Coomassie Brilliant Blue R250* and dissolve in
		100 ml of methanol, add 20 ml of glacial acetic acid and make
		up the volume to 200 ml with Milli-Q water Keep on magnetic
		stirrer for at least half an hour for proper dissolution.
	5.1.9	Destain Solution
		Mix 40 ml of methanol, 10 ml of glacial acetic acid and make
		up the volume to 100 ml with Milli-Q water. Prepare fresh at
		the time of destaining the gel.
	5.2	Casting of gel
	5.2.1	Clean the glass plates with detergent followed by washing
		with Milli-Q water and fix them in the casting frame.
	5.2.2	Prepare 12.5% Separating Gel mixture (7.5 ml) in a falcon
		tube consisting of following reagents:
		30% Acryl amide-3.125 ml
		1.5 M Tris (pH 8.8) — 1.875 ml
		20% SDS — 0.15 ml
		Milli-Q water — 2.275 ml
		10% APS- 75 µl
		TEMED- 5 µl
		Mix the contents gently by inverting the tube two-three times
	5.2.3	Immediately pour 12.5% Separating Gel mixture between the two
		glass plates leaving 4-5 cm space above for Stacking Gel and
		overlay it carefully with Milli-Q water.
	5.2.4	Prepare the Stacking Gel mixture (3.75 ml) in a tube
		consisting of following reagents:
		30% Acrylamide- 0.625 ml
		0.5 M Tris (pH 6.8) - 0.9375 ml
		20% SDS-0.075 ml
		Milli-Q water —2.0 ml
		10% APS-50 µl
		TEMED – 5 µl
	5.2.5	Pour the stacking gel mixture over the surface of the
		polymerized separating gel and immediately insert the 10-well
		comb of 0.75mm.
	5.2.6	Allow the gel to polymerize for 10 minutes.
	5.2.7	Dilute the 10X gel running buffer to 1 X by mixing 100 ml of
		the 10X stock solution in 900 ml of Milli-Q water.
	5.2.8	Remove the comb from the gel and fix the glass plate
		containing polymerized gel set on the gel cassette sandwich
		of the electrophoresis assembly.
	5.2.9	Add 1 X gel running buffer between and around the buffer tank
		of electrophoresis assembly.
	5.3	Standard and Sample Preparation :
	5.3.1	Take 0.05 mL of 10 mg/mL Reference solution/sample and
		diluted with 0.45 mL of purified water to obtain a
		concentration of 1 mg/mL.
	5.3.2	Take 5 µL of 1 mg/mL Reference solution/sample and added 8 µL
		of sample buffer (- β mercaptoethanol) and 27 µL of purified
		water to obtain a concentration of 5 µg.
	5.3.3	Loaded 20 µL of 5 µg Reference solution to obtain a
		concentration of 2.5 µg.
	5.4	Running SDS-PAGE gel:
		Connect the gel apparatus (the negative and positive electrodes)
		with the power pack and set the power pack at 300V for 45 min or
		until the dye front reaches at the bottom of the separating gel.
		Stop the power pack once dye front reaches at the bottom of the
		separating gel.
	5.5	Staining and de-staining of the gel:
	5.5.1	Once the gel run is over, remove the gel from the plate and
		place the gel in staining solution in a plastic tray for 20
		minutes with gentle agitation on gel rocker.
	5.5.2	De-stain the gel with de-staining solution to remove the
		extra stain till the gel background becomes clear and all the
		bands become clearly visible.
	5.6	Analysis of SDS-PAGE gel :
	5.6.1	After destaining, scan the gel in using densitometer and
		save for record

CERTIFICATE OF ANALYSIS
For BioBridge Healthcare Solutions Pvt. Ltd.
Authorized Signatory
Product: | Bulk of Diphtheria Toxoid
Product code no.: | B/DT 003
Appearance: | Clear, Light yellowish brown solution without suspended particles
Form: | Liquid
Buffer: | Physiological saline
Manufacturing Date: | April 2015
Expiry Date: | Mar 2020
Antigen Content: | 2000 Lf/ml
Antigenic Purity: | 1800 Lf/mg of Protein Nitrogen
Sterility: | Sterile Product
pH: | 6.7
Specific Toxicity: | Complied
Identity: | Positive
Free formaldehyde: | 0.06g/ L
Irreversibility of toxoid: | Complied (No irreversibility observed)
Storage: | 5±3°C (Do not freeze)
Note: To be used for research or in-vitro testing purpose only | Note: To be used for research or in-vitro testing purpose only

- * PS: Polysaccharide
- S. No | Test/Assay | Specifications
- 1 | Appearance | White Powder or Lump
- 2 | Identity | Should react with specific antibodies
- 3 | Sialic Acid Content | ≥ 80 % of dry weight of MenC Ps
- 4 | O acetyl Content | ≥ 1.5 mmol/gm of dry weight of MenC Ps
- 5 | KD Molecular Size Distribution | $\geq 75\%$ KD= 0.5
- 6 | Moisture content | To report results
- 7 | Protein Content | ≤ 1.0 % of dry weight of MenC Ps
- 8 | Nucleic acid content | ≤ 1.0 % of dry weight of MenC Ps
- 9 | Cell Wall polysaccharide content | ≤ 1.0 % of dry weight of MenC Ps
- 10 | Endotoxin content | < 25 IU/ μ g of MenC Ps
- 11 | Residual CTAB Content | ≤ 1.0 % of dry weight of MenC Ps
- 12 | Residual Formaldehyde | ≤ 1.0 % of dry weight of MenC Ps
- 13 | Residual DOC content | ≤ 1.0 % of dry weight of MenC Ps

[1.0]Objective: |
 |To lay down the procedure for the determination of free carrier protein|
 |in PRP-TT conjugate (bulk conjugate) of Haemophilus Influenzae type b |
 |conjugate vaccine. |
 [2.0]Scope: |
 |This Standard Operating Procedure is applicable for the determination |
 |of free carrier protein present in bulk conjugate of Haemophilus |
 |Influenzae type b conjugate vaccine. |
 [3.0]Abbreviations and Definitions: |

3.19	μg	: microgram
3.20	SST	: System Suitability Test
3.21	System Suitability test : System suitability tests are an integral	
part of gas and liquid chromatographic methods. They are used to		
verify that the resolution and reproducibility of the		
chromatographic system are adequate for the analysis to be done.		
The tests are based on the concept that the equipment,		
electronics, analytical operations and samples to be analyzed		
constitute an integral system that can be evaluated as such.		
[4.0]Procedure		
4.1	Precautions to be taken:	
4.1.1	Always wear laboratory coat.	
4.1.2	Always use filtered solutions. Filtration of solution should	
	be done in order to eliminate the entry of possible	
	particles, if any, into the system as well as the column.	
4.1.3	Degas all solutions.	
4.1.4	Avoid entry of bubbles into the system as well as column.	
4.1.5	All the solution bottle openings should be well covered with	
	aluminum foil.	
4.1.6	Check the calibration status of all equipment and	
	instrument.	
4.2	Requirement:	
4.2.1	Equipment:	
	4.2.1.1	Calibrated HPLC System with ChemStation software.
	4.2.1.2	Ultrasonic Cleaner
	4.2.1.3	Vacuum Pump
4.2.2	Instrument:	
	4.2.2.1	pH Meter
	4.2.2.2	Magnetic stirrer
	4.2.2.3	Precision balance
	4.2.2.4	Analytical balance
4.2.3	Materials:	
	4.2.3.1	TSK gel G3000SWXL column {30cm(l), 7.8mm(i.d)}
	4.2.3.2	Laboratory Glassware
	4.2.3.3	Screw cap vials
	4.2.3.4	Solvac Filter Holder
	4.2.3.5	Nylon 6,6 membrane 0.20/0.22/0.45 μm membrane
	filter	
	4.2.3.6	Auto pipettes (10-100μL), (20-200(L), (100-1000(L)
	4.2.3.7	Tips for the Auto pipettes
4.2.4	Reagents:	
	4.2.4.1	Sodium Chloride (NaCl)
	4.2.4.2	Disodium hydrogen phosphate anhydrous (Na₂HPO₄)
	4.2.4.3	Sodium dihydrogen phosphate monohydrate
	4.2.4.4	Purified water
4.3	Preparation of solutions:	
	Prepare all the solutions as described below and Carry out the	
	labelling of the prepared solutions and assign the lot numbers.	
4.3.1	Isopropyl alcohol 70%	
	Take 700 mL of 2-propanol in a volumetric flask and make up	
	the volume to 1000 mL with Purified Water. This solution can	
	be stored at room temperature for 3 months.	
4.3.2	Solution I: [Na₂HPO₄ (0.1M), NaCl (0.1M)] For a volume of	
	1000 mL, weigh 14.19 g of Na₂HPO₄and 5.84 g of NaCl and	
	Dissolve in 700mL of purified water in a volumetric flask	
	and make up the volume to 1000mL. Prepare fresh before use.	
4.3.3	Solution II: (NaH₂PO₄.H₂O, 0.1 M) : For a volume of 500 mL,	
	weigh 6.85g of NaH₂PO₄.H₂O and dissolve in 400mL of	
	purified water in a volumetric flask and make up the volume	
	to 500mL. Prepare fresh before use.	
4.3.4	0.1M Sodium Phosphate buffer: (0.1 M Na₂HPO₄,0.1M NaCl	
	+0.1M NaH₂PO₄.H₂O, pH 7.0)	
	For a volume of 1000mL, take approximately 600mL of	

			Solution I and 400mL of Solution II. The pH of the solution
			should be 7.0 ± 0.2. Use the mobile phase within four days
			from the date of preparation if it remains clear and no
			turbidity or fibers observed in it.
		4.3.5	Column Preservation Solution: Prepare and use it.
		4.3.6	1 mg/mL of p-Aminobenzoic Acid Stock: For a Volume of 5 mL,
			weigh: 5 mg of p-Aminobenzoic acid (4-Aminobenzoic acid)
			and Dissolve in 5mL of purified water and make up the
			volume to 5mL.
		4.3.9	Working standard of p-Aminobenzoic Acid :Dilute 1 mg/mL of
			the stock solution to 1/10 with purified water.
			Note: All the solutions prepared for use are vacuum
			filtered using Nylon 6, 6 membrane 0.20 µm or 0.22 µm ,
			depending upon the nature of solution to be filtered. For
			organic solvents 0.45µm filters should be used (filtration
			not necessary if the solution is prepared in 0.2 µ filtered
			purified water).
		4.4	Preparing the HPLC System for run, Agilent Series:
		4.5	Run Conditions:
		4.5.1	Load method HIBTT FREE PROTEIN.M.
		4.5.2	Flow Rate: 0.75 mL/min
		4.5.3	Detection Wavelength: 280nm
		4.5.4	Run time: 20 minutes
		4.6	Equilibration of the system and the column:
			Equilibrate the column with mobile 0.1 M sodium phosphate buffer
			at 280nm until a stable baseline is observed on the online plot
			window.
		4.7	Sample Preparation and Application:
		4.7.1	Test sample and standards are loaded in screw cap vials and
			placed against the appropriate no. on the sample tray by
			clearly marking the screw cap vial.
		4.7.2	Load the required volume of sample as per the PRP
			concentration equivalent to 2.5 µg in the sample vial.
			Example: If a sample has a PRP concentration of 0.5 mg/mL,
			to calculate volume required for 2.5 µg of protein,
			0.5 mg (500 µg) ----1 mL
			2.5 µg-----X mL
			X mL = 2.5 µg x 1 mL
			500 µg
			X mL = 5 µL
			Therefore, 5 µL of volume is taken for sample having PRP
			concentration of 0.5 mg/mL.
		4.8	Running of sequence:
		4.8.1	Load sequence HIBTT FREE PROTEIN.S
		4.8.2	Open the sequence parameter option by clicking Sequence
			menu.
		4.8.3	Enter information about the data directory and operator
			name.
		4.8.4	In the shutdown option, click on the post-sequence option
			and select LAMPOFF/STANDBY.
		4.8.5	In sequence table option, specify the sample names, methods
			and vials to run in the sequence as per the following
			table:

S	No	Sample Code	Sample details	No. of	Injection
1	1	Blank	Eluent Blank	1	10
2	2	p-Aminobenzoic	System	6	1
3	3	Blank	Eluent Blank	1	10
4	4	Test Sample(s)	Sample	1	2.5µg of
					PRP

		5.8.6	Click on run sequence option in run control menu to start	
			the sequence.	
		5.8.7	Each sample run will be of 20 min. and after running all	
			the samples the sequence will automatically stop.	
		5.8.8	Inject the eluent blank after every 20 injections.	
			One extra vial with same SST sample can be used if 6	
			injections are not possible from single vial.	
		4.9	Calculations :	
			Area under curve for the standards/sample is analyzed by	
			Chemstation software.	
		4.9.1	Open the acquired chromatogram in the data analysis view in	
			the offline copy of the software.	
		4.9.2	Optimize integration with initial events in the signal	
			specific events table.	
		4.9.3	Enter the value of retention time of peak maxima in	
			integration with timed events option.	
		4.9.4	The percentage of free carrier protein in sample is	
			calculated by taking the percentage area of the peak maxima	
			corresponding to the lower molecular weight compared to the	
			peak maxima of higher molecular weight.	
		4.9.5	Calculations for System Suitability Test:	
			4.9.5.	Note the values of area under the curve and
			1	retention time for p-Aminobenzoic acid. (SST
			standard)	
			4.9.5.	Every time a sample is run with system suitability
			2	test, calculate the results for system suitability
			by creating a copy of Master EXCEL in the desired	
			folder and record the same.	
			4.9.5.	Attach the hard print of SST calculation along with
			3	chromatograms and the record form.

- | |4.10 |Acceptance Criteria : |
- | |4.10.1 |For System Suitability Test : |
- | | |4.10.1. |RSD calculated for Retention time should be <5.0%.|
- | | |1 |
- | | |4.10.1. |RSD calculated for Area should be <5.0%. |

CERTIFICATE OF ANALYSIS

Product: Bulk of Tetanus Toxoid

Product code no.: B/TT 002

Appearance: Clear, Yellow to brownish solution without any suspended particles

Form: Liquid

Buffer: Physiological Saline

Manufacturing Date: Feb 2015

Expiry Date: Jan 2020

Antigen Content: 2100 Lf/ml

Antigenic Purity: 1250 Lf/mg of Protein Nitrogen

Sterility: Sterile Product

pH: 6.6

Specific Toxicity: Complied

Identity: Positive

Free formaldehyde: 0.08g/ L

Irreversibility of toxoid: Complied (No irreversibility observed)

Storage: 5±3°C (Do not freeze)

Note: To be used for research or in-vitro testing purpose only

For BioBridge Healthcare Solutions Pvt. Ltd.

S. No. | Parameter | Specification

1 | Physical appearance | White lyophilized pellet which is resuspended using 0.9 % saline diluents.

2 | pH | 6.40 – 7.20

3 | Identity for Polysaccharide (PRP) | Line of precipitation should be observed on reaction against specific antibody

4 | Identity for Tetanus Toxoid | Line of precipitation should be observed on reaction against specific antibody

5 | Purified capsular polysaccharide – (PRP content) | 10 mcg ($\pm$ 20%) per single human dose of 0.5 ml (by chromatographic method)

6 | Tetanus Toxoid (carrier protein) | 19 to 30 mcg per single human dose

7 | Residual moisture | The average residual moisture content of all the vials analyzed should not be more than 2.5 %. And

None of the vial should have residual moisture content above 3%.

8 | Pyrogen content | Should pass the assay.

9 | Abnormal Toxicity | None of the animals should show any signs of illness or death during the 7 days of observation period.

10 | Sterility | No microbial growth should be observed during the 14 days of incubation period.

1.0	Objective		
	To lay down the procedure for determining the identity of diphtheria		
	component in vaccine.		
2.0	Scope		
	This Standard Operating Procedure is applicable to the diphtheria component		
	either single component or combined with other component by limes		
	flocculation test.		
3.0	Responsibility		
	3.1	The QC analyst shall be responsible for performing the described	
	procedure correctly.		
	3.2	Supervisor shall be responsible for verifying that the same has been	
	carried out correctly.		
	3.3	Head QC or his designee shall be responsible for overall compliance	
	of the SOP.

Test | Specifications

Organoleptic characteristics | A white to almost white suspension that separates in two phases on keeping.

Ph | 6.0 – 7.0

Specific Toxicity test for D & T component

(Invivo technique) | Animals should not show any ill health within six weeks of injection and at least 80% of the animals should survive the test period

Mouse Weight gain test for Inactivated w-B. pertussis component (In vivo technique) | Total weight of test animals in vaccine group on 3rd day should not be less than that on zero day and at the end of 7th day the average increase in weight in the vaccine group is not less than 60 % of that of in the control group

Potency test of Diphtheria Toxoid

(By challenge method) | ≥ 30 IU / SHD, the limit of the 95% confidence intervals of the estimated potency shall be within 50 to 200% of the estimated potency unless the lower limit of the 95% confidence interval of the estimated potency is greater than 30 IU /SHD. | ≥ 30 IU / SHD, the limit of the 95% confidence intervals of the estimated potency shall be within 50 to 200% of the estimated potency unless the lower limit of the 95% confidence interval of the estimated potency is greater than 30 IU /SHD.

Potency test of Tetanus Toxoid

(By challenge method) | ≥ 60 IU /SHD when test is carried out in mice. For three dilution assay, the limits of 95% confidence intervals of the estimate of potency shall be within 50 to 200% of the estimated potency unless the lower limit of the 95% confidence interval of the estimated potency is greater than 60 IU /SHD | ≥ 60 IU /SHD when test is carried out in mice. For three dilution assay, the limits of 95%

confidence intervals of the estimate of potency shall be within 50 to 200% of the estimated potency unless the lower limit of the 95% confidence interval of the estimated potency is greater than 60 IU /SHD

Potency test of Inactivated w-B. pertussis (By active challenge method) | ≥ 4.0 IU/ SHD (the lower fiducial limit (P= 0.95) of the estimated is not potency is less than the 2.0 IU).

Determination of PRP Content

(By HPAEC-PAD method) | Total PRP content = 16 to 24 μ g/ml

free PRP should be less than 20 % of total PRP content

In-vivo potency test of Hepatitis B surface antigen (In vivo potency and ELISA) | Upper confidence limit of relative potency should be > 1 .

In-vitro potency test of Hepatitis B surface antigen (ELISA method) | Upper confidence limit of relative potency should be > 1 .

Adsorption test of Diphtheria component | % adsorption of Diphtheria toxoid > 50

Adsorption test of Tetanus component | % adsorption of Tetanus toxoid > 30

Free formaldehyde content | Not more than 0.02% w/v (< 200 μ g/ml)

Aluminum content | ≤ 1.25 mg/ml.

Thiomersal content | ≤ 0.1 mg/ml

Abnormal toxicity test | No signs of sickness during observation period of 7 days

Extractable Volume | 0.60 ± 0.05 ml

Sterility | No microbial growth.

[1.0]Objective: |
	To lay down the procedure for the determination of protein concentration in
	Active Raw Material of Hepatitis B Vaccine based on the physical property
	of the proteins to absorb UV light at 280 nm. Since absorbance of this
	light and concentration of proteins are related, it is possible to
	calculate the concentration of protein with the help of extinction
	coefficient following Lambert – Beer's law.
[2.0]Scope:	
	This Standard Operating Procedure is applicable to the Active Raw Material
	(ARM) of Hepatitis-B vaccine (rDNA).
[3.0]Responsibility:	
	3.1

[1.0]Objective: |
|To detect and quantify mouse immunoglobulin (IgG) contaminants in samples by|
|using kit from Cygnus Technologies, Inc. |
[2.0]Scope: |
|This Standard Operating Procedure is applicable to the In process Samples |
|after immunoaffinity step and Active Raw Material (ARM) of Hepatitis-B |
|vaccine (rDNA). |
[3.0]Responsibility: |
|3.1 |The analyst of the Immunochemistry laboratory shall be responsible for |
|executing the described procedure correctly. |
|3.2 |The supervisor of the laboratory shall be responsible for verifying |
|that the procedure is followed correctly and for checking the results. |
|3.3 |The Departmental Head shall be responsible for the overall compliance |
|of the SOP and shall ensure that the SOP is reviewed every two years or|
|if required earlier. |

[5.0] Procedure |
|Note: Make sure that all the reagents are at room temperature before use. |
|5.1 |Pipette 50µl of Standards, controls and samples into wells. |
|5.2 |Pipette 200µl of anti-mouse immunoglobulin: alkaline phosphatase into|
|each well. |
|5.3 |Cover and incubate on dancing shaker at room temperature for 2 hour. |
|5.4 |Aspirate the contents to waste. Blot and vigorously bang out residual|
|liquid over absorbent paper. Wash generously with diluted wash |
|solution by flooding the wells with solution by pipeting in 300µl. |
|Dump and bang again. Repeat for a total of 4 washes. Wipe off any |
|liquid from the bottom outside of the microtiter wells as any residue|
|can interfere in the reading step. |
5.5	Pipette 200µl of substrate provided in the kit.
5.6	Cover and incubate for the plate for 60 minutes. Do not shake.
5.7	Read absorbance at 405/490nm using a ELISA reader.
5.8	Follow the given pathway to save the Absorbance obtained from ELISA
reader:	
5.8.1	File→Save Data/Template as →My Computer →D: →Raw Data from

			Microplate Manager→IgG→ In-Process Batches/Regular Batches ARM	
			/Stability Batches→ File Name → Save → File→ Print	
			Note: File Name is given as Batch No. of ARM in case of Regular	
			Batches, In-Process stage in case of In-Process samples and	
			Batch No./Type of Stability/Interval in case of stability	
			batches.	
			5.9	Raw data processing and interpretation of results:
			5.9.1	Open the ELISA_3 program following the pathway given below:
			My Computer→C: →ELISA→ELISA_3	
			5.9.2	Enter the values of Absorbance obtained, in ELISA_3 software as
			follows: In the column entitled "Val (X)" type the different	
			concentrations of standard. In the columns entitled "Serie 1"	
			and "Serie 2" type the corresponding absorbance values of	
			replicates 1 and 2 for each concentration of the standard.	
			5.9.3	Press F5 and select the option "Reg/Tipo". Further select
			Parabolica".	
			5.9.4	Press F3 to perform the regression, followed by ESC to return
			to the previous screen.	
			5.9.5	Press F4 key. In the column entitled "Muestras" type the name
			or code of the sample. For each sample take a row. Under the	
			columns entitled "Abs1" and "Abs 2" type the absorbance values	
			of the replicates 1 and 2 of the sample. In the column entitled	
			"Dil" type the dilution of the sample. Do not try to fill the	
			last column entitled "Conc." as the estimated concentration of	
			each dilution of the sample will automatically appear. The	
			calculated results of the samples expressed in the program are	
			given in ng/ml.	
			5.9.6	Press F5 key and select the option "Files" using the arrow keys
			and press "Enter". Further select "Buscar" to open an already	
			existing file or "Salvar" to save a new file. The file name is	
			a eight-digit code consisting date, month and year (DDMMYYXX).	
			Here DDMMYY is Date, Month, Year and XX is the serial no. of	
			the file saved on that particular day. Press "ESC" to return to	
			the previous screen.	
			5.9.7	Press F5 key and select the option "Imprimir" using the arrow
			keys. Further select "Reporte" and press "enter" to print the	
			regression report. In order to print the sample results, select	
			"Muestras" and press "Enter". Press "ESC" key to return to the	
			previous screen. In order to exit the program, again press	
			"ESC" key. When a message appears on the screen, whether to	
			exit or not, press "S" to exit and "N" to continue.	
			5.9.8	The print out of report shall be authenticated by signing the
			document by the doer and checker and attached with the data	
			record form.	
			5.10	Reporting of results:
			5.10.1	For In process samples the value (calculated using ELISA_3
			program) shall be reported in term of ng/ml) as the final	
			results.	
			5.10.2	For ARM samples the results shall be reported in terms of
			percentage IgG contaminants and the calculations are done as	
			follows:	
			IgG contaminants in terms of nanograms per dose (Z)**	
			=[Concentration* of IgG contaminants (ng/ml) × Quantity of	
			HBsAg per dose (ng/dose)] / [Protein concentration (ng/ml)]	
			Where:	
			Protein concentration of the sample = X ng/ml (Calculated	
			using O.D. at 280 nm	
			Concentration* of IgG contaminants (ng/ml) = Y* ng/ml	
			(Calculated using ELISA_3 program).	
			Percentage IgG contaminants =	
			IgG contaminants in ng per dose (Z)** × 100	
			Concentration of HBsAg (ng/dose)	
			5.11	Validity criteria:
			5.11.1	The coefficient of regression must be greater than 0.96.
			5.11.2	The coefficient of variation between the replicates of same
			point of standard curve must be less than 10%.

 5. |Procedure: |
 |5.1 |Equipment, Materials and Reagents | | |
 | |5.1.1 |Weighing balance |
 | |5.1.2 |Laminar air flow cabinet |
 | |5.1.3 |Autoclave |
 | |5.1.4 |Test sample |
 | |5.1.5 |Autopipettes |
 | |5.1.6 |Test tubes |
 | |5.1.7 |Test tube racks |
 | |5.1.8 |Glass vials, 10 ml |
 | |5.1.9 |Disposable syringes (2ml, 5 ml) |
 | |5.1.10 |Sodium Hydroxide |
 | |5.1.11 |Hydrochloric acid |
 | |5.1.12 |Sodium Chloride |
 | |5.1.13 |Peptone |
 | |5.1.14 |Purified Water |
 |5.2 |Preparation of solutions: |
 | |5.2.1 |Normal saline: |
 | | |Weigh 0.9 g of sodium chloride and dissolve in 60 ml of the |
 | | |purified water. Make up the volume up to 100 ml with |
 | | |purified water. |
 | |5.2.2 |Peptone water: |
 | | |Weigh 1 g of peptone and 0.5 g of sodium chloride. Dissolve |
 | | |in 60 ml of purified water. Make up the volume up to 100 ml |
 | | |with purified water. Sterilize by autoclaving at 121°C for |
 | | |20 minutes. |
 |5.3 |Selection of test animals: |
 | |5.3.1 |Select 116 guinea pigs weighing between 250 – 350 g at |
 | | |least one day before immunization. |
 | |5.3.2 |Preferably choose guinea pigs of the same sex. Otherwise |
 | | |equally distribute males and females in each group. |
 | |5.3.3 |Make six groups of 16 guinea pigs each and four groups of 4 |
 | | |guinea pigs each. |
 | |5.3.4 |Allocate three groups out of six to each of three dilutions |
 | | |of reference vaccine and other three groups to each of |
 | | |three dilutions of the test vaccine. |
 | |5.3.5 |Four groups of 4 guinea pigs each are to be used for LD₅₀ |
 | | |determination. Distribute all the guinea pigs in various |
 | | |groups by randomization. |
 | |5.3.6 |Mark each group of guinea pigs with appropriate color |
 | | |scheme. |
 |5.4 |Preparation of Vaccine dilution : |
 | |5.4.1 |Preparation of dilutions of reference vaccine: |
 | |5.4.2 |Dilute reference vaccine in normal saline so as to contain |
 | | |200 –300 IU/ml. Make further dilutions of the reference |
 | | |preparation as detailed below. |
 | | |5.4.2.1 |1/10 dilution: Add 1 ml of vaccine to 9 ml of |
 | | |normal saline and mix thoroughly. |
 | | |5.4.2.2 |1/50 dilution: Add 8 ml of 1/10 dilution of |
 | | |vaccine to 32 ml of normal saline and mix |
 | | |thoroughly. |
 | | |5.4.2.3 |1/100 dilution: Add 20 ml of 1/50 dilution of |
 | | |vaccine to 20 ml of normal saline and mix |
 | | |thoroughly. |
 | | |5.4.2.4 |1/200 dilution: Add 20 ml of 1/100 dilution of |
 | | |vaccine to 20 ml of normal saline and mix |
 | | |thoroughly. |
 | | |5.4.2.5 |Preparation of dilutions of test vaccine: Take |
 | | |test vaccine and dilute it following steps 5.4.2.1 |
 | | |to 5.4.2.4. |
 |5.5 |Immunization: |
 | |5.5.1 |Inject subcutaneously each of 16 guinea pigs in each group |
 | | |with 1.0 ml of appropriate dilution (1/50, 1/100 and 1/200) |
 | | |of test and reference vaccine allocated to that group. |
 | |5.5.2 |Keep the four groups of 5 guinea pigs each as uninoculated. |
 | |5.5.3 |Keep the immunized animals under observations for 28 days. |
 | | |The animals should show normal growth and good health |

			during the period of observation	
	5.6	Preparation of Challenge Diphtheria toxin:		
		5.6.1	Suitably dilute the stabilized diphtheria toxin in peptone	
			water in such a way that it contains approximately 100	
			LD50/ml.	
		5.6.2	1/25 dilution of challenge toxin: Add 1 ml of challenge	
			toxin prepared to 24 ml of peptone water. Mix it	
			thoroughly. (4LD50/ml)	
		5.6.3	1/50 dilution of challenge toxin: Add 5 ml of 1/25 dilution	
			of challenge toxin to 5 ml of peptone water. Mix it	
			thoroughly. (2 LD50/ml)	
		5.6.4	1/100 dilution of challenge toxin: Add 5 ml of 1/50	
			dilution of challenge toxin to 5 ml of peptone water. Mix	
			it thoroughly. (1 LD50/ml)	
		5.6.5	1/200 dilution of challenge toxin: Add 5 ml of 1/100	
			dilution of challenge toxin to 5 ml of peptone water. Mix	
			it thoroughly. (1/2 LD50/ml)	
		5.7	Inoculation of challenge toxin:	
			After twenty-eight days of immunization, inject all groups of guinea	
			pigs subcutaneously with 1.0 ml of the challenge toxin containing	
			approximately hundred times the 50% Lethal dose (100 LD50).	
		5.8	LD50 estimation:	
			Take four groups of 4 guinea pigs each (selected on the day of	
			immunization). Inject subcutaneously 1ml of challenge toxin	
			containing 4LD50, 2LD50, m, 1LD50 and ½ LD50 dose per ml respectively	
			in 4 guinea pigs each.	
		5.9	Observations:	
			Observe all the injected Guinea pigs daily and record the deaths	
		5.10	Calculations:	
			Count the number of surviving guinea pigs 5 days after injection of	
			the challenge toxin and calculate the potency of the vaccine being	
			examined relative to the potency of the standard preparation. This	
			may be done on the basis of the number of surviving animals in each	
			of the six groups of sixteen, using standard statistical methods. (By	
			probit analysis as per software programme evolved by F.R. Marsman	
			RIVM, Bilthoven, Netherland).	
		5.11	Validity criteria:	
			5.11.1	The slopes of the dose response curves of the vaccine under
			test and the standard are linear and parallel.	
			5.11.2	The 50% effective dose of each vaccine lies between the
			largest and the smallest immunizing doses.	
			5.11.3	Challenge toxin should be between 50-200% of lethal dose.
		5.12	Acceptance criteria:	
			5.12.1	The estimated potency is not less than 30 I.U. per single
			human dose.	
			5.12.2	The limit of 95% confidence intervals of the estimate of
			potency is within 50-200% unless the lower limit of the 95%	
			confidence interval of the estimated potency is greater	
			than 30 I.U. per single human dose.	
	6.0	Forms and Records		
		6.1	Raw data form for recording the details of potency test of diphtheria	
			toxoid by challenge method in Guinea pigs	
		6.2	Raw data form for recording the observations on Guinea pigs of	
			diphtheria potency test	
		6.3	Form for reporting the results of potency test of diphtheria toxoid	
			by challenge method in Guinea pigs

10 | Endotoxin content | < 25 IU/ μ g of MenW Ps

11 | Residual CTAB Content | ≤ 1.0 % of dry weight of MenW Ps

12 | Residual Formaldehyde | ≤ 1.0 % of dry weight of MenW Ps

13 | Residual DOC content | ≤ 1.0 % of dry weight of MenW Ps

1.0 |Objective |
 |To lay down the procedure for preparation and standardization of diphtheria|
 |antitoxin (Working standard) for flocculation test of Diphtheria antigens. |
 2.0 |Scope |
 |This procedure is applicable for preparation and standardization of |
 |diphtheria antitoxin for flocculation test of Diphtheria antigens. |
 3.0 |Responsibility |
 |3.1 |The Analyst shall be responsible for carrying out the procedure as |
 |established in this SOP. |
 |3.2 |Supervisor shall be responsible for verifying that the same has been |
 |carried out correctly. |
 |3.3 |Head QC or his designee shall be responsible for overall compliance |
 |of the SOP. |
 4.0 |Abbreviations and Definitions |
4.1	SOP	: Standard Operating Procedure
4.2	QA	: Quality Assurance
4.3	QC	: Quality control
4.4	DATF	: Diphtheria Antitoxin for Flocculation
4.5	mL	: milliliter
4.6	°C	: Degree Celsius
4.7	%	: Percent
4.8	Lf/ml	: Limes-flocculation per milliliter
5.0	Procedure:	
5.1	Equipment, Materials and Reagents	
5.1.1	Diphtheria toxoid Standard (NIBSC code: 02/176)	
5.1.2	Micropipettes	
5.1.3	Micro tips	
5.1.4	Flocculation tube rack	
5.1.5	Flocculation tube	
5.1.6	Thermometer	
5.1.7	Stop watch	
5.1.8	Convex lens	
5.1.9	Sterile 10ml & 50ml vials	
5.1.10	Physiological saline (0.9% w/v)	
5.1.11	Thiomersal	
5.1.12	International Diphtheria Antitoxin for flocculation (NIBSC	
code: 63/007)		
5.2	Preparation of solutions	
5.2.1	Physiological saline (0.9% w/v)	
Add 0.9 gm of weighed Sodium Chloride to 50ml of purified		
water, mix well and make up it to 100ml.		
5.2.2	1% w/v Thiomersal Solution	
Add 1 gm of weighed Thiomersal to 50ml of purified water, mix		
well and make up it to 100ml.		
5.3	Preparation of Internal Reference Diphtheria toxoid (50Lf/mL)	
5.3.1	Obtain Diphtheria toxoid bulk purified from production	
facility/ external source which complies with the		
predetermined specifications.		
5.3.2	Dilute the toxoid to 50Lf/mL based on the previous estimated	
value.		
5.4	Standardization of Standard toxoid (50Lf/mL)	
5.4.1	Reconstitute the National/International reference standard of	
antitoxin for flocculation to 100Lf/mL based on the label		
claim with normal saline.		
5.4.2	Determine the unitage of standard toxoid using the	
National/International reference standard of antitoxin by		
flocculation test.		
5.4.3	The test is valid if the standard toxoid concentration is 50 ±	
1 Lf/mL.		
5.5	Preparation of Internal Reference Antitoxin	
5.5.1	Take the required quantity of antitoxin obtained from the	
reputed vendor in a suitable glass container		
5.5.2	Dilute the antitoxin to 100 Lf/mL with normal saline	
containing preservatives based on the label claim.		
5.6	Standardization of Antitoxin	
5.6.1	Determine the unitage of standard toxoid using the candidate	
diphtheria antitoxin at 100 Lf/ml by flocculation test.		
5.6.2	If the candidate diphtheria antitoxin gives the unitage of	
standard toxoid more than 50 Lf/ml then make small additions		
of candidate diphtheria antitoxin till it gives the unitage		
of standard toxoid 50 Lf/ml.		
5.6.3	If the candidate antitoxin gives the unitage of standard	
toxoid less than 50 Lf/ml then make small additions of normal		
saline till it gives the unitage of standard toxoid 50 Lf/ml.		
5.6.4	Candidate diphtheria antitoxin when gives the unitage of	
standard toxoid as 50 Lf/ml is considered to be standardized		
for use as working standard of diphtheria antitoxin for		
flocculation test and assigned the value of 100 Lf/ml.		
5.6.5	After standardization, sterile filter the antitoxin by using	
0.2μ filters and distributes it to 100 mL bottles.		
5.7	Monitoring of Internal Reference Antitoxin	
5.7.1	Check the Lf / mL concentration of Internal Reference	
antitoxin for flocculation once in three months with internal		
/ national / international standard toxoid.		
5.7.2	Discard the reference antitoxin if any drop is observed in Lf	
concentration and establish a new one.		
6.0	Forms and Records

3 | KD (Molecular size distribution) | $PRP \geq 40\%$; $Kd \leq 0.3$

4 | Ribose Content | $> 32\%$ w/w (DWB)

5 | PRP content | > 0.73 mg/mg (DWB)

6 | Phosphorus Content | $6.8 - 9.0\%$ w/w (DWB)

7 | Protein Content | $\leq 1\%$ w/w (DWB)

8 | Nucleic acid Content | $\leq 1\%$ w/w (DWB)

9 | Endotoxin Content | < 25 IU/ μ g of PRP

1.0 |Objective |
 |To lay down the procedure for Specific toxicity test of pertussis component|
 |in pertussis bulk concentrate. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to all the ARM samples and |
 |final lots of Pertussis vaccine. |
 3.0 |Responsibility |
 |3.1 |The QC analyst shall be responsible for performing the described |
 |procedure correctly. |
 |3.2 |Supervisor shall be responsible for verifying that the same has been |
 |carried out correctly. |
 |3.3 |Head Animal House/Veterinarian/supervisor shall be responsible for |
 |supply of quality animals and their maintenance. |
 |3.4 |Head QC or his designee shall be responsible for overall compliance |
 |of the SOP. |
 4.0 |Abbreviations and Definitions |
4.1	SOP	: Standard Operating Procedure
4.2	QA	: Quality Assurance
4.3	QC	: Quality control
4.4	OU	: Opacity Unit
4.5	AH	: Animal House
4.6	mL	: milliliter
4.7	%	: Percent
4.8	MWGT	: Mouse Weight Gain Test
5.0	Procedure:	
5.1	Equipment, Materials and Reagents	
5.1.1	Biosafety Cabinet	
5.1.2	Weighing balance	
5.1.3	Micropipette	
5.1.4	Vortex mixer	
5.1.5	Cotton	
5.1.6	Disposable syringes with needle	
5.1.7	Sterilized Glass Vials	
5.1.8	Sterile micropipette tips	
5.1.9	70% Isopropyl alcohol	
5.1.10	Sodium chloride	
5.1.11	2 phenoxyethanol	
5.2	Preparation of solutions	
5.2.1	Physiological saline (0.9% w/v)	
Add 0.9 gm of weighed Sodium Chloride to 50ml of purified		
water, mix well and make up it to 100ml.		
5.3	Place request for Swiss Albino mice (14-16g) to Head Animal House.	
After health status evaluation of animals by Veterinary officer		
receive the animals.		
5.4	Selection of animals for test:	
5.4.1	Select Swiss Albino mice (Test and Control) weighing 14 – 16	
g. Each group consisting of 10 animals. Color codes the		
animals.		
5.4.2	Take the group weight of the mice to be injected with test	
sample as well as with diluent (Control).		
5.4.3	The mice used for testing the test sample and the control	
group should be of the same sex. If both sexes are used, they		
should be equally distributed in both the groups.		
5.4.4	Animals should have free access to food and water for at least	
2 hours before injection and thereafter continuously		
throughout the duration of the test.		
5.4.5	The cages housing the mice shall bear labels.	
5.5	Preparation of diluent:	
5.5.1	For bulk containing 2 Phenoxyethanol as preservative:	
Add 5mg/mL of 2 phenoxyethanol in physiological saline. (0.5%)		
5.5.2	These solutions shall be prepared freshly for each test.	
5.6	Preparation of dilution for pertussis bulk:	
5.6.2	Based on the initial opacity, dilute the test sample with	
physiological saline containing preservative so that after		
dilution, bulk sample contains 40 OU/mL.		
5.6.3	Take 3 mL of diluted bulk and dilute it with 3 mL of diluent.	
Mix thoroughly with vortex mixer.		
5.7	Injection:	
5.7.1	Inject each mouse of the test group with 0.5 mL of the diluted	
Pertussis Bulk (20 OU/mL) intraperitoneally.		
5.7.2	Inject each mouse of the control group with 0.5 mL of the	
diluent intraperitoneally.		
5.8	Observations:	
5.8.1	Observe the health of each of the inoculated mice twice daily.	
5.8.2	Take the group weight of both control and test group at the	
end of 72 hours and at the end of 7 days, record the results		
5.9	Calculations:	
Percentage of mouse weight gain test is calculated for		
Pertussis bulk concentrate and test vaccine by the following		
formula:		
% MWGT = (B – A) / (D – C) x 100		
A = Group weight of mice injected with test vaccine on day – 0		
B = Group weight of mice injected with test vaccine on day – 7		
C = Group weight of mice injected with diluent(control) on day		
D = Group weight of mice injected		
with diluent(control) on day – 7		
5.10	Acceptance criteria:	
The test sample passes the test and is considered to be non		
toxic if		
5.10.1	At the end of 72 hours, total group weight of the	

				test animals is not less than that at the time of
			injection.	
			5.10.2	At the end of 7 days the average weight gain per
			mouse in test group mouse is not less than 60 % of	
			that of control group mice.	
			5.10.3	No deaths occur when 10 mice are used.
			5.11	Retest Criteria:
			Repeat the test if it fails to meet the acceptance criteria in the	
			1st test.	
			5.11.1	If repeat test (2nd test) fails, the sample fails the test.
			5.11.2	If the repeat tests (2nd test) passes then one additional test
			(3rd test) to be performed. If this test passes then sample	
			passes or otherwise sample fails the test.

CERTIFICATE OF ANALYSIS
For BioBridge Healthcare Solutions Pvt. Ltd.
Authorized Signatory
Product: | Bulk of Hepatitis B surface Antigen (HBsAg)
Product code no.: | B/HepB 003
Appearance: | Colorless to light yellow color, clear liquid without any suspended particle
Form: | Liquid (Aqueous Solution)
Buffer: | Phosphates of Sodium and Potassium and Sodium Chloride
Manufacturing Date: | October 2015
Expiry Date: | September 2017
Antigen Content: | 1.03 mg/ml (as total protein by Lowry Method)
Purity: | 100% (by SDS), 99.98% (by HPLC)
Sterility: | Sterile Product
pH: | 7.08
Storage: | 5±3°C (Do not freeze)
Volume: | ~30ml x 1 Tube
Note: To be used for research or in-vitro testing purpose only | Note: To be used for research or in-vitro testing purpose only

* Ps : Polysaccharide

S.No | Test/Assay | Specifications

1 | Appearance | White Powder or Lump

2 | Identity | Should react with specific antibodies

3 | Phosphorous Content | ≥ 8.0 % of dry weight of MenA Ps

4 | O acetyl Content | ≥ 2 mmol/gm of dry weight of MenA Ps

5 | KD Molecular Size Distribution | $\geq 65\%$ KD= 0.5

6 | Moisture content | Report results

7 | Protein Content | ≤ 1.0 % of dry weight of MenA Ps

8 | Nucleic acid content | ≤ 1.0 % of dry weight of MenA Ps

9 | Cell Wall polysaccharide content | ≤ 1.0 % of dry weight of MenA Ps

10 | Endotoxin content | < 25 IU/ μ g of MenA Ps

11 | Residual CTAB Content | ≤ 1.0 % of dry weight of MenA Ps

12 | Residual Formaldehyde | ≤ 1.0 % of dry weight of MenA Ps

13 | Residual DOC content | ≤ 1.0 % of dry weight of MenA Ps

[1. |Objective: |
 ||To lay down the procedure to determine the sterility of products |
 ||purported to be sterile. |
 [2. |Scope: |
	This Standard Operating Procedure is applicable for all the In process,	
	ARM final bulk and final lot samples	
	2.1	For preparation, storage, growth promotion test and application of
	media, used in sterility testing.	
[3.	Abbreviations and Definitions:	
	3.1	°C
	3.2	IP
	3.3	ml
	3.4	USP
	3.5	EP
[4.	Procedure:	
	4.1	Equipments, Materials and Reagents
	4.1.1	Laminar airflow cabinet
	4.1.2	Incubators at 32.5 + 2.5°C and 22.5 + 2.5°C
	4.1.3	Sterile syringes
	4.1.4	Sterile pipettes
	4.1.5	Sterile gloves
	4.1.6	Sterile forceps
	4.1.7	McCartney bottles
	4.1.8	Purified water
	4.1.9	Tryptone Soya Broth
	4.1.10	Fluid Thioglycollate Medium
	4.1.11	Soya Bean Casein Digest media
	4.2	Preparation of Sterility Media:
	4.2.1	Fluid Thioglycollate Medium (FTM):
	4.2.1.1	Media for the test may be prepared as described
		below, or equivalent commercial media may be used
		provided that they comply with the growth promotion
		test.
	4.2.1.2	Prepare FTM media is prepared as per the produce
		mentioned below:
		Ingredient
		L-Cystine
		Agar
		Sodium chloride
		Glucose monohydrate/anhydrous
		Yeast extract (water-soluble)
		Pancreatic digest of casein
		Sodium thioglycollate or
		Thioglycollic acid
		Resazurin sodium solution (1 g/l
		of resazurin sodium), freshly
		prepared
		Water R
	4.2.1.3	Mix the L-cystine, agar, sodium chloride, glucose,
		water-soluble yeast extract and pancreatic digest of
		casein in 700 ml of purified water R and heat until
		the components are completely dissolved.
	4.2.1.4	Dissolve the sodium thioglycollate or thioglycollic
		acid in the solution and, if necessary, add sodium
		hydroxide (1 mol/l) so that, after sterilization,
		the solution will have a pH of 6.9 to 7.3.
	4.2.1.5	Add the resazurin sodium solution, mix and place the
		medium in suitable vessels which provide a ratio of
		surface to depth of medium such that not more than
		the upper half of the medium has undergone a colour
		change indicative of oxygen uptake at the end of the
		incubation period.
	4.2.1.6	Make up the volume of the media to 1000 ml with
		purified water and distribute the media in suitable
		bottles / containers
	4.2.1.7	Fill the media in sterile glass bottles / containers
		in a volume of 80 to 100ml. The volume of the media
		is validated such that the sample that needs to be
		analyzed does not get over diluted. If any
		antimicrobials or preservatives are present in the
		test sample should get sufficiently diluted so that
		their inhibitory effect is lost.
	4.2.1.8	Sterilize the bottles by autoclaving, after
		sterilization, store the media at a temperature
		between 2 °C and 25 °C. Do not use the medium for a
		longer storage period than has been validated.
	4.2.2	Soyabean Casein Digest Medium (SCDM):
	Media for the test may be prepared as described below, or	
	equivalent commercial media may be used provided that they	
	comply with the growth promotion test.	
	Prepare SCDM media is prepared as per the produce mentioned	
	below:	
	Ingredient	Content
	Pancreatic digest of casein	17.0 g
	Papaic digest of soya-bean	3.0 g
	meal	
	Sodium chloride	5.0 g
	Dipotassium hydrogen	2.5 g
	phosphate	
	Glucose monohydrate/anhydrous	2.5/2.3 g

			Water R	1000 ml
			4.2.2.1	Dissolve the solids in 700 ml of purified water R,
			warming slightly to dissolve the contents.	
			4.2.2.2	Cool the solution to room temperature and add sodium
			hydroxide (1 mol/l) VS, if necessary, so that after	
			sterilization the solution will have a pH of 7.1 to	
			7.5.	
			4.2.2.3	Make up the volume of the media to 1000 ml with
			purified water and distribute the media in suitable	
			bottles / containers to sterilize the media by	
			autoclaving.	
			4.2.2.4	Fill the media in sterile glass bottles / containers
			in a volume of 80 to 100ml. The volume of the media	
			is validated such that the sample that needs to be	
			analyzed does not get over diluted. If any	
			antimicrobials or preservatives are present in the	
			test sample should get sufficiently diluted so that	
			their inhibitory effect is lost.	
			4.2.2.5	Sterilize the bottles by autoclaving, after
			sterilization; store the media at a temperature	
			between 2 °C and 25 °C. Do not use the medium for a	
			longer storage period than has been validated.	
	4.3	Growth Promotion Test (GPT): Each batch of medium prepared either		
		from dehydrated medium or from ingredients has to be tested for		
		growth promotion test of aerobes, anaerobes and fungi.		
	4.3.1	GPT for Fluid Thioglycolate Media:		
			4.3.1.1	Prepare suspensions of Clostridium sporogenes,
			Pseudomonas aeruginosa and Staphylococcus aureus and	
			inoculate each suspension into separate containers	
			of FT media.	
			4.3.1.2	Inoculate each suspension as not more than 100 CFUs.
			4.3.1.3	Incubate the containers at 30–35 °C for next 3 days.
			4.3.1.4	The media is considered suitable for use if a
			clearly visible growth of the microorganisms occurs	
			at the end of incubation period.	
	4.3.2	GPT for Soyabean Casein Digest Medium:		
			4.3.2.1	Prepare suspensions of Aspergillus brasiliensis,
			Bacillus subtilis and Candida albicans. and	
			inoculate each suspension into separate containers	
			of SCD media.	
			4.3.2.2	Inoculate each suspension as not more than 100 CFUs.
			4.3.2.3	Incubate the containers at 20–25 °C for not more
			than 3 days in the case of bacteria and not more	
			than 5 days in the case of fungi.	
			4.3.2.4	The media is considered suitable for use if a
			clearly visible growth of the microorganisms occurs	
			at the end of incubation period.	
		Strains of the test microorganisms suitable for use in the Growth		
		promotion test:		
		Aerobic bacteria:		
			Staphylococcus aureus	ATCC 6538, CIP 4.83, NCTC
			10788, NCIMB 9518, NBRC 13276,	
			NBRC 13276	
			Bacillus subtilis	ATCC 6633, CIP 52.62, NCIMB
			8054, NBRC 3134	
			Pseudomonas aeruginosa	ATCC 9027, NCIMB 8626, CIP
			82.118, NBRC 13275	
			Anaerobic bacterium	
			Clostridium sporogenes	ATCC 19404, CIP 79.3, NCTC 532
			or ATCC 11437, NBRC 14293	
			Fungi	
			Candida albicans	ATCC 10231, IP 48.72, NCPF
			3179, NBRC 1594	
			Aspergillus brasiliensis	ATCC 16404, IP 1431.83, IMI
			149007, NBRC 9455	
	4.3.3	Execution of the test for liquid culture media:		
			4.3.3.1	Test each sterilized lot of the liquid media.
			Transfer 1 ml of inoculum in each test bottle of	
			dilution having 10-100 CFU/ml of each test	
			microorganism listed in the Table, and its previous	
			dilution.	
			4.3.3.2	Simultaneously transfer 0.1 ml of the selected
			dilution having 10-100 CFU/ml on Tryptone Soya Agar	
			Plate, which will act as control plate, with the	
			purpose of checking the viability and the presence	
			of contamination in the Inoculum.	
			4.3.3.3	Spread the inoculum with the help of spreader and
			thoroughly spread it to dry	
			4.3.3.4	Incubate the inoculated media bottles and Petri
			plates according to the requirement of test	
			microorganisms.	
			4.3.3.5	Count the cfu in the control plates, calculate the
			productivity ratio and % efficiency as described	
			below. Observe the turbidity in case of the	
			bottles and record the findings.	
			The Productivity Ratio is calculated in the following	
			way:	
			P.R = A x B	
			C x D	
			where: A: Average Count in the Test Plate	
			B: Dilution Factor of Test Plate	

				C: Average Count in the Control Plate				
				D: Dilution factor of the Control Plate				
				Calculate the % Efficiency as follows:				
				$\% \text{ Efficiency} = P.R \times 100$				
	4.3.5	Procedure for checking the Growth Promotion Properties of						
		Culture Medium/Media in case of Clost. sporogenes:						
		4.3.5.1	Take 48 hours growth of C. sporogenes in cooked meat					
			medium. Make serial dilution of the culture up to					
			10-8 dilution to determine the dilution containing					
			10 to 100 cfu.					
		4.3.5.2	Transfer 0.1 ml aliquot of the dilutions 10-5, 10-6,					
			10-7 and 10-8 in duplicate to Tryptone Soya Agar					
				with Glucose) to confirm the viability and number				
				of organisms in the dilution.				
		4.3.5.3	Place the plates in Anaerobic Gas Jar in an inverted					
			position.					
		4.3.5.4	Place an oxygen-absorbing pack inside the Gas jar					
			for maintaining an anaerobic environment and for the					
			detection of an anaerobic environment in the Gas jar					
				place an indicator tablet. Use the pack and				
				indicator tablet according to the supplier's				
				directions. Properly seal the Gas jar.				
		4.3.5.6	Incubate the Gas jar with plates at $36 \pm 2^\circ\text{C}$ for 48					
			to 72 hours.					
		4.3.5.7	Count the CFU in the plates and the growth should be					
			verified by Gram Staining for its purity and					
			determination of any contamination.					
		4.3.5.8	In case of Fluid Thioglycollate Medium, transfer 1					
			ml aliquot of the dilution having 10–100 CFU and the					
			preceding dilution in the respective bottles and					
			incubate at $33.0 \pm 2^\circ\text{C}$ for 48-72 hours					
		4.3.5.9	Observe for growth/turbidity at the completion of					
			the incubation period.					
	4.3.6	Interpretation of the results:						
		4.3.6.1	The test media are satisfactory if clear evidence of					
			growth or turbidity appears in the test media					
			container within specified period for bacteria and					
			fungal cultures as per specification. Follow the					
			table to interpret the results.					
				Sr.No	Observation	Test	Control	Result
					bottle	plate		
				1.	Growth	Positive	Positive	Passes
				2.	Growth	Negative	Positive	Fails
				3.	Growth	Negative	Negative	Repeat
					the test			
				4.	Negative	Negative	Positive	Passes
					control *			
		4.3.6.2	The growth should be verified by Gram Staining for					
			its purity and determination of any					
			contamination.					
	4.4	Control of the culture media:						
	4.4.1	Control of Fluid Thioglycollate Medium and Tryptone Soya						
		Broth (used in Sterility Testing):						
		4.4.2	Incubate the entire sterilized lot of the medium, Fluid					
			Thioglycollate at $33.0 \pm 2^\circ\text{C}$ and Tryptone Soya Broth at $22.5 \pm 2^\circ\text{C}$, for 48-72 h.					
		4.4.3	If 2 % or more of the batch is contaminated discard the					
			whole batch after decontamination otherwise re-incubate two					
			bottles of each media and observe for sterility for 14 days					
			along with the Sterility test.					
		4.4.4	However, the sterility test of the test media is considered					
			invalid if the growth promotion test fails.					
	4.5	Preliminary Operations for Sterility test:						
	Switch "ON" the laminar airflow cabinet for at least half an hour							
	before starting with the test.							
	4.5.1	Preparation of Material and equipment for sterility testing:						
		4.5.1.1	Label the previously prepared media bottles for					
			Fluid Thioglycollate Medium and Tryptone Soya Broth					
			Medium with the sample name and code.					
		4.5.1.2	Remove the first paper wrapping from all the					
			sterilized materials required in the test and place					
			them in the material transfer hatch of sterility					
			testing room from the sterilization and material					
			preparation laboratory.					
		4.5.1.3	Remove the second wrapping from the materials					
			whenever required, inside the laminar airflow					
			cabinet.					
	4.6	Procedure for performing the Sterility Test by membrane filtration						
	method:							
	4.6.1	Ensure that all three valves of the sterilized membrane						
			filtration assembly are in closed position.					
	4.6.2	Connect a sterilized filtration flask to the drain pipe of						
			the sterilized membrane filtration assembly.					
	4.6.3	Open the filtration funnels and place pre-sterilized 0.45						
			micron membrane filters with the help of sterile forceps.					
			Close the funnel lid.					
	4.6.4	Open the lid of the manifold of membrane filtration assembly						
			and add approximately 5 ml of sterile purified water/rinse					
			solution in all the funnels to wet the membrane filters.					
	4.6.5	Switch "ON" the vacuum Pump and open the valves of membrane						
			filtration assembly for drainage.					

	4.6.6	Close the valves and switch “OFF” the vacuum pump. Add the	
		required amount of sample. Now rinse with enough volume of	
		sterile rinse solution for ARM and Final Bulk of Vaccine.	
		Switch ON the vacuum pump and allow it to pass through the	
		membrane filter.	
	4.6.7	After filtration switch “OFF” the vacuum pump and open the	
		latch of the funnel. Aseptically remove the membrane(s) from	
		the holder, transfer the membrane in Fluid Thioglycollate	
		Medium and in Tryptone Soya Broth Medium	
	4.6.8	System suitability for membrane filtration method	
		After transferring the content of the container or	
		containers under test to the membrane, add an inoculum of a	
		small number of viable microorganisms (not more than 100	
		CFU) to the final portion of sterile diluent used to rinse	
		the filter.	
	4.7	Sterility by direct inoculation method	
	4.7.1	With sterile syringe(s) or pipette(s) withdraw the test	
		sample as per the specification for the test sample.	
	4.7.2	Dispense 1 ml aliquots of the sample in one bottle each of	
		Fluid Thioglycollate Medium and Tryptone Soya Broth	
		Medium/SCDM media.	
	4.7.3	System suitability for direct inoculation method	
		After transferring the contents of the container or	
		containers under test to the culture medium, add an inoculum	
		of a small number of viable microorganisms (not more than	
		100 CFU) to the medium.	
	4.7.4	In both system suitability tests, use the same	
		microorganisms as those described above under Growth	
		promotion test of aerobes, anaerobes and fungi.	
	4.7.5	Incubation conditions:	
		Incubate bottles containing Tryptone Soya Broth Medium at	
		22.5 + 2.5°C and those containing Fluid Thioglycollate	
		Medium at 32.5 + 2.5°C for 14 days.	
	4.7.6	Minimum quantity of sample to be used for each medium	
		Quantity per container	Minimum quantity to be used for
		each medium unless otherwise	
		Justified and authorized	
	Liquids		
		Less than 1 ml	The whole contents of each
		container	
		1-40 ml	Half the container of each
		container but not less than 1 ml	
		Greater than 40ml and	20ml
		not greater than 100ml	
		greater than 100ml	10 % of the content of the
		container but not less than 20ml	
		Antibiotic liquids	1ml
	Solids		
		Less than 50mg	The whole contents of each
		container	
		50 mg or more but not	Half the contents of each
		less than 300mg	container but not less than 50 mg
		300 mg -5 g	150mg
		Greater than 5g	500mg
	Final Lot (Vials, ampoules, PFS)		
	Batch Size	Sample quantity for sterility	
		assay	
		Not more than 100	10% or 4 containers whichever is
		containers	greater
		More than 100 but less	10 containers
		than 500 containers	
		More than 500 containers	2% or 10 containers whichever is
		less	
	4.8	Observations and Interpretation of the results:	
	4.8.1	During the incubation period and at its conclusion, examine	
		the media for evidence of microbial growth/turbidity.	
	4.8.2	When the material/sample being tested renders the medium	
		turbid so that the presence or absence of microbial growth	
		cannot be determined by visual examination, then transfer 1	
		ml of the medium to fresh bottles of the same medium at the	
		end of incubation period of 3 days.	
	4.8.3	Incubate the original and fresh bottles for a period of next	
		14 days.	
	4.8.4	If no evidence of microbial growth is found, the product	
		examined complies with the test for sterility.	
	4.8.5	If evidence of microbial growth is found the product	
		examined does not comply with test for sterility, unless it	
		can be clearly demonstrated that the test was invalid for	
		causes unrelated to the examined product.	
	4.8.6	If test is declared to be invalid, it is repeated using	
		sterility retention sample.	
	4.8.7	If no evidence of microbial growth is found in the sterility	
		repeat test, the product examined complies with the test for	
		sterility.	
	4.8.8	If microbial growth is found in the repeat test, the product	
		examined does not comply with the test for sterility.	
	4.9	Bacteriostasis and Fungistasis assay:	
	4.9.1	Before starting to analyze of a new product it should be	
		ensured that no inhibitory substances for bacterial or	
		fungal growth are present in it, therefore, it is necessary	
		to demonstrate that no inhibitory substances are present or	
		the test conditions are to be adjusted / modified to nullify	

			these effects. The bacteriostasis and fungistasis assay	
			shall be carried out one time.	
		4.9.2	Preparation of the inoculum for Bacteriostasis and	
			Fungistasis assay:	
			Take slants of strains, listed in Table 1 below, from	
			culture bank stored at 2-8°C. Streak them on fresh slants of	
			Tryptone Soya Agar and incubate at the temperature optimum	
			for that strain as mentioned in the respective dossier. To	
			the growth, add 9 ml of Peptone Water Saline and mix gently.	
			From this suspension make serial dilutions in Peptone Water	
			Saline for all organisms. Take Tryptone Soya Agar Petri	
			plates and spread dilutions 10⁻⁵ to 10⁻⁸. Incubate at the	
			optimum temperature for that microorganism as mentioned in	
			the respective dossier for the microorganism and enumerate	
			the Colony Forming Units at the end of the incubation	
			period. Select the dilution that has 10 to 100 CFU/ml	
		TABLE 1		
		Media	Microorganisms	
		Fluid	Bacillus subtilis	ATCC 6633, CIP 52.62, NCIMB 8054,
		Thioglycollate		NBRC 3134
		Medium		
		Clostridium sporogenes	ATCC 19404, CIP 79.3, NCTC 532 or	
		ATCC 11437, NBRC 14293		
		Pseudomonas aeruginosa	ATCC 9027, NCIMB 8626, CIP	
		82.118, NBRC 13275		
		Candida albicans	ATCC 10231, IP 48.72, NCPF 3179,	
		NBRC 1594		
		Staphylococcus aureus	ATCC 6538, CIP 4.83, NCTC 10788,	
		NCIMB 9518, NBRC 13276, NBRC		
		13276		
		Tryptone Soya	Bacillus subtilis	ATCC 6633, CIP 52.62, NCIMB 8054,
		Broth Medium		NBRC 3134
		Candida albicans	ATCC 10231, IP 48.72, NCPF 3179,	
		NBRC 1594		
		Aspergillus	ATCC 16404, IP 1431.83, IMI	
		brasiliensis	149007, NBRC 9455	
		4.9.3	Perform the test with the same volume of each medium as is	
			to be used in the sterility test and introduce in it the	
			same volume of sample whose sterility is to be checked as in	
			the main test. Also inoculate 1 ml aliquot of the dilution	
			containing 10 to 100 viable microorganisms/ml of each test	
			microorganism mentioned in Table 1. Incubate all bottles of	
			Fluid Thioglycollate Medium at 33.0 ± 2°C and that of	
			Tryptone Soya Broth at 22.5 + 2°C. Observe for appearance of	
			growth for 3 days in case of bacteria and 5 days in case	
			fungi.	
		4.9.4	Control: Take same volume of each medium as is to be used in	
			the sterility test. Inoculate it with 1 ml of the dilution	
			containing 10 to 100 viable microorganisms per ml of each	
			test microorganism mentioned in Table 1. Incubate all	
			bottles of Fluid Thioglycollate Medium at 33.0 + 2°C and	
			that of Tryptone Soya Broth at 22.5 + 2°C. Incubate for 3	
			days in case of bacteria and for 5 days for fungi.	
		4.9.5	Interpretation of results	
		4.9.5.1	If clearly visible growth of microorganisms is	
			obtained after the inoculation, visually comparable	
			to that in the control bottle, the test for	
			sterility can be carried out without further	
			modification in the amount of the sample and in the	
			medium to be used.	
		4.9.5.2	If clearly visible growth is not obtained in	
			presence of the sample under examination, visually	
			comparable to that in the control bottle without the	
			sample, the sample possesses Bacteriostasis and	
			Fungistasis activity. A neutralising agent may be	
			used adjusting the concentration of neutralizing	
			agent till the inhibitory effect of Bacteriostasis	
			and Fungistasis activity is completely neutralized.	
		4.9.5.3	If a neutralizing agent is not available modify the	
			amount of the sample and medium to be used in order	
			to eliminate Bacteriostasis and Fungistasis activity	
			and repeat the test.	
		4.9.5.4	When the sample exhibits antimicrobial activity in	
			the medium, increase the quantity of the medium so	
			that, the sample is sufficiently diluted to prevent	
			inhibition of growth	
		4.9.5.5	If no growth is present in both the control and test	
			bottles, repeat the test.

1. Purpose:

To analyze purified protein samples of CRM197 for the determination of percentage purities by Size Exclusion High Performance Liquid Chromatography using PDA detector.

2. Scope:

This standard testing procedure is applicable to the purified protein samples of CRM197.

3. Responsibility:

1. Qualified Analysts shall be responsible for the preparation and execution of this STP.

2. Group leader shall supervise and check that the STP is followed properly.

3. Head, R&D and Incharge, QA shall be responsible for the implementation and compliance of this STP.

4. Materials & Equipments:

1. Purified CRM1 97 Samples

2. HPLC system (Waters) with PDA detector (Waters)

3. Potassium dihydrogen phosphate anhydrous

4. Dipotassium hydrogen phosphate anhydrous

5. Sodium Chloride

6. Potassium Hydroxide

7. Sucrose

8. TSKgel G2000 SWxl column; 30 cm x 7.8 mm ID (Tosoh Bioscience, Cat. No. 8-08540)

9. TSKgel G2000 SWx1 Guard column; 4 cm x 6.0 mm ID (Tosoh Bioscience, Cat. No. 8-08543)

10. Milli-Q Water

11. HNC screw top vials 12 x 32 mm (Waters, Cat. No. 186000307C)

12. Glass filter assembly (Millipore, 1.5L)

13. Sonicator (Power Sonic 410, HWASHIN Technology Co.)

14. pH meter

15. Vacuum pump

16. 0.22 µ Syringe filter

17. 2.0 ml Disposable syringes

5. Definitions/ Abbreviations:

1. M : Molarity

2. mM : milli Mole

3. µg : Microgram

4. µl : Microliter

5. SE-HPLC : Size Exclusion High Performance Liquid Chromatography

6. PDA : Photo Diode Array

7. KOH : Potassium Hydroxide

6. Procedure:

1. Buffer preparation:

1. Preparation of 100 mM Potassium dihydrogen phosphate solution (1 litre):

To prepare 1000 ml solution of 100 mM Potassium dihydrogen phosphate solution, add 13.609 g of Potassium dihydrogen phosphate in 1000 ml of Milli-Q water and mix well.

2. Preparation of 100 mM Dipotassium hydrogen phosphate solution (500 ml):

To prepare 500ml solution of 100 mM Dipotassium hydrogen phosphate solution, add 8.709 g of Dipotassium hydrogen phosphate in 500 ml of Milli-Q water and mix well.

3. Preparation of 100 mM Potassium hydroxide solution (for pH adjustment):

To prepare 10 ml of 100 mM Potassium hydroxide solution, take 561.1 mg of Potassium hydroxide pellets and dissolve in 10 ml of Milli-Q water.

4. Preparation of 100 mM Potassium phosphate buffer, pH 6.8 (1 litre):

To prepare 1 liter 100 mM solution of Potassium Phosphate buffer (PH-6.8); add 490 ml of 100mM Dipotassium hydrogen phosphate solution and 510 ml of 100mM Potassium dihydrogen phosphate solution.

5. Preparation of 100 mM Potassium phosphate+ 100 mM NaCl working buffer(1 litre):

1. To prepare Potassium phosphate working buffer, add 5.844 g of NaCl in 1 liter of 100 mM Potassium Phosphate buffer, mix well and if required, adjust the pI-I to 6.8 using 1 M KOH solution.

2. Filter the working buffer with 0.22 µ filter and degas using the ultrasonication bath & vacuum pump. It can be stored at room temperature for one month.

2. Preparation of Sample Blank (10mM Potassium phosphate buffer with 5% sucrose):

1. To prepare 100 ml sample blank, take 5.1 ml 100 mM potassium dihydrogen phosphate and mix with 4.9 ml of 100 mN4 Dipotassium hydrogen phosphate solution.

2. Add 90 ml of Milli-Q water and adjust the pH to 6.8 using 1 M KOH solution, if required.

3. Add 5 g of sucrose to 100 ml of buffer as prepared in above mentioned step and filter the solution with 0.2 µ membranes.

(Note: Take Sample blank (10mM Potassium phosphate buffer with 5% sucrose) preferably from the purification group

in order to subtract any possible impurities carried by the sample buffer. Use the same sample1-.41-atk in diluting the concentrated protein samples for injection in HPLC. In case the buffer is not available, prepare the sample blank by the above mentioned method.)

3. Sample preparation for Purified CRM197:

1. If the concentration of the CRM 197 sample is more than 1mg/ml (as analysed by BCA Protein Assay kit), dilute the sample using sample blank to make the final concentration of 1mg/ml. In case protein concentration is less than 1mg/ml (as analysed by BCA Protein Assay kit method), use undiluted samples for HPLC.

2. Filter the sample with 0.22 µ syringe filter before injection.

4. HPLC Run conditions:

1. HPLC SEC Column used: TSKgel G2000 SWx1 column, 30 cm x 7.8 mm ID & TSKgel G2000 SWxi Guard column; 4 cm x 6.0 mm ID.

2. Mobile phase used : 100mM Potassium phosphate ± 100mM NaCl working buffer (pH-6.8)

3. Flow rate used: 0.6 ml/min.

4. Run Time: 30 min.

5. Injection volume: Sample Blank: 25 µl if sample concentration is 1mg/ml or 100 µl if sample concentration is < 1mg/ml.

6. Detector used : PDA

5. HPLC run procedure:

1. Equilibrate the column with 100 mM Potassium phosphate + 100mM NaCl working buffer (pH-6.8) for 1 hour at 200 to 300 nm wavelength of PDA detector.

2. After the PDA detector baseline is stabilized, inject Sample Blank (25 µl injection volume if the sample concentration is 1mg/ml or 100 µl if the sample concentration is less than 1 mg/ml).

3. Inject the purified CRM197 protein sample (25 µl injection volume if the sample concentration is 1 mg/ml or 100 µl if the sample concentration is less than 1 mg/ml).

(Note: Peak of the CRM 197 protein is obtained at 13.7 ± 0.5 minutes.)

6. Results Evaluation:

1. Compare the peak profile of purified CRM 197 protein sample and sample blank injected at same volume and calculate the percentage purity of the sample using the HPLC software.

2. To subtract the sample chromatogram with the sample blank in Waters HPLC, go to the project (Injection Select the Sample blank run file (Right click on the Sample blank file Select the Option Alter Sample (3 Type the text 'blank' in the column named Label 3 Save

3. Go to the Project (Methods (Select the Method set (eg.CRM SEC) (Derived Channel (select Instrument method CRM SEC (Fill the Channel name with the text '280nm' (Make sure, In the first only channel type Constant is 1X.

4. In the Option Channel PDA, select the option Single Wavelength (Type 280nm in the Box Wavelength (Second channel (select (-) for subtraction in the option Operation (Constant 1.0 (Channel 280nm (Click the box from injection labeled and type the text 'blank' in the box (PDA 3D Blank Subtraction (blank (Click the box save extended channel

5. For subtracting Right click on sample (Review (File (Open (Method Set (CRM SEC) (Open (See the chromatogram integrate and calibrates to reveal the peaks and see the calculated % Area for purity analysis.

Note: The absorbance of sucrose at UV wavelength 280 is not specific so even after subtracting the blank containing 5% sucrose from CRM 197 Sample's chromatogram, sometimes sucrose peak may not be completely subtracted. So the peak of sucrose need not to be integrated and should not be considered in determining purity of the samples. If blank subtraction option is not available in the HPLC software then for the determination of % purity of CRM 197 samples, integrate all peaks except the peak of sucrose (identified from the blank run) and determine the % Peak area of the CRM 197 peak, to determine the % purity.

8. Annexures:

Format for "Analysis of Purified CRM 197 protein Samples for determination of percentage purity by Size Exclusion High Performance Liquid Chromatography (SE-HPLC)"

1.0	Objective:		
	To lay down the procedure for determination of pH.		
2.0	Scope:		
	This Standard Operating Procedure is applicable to all the In- process		
	and finished product samples.		
3.0	Abbreviations and Definitions:		
	Not applicable		
4.0	Procedure:		
	4.1	Equipment, Materials and Reagents	
		4.1.1	Tissue paper
		4.1.2	100 ml. vial
		4.1.3	100 ml beaker
		4.1.4	Wash bottle
		4.1.5	Purified water
	4.2	Preparation of solutions:	
		4.2.1	Buffer solution, pH =4.00
		4.2.2	Buffer solution, pH =7.00
		4.2.3	Buffer solution, pH=9.20
	4.3	pH Electrode Calibration:	
		4.3.1	Check that the equipment is correctly connected to electrical
		supply.	
		4.3.2	Switch on the instrument by pressing ON/OFF key on front
		panel.	
		Use a combination of two standard buffer for calibration	
		according to requirements i.e.:	
		Case 1- For solution with pH less than 7.00 uses standard	
		buffers of 4.00 & 7.00.	
		Case 2- For solution with pH more than 7.00 use standard	
		buffers of 7.00 & 9.20	
		(Note: The pH meter shall be set for the different buffers to	
		be used at the time of installation based on the future use.	
		This setting is changed only in case the range of pH readings	
		is different than preset.)	
		4.3.3	Clean pH electrode with purified water and blot dry.
		4.3.4	Put the standard buffers that are used in calibration in
		clean beakers.	
		4.3.5	Introduce pH electrode in first buffer according to case 1 or
		case 2 and wait for 2 seconds to stabilize the pH.	
		4.3.6	Remove pH electrode, rinse with purified water and blot dry
		and put in second standard buffer according to case 1 or case	
		2 and wait for 2 seconds to stabilize the pH.	
		4.3.7	Remove pH electrode, rinse with purified water and blot dry
		and put in potassium chloride solution.	
	4.4	pH Measurement:	
		4.4.1	Clean pH electrode with purified water and blot dry.
		4.4.2	Put the sample in clean beaker to check the pH.
		4.4.3	Introduce the pH electrode in beaker having sample solution
		4.4.4	Press [Read] key for pH measurement.
		4.4.5	Rinse, blot and store the electrode in a beaker having
		saturated KCl solution.	
5.	Reporting:		
	5.1	Record the information of operation and calibration in corresponding	
	log book		
6.	References:		
	NA		

1.0|Objective |
 |To lay down the procedure for the determination of Thiomersal concentration|
 |in Recombinant Hepatitis B vaccine. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to the samples of Hepatitis|
 |B Vaccine that contains Thiomersal as a preservative, received in the |
 |Quality control department. |
 3.0 |Responsibility |
 |3.1 |The analyst shall be responsible for executing the described |
 |procedure correctly. |
 |3.2 |Supervisor shall be responsible for verifying that the procedure is |
 |complied with and the results are checked. |
 |3.3 |HOD shall be responsible for overall compliance of this SOP. |
 4.0 |Abbreviations and Definitions |
4.1	Abbreviations:		
	4.1.1	CV	:Coefficient of variation
	4.1.2	g	:Gram

	4.1.13	SD	:Standard Deviation
	4.1.14	SOP	:Standard Operating Procedure
	4.1.15	UV	:Ultra Violet
	4.1.16	HOD	:Head of Department
4.2	Definitions:		
		Not Applicable.	
5.0	Procedure:		
5.1	Preparation of Solutions:		
	5.1.1	0.002 % Dithizone Solution :	
		5.1.1.	Weigh 2 mg of Dithizone.
		1	
		5.1.1.	Transfer it to a 100 mL volumetric amber coloured
		2	flask, covered in such a way that no light should reach
		the solution.	
		5.1.1.	Make up the volume to 100 mL using acetone.
		3	
		5.1.1.	This solution should be stored in a refrigerator
		4	(temperature 2 - 8 °C) and used within 24 hours.
	5.1.2	0.01mg / mL Thiomersal :	
		5.1.2.	Weigh 50 mg of Thiomersal
		1	
		5.1.2.	Transfer it to a 100 mL volumetric flask and make up
		2	the volume to 100 mL with purified water (0.5 mg/mL).
		5.1.2.	Take 5 mL of the above solution (0.5 mg/mL) and
		3	transfer it to a 25 mL volumetric flask.
		5.1.2.	Make up the volume to 25 mL with purified water (0.1
		4	mg/mL).
		5.1.2.	Take 5 mL of the above solution (0.1 mg/mL) and
		5	transfer it to a 50 mL volumetric flask.
		5.1.2.	Make up the volume to 50 mL with purified water (0.01
		6	mg/mL).
		5.1.2.	The solution can be stored at room temperature for a
		7	maximum of 6 months.
	5.1.3	50 % Sodium Hydroxide Solution :	
		5.1.3.	Weigh 50 g of sodium hydroxide.
		1	
		5.1.3.	Transfer it to a 100 mL volumetric flask and dissolve
		2	in sufficient amount of purified water and finally make
		up the volume to 100 mL with purified water.	
		5.1.3.	This solution should be used within 6 months and stored
		3	at room temperature in plastic bottle.
5.2	Preparation of Calibration curve:		
	5.2.1	Prepare calibration curve (1-10 µg/mL) with Thiomersal	
		solution (0.01 mg/mL) in 10 labelled test tubes of 20 mL.	
		The solutions for making thiomersal calibration curve are	
		prepared as follows:	
		Final	0.01 mg/ml
		Concentration	Thiomersal
		(µg/ml)	Solution
			(ml)
		1	0.2
		2	0.4
		3	0.6
		4	0.8
		5	1.0
		6	1.2
		7	1.4
		8	1.6
		9	1.8
		10	2.0
		Note: The Calibration curve is accepted if it is meeting the	
		validated parameters of intercept, slope and correlation coefficient.	
5.3	Preparation of the samples:		

		5.3.1	Take 0.2 mL of the test sample and add it in 1.8 mL of
			purified water (1/10 dilution) in duplicate sets in 20 mL of
			labeled test tubes. However reference vaccine treated like
			test sample can be used in the assay as control, occasionally.
		Note: The dilution mentioned can vary depending upon the thiomersal	
		concentration. If there is any sample outside the range of the	
		calibration curve, carry out the calculation for more appropriate	
		dilution.	
		5.3.2	Treat 2 mL of purified water as Blank.
		5.4	Test:
		5.4.1	Add 2 mL of 0.002% dithizone solution to all the tubes of
			Calibration curve, Sample, Control and Blank and mix gently.
		5.4.2	Add 2 mL of acetone to all these test tubes and again mix
			gently using a vortex mixer.
		5.4.3	Now add 0.1 mL of 50% Sodium Hydroxide solution to each of
			these tubes and mix gently using a vortex mixer. The colour of
			the contents of each tube change to light pink.
		5.4.4	Set the wavelength in spectrophotometer at 538 nm. Zero the
			absorbance of blank and then measure the absorbance of
			calibration curve and test samples.
		5.4.5	The concentration of thiomersal in the test sample(s) is
			calculated by comparing results of its absorbance obtained
			against the plotted calibration curve of known thiomersal
			concentration.
		5.5	Calculations:
		5.5.1	Once the absorbance of the standards and the test samples have
			been taken, calculation shall be done using the excel sheet
			carrying formulas for the required calculation.
		5.5.2	Enter the absorbance for calculations starting from
			Calibration curve prepared between 1 and 10 g of Thiomersal
			and test samples. The calculations are made according to the
			equation of minimum squares.
		5.5.3	For calculating the Thiomersal concentration use the equation
			$Y = mX + b$.
			Where: m = slope
			b = intercept
			Y = absorbance
			X = concentration
		5.5.4	Record all the calculations in the data record form and also
			attach the hard copy of the excel sheet used for calculation
			along it.
		5.6	Acceptance criteria:
		5.6.1	The coefficient of variation (CV) between the replicates of
			the samples should be $\leq 5\%$.
		5.6.2	The value of the control should be within the acceptance
			limits.
		5.6.3	Thiomersal concentration in the sample should be within the
			specified limits.

		6.1	A new method for Spectrophotometric Determination of Thiomersal in
			Biologicals: Shrivastaw, K.P and Sarbjit Singh. Biologicals (1995) 23,
			65-69.

1.0	Objective		
	To lay down the procedure for specific toxicity test on bulk purified		
	tetanus toxoid.		
2.0	Scope		
	Applicable to the batches of bulk purified tetanus toxoid.		
3.0	Responsibility:		
	3.1	The QC analyst shall be responsible for performing the described	
	procedure correctly.		
	3.2	Supervisor shall be responsible for verifying that the same has been	
	carried out correctly.		
	3.3	Head Animal House/Veterinarian/supervisor shall be responsible for	
	supply of quality animals and their maintenance.		
	3.4	Head QC or his designee shall be responsible for overall compliance	
	of the SOP.		
4.0	Abbreviations and Definitions		
	4.1	g	: Grams
	4.2	°C	: Degree Celsius
	4.3	%	: Percent
	4.4	IU/ml	: International unit per milliliter
	4.5	QA	: Quality Assurance
	4.6	SOP	: Standard Operating Procedure
	4.7	Lf/ml	: Limes-flocculation per milliliter
5.0	Procedure:		
	5.1	Equipment, Materials and Reagents	
		5.1.1	Weighing balance
		5.1.2	Glass Beakers (10ml, 50ml, 100ml, 500ml)
		5.1.3	Sodium Chloride
		5.1.4	Disposable syringes
	5.2	Preparation of Normal Saline:	
		Weigh 0.9 g of sodium chloride and dissolve in 60 ml of the purified	
	water. Make up the volume up to 100 ml with purified water. Adjust		
	the pH at 7 ± 0.1 . Sterilize by autoclaving at 121°C for 20		
	minutes.		
	5.3	Preparation of test animals:	
		5.3.1	Select five Guinea pigs each weighing between 250 -350 g
		5.3.2	Mark each Guinea pig with appropriate color scheme.
	5.4	Preparation of toxoid dilution:	
		Appropriately dilute the bulk purified tetanus toxoid in sterile	
	normal saline so that it contains 500 Lf per ml.		
	5.5	Injection:	
		Inject subcutaneously 1 ml of the toxoid diluted to 500 Lf/ml into	
	each of the five guinea pigs.		
	5.6	Observations:	
		Observe daily for three weeks all the injected Guinea pigs for any	
	symptoms of tetanus intoxication, Record the result.		
	5.7	Acceptance criteria	
		The bulk purified tetanus toxoid passes the test if no guinea pig	
	shows paralysis or any other signs of tetanus within 3 weeks of		
	injection and at least 80 % of the animals survive the test period.

		4.1.10	RT	:Room Temperature				
		4.1.11	SD	:Standard Deviation				
		4.1.12	SOP	:Standard Operating Procedure				
	4.2	Definitions:						
		Not Applicable.						
5.0	Procedure:							
	5.1	Preparation of Solutions:						
		5.1.1	Extraction Mixture:					
			5.1.1.1	Prepare the extraction mixture with two volumes of				
				1	methanol and one volume of chloroform.			
		5.1.2	1mg/ml Cholesterol Solution:					
			5.1.2.1	Weigh 25 mg of Cholesterol and transfer it to a 25 ml				
				1	volumetric flask.			
			5.1.2.2	Make up the volume to 25 ml using Chloroform.				
				2				
			5.1.2.3	This solution must be prepared freshly.				
				3				
		5.1.3	13 mM Vanillin Solution :					
			5.1.3.1	Prepare 13 mM of Vanillin solution in 14 M of				
				1	Phosphoric acid.			
			5.1.3.2	Weigh 1.9779 g of Vanillin and dissolve it in 944 ml of				
				2	Phosphoric acid in 1 liter amber colour Volumetric			
				flask.				
			5.1.3.3	Make up the volume to 1000 ml with purified water and				
				3	mix with magnetic stirrer for twelve hours.			
			5.1.3.4	Protect from light and store this solution at Room				
				4	temperature and use within 6 months.			
	5.2	Preparation of Calibration curve:						
		5.2.1	Prepare calibration curve (50-250µg) with freshly prepared					
			cholesterol solution (1 mg/ml) in 5 labeled test tubes of 10					
			ml as follows:					
			Concentration	50	100	150	200	250
			(µg)					
			Cholesterol	50	100	150	200	250
			Solution 1					
			mg/ml (µl)					
			Evaporate the contents in respective test tubes to dryness by					
			purging nitrogen gas.					
		Note: The Calibration curve is accepted if it is meeting the						
		validated parameters of intercept, slope and correlation coefficient.						
	5.3	Test:						
		5.3.1	Take 0.1 ml of the Sample in a test tube (this volume may					
			vary, depending on the concentration of lipids in the sample).					
			However reference ARM treated like test sample can be used in					
			the assay as control, occasionally.					
		5.3.2	Add 2 ml of concentrated sulphuric acid slowly to the test					
			Sample, Control as well as the samples of calibration curve					
			containing dried cholesterol.					
		5.3.3	Mix thoroughly by shaking the tubes gently, cover the tubes					
			with cotton plug and put it in a boiling water bath for ten					
			minutes.					
		5.3.4	Allow the tubes to cool at room temperature					
		5.3.5	Pipette out 0.1 ml of the reaction mixture from each tube and					
			add to the new test tubes (perform the Sample, Control as well					
			as Calibration curve in duplicate).					
		5.3.6	Treat the blank in parallel using Concentrated sulphuric acid.					
		5.3.7	Add 2.5 ml of vanillin solution to all the tubes and keep them					
			at resting position for about 30 minutes.					
		5.3.8	Measure the absorbance at 530 nm against the Blank.					
		5.3.9	In case of samples having lipid content lower than the range					
			of standard curve (50-250 µg) then extraction must be done.					
	5.4	Extraction of Sample:						
		5.4.1	Place 1 ml of sample in a separating funnel and add 3.75 ml of					
			extraction mixture to it.					
		5.4.2	Shake the separating funnel vigorously					
		5.4.3	Add 1.25 ml of Chloroform to it and again shake vigorously.					

		5.4.4	Allow the funnel to stand still for some time to get two
			separate phases
		5.4.5	Collect the mixture settled at the bottom of funnel into a
			test tube.
		5.4.6	Evaporate and dry the collected sample by purging with
			nitrogen gas and re-dissolve it in 250 µl of chloroform.
		5.4.7	Again evaporate and dry the sample with nitrogen gas.
		5.5	Calculations:
		5.5.1	Once the absorbance of the standards and the test samples have
			been taken, calculation shall be done using the excel sheet
			carrying formulas for the required calculation.
		5.5.2	If the assay is performed with 100 µl of the sample, the
			result is to be multiplied by 10.5 (2.1/2 * 10) in order to
			correct the volume and in order to convert it to ml.
		5.5.3	If the assay is performed with 200 µl of the sample, the
			result is to be multiplied by 5.5 (2.2/2 * 5) in order to
			correct the volume and in order to convert it to ml.
		5.5.4	If extraction of sample is performed than the result is to be
			multiplied with 4 in order to convert it to ml.
		5.5.5	Enter the absorbance for calculations starting from
			Calibration curve prepared between 50 and 250 g of Cholesterol
			and test samples. The calculations are made according to the
			equation of minimum squares.
		5.5.6	$Y = mX + b$.
			Where: m = slope
			b = intercept
			Y = absorbance
			X = concentration
			Final lipid concentration is calculated by multiplying the
			value of X obtained from linear line equation with the
			conversion factor as per the volume of sample taken and the
			procedure used.
			$X_f = X * (\text{Conversion factor})$
		5.5.7	Taking into account the equivalence between the ARM volume and
			the antigen concentration, express the result per 20 g of
			protein. Enter the protein concentration estimated by OD at
			280nm in the excel sheet.
		5.5.8	If the Protein concentration of Active Raw Material of
			Hepatitis B Vaccine by Absorbance at 280 nm. is 1.40 mg/ml
			calculations are done as given below:
		5.5.9	$C = 20 \times X_f / 1.40 / 1000$
		5.5.10	Where:
			C = Carbohydrate Concentration per 20µg of Protein
			20 = Dose of Hepatitis B vaccine (20µg)
			Xf = Total concentration of Lipids calculated (µg/ml) after
			multiplying with the conversion factor.
			1.40mg/ml = Concentration of protein in the sample by
			Absorbance at 280 nm)
			1000 = Conversion factor
		5.5	Acceptance criteria:
		5.5.1	The coefficient of variation (CV) between the replicates of
			the samples $\leq 5\%$.
		5.5.2	The value of the control should be within the acceptance
			limits.
		5.5.3	Lipid content in the sample should be within the specified
			limits.

1.0 |Purpose: |
 |To lay down a procedure for quantifying the protein concentration in HIB-TT|
 |conjugate samples received from the production process. |
 2.0 |Applicable to: |
 |This Standard Operating Procedure is applicable to all the samples of |
 |HIB-TT conjugate received from the production process. |
 3.0 |Equipment: |
 |3.1 |HIB-TT |: Haemophilus influenzae type b with tetanus toxoid |
 4.0 |Procedure: |
4.1	Materials and reagents:							
	4.1.1	Reagents						
	4.1.2	Copper Sulphate Pentahydrate						
	4.1.3	Sodium and potassium tartrate pentahydrate						
	4.1.4	Folin-Ciocalteu reagent 2N						
	4.1.5	Anhydrous Sodium Carbonate						
	4.1.6	Purified water						
	4.1.7	Lyophilized Bovine Serum Albumin						
	Materials:							
	4.1.9	20, 200, 1000 and 5000µl Automatic micropipettes, Pipette tips						
	4.1.10	5 or 10 ml Measuring cylinders						
	4.1.11	Thermo Resistant Test tubes (with a maximum capacity of 10 ml)						
	4.1.12	500 and 1000 ml Volumetric flasks (amber coloured)						
	4.1.13	25, 50 and 100 ml Beaker						
	4.1.14	3 ml Quartz cuvettes (1 cm width)						
	4.1.15	Tissue paper						
	4.1.16	Screw capped bottles (amber colored)						
4.2	Preparation of Solutions:							
	4.2.1	Alkaline Copper solution:						
		4.2.1.1	Dissolve 40 g of anhydrous sodium carbonate in 400 ml					
			1	of purified water.				
		4.2.1.2	Dissolve 0.6 g of sodium and potassium tartrate in 100					
			2	ml of purified water and add 0.46 g of copper sulphate				
			pentahydrate to it , shake untill it dissolves					
			completely.					
		4.2.1.3	Mix these two solutions gently. Transfer it to a 1000					
			3	ml volumetric flask and make up the volume to 1000 ml				
			with purified water. This solution should be stored in					
			an amber coloured bottle with a ground glass stopper at					
			2 - 8°C and should be used within 2 months .					
	4.2.2	1 N Folin-Ciocalteu reagent:						
		4.2.2.1	Dilute 2N Folin-Ciocalteu reagent to 1N. For this,					
			1	take 250 ml of the reagent and pour it in a 500 ml				
			amber flask. Make up the volume to 500 ml with purified					
			water. Store the solution in a screw cap amber flask at					
			2 to 8 °C, for a maximum of 6 months.					
	4.2.3	Lyophilized Bovine serum albumin reference material: 2 mg/vial						
		(for the calibration curves):						
		4.2.3.1	Prepare this solution according to the procedure					
			1	indicated in its documentation .The Reference material				
			of HIB-TT conjugate samples (as the control of the					
			technique) should be prepared according to the					
			procedure described earlier.					
4.3	Procedure:							
	4.3.1	Preparation of the Calibration Curve:						
		Reconstitute the reference material that is Bovine Serum						
		Albumin(BSA) in 2 ml of purified water						
		Now dilute the above material 10 times. This is done by taking						
		0.4 ml of BSA and adding to it 3.6 ml of purified water. A						
		final concentration of 100 µg/ml can be obtained .This is						
		further used in the preparation of low range calibration curve						
		(10-100 µg/ml).						
		Prepare the dilutions in test tubes, prepare a single dilution						
		for each concentration in a single tube, the volume should be						
		enough for the preparation of standard curve in duplicate.						
		The volumes taken for the preparation of Low Range Calibration						
		Curve are as follows:						
		Low range (10-100 µg/ml)						
		Water (ml)	0.9	0.8	0.6	0.4	0.2	-
		RM BSA 100 µg/ml (ml)	0.1	0.2	0.4	0.6	0.8	1.0
		Concentration (µg/ml)	10	20	40	60	80	100
		To obtain the high range calibration curve points, prepare the working						
		dilutions of Bovine Serum Albumin (reference material) at a						
		concentration of 1mg/ ml .						
		high range (100-500 µg/ml)						
		Water (ml)	0.9	0.8	0.7	0.6	0.5	
		RM BSA 1 mg/ml (ml)	0.1	0.2	0.3	0.4	0.5	
		Concentration (µg/ml)	100	200	300	400	500	
		Note:						
		Prepare the calibration curve whenever there is any change in the test						
		conditions (as when the new batches of reagents are prepared,						
		recalibration of the equipment, change in the analysts or new batch of						
		reference material etc.)						
		The test is accepted if the parameters of the intercept, the slope and						
		the correlation coefficient are found within the acceptance limits.						
		Record the results of the calibration curve.						
4.3.2	Treatment of samples with possible interference:							
		Each sample is treated according to the composition of elements that						
		may interfere in determination of protein concentration (Table 1). If						
		one or more interfering elements are present in the sample, carry out						
		the treatment, washing or acid precipitation as described below.						

	Table 1. Substances that interfere with Lowry test.			
	The numbers in parenthesis indicate the concentration limit that			
	should be present (according to the reports of the literature) (2).			
	Buffers			
	Tris (100 µmol/L), Phosphate (100 mmol/L), Tricine (100µmol/L), MOPS			
	(10 µmol/L), Hepes (1 µmol/L), Bicine (5 µmol/L), Citrate (1 mmol/L),			
	Glycylglycine (100 µmol/L).			
	Amino acids			
	Histidin (150 mmol/L), Tyrosine (150 mmol/L), Tryptophan (150 mmol/L),			
	Cysteine (40 µmol/L), Glycine (1 mmol/L), Glutamate (value not			
	described in the literature).			
	Carbohydrates			
	Saccharose (4 mmol/L), Monosaccharides (glucose, fructose, manose,			
	xilose, ramnose) (150 µmol/L), Glucosamine (5 mg/L), Glycerol (100			
	mL/L), Ethylenglycol (1 g/L), Ficoll, Polyvinylpyrrolidone.			
	Reductors			
	Phenol (except the nitrophenol), Dithiothreitol (20 µmol/L), Glutathion			
	(40 µmol/L), 2-Mercaptoethanol (700 µmol/L), Hydrazine (5 mg/L).			
	Ascorbic acid (100 µg/L).			
	Salts, metals, etc.			
	(NH₄)₂SO₄ (1.5 g/L), K⁺ (12 mmol/L), Hg²⁺ (15 µmol/L), Mn²⁺ (15			
	µmol/L), Co²⁺ (1 µmol/L), NaCl (0.7 mol/L), NaI (15 mmol/L)			
	Miscellaneous			
	EDTA (70 µmol/L), Haematin (15 µg/L), Triton X-100 (10 mg/mL),			
	oxidated lipids (10-200 µmol/L), Fatty acids (1 mmol/L), Ampholine,			
	Salicilate (20 µg/L), Penicillin (0.5 units/mL), Acetyl acetone (2			
	µmol/L).			
	4.3. Preparation of the samples and control:			
	3			
	4.3.3.1 Prepare the blank with water by substituting the volume			
	used for the sample.			
	4.3.3.2 For Preparing the control of HIB-TT conjugate samples,			
	dilute it 5 fold .			
	For example: Take 0.2 ml of HIB-TT conjugate samples and add 0.8 ml			
	of water to it. Prepare appropriate dilutions of the samples			
	accordingly. The dilutions are shown in the following table:			
	Sample	Dilution	Volume of the	Volume of water
		factor	sample (ml)	(ml)
	HIB-TT conjugate	1/5	0.200	0.800
	samples (ARM)			
	Note:			
	The dilutions mentioned can vary depending upon the protein			
	concentration. If there is any sample outside the range of the			
	calibration curve, carry out the calculation for more appropriate			
	dilution.			
	4.3. Coloured reaction:.			
	4			
	4.3.4.1 For the development of the colored reaction the solutions			
	should be mixed in the following proportion:			
	Sample	1.0 volume		
	Copper alkaline solution	5.0 volume		
	1N Folin reagent	0.5 volume		
	4.3. Test:			
	5			
	4.3.5.1 Switch on the thermostat bath and maintain it at a temperature			
	of 37 °C.			
	4.3.5.2 Take 0.4 ml of the blank , control and sample (already			
	diluted) and pour them in test tubes. (Perform the test			
	twice).			
	4.3.5.3 Add 2 ml of alkaline copper solution in each test tube.			
	4.3.5.4 Stir gently and incubate at 37 °C for 30 minutes.			
	4.3.5.5 Add 0.2 ml of 1 N Folin - Ciocalteau reagent. Stir immediately			
	after the addition of Folin until a homogeneous colour is			
	obtained.			
	4.3.5.6 Incubate at 37 °C for 20 minutes and read the absorbance at			
	730 nm in the spectrophotometer			
	4.3. Calculations:			
	6			
	For calculating the protein concentration use the equation $Y = mX + b$.			
	Where: m = slope			
	b = intercept			
	Y = absorbance			
	X = concentration			
	4.3.6.1 Use EXCEL programme for the preparation of calibration curve			
	and report the results (Multiply by the dilution factor.			
	Divide with 1000 to change µg/ml to mg/ml).			
	4.3. Acceptance criteria:			
	7			
	The variation coefficient for replicate of the samples, control of the			
	HIB-TT conjugate vaccine and Bovine Serum Albumin is (5 % .			
	The value of the HIB-TT conjugate controls is within the acceptance			
	limits according to the graph controlling it.

|| 5.2.4 |Reagents: |

||| 5.2.4.1 |Sodium Azide (NaN₃) |

||| 5.2.4.2 |Potassium Chloride (KCl) |

||| 5.2.4.3 |Sodium Chloride (NaCl) |

||| 5.2.4.4 |Disodium hydrogen phosphate anhydrous (Na₂HPO₄) |

||| 5.2.4.5 |Potassium dihydrogen phosphate (KH₂PO₄) |

||| 5.2.4.6 |Purified Water |

||| 5.2.4.7 |Hydrochloric Acid (HCl 37%) |

||| 5.2.4.8 |2- Propanol |

|| 5.3 |Preparation of solutions: |

|| 5.3.1 |Isopropyl alcohol 70% |

||| Take 700 mL of 2-propanol in a volumetric flask and make up the |

||| volume to 1000 mL with Purified Water. This solution can be |

||| stored at room temperature for 3 months. |

|| 5.3.2 |Running Buffer 10 X |

||| Na₂HPO₄ (79.0 mM), KH₂PO₄ (17.0 mM), KCl (27.0 mM) and NaCl |

||| (2.5 M) |

||| For a total volume of 500mL, weigh: |

||| Na₂HPO₄ |5.5 g |

||| KH₂PO₄ |1.2 g |

||| KCl |1 g |

||| NaCl |73 g |

||| Dissolve all the reagents in approximately 450 mL of purified |

||| water in a beaker. Adjust the pH to 7 with concentrated |

||| Hydrochloric Acid or 1N Sodium Hydroxide by continuous |

||| stirring. Make the volume to 500mL with purified water in a |

||| volumetric flask. Prepare fresh before use. |

|| 5.3.3 |Running Buffer 1 X |

||| For a volume of 2L, add 200mL of Running Buffer 10X in a |

||| volumetric flask and make the volume to 2 L with purified |

||| water. Use the mobile phase within four days from the date of |

||| preparation if it remains clear and no turbidity or fibers |

||| observed in it. |

|| 5.3.4 |Column Preservation Solution: |

||| 20% Ethanol solution: |

||| For a total volume of 500mL, take 100mL of absolute ethanol and |

||| make up the volume to 500mL with 0.2µ/0.22µ filtered purified |

||| water in a volumetric flask. Prepare fresh before use. |

||| Note: All the solutions prepared for use are vacuum filtered |

||| using Nylon 6, 6 membrane 0.20 µm or 0.22 µm , depending upon |

||| the nature of solution to be filtered. For organic solvents |

||| 0.45µm filters should be used (filtration not necessary if the |

||| solution is prepared in 0.2 µ filtered purified water). |

|| 5.4 |Preparing the HPLC System for run, Agilent Series: |

|| 5.5 |Run Conditions: |

|| 5.5.1 |Load method HBSAG.M. |

|| 5.5.2 |Flow Rate: 0.4 mL/min |

|| 5.5.3 |Detection Wavelength: 280nm |

|| 5.5.4 |Run time: 110 minutes |

|| 5.5.5 |Detector: DAD/VWD |

|| 5.6 |Equilibration of the system and the column: |

||| Equilibrate the system and the column with Running Buffer 1X at 280nm |

||| until a stable baseline is observed on the online plot window. |

|| 5.7 |Sample Preparation and Application: |

|| 5.7.1 |Centrifuge the standards/samples to be applied at 12000 rpm, |

||| for 3 to 5 minutes. |

|| 5.7.2 |Samples are loaded in screw cap vials and placed against the |

||| appropriate no. on the sample tray with proper labeling on the |

||| sample vials in coordination with the sequence loaded. |

|| 5.7.3 |Load the required volume of sample as per the protein |

||| concentration equivalent to 40µg in the sample vial. |

||| Example: If a sample has an antigen concentration of 0.5 mg/mL, |

||| to calculate volume required for 40µg of protein |

||| 0.5mg (500µg) ----1mL |

||| 40µg-----X mL |

||| X mL = 40µg x 1mL |

||| 500µg |

||| X mL = 80µL |

||| Therefore, 80µL of volume is taken for sample having protein |

||| concentration of 0.5 mg/mL. |

||| Note: Protein concentration is calculated as per SOP OD at 280 |

||| nm. |

|| 5.8 |Running of sequence: |

|| 5.8.1 |Load sequence HBSAG.S. |

|| 5.8.2 |Open the sequence parameter option by clicking Sequence menu. |

|| 5.8.3 |Enter information about the data directory and operator name. |

|| 5.8.4 |In the shutdown option, click on the post-sequence option and |

||| select LAMPOFF/STANDBY. |

|| 5.8.5 |In sequence table option, specify the sample names, methods and |

||| vials to run in the sequence as per the following table: |

||| S. No |Sample Code |Sample details |No. of |Injection |

||| | |Injections |Volume (µL) |

||| 1. |Blank |Eluent Blank |1 |10 |

||| 2. |In-house |System |6 |40 µg of |

||| |Reference |Suitability Test |Protein |

||| 3. |Blank |Eluent Blank |1 |10 |

||| 4. |Test |Test Sample |1 |40 µg of |

||| |Sample(s) |Protein |

|| 5.8.6 |Click on run sequence option in run control menu to start the |

||| sequence. |

|| 5.8.7 |Each sample run will be of 110 minutes and after running all |

||| the samples the sequence will automatically stop. |

		5.8.8	Inject the eluent blank after every 20 injections.	
			Note: One extra vial with same SST sample can be used if 6	
			injections are not possible from single vial.	
		5.9	Calculations :	
		5.9.1	Area under curve and retention time for the standards/sample is	
			analyzed by Chemstation software.	
		5.9.2	Calculations for System Suitability Test:	
			5.9.2.1	Note the values of area under the curve and retention
			time for reference (SST standard) and also in EXCEL	
			format for calculation of Relative standard deviation.	
			Path for Master EXCEL format is	
			My Computer → D drive → SST Master EXCEL (folder) →	
			SST Master EXCEL.	
			5.9.2.2	Every time a sample is run with system suitability
			test, calculate the results for system suitability by	
			creating a copy of Master EXCEL in the desired folder	
			and record.	
			5.9.2.3	Attach the hard print of SST calculation along with
			chromatograms and the record form.	
		5.10	Acceptance Criteria :	
		5.10.1	For System Suitability Test :	
			5.10.1.1	RSD calculated for Retention time should be <5.0%.
			5.10.1.2	RSD calculated for Area should be <5.0%.
		5.10.2	For ARM of Hepatitis-B vaccine :	
			5.10.2.1	Purity by Chromatography should be $\geq 95.00\%$ (Area
			under the major Peak of Curve).	
			5.10.2.2	The retention time of sample should be ± 1 minute to
			that of the average of the retention time of the ARM	
			Reference.

	18	
	5.0	Procedure:
	5.1	Preparation of solutions:
	5.1.1	30 % Acryl amide and 0.8% Bis-acrylamide solution:
		Weigh 29.2 g of acrylamide and 0.8 g of Bis-acrylamide and
		dissolve in 80ml Milli-Q water, make up the volume to 100 ml.
		Keep on stirring for at least 2 hours and finally filter the
		solution with 0.4511 µ filter and store at 2-8°C covered with
		aluminum foil.
	5.1.2	1.5 M Tris solution, (pH 8.8):
		Weigh 18.171 g of Tris and dissolve in 80ml of Milli-Q water.
		Adjust pH to 8.8 with concentrated Hydrochloric Acid (37%).
		Make up the volume to 100 ml and finally filter the solution
		with 0.4511 µ filter. Can be stored at room temperature for 3
		months.
	5.1.3	0.5 M Tris solution (pH 6.8)
		Weigh 6.057 g of Tris and dissolve in 80ml of Milli-Q water.
		Adjust pH to 8.8 with concentrated Hydrochloric Acid (37%).
		Make up the volume to 100 ml and finally filter the solution
		with 0.4511 µ filter. Can be stored at room temperature for 3
		months.
	5.1.4	20% SDS solution
		Weigh 20 g of SDS and dissolve in Milli-Q water, make up the
		volume to 100 ml. Can be stored at room temperature for 3
		months.
	5.1.5	10% Ammonium Persulphate solution
		Weigh 1 g of APS and dissolve in 9ml of Milli-Q water in
		5ml falcon tube, make up the volume to 10 ml. Make aliquots
		of 500µl and store at 20°C for 3 months.
	5.1.6	Gel running buffer (10X)
		Weigh 30.2 g Tris, 144 g Glycine and 10 g SDS & dissolve in
		800ml of Milli-Q water. Adjust the pH to 8.3 with HCl & make
		up the volume to 1000 ml.
	5.1.7	Sample Solubilising Buffer (6X)
		Mix 2.4 ml of 0.5M Tris (pH 6.8), 3 ml of Glycerol, 3 ml of
		20% SDS. 6 mg of Bromophenol blue. 1.6 ml of
		β-mercaptoethanol and make up the volume to 10 ml. Make
		aliquots of 1ml each and store at -20°C. For running samples
		in non reducing condition, do not add β-mercaptoethanol in
		sample solubilizing buffer.
	5.1.8	Coomassie Brilliant Blue stain:
		Weigh 1 g of Coomassie Brilliant Blue R250* and dissolve in
		100 ml of methanol, add 20 ml of glacial acetic acid and make
		up the volume to 200 ml with Milli-Q water Keep on magnetic
		stirrer for at least half an hour for proper dissolution.
	5.1.9	Destain Solution
		Mix 40 ml of methanol, 10 ml of glacial acetic acid and make
		up the volume to 100 ml with Milli-Q water. Prepare fresh at
		the time of destaining the gel.

	5.2	Casting of gel
	5.2.1	Clean the glass plates with detergent followed by washing
		with Milli-Q water and fix them in the casting frame.
	5.2.2	Prepare 12.5% Separating Gel mixture (7.5 ml) in a falcon
		tube consisting of following reagents:
		30% Acryl amide-3.125 ml
		1.5 M Tris (pH 8.8) — 1.875 ml
		20% SDS — 0.15 ml
		Milli-Q water — 2.275 ml
		10% APS- 75 µl
		TEMED- 5 µl
		Mix the contents gently by inverting the tube two-three times
	5.2.3	Immediately pour 12.5% Separating Gel mixture between the two
		glass plates leaving 4-5 cm space above for Stacking Gel and
		overlay it carefully with Milli-Q water.
	5.2.4	Prepare the Stacking Gel mixture (3.75 ml) in a tube
		consisting of following reagents:
		30% Acrylamide- 0.625 ml
		0.5 M Tris (pH 6.8) - 0.9375 ml
		20% SDS-0.075 ml
		Milli-Q water —2.0 ml
		10% APS-50 µl
		TEMED – 5 µl
	5.2.5	Pour the stacking gel mixture over the surface of the
		polymerized separating gel and immediately insert the 10-well
		comb of 0.75mm.
	5.2.6	Allow the gel to polymerize for 10 minutes.
	5.2.7	Dilute the 10X gel running buffer to 1 X by mixing 100 ml of
		the 10X stock solution in 900 ml of Milli-Q water.
	5.2.8	Remove the comb from the gel and fix the glass plate
		containing polymerized gel set on the gel cassette sandwich
		of the electrophoresis assembly.
	5.2.9	Add 1 X gel running buffer between and around the buffer tank
		of electrophoresis assembly.
	5.3	Sample Preparation For Upstream Samples:
	5.3.1	Prepare CRM197 standards from stock CRM197 standard
		concentration of 100 µg/ml in water to make four different
		concentrations (1.0µg, 0.5µg, 0.25µg and 0.125 µg per 12µl
		water) and mix with sample solubilizing buffer for reducing
		SDS PAGE.
	5.3.2	Take 50 µl of upstream samples and mix with 10µl of sample
		solubilizing buffer for reducing SDSPAGE. Boil standards and
		samples in water bath for 5 min or in microwave for 2 minutes
		at 100°C. Load 15µl each of prepared samples and standards in
		the gel.
	5.4	Preparation For Non reducing SDS PAGE samples:
		Adjust the concentration of purified CRM197 samples 2.0µg in 12 µl
		water by dilutions and mix with 3µl of sample solubilizing buffer.
		Load the samples in the gel along with CRM197 Standard (2.0µg) in
		one of the well of SDS PAGE gel.
	5.5	Preparation For reducing SDS PAGE samples:
	5.5.1	Adjust the concentration of purified CRM197 samples 2.0µg in
		12 µl water by dilutions and mix with 3 µl of sample
		solubilizing buffer. Boil these samples in water bath for 5
		min at 100°C.
	5.5.2	Load the samples in the gel along with CRM197 Standard (2.0
		µg) in one of the well of SDS PAGE gel.
	5.5.3	Note: Load the Molecular weight marker for determining the
		approx. molecular weight of CRM 197 protein as per the
		requirement.
	5.6	Running SDS-PAGE gel:
		Connect the gel apparatus (the negative and positive electrodes)
		with the power pack and set the power pack at 90V till the time dye
		front comes out of stacking gel. After that, turn the voltage to
		160V for further running of the samples. Stop the power pack once
		dye front reaches at the bottom of the separating gel.
	5.7	Staining and de-staining of the gel:
	5.7.1	Once the gel run is over, remove the gel from the plate and
		place the gel in staining solution in a plastic tray for 20
		minutes with gentle agitation on gel rocker.
	5.7.2	De-stain the gel with de-staining solution to remove the
		extra stain till the gel background becomes clear and all the
		bands become clearly visible.
	5.8	Analysis of SDS-PAGE gel (For Upstream samples)
	5.8.1	After destaining, scan the gel in BIORAD densitometer using
		Quantity one software and save for record
	5.8.2	For semi quantitative estimation of CRM 197 protein
		expression in upstream cell culture supernatant, open the
		saved image through the Quantity one software.
	5.8.3	Go to the volume menu and select the volume contour tool.
		Select the bands in volume contour/tool mode. For standard
		bands, double click on the band so that volume properties
		window appears. Select the standard option which leads to the
		concentration menu. Write the concentration of that
		particular band in given space. Click OK to save the data.
	5.8.4	After selecting the standard bands, select the unknown bands
		and mark them unknown such as U1, U2, U3, U4, U5 and U6.
	5.8.5	Double click on gel background and select the background in
		volume appear window to subtract the background as Bl. Again
		go to the volume and select the volume analysis report. Press
		done button to generate volume report.
	5.8.6	Print the volume report and calculate the unknown

			concentration by using following formula- Concentration X
			1000
			Volume of sample loaded in gel (in µl)
			This will give protein concentration in µg/ml.
		5.9	Analysis of SDS-PAGE gel (For Non reducing samples)
		5.9.1	After destaining, scan the gel in BIORAD densitometer using
			Quantity one software and save for record. For percentage
			purity analysis of purified CRM 197 protein, open the saved
			image through the Quantity one software.
		5.9.2	Go to the Lane menu, select the frame lanes and create no of
			lanes as per the samples loaded in the wells. Press OK to
			frame lanes.
		5.9.3	Go to the band menu and select the detect band option.
			Separate detect band window will open. Press OK to detect the
			bands in the lane.
		5.9.4	See carefully in the gel and make sure the all the bands in
			the lane are selected. If required, bands can be created or
			deleted through the options given in the band menu.
		5.9.5	Go to the band menu again and press the band attribute.
			Separate window will open. Select the relative quantity
			option and press OK. Percentage purity of each band in the
			lane will be displayed on the bands. Save or print the data
			for report preparation.
		5.10	Analysis of SDS-PAGE gel (For Reducing samples to calculate %
		Nicking)	
		5.10.	After destaining, scan the gel in BIORAD densitometer using
		1	Quantity one software and save for record.
		5.10.	For percentage nicking analysis of purified CRM 197 protein,
		2	open the saved image through the Quantity one software.
		5.10.	The electrophoretic separation of CRM197 protein in reduced
		3	conditions is being used to evaluate "nicking" of this
			protein in two fragments A and B. Look for the presence of
			three bands on the gel, the intact CRM197 protein (major
			band, 591kD), two smaller more lighter stained bands as
			fragment A (21kD)) and fragment B (37kD).
		5.10.	Go to the volume menu and select the volume contour or volume
		4	rectify tool to select all the bands present in the lanes.
		5.10.	Double click on gel background and select the background in
		5	volume appear window to subtract the background as BI
		5.10.	Go to the volume menu and press the volume analysis report
		6	option. Separate window will appear Make sure following
			options are selected:
			Name, Volume, Adj. volume, % volume, concentration, density,
			display image in report, print image on report, show overlays
			in image and global background subtraction.
		5.10.	Press done to generate the report. Print the report
		7	
		5.10.	Express the percent of nicked protein as percent of the
		8	summed areas (Adj. volume) for fragment A and B divided by
			the sum of all areas measured (fragment A+ fragment B+
			CRM197).

		toxicity. Toxicon 51 (2008) 473-477.	

1.0	Objective							
	To lay down the procedure for Spectrophotometric determination of Potassium							
	Thiocyanate concentration in Active Raw Material (ARM) of recombinant							
	Hepatitis B vaccine.							
2.0	Scope							
	This Standard Operating Procedure is applicable to all the samples of							
	Active Raw Material of recombinant Hepatitis B surface antigen, , received							
	in the Quality control department.							
3.0	Responsibility							
	3.1	The analyst shall be responsible for executing the described						
	procedure correctly.							
	3.2	Supervisor shall be responsible for verifying that the procedure is						
	complied with and the results are checked.							
	3.3	HOD shall be responsible for overall compliance of this SOP.						
4.0	Abbreviations and Definitions							
	4.1	Abbreviations:						
	4.1.1	ARM	:Active Raw Material					
	4.1.2	CV	:Coefficient of variation					
	4.1.3	g	:Gram					
	4.1.4	ID	:Identification					
	4.1.5	mg	:Milligram					
	4.1.6	ml	:Millilitre					
	4.1.7	µl	:Micro litre					
	4.1.8	µg	:Microgram					
	4.1.9	nm	:Nanometer					
	4.1.10	SD	:Standard Deviation					
	4.1.11	SOP	:Standard Operating Procedure					
	4.2	Definitions:						
		Not Applicable.						
5.0	Procedure:							
	5.1	Preparation of Solutions:						
		5.1.1	37 % w/v Zinc Chloride solution :					
			5.1.1.1	Weigh 37 g of zinc chloride and transfer it to a 100 ml				
			1	volumetric flask.				
			5.1.1.1	Make up the volume to 100 ml with purified water.				
			2					
			5.1.1.1	Store at room temperature, the solution should be used				
			3	within 6months.				
		5.1.2	6 % w/v Ferric Chloride solution :					
			5.1.2.1	Weigh 3 g of ferric chloride and transfer it to a 50 ml				
			1	volumetric flask.				
			5.1.2.1	Make up the volume to 50 ml with concentrated				
			2	hydrochloric acid. Heat the solution slightly if not				
				dissolved properly.				
			5.1.2.1	Store at room temperature, the solution should be used				
			3	within 6 months.				
		5.1.3	1 mg/ml Potassium Thiocyanate Solution :					
			5.1.3.1	Weigh 50 mg of Potassium Thiocyanate and transfer it to				
			1	a 50 ml volumetric flask.				
			5.1.3.1	Make up the volume to 50 ml with Purified water.				
			2					
			5.1.3.1	This solution should be freshly prepared.				
			3					
	5.2	Preparation of Calibration curve:						
		5.2.1	Take 5 volumetric flasks of 25 ml each and label the details					
			with pen marker. Prepare calibration curve (5-25 µg/ml) by					
			adding 1mg/ml potassium thiocyanate to purified water as per					
			the following table:					
			Concentration (µg/ml)	5	10	15	20	25
			Potassium Thiocyanate	125	250	375	500	625
			(1mg/ml) taken (µl)					
			Volume Make up with	25	25	25	25	
			purified water in a					
			volumetric flask (ml)					
		Note: The Calibration curve is accepted if it is meeting the						
		validated parameters of intercept, slope and correlation coefficient.						
	5.3	Test:						
		5.3.1	Take 1ml from 5 to 25 µg/ml Potassium Thiocyanate solutions of					
			calibration curve, Test sample (ARM) and Blank (Purified water)					
			used as blank) in duplicates in separate 2 ml previously					
			labelled micro centrifuge tubes. However reference ARM treated					
			like test sample can be used in the assay as a control,					
			occasionally.					
		5.3.2	To these micro centrifuge tubes add 100 l of 37% Zinc Chloride					
			solution and 900 l of Purified water.					
		5.3.3	Allow the tubes to stand for 10 minutes and centrifuge at 3000					
			RPM for 20 minutes.					
		5.3.4	Take 1 ml of supernatant from each micro centrifuge tube and					
			transfer to the previously labeled fresh micro centrifuge					
			tubes after centrifugation.					
		5.3.5	Add 100 l of 6%w/v ferric chloride solution to each tube and					
			mix the contents using vortex mixer.					
		5.3.6	Allow these tubes to stand for five minutes.					
		5.3.7	Adjust the wavelength in spectrophotometer at 475 nm and					
			measure the absorbance.					
		Note: If absorbance of the sample falls outside the range of						
		calibration curve, dilute the sample appropriately so that it comes						
		under the range of calibration curve.						
	5.4	Calculations:						
		5.4.1	Once the absorbance of the standards and the test samples have					

			been taken, calculation shall be done using the excel sheet
			carrying formulas for the required calculation.
		5.4.2	Enter the absorbance for calculations starting from
			Calibration curve prepared between 5 and 25 g/ml of Potassium
			Thiocyanate solution and test samples. The calculations are
			made according to the equation of minimum squares.
		5.4.3	$Y = mX + b$.
			Where: m = slope
			b = intercept
			Y = absorbance
			X = concentration
			(multiply with the dilution factor)
		5.4.4	Taking into account the equivalence between the ARM volume and
			the antigen concentration, express the result per 20 g of
			protein. Enter the protein concentration estimated by OD at
			280nm in the excel sheet.
		5.4.5	If the Protein concentration of Active Raw Material of
			Hepatitis B Vaccine by Absorbance at 280 nm. is 1.40 mg/ml
			calculations are done as given below:
		5.4.6	$C = 20 \times X / 1.40 / 1000$
			Where:
			C = Potassium Thiocyanate concentration per 20 μ g of Protein
			20 = Dose of Hepatitis B vaccine (20 μ g)
			X = Total concentration of Potassium Thiocyanate calculated
			from the calibration curve (μ g/ml)
			1.40mg/ml = Concentration of protein in the sample by
			Absorbance at 280 nm)
			1000 = Conversion factor
		5.4.7	Record all the calculations in the data record form and also
			attach the hard copy of the excel sheet used for calculation
			along it.
		5.5	Acceptance criteria:
		5.5.1	The coefficient of variation (CV) between the replicates of
			the samples should be $\leq 5\%$.
		5.5.2	The value of the control should be within the acceptance
			limits.
		5.5.3	Potassium thiocyanate content in the sample should be within
			the specified limits.

5.0 |Procedure |
 |5.1 |Precautions to be taken: |
 |5.1.1 |Handle Acrylamide and Bis-acrylamide carefully, with gloves,|
 |as these are neurotoxic. |
 |5.1.2 |Always wear laboratory coat, mask and personnel protective |
 |equipment. |
 |5.1.3 |Handle acids carefully under fume hood. |
 |5.1.4 |Acetic acid causes serious burns. So do not inhale vapours. |
 |In case of contact with the eyes, wash immediately with |
 |abundant water and get medical attention. |
 |5.1.5 |Methanol is toxic if inhaled or ingested and is also |
 |inflammable. Keep away from ignition sources. Avoid contact |
 |with the skin. Avoid inhalation. |
 |5.1.6 |Silver nitrate causes severe burns. In the event of contact |
 |with the eyes wash immediately with abundant water and get |
 |medical attention. |
 |5.1.7 |Ammonia solution causes irritation in eyes, skin and also in|
 |lungs on inhalation. In the event of contact with eyes, wash|
 |immediately with abundant water and get medical attention. |
 |5.1.8 |Never touch the gel with fingers, as the fingerprints get |
 |marked on the gel. |

	5.3	Preparation of solutions:		
	5.3.1	Monomeric Solution		
			(Acrylamide 30%; Bis-acrylamide 0.8%), For a total volume of	
			250mL, weigh:	
			Acrylamide	75.0g
			Bis-acrylamide	2.0g
			Dissolve in 170mL of purified water in a beaker. Make up the	
			volume to 250mL with purified water in a volumetric flask.	
			Keep on stirring for at least 2 hours and finally filter the	
			solution using whatman paper No.42. This solution can be	
			stored at 2-8°C in an amber colour reagent bottle for 2	
			months.	
	5.3.2	Separating Gel Buffer (1.5 M)		
			(Tris-HCl 1.5M; pH-8.8), For a volume of 250mL, weigh:	
			Tris	45.4g
			Dissolve in 170mL of purified water in a beaker. Adjust pH	
			to 8.8 with concentrated Hydrochloric Acid (37%). Make up	
			the volume to 250mL with purified water in a volumetric	
			flask and finally filter the solution, using whatman paper	
			No.42. This solution can be stored at 2-8°C for 6 months.	
	5.3.3	Stacking Gel Buffer (0.5 M)		
			(Tris-HCl 0.5 M; pH-6.8), For a volume of 50mL, weigh:	
			Tris	3.0g
			Dissolve in 20 mL purified water in a beaker. Adjust pH to	
			6.8 with concentrated Hydrochloric Acid (37%). Make up the	
			volume to 50mL with purified water in a volumetric flask and	
			finally filter the solution using whatman paper No.42. This	
			solution can be stored at 2-8°C for 6 months.	
	5.3.4	Stacking Gel Buffer (2.0 M)		
			(Tris-HCl 2M; pH-6.8), For a volume of 50mL, weigh:	
			Tris	12.11g
			Dissolve in 20mL of purified water in a beaker. Adjust pH to	
			6.8 with concentrated Hydrochloric acid (37%). Make up the	
			volume to 50mL with purified water in a volumetric flask and	
			finally filter the solution using whatman paper (No 42).	
			This solution can be stored at 2-8°C for 6 months.	
	5.3.5	Sodium Dodecyl Sulphate (SDS) – 10%		
			For a volume of 500mL, weigh:	
			SDS	50g
			Dissolve in 300 mL of purified water in a beaker. Make up	
			the volume to 500mL with purified water in a volumetric	
			flask. This solution can be stored at room temperature for	
			6 months.	
	5.3.6	Sodium Dodecyl Sulphate (SDS) – 20%		
			For a volume of 100mL, weigh:	
			SDS	20g
			Dissolve in 75mL of Purified water in a beaker. Make up the	
			volume to 100mL with Purified water in a volumetric flask.	
			This solution can be stored at room temperature for 6	
			months.	
	5.3.7	Ammonium per Sulphate (APS) – 10%		
			For a volume of 5mL, weigh:	
			APS	0.5g
			Dissolve in 4mL of purified water in a beaker. Make up the	
			volume to 5mL with purified water in a volumetric flask.	
			Divide in aliquots of 0.5mL in eppendorf. This can be stored	
			at -20±5°C for 2 months.	
	5.3.8	Bromophenol Blue (1%)		
			For a volume of 5mL, weigh:	
			Bromophenol blue	0.05g
			Dissolve in 4mL of purified water in a beaker. Make up the	
			volume to 5mL with purified water in a volumetric flask.	
			Divide in aliquots of 500µL in eppendorf. This can be stored	
			at -20±5°C for 6 months.	

		5.3.9	2X Reducer Buffer with dye	
		[[Tris(hydroxymethyl)aminomethane] 0.125M; Sodium Dodecyl		
		Sulphate 4%; Glycerol 20%; 2-Mercaptoethanol 10%;		
		Bromophenol blue 0.01%.]		
		For a volume of 10mL, add the following solutions:		
		Stacking Gel Buffer 2.0M	0.625mL	
		SDS 20%	2.0mL	
		Glycerol	2.0mL	
		2-Mercaptoethanol	1.0mL	
		Bromophenol Blue 1%	0.1mL	
		Make up the volume to 10mL with purified water in a		
		volumetric flask. Divide in aliquots of 500µL in eppendorf.		
		This can be stored at -20±5°C for 6 months.		
		5.3.10	5X Reducer Buffer with dye	
		[[Tris(hydroxymethyl) aminomethane] 0.3125M; Sodium Dodecyl		
		Sulphate 10%; Glycerol 50%; 2-Mercaptoethanol 25%;		
		Bromophenol blue 0.01%.]		
		For a volume of 10mL, add the following solutions in a		
		beaker, weigh SDS and dissolve it in that mixture:		
		Stacking Gel Buffer 2.0M	1.56mL	
		SDS	1.0g	
		Glycerol	5.0mL	
		2-Mercaptoethanol	2.5mL	
		Bromophenol Blue 1%	0.1mL	
		Make up the volume to 10mL with purified water in a		
		volumetric flask. Divide in aliquots of 500µL in eppendorf.		
		This can be stored at -20±5° C up to 6 months.		
		5.3.11	Running Buffer 10X	
		[[Tris (hydroxymethyl) aminomethane] 0.25M; Glycine 1.92M;		
		Sodium Dodecyl Sulphate 10%).]		
		For a volume of 1L, weigh:		
		Tris	30.2g	
		Glycine	144.0g	
		SDS	10.0g or SDS 10%	100mL
		Dissolve in 700mL of Purified water in a beaker. The pH of		
		the solution should be 8.3. Make up the volume to 1L with		
		purified water in a volumetric flask. This can be stored at		
		room temperature for 6 months.		
		5.3.12	Running Buffer, 1X	
		[[Tris-(hydroxymethyl) aminomethane 0.025M; Glycine 0.192M;		
		Sodium Dodecyl Sulphate 0.1%).]		
		For a volume of 1L, add 100mL of Running Buffer 10X, in a		
		volumetric flask and make up the volume to 1L with purified		
		water. This can be stored at room temperature up to 6		
		months.		
		5.3.13	2 - Butanol (50%)	
		For a volume of 100mL take:		
		2-Butanol	50mL	
		Make up the volume to 100mL with purified water in a		
		volumetric flask. Shake and allow to stand until the		
		appearance of two phases (upper phase: 2-Butanol saturated		
		with water, lower phase: water). Carefully collect the upper		
		phase for use. This solution can be stored at room		
		temperature up to 6 months.		
		5.3.14	Fixation Solution	
		(Methanol-50%; Acetic Acid-7%)		
		For a volume of 1L, take:		
		Methanol	500mL	
		Acetic Acid	70mL	
		Make up volume with purified water to 1L in a volumetric		
		flask. Store in amber colour bottle at room temperature. The		
		expiry date of this solution is 6 months, but it must not be		
		used more than 10 times.		
		5.3.15	Staining Solution	
		(Coomassie Brilliant Blue (CBB) G-250, 0.05%; Methanol 10%;		
		Acetic Acid 10%)		
		For a volume of 1L, in a beaker take:		
		Coomassie Brilliant Blue	0.5g	
		G-250		
		Methanol	100mL	
		Acetic Acid	100mL	
		Make up volume with purified water to 1L in a volumetric		
		flask. Stir it for 1 hour and filter it using Whatman Filter		
		Paper No.42. Store the staining solution in amber colour		
		bottle at room temperature. The expiry date of this solution		
		is 6 months, but it must not be used more than 10 times.		
		5.3.16	Destaining Solution	
		(Methanol 10%; Acetic Acid 10%)		
		For a volume of 1L, take:		
		Methanol	100mL	
		Acetic acid	100mL	
		Make up the volume with purified water to 1L in a volumetric		
		flask. Store in amber colour bottle at room temperature. The		
		expiry date of this solution is 6 months, but it must not be		
		used more than 10 times. The used Destaining solution is		
		filtered through activated charcoal for re-use.		
		5.3.17	Staining Solution II	
		(Coomassie Brilliant Blue (CBB) G-250, 0.2%; Methanol 40%;		
		Acetic Acid 10%)		
		For a volume of 500mL, in a beaker take:		
		Coomassie Brilliant Blue	1.0g	
		G-250		

			Methanol	200mL
			Acetic Acid	50mL
			Make up volume with purified water to 500mL in a volumetric	
			flask. Stir it for 1 hour and filter it using Whatman Filter	
			Paper No.42. Store in amber colour bottle at room	
			temperature. The expiry date of this solution is 6 months,	
			but it must not be used more than 5 times.	
			5.3.18	Destaining Solution II
			(Methanol 40%; Acetic Acid 10%)	
			For a volume of 500mL, take:	
			Methanol	200mL
			Acetic acid	50mL
			Make up the volume with purified water to 500mL in a	
			volumetric flask. Store in amber colour bottle at room	
			temperature. The expiry date of this solution is 6 months,	
			but it must not be used more than 5 times. The used	
			Destaining solution is filtered through activated charcoal	
			for re-use.	
			5.3.19	Sodium Hydroxide Solution (0.36%):
			For a volume of 1L, weigh:	
			Sodium Hydroxide	3.6g
			Dissolve in 700mL of purified water in a beaker. Make up	
			volume with purified water to 1L. This solution can be	
			stored in a glass bottle at room temperature for 6 months.	
			5.3.20	Citric Acid Solution (1%):
			For a volume of 10mL, weigh:	
			Citric Acid	0.1g
			Dissolve in 7mL of purified water in a beaker. Make up the	
			volume with purified water to 10mL in a volumetric flask and	
			pour aliquot of 1.35mL in eppendorf of 1.5mL. This solution	
			can be stored at -20 ±5 °C for 6 months.	
			5.3.21	Fixation and Stopping Solution:
			(Methanol-50%)	
			For a volume of 500mL, take:	
			Methanol	250mL
			Make up the volume to 500mL with purified water in a	
			volumetric flask.	
			Note: Prepare the solution prior to use.	
			5.3.22	Staining Solution:
			(AgNO₃ 0.4 %; NaOH 0.076%; NH₃ 0.38%)	
			For a volume of 100mL, take:	
			Silver nitrate	0.4g (dissolves in 4mL purified
			water)	
			Sodium hydroxide (0.36%)	21mL
			Ammonia (25%)	1.52mL
			Make up the volume to 100mL with purified water in a	
			volumetric flask.	
			For a volume of 250mL, take:	
			Silver nitrate	1g (dissolves in 10mL purified
			water)	
			Sodium hydroxide (0.36%)	52.5mL
			Ammonia (25%)	3.8mL
			Make up the volume to 250mL with purified water in a	
			volumetric flask.	
			Note: Prepare the solutions prior to use.	
			5.3.23	Developing Solution:
			(Formaldehyde 0.0185 %; Citric Acid 0.005%), For a volume of	
			250mL, take:	
			Formaldehyde (37%)	125μL
			Citric Acid (1%)	1.25mL
			Make up the volume to 250mL with purified water in a	
			volumetric flask.	
			Note: Always prepare this solution prior to use.	
			5.4	Preparation of Separating gel for Hoefer Series {140(w) x 240(l) x
			1.5(t)mm} :	
			5.4.1	Assembly of Electrophoresis Unit
			5.4.1.1	Take two of the cleaned and unchipped glass plates
			and two cleaned spacers. Lay one plate on a flat	
			surface and place the spacers along each edge.	
			Place the spacer mate in between for proper	
			alignment and lay the second glass plate on the	
			top. Tight the glass plates with the help of	
			clamps.	
			5.4.1.2	Place the blank silicone rubber gasket into the
			casting cradle with the foam side down.	
			5.4.1.3	Assemble the plates on the casting cradle.
			5.4.1.4	Check for leakage by pouring of Purified water
			between the assembled glass plates.	
			Note: In case of leakage apply thin film of gel	
			seal only the bottom corner surfaces created by	
			spacers and the plates.	
			5.4.1.5	Remove the water by tilting the chamber carefully.
			After that, dry the interior of chamber with	
			filter paper.	
			5.4.2	Prepare the gel of required percentage as given in Table-1
			as per Annexure 1.	
			5.4.2.1	APS 10% and TEMED should always be added just
			before casting the gel, without forming bubbles.	
			5.4.2.2	Slowly pour the above mixture of solutions,
			between the glass plates, using autopipette/glass	
			pipette with the help of a macro pipette	
			controller, up to a height approximately 5 cm	

			below the top. To check the polymerisation, leave	
			a small portion of the mixture in the beaker.	
			5.4.2.3	Add 100µl of 50% 2-Butanol immediately for
			complete polymerization of the gel. Leave for at	
			least 15 minutes to allow the polymerization of	
			the gel. When the gel has polymerized a brief	
			interface of liquid-gel appears.	
	5.5	Preparation of Separating gel for Minigel Apparatus (8.6 x 7.7 cm) :		
	5.5.1	Assemble the chamber of vertical minigel electrophoresis		
		equipment.		
	5.5.2	Take two of the thoroughly cleaned glass plates (one glass		
		plate with fixed spacers, and another notched glass plate).		
		Lay one plate with fixed spacers on a flat surface, and		
		place silicone rubber seal on it and lay the second notched		
		glass plate on the top. Fix the glass plate set on the		
		vertical chamber with clips.		
	5.5.3	Check for leakage by pouring of purified water between the		
		assembled glass plates.		
	5.5.4	Remove the water by tilting the chamber carefully. After		
		that, dry the interior of chamber with filter paper.		
	5.5.5	Prepare the gel of required percentage as given in Table-2		
		of Annexure 1.		
	5.5.6	APS 10% and TEMED should always be added just before casting		
		the gel, without forming bubbles.		
	5.5.7	Slowly pour the above mixture of solutions, between the		
		glass plates, using a 1mL autopipette. To check the		
		polymerization, leave a small portion of the mixture in the		
		beaker.		
	5.5.8	Add 50µl of 50% 2-Butanol immediately for complete		
		polymerization of the gel. Leave at least 10 minutes for		
		polymerization of the gel. When the gel has polymerized a		
		brief interface of liquid-gel appears.		
	5.6	Preparation of the Stacking gel for Hoefer Series (140 x 240 x 1. 5		
		mm) :		
	5.6.1	Remove 50% 2-Butanol from the surface of the gel, by tilting		
		the chamber carefully and rinsing with purified water. After		
		that, dry the interior of the chamber with filter paper.		
	5.6.2	Mix the solutions of the stacking gel according to the		
		quantities described in Table-1 of Annexure 1.		
	5.6.3	APS 10% and TEMED should always be added just before casting		
		the gel, without forming bubbles.		
	5.6.4	Pour the solution between the glass plates over the		
		separating gel and fill up to the top with the help of		
		autopipette/glass pipette with macro pipette controller.		
	5.6.5	Place the comb, between the glass plates in such a way that		
		there are no air bubbles under the teeth. It takes		
		approximately 30 minutes for the stacking gel to get		
		polymerized.		
	5.7	Preparation of the Stacking gel for Minigel Apparatus (8.6 x 7.7 cm)		
	:			
	5.7.1	Remove 50% 2-Butanol from the surface of the gel, by tilting		
		the chamber carefully and rinsing with purified water. After		
		that, dry the interior of the chamber with filter paper.		
	5.7.2	Mix the solutions of the stacking gel according to the		
		quantities described in Table-2 of Annexure 1.		
	5.7.3	APS 10% and TEMED should always be added just before casting		
		the gel, without forming bubbles.		
	5.7.4	Pour the solution between the glass plates over the		
		separating gel and fill up to the top with the help of		
		autopipette.		
	5.7.5	Place the comb, between the glass plates in such a way that		
		there are no air bubbles under the teeth. It takes		
		approximately 20 minutes for the stacking gel to get		
		polymerized.		
	5.7.6	After polymerization of the stacking gel, take out the comb		
		carefully without breaking the wells.		
	5.7.7	Clean the wells with purified water to remove the remains of		
		unpolymerised gel.		
	5.8	Preparation of the Samples: SDS is an anionic detergent, which		
		breaks the non-covalent intermolecular linkages in the proteins. SDS		
		binds strongly to proteins (1.4 g of SDS binds with one gram of		
		protein, forming negatively charged complex). The separation of the		
		proteins, in presence of SDS in polyacrylamide gel, depends		
		fundamentally on the molecular weight of proteins.		
	5.8.1	The description of the quantities, for loading of the		
		samples of various products with different protein		
		concentrations for both the apparatus, Hoefer Series and		
		Minigel are given in the Annexure 2.		
	5.8.2	Prepare the samples in eppendorf, taking equal volumes of		
		the sample and Reducer buffer 2X or 4 volumes of the sample		
		and 1 volume of Reducer Buffer 5X depending upon the protein		
		concentration.		
	5.8.3	In case of Hoefer Series the samples having protein		
		concentrations less than 0.5 mg/mL are to be treated with		
		Reducer Buffer 5X, so that the total volume to be applied in		
		the gel remains the same and protein samples having protein		
		concentration greater than 0.5mg/mL, use Reducer Buffer 2X		
		to treat the samples.		
		Maximum Loading Capacity = 180µL per well.		
	5.8.4	In case of Mini Gel Apparatus the samples having protein		
		concentrations between less than 0.6mg/mL are to be treated		
		with 5X reducer buffer so that the total volume to be		

			applied in the gel remains the same and samples having
			protein concentration greater than 0.6mg/mL, use Reducer
			Buffer 2X to treat the samples.
			Maximum Loading Capacity for Comb With 10 wells = 23µL per
			well.
			Maximum Loading Capacity for Comb With 5 wells = 60µL per
			well.
		5.8.5	Once all the samples and the reference material are prepared
			with the appropriate quantities of Reducer Buffer, heat the
			samples except molecular Weight marker at 75°C for 10
			minutes. Thereafter centrifuge all the samples at 8000rpm
			for 3 to 5 minutes. Then load the samples in the wells using
			an autopipette.
			Note: Samples for Anthrax are treated at 100°C for 1 minute
			in a water bath.
		5.9	Running of the Gel:
		5.9.1	Assemble the electrophoresis apparatus and fill both the
			reservoirs with 1X running buffer.
		5.9.2	Connect the electrophoresis chamber to the power supply,
			ensuring the correct polarity of the electrodes. The
			negative terminal from the power source is to be connected
			to the upper buffer reservoir and the positive terminal is
			to be connected to the lower buffer reservoir.
		5.9.3	Switch ON the Power Supply and set the current conditions as
			per the requirement for Hoefer Series; Current: 25mA whereas
			for Mini Gel Apparatus; Current: 12mA.
		5.9.4	Once sufficient dye front has traveled through the
			separating gel, press STOP and then switch off the power
			supply. Disassemble the chamber and remove the gel
			carefully.
		5.9.5	Separate the stacking gel and stain the separating gel.
		5.9.6	Wash the glass plates using detergent and tap water and then
			rinse with purified water. Finally clean with absolute
			ethanol. Dry the plates with lint free cloth or tissue
			paper.
		5.10	Staining of the gel run on Hoefer Series by Coomassie Brilliant Blue
		5.10.1	Place the gel in a tray containing 500mL of Fixation
			Solution for at least 30 minutes.
		5.10.2	Decant the Fixation Solution and add at least 500mL of
			Staining Solution.
		5.10.3	Leave it for overnight on a gel rocker at moderate speed.
		5.10.4	Decant the Staining Solution and add 500mL of Destaining
			Solution.
			Note: Mark on the label after each use of the Fixation,
			Staining and Destaining Solution. (See Table-1 of Annexure
			1).
		5.10.5	Destain the gel until a transparent background is achieved
			by changing the solution after every 30-45 minutes. Once the
			background of the gel is transparent remove the Destaining
			Solution, rinse the gel with purified water and scan the gel
			using GS-800 Calibrated Densitometer.
		5.11	Coomassie Staining of the gel run on Minigel Apparatus (8.6 x 7.7
			cm):
		5.11.1	Place the gel in a tray containing 250mL of Fixation
			Solution for at least 15 minutes.
		5.11.2	Decant the Fixation Solution and add at 250mL of Staining
			Solution II.
		5.11.3	Leave it for 2 hours on a gel rocker at moderate speed.
		5.11.4	Decant the Staining Solution II and add 250mL of Destaining
			Solution II.
			Note: Mark on the label after each use of the Fixation,
			Staining and Destaining Solution. (See Table-2 of Annexure
			1).
		5.11.5	Destain the gel until a transparent background is achieved
			by changing the solution after every 30minutes. Once the
			background of the gel is transparent remove the Destaining
			Solution, rinse the gel with purified water and scan the gel
			using GS-800 Calibrated Densitometer.
		5.12	Silver Nitrate Staining of the gel run on Hoefer Series (140 x 240 x
			1.5 mm):
		5.12.1	Introduce the gel in a tray, containing 250mL of fixation
			solution for minimum of 4 hours to overnight.
		5.12.2	Decant the Fixation Solution and rinse the gel with purified
			water. Carry out 3 serial rinses with 500mL of purified
			water, 5 to 7 minutes each.
		5.12.3	Decant the purified water and add 250mL Staining Solution,
			for 10 minutes with strong agitation on a gel rocker, so
			that the solution covers the surface of the gel. Perform
			this step in the dark, by covering the tray with aluminium
			foil.
		5.12.4	Remove the aluminium foil and decant the Staining Solution
			from the tray and rinse the gel with purified water. Carry
			out 3 serial rinses with 500mL purified water for a total
			time of 5 minutes, shaking slowly on a gel rocker.
		5.12.5	Add 250mL of the Developing Solution and place the tray on
			the gel rocker with moderate agitation. Until the appearance
			of band of 0.2(g of Reference Active Raw Material which is
			the Stopping Point for developing of the bands.
		5.12.6	Once the Stopping Point of enough intensity appears, decant
			the Developing Solution and rinse the gel with purified
			water and stop the developing reaction with addition of
			250mL of Stopping Solution, for 30 minutes.

A 10x4 grid of vertical bars representing a binary matrix. The bars are arranged in four columns. The first column has bars at rows 1, 3, 5, 7, 9. The second column has bars at rows 2, 4, 6, 8, 10. The third column has bars at rows 1, 3, 5, 7, 9. The fourth column has bars at rows 2, 4, 6, 8, 10. The bars are labeled 'B' at the top and bottom of the fourth column.

			on the "new standard" option in the dialog box and by
			entering the values of the molecular weight standard in the
			given table. Click the "type" button and then click on the
			lane, which contains molecular weight standards.
		5.14.13	Click "Band Attributes" then Band labels are displayed and
			select Molecular weight option to know the molecular weights
			of the bands in unknown lanes with respect to the standard
			lane.
		5.14.14	Similarly to find out the purity percentage of each band in
			a particular lane, click "band attributes" then Band labels
			are displayed and select Relative quantity to know the
			percentage of each band detected in a lane.
		5.14.15	With the relative quantity option, the quantity of a
			particular band in a lane is expressed as a percentage of
			either:
			(1) Percentage of lane.
			(2) Percentage of bands in lane.
			Select percentage of bands in lane by clicking Edit menu and
			select Preferences followed by Application.
		5.14.16	Click "Text Overlay Tools" in the Title bar and select Text
			Tools to name the samples loaded in various lanes of the
			gel. Save the gel with current analysis.
		5.14.17	To print the image, click "print image".
		5.14.18	The printed report is signed by the analyst who does the
			analysis and also checked by the other analyst.

Annexure 2

QUALITY CONTROL DEPARTMENT |
 QUANTITIES OF THE SAMPLES TO BE LOADED IN THE GEL |

1. HOEFER SERIES

1. 25µg of reduced protein should be applied for all the samples along with Reference Material.
2. 10µl of Molecular Weight Marker should be applied along with all ARM samples.
3. After running of the gels at a constant current of 25mA, they are stained with Coomassie Brilliant Blue G-250.

2. MINI GEL

1. 20µg of reduced protein should be applied for all the samples along with Reference Material.
2. 5µl of Molecular Weight Marker should be applied along with all ARM samples.
3. After running of the gels at a constant current of 12mA, they are stained with Coomassie Brilliant Blue G-250.

[1.0]Objective: |
 ||To lay down the procedure for calculating the Specific Activity of the |
 ||Active Raw Material of Recombinant Hepatitis B vaccine. |
 [2.0]Scope: |
 ||This Standard Operating Procedure is applicable to the Active Raw Material |
 ||(ARM) of Hepatitis-B vaccine (rDNA). |
 [3.0]Responsibility: |
	3.1	The analyst of the shall be responsible for executing the described
		procedure correctly.
	3.2	The supervisor of the laboratory shall be responsible for verifying
		that the procedure is followed correctly and for checking the results.
	3.3	The Departmental Head shall be responsible for the overall compliance
		of the SOP .
[4.0]Abbreviations and Definitions:		
	4.1	µg
	4.2	nm
	4.3	ARM
	4.4	QA
	4.5	QC
	4.6	SOP
[5.0] Procedure:		
	5.1	Note the results obtained of the test for the Determination of
		protein concentration by a specific method (example: ELISA Method)
		and the Determination of the concentration of total proteins by
		general method (example: Lowry's method).
	5.2	Calculations:
		5.2.1
		5.2.3
		5.2.4
		Note :The value of specific activity is expressed in percentage
	5.3	Acceptance limits:
		5.3.1
[6.0]References:		
	NA	

S. No | Test/Assay | Specifications

- 1 | Physical Appearance | Brownish to yellow liquid without suspended particles
- 2 | pH | 6.0 -7.4
- 3 | PRP Content | Not less than 0.5 mg/ml
- 4 | Protein content | Not less than 0.92 mg/ml
- 5 | PRP to protein ratio | 0.30-0.55
- 6 | Free Polysaccharide | < 20%
- 7 | Free Protein | < 1%
- 8 | KD (Molecular size distribution) | ≥ 85 % elution at KD < 0.5
- 9 | Identity | Positive
- 10 | Sterility | No microbial growth.
- 11 | EDAC Content | < 1.0 $\mu\text{g/ml}$
- 12 | CDAP Content | < 200 ng /dose (10 μg PRP)
- 13 | Endotoxin Content | <25 EU/ μg of PRP

1.0 |Objective: |
|To lay down the procedure for determination of pH. |
2.0 |Scope: |
|This Standard Operating Procedure is applicable to all the In- process |
|and finished product samples. |
3.0 |Abbreviations and Definitions: |
|Not applicable |
4.0 |Procedure: |
4.1	Equipment, Materials and Reagents	
	4.1.1	Tissue paper
	4.1.2	100 ml. vial
	4.1.3	100 ml beaker
	4.1.4	Wash bottle
	4.1.5	Purified water
4.2	Preparation of solutions:	
	4.2.1	Buffer solution, pH =4.00
	4.2.2	Buffer solution, pH =7.00
	4.2.3	Buffer solution, pH=9.20
4.3	pH Electrode Calibration:	
	4.3.1	Check that the equipment is correctly connected to electrical
	supply.	
	4.3.2	Switch on the instrument by pressing ON/OFF key on front
	panel.	
	Use a combination of two standard buffer for calibration	
	according to requirements i.e.:	
	Case 1- For solution with pH less than 7.00 uses standard	
	buffers of 4.00 & 7.00.	
	Case 2- For solution with pH more than 7.00 use standard	
	buffers of 7.00 & 9.20	
	Note: The pH meter shall be set for the different buffers to	
	be used at the time of installation based on the future use.	
	This setting is changed only in case the range of pH readings	
	is different than preset.)	
	4.3.3	Clean pH electrode with purified water and blot dry.
	4.3.4	Put the standard buffers that are used in calibration in
	clean beakers.	
	4.3.5	Introduce pH electrode in first buffer according to case 1 or
	case 2 and wait for 2 seconds to stabilize the pH.	
	4.3.6	Remove pH electrode, rinse with purified water and blot dry
	and put in second standard buffer according to case 1 or case	
	2 and wait for 2 seconds to stabilize the pH.	
	4.3.7	Remove pH electrode, rinse with purified water and blot dry
	and put in potassium chloride solution.	
4.4	pH Measurement:	
	4.4.1	Clean pH electrode with purified water and blot dry.
	4.4.2	Put the sample in clean beaker to check the pH.
	4.4.3	Introduce the pH electrode in beaker having sample solution
	4.4.4	Press [Read] key for pH measurement.
	4.4.5	Rinse, blot and store the electrode in a beaker having
	saturated KCl solution.	
5. |Reporting: |
|Record the information of operation and calibration in corresponding log |
|book |
6. |References: |
|pH meter instruction manual |

1.0 |Objective |
 | |To lay down Procedure of Nitrate reduction Test. |
 2.0 |Scope |
 | |This Standard Operating Procedure is applicable to identification of |
 | |Nitrate reduction organism for all samples. |
 3.0 |Responsibility |
	3.1	The Analyst shall be responsible for carrying out the procedure as
	established in this SOP.	
	3.2	Supervisor shall be responsible for verifying that the same has been
	carried out correctly.	
	3.3	Head QC or his designee shall be responsible for overall compliance
	of the SOP.	
4.0	Abbreviations and Definitions	
	4.1	SOP
	4.2	QA
	4.3	QC
	4.4	mL
	4.5	µL
5.0	Procedure:	
	5.1	Equipment, Materials and Reagents
	5.1.1	Autoclave
	5.1.4	Nitrate Reduction Kit (Cat no 73426,Milipore)
	5.1.5	Incubator
	5.1.6	Glass tubes, Durham tube
	5.1.7	Weighing balance
	5.1.8	pH meter
	5.1.9	Magnetic stirrer with hot plate
	5.2	Preparation of solutions
	5.2.1	Nitrate broth
		5.2.1.1
		5.2.1.2
		5.2.1.3
		5.2.1.4
		5.2.1.5
	5.2.2	Sulfanilic acid solution (Reagent A): Dissolve 8 g of
		sulfanilic acid in 1 litre 5N acetic acid. Store Reagent A at
		room temperature for up to 3 months, in dark.
	5.2.3	α-Naphthylamine solution (Reagent B): Dissolve 6 g of
		N,N-Dimethyl-1-naphthylamine in 1 litre 5N acetic acid. Store
		Reagent B at 2 to 8°C for up to 3 months, in dark.
	5.3	Test procedure
	5.3.1	Inoculate the nitrate broths with bacterial suspension.
	5.3.2	Incubate the tubes at the optimal temperature 30°C or 37°C for
		24 hours.
	5.3.3	After incubation look for N₂ gas first before adding reagents.
	5.3.4	After incubation, Put a 5 drops of reagent A and 5 drops of
		reagent B into the tube containing culture to be tested. Shake
		the tube well to mix reagents with medium.
	5.3.5	Observe for the reaction (color development).
	5.4	Interpretation of results:
	5.4.1	If the suspension turns pink-red color, the reaction is
	5.4.2	positive.
		If the suspension is colorless after the addition of reagents A
		and B, add a small amount ("sharp knife point") of zinc powder
		to the medium. Shake the tube vigorously and allow it to stand
		at room temperature for 10-15 min.
	5.4.3	If the medium remains colorless after the addition of Zn
		powder, the test result is positive.
	5.4.4	If the medium turns pink after the addition of Zn powder, the
		result is negative.

CERTIFICATE OF ANALYSIS
For BioBridge Healthcare Solutions Pvt. Ltd.
Authorized Signatory
Product: | Bulk of Pertussis
Product code no.: | B/BP 002
Appearance: | Light creamish turbid suspension of inactivation harvests of Bordetella pertussis in saline.
Form: | Liquid
Buffer: | Phosphates of Sodium and Potassium and Sodium Chloride
Manufacturing Date: | OCT 2015
Expiry Date: | Mar 2018
Opacity: | ≥ 192 IOU / ml
Sterility: | Sterile Product
pH: | 7.2
Specific Toxicity: | Complied
Identity: | Positive (Presence of agglutinogens 1,2 and 3)
Potency
(at a concentration not more than 20 IOU/SHD, Adjuvanted) | Not less than 4 IU/dose
Lower confidence limit ($p=0.95$) : minimum 2 IU/dose
Storage: | $5\pm 3^{\circ}\text{C}$ (Do not freeze)
Note: To be used for research or in-vitro testing purpose only | Note: To be used for research or in-vitro testing purpose only

1.0 |Objective |
 |To lay down the procedure for preparation of Hepatitis B vaccine Active Raw |
 |Material (ARM) sample by desorption of Aluminium Hydroxide gel for SDS-PAGE.|
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to all Active Raw Material |
 |samples adjuvanted to Aluminium Hydroxide gel. |
 3.0 |Responsibility |
3.1	The analyst shall be responsible for carrying out the described
	procedure correctly.
3.2	The Supervisor of the laboratory shall be responsible for verifying
	that the procedure is complied with and for checking the results.
3.3	The departmental head/designee shall be responsible for overall
	compliance of the SOP.
3.4	Head QA/Designee shall be responsible for final approval and
	compliance of the SOP.

	5.3.3
	5.3.4

||| |can be stored at 2-8°C for 6 months. |

|| |5.3.5 |Sodium Dodecyl Sulphate (SDS) – 20% |

|| | |For a volume of 100mL, weigh: |

|| | |SDS |20g |

|| | |Dissolve in 75mL of Purified water in a beaker. Make up the |

|| | |volume to 100mL with Purified water in a volumetric flask. This |

|| | |solution can be stored at room temperature for 6 months. |

|| |5.3.6 |Bromophenol Blue (1%) |

|| | |For a volume of 5mL, weigh: |

|| | |Bromophenol blue |0.05g |

|| | |Dissolve in 4mL of purified water in a beaker. Make up the |

|| | |volume to 5mL with purified water in a volumetric flask. Divide|

|| | |in aliquots of 500µL in eppendorf. This can be stored at -20±5°C|

|| | |for 6 months. |

|| |5.3.8 |Reducer 2X without dye: |

|| | |For a volume of 10 mL, add the following solutions: |

|| | |Stacking gel Buffer Tris HCl 2.0 M |0.625 mL |

|| | |SDS 20% |2.0 mL |

|| | |Glycerol |2.0 mL |

|| | |2 -Mercaptoethanol |1.0 mL |

|| | |Make up the volume to 10 mL with purified water. Divide in |

|| | |aliquots of 500µL in eppendorfs and freeze at – 20 ±2° C. This |

|| | |solution can be stored upto 6 months. |

|| |5.4 |Desorption of Active Raw Material (ARM) from Aluminium Hydroxide Gel: |

|| |5.4.1 |Homogenize the reference vaccine and the test vaccine vials to |

|| | |be analyzed and take 1mL of homogenized samples in different |

|| | |eppendorfs. |

|| |5.4.2 |Centrifuge the samples at 2000 rpm for 15 minutes, at room |

|| | |temperature. |

|| |5.4.3 |Discard the supernatant carefully without disturbing the pellet.|

|| |5.4.4 |Add 100 µL of Phosphate Buffer Solution to the pellet. |

|| |5.4.5 |Add 100 µL of Reducer 2X without dye to the pellet. |

|| |5.4.6 |Shake well to homogenize the sample mixture. |

|| |5.4.7 |Heat the eppendorfs containing sample mixture at 95°C for 3 |

|| | |minutes. |

|| |5.4.8 |Centrifuge the sample mixtures at 3000 rpm for 10 minutes, at |

|| | |room temperature. |

|| |5.5 |Preparation of Samples for loading in SDS PAGE: |

|| |5.6.1 |For gel running on Minigel, take 3 µL of supernatant from |

|| | |desorbed sample mixture in a fresh eppendorf and add 0.3 µL of |

|| | |1% Bromophenol Blue. 0.02(g of Reference Active Raw Material |

|| | |should also be loaded along with desorbed vaccine samples, which|

|| | |is heated at 75°C for 10 minutes, which acts the Stopping Point |

|| | |for silver nitrate staining. |

|| |5.6.2 |Homogenize and centrifuge all the samples at 8000 rpm for 3 to 5|

|| | |minutes. |

|| |5.6.3 |Load all desorbed vaccine sample that is 3.3 µL for Minigel. |

|| | |Load Reference Active Raw Material as per the above said protein|

|| | |concentration. |

|| |5.6.4 |Running of the Gel: |

|| | |As per QC Procedure For Separation Of Proteins By Sodium Dodecyl|

|| | |Sulphate Polyacrylamide Gel Electrophoresis (SDS-PAGE) |

|| |5.6.5 |Staining of the gel with Silver Nitrate: |

|| | |As per QC Procedure For Separation Of Proteins By Sodium Dodecyl|

|| | |Sulphate Polyacrylamide Gel Electrophoresis (SDS-PAGE) |

|| |5.6.6 |Analyzing the protein bands separated: |

|| | |Analyze the protein bands as per As per QC Procedure For |

|| | |Separation Of Proteins By Sodium Dodecyl Sulphate Polyacrylamide|

|| | |Gel Electrophoresis (SDS-PAGE). |

1.0 |Objective |
|To lay down the procedure for determining the Maximal Toxic Value (MTV) of |
|tetanus toxin and also to determine the correct flocculation zone that has |
|be used to determine the Lf. |
2.0 |Scope |
|This Standard Operating Procedure is applicable to all batches of Teatnus |
|toxin. |
3.0 |Responsibility |
3.1	The QC analyst shall be responsible for performing the described
	procedure correctly.
3.2	Supervisor shall be responsible for verifying that the same has been
	carried out correctly.
3.3	Head Animal House/Veterinarian/supervisor shall be responsible for
	supply of quality animals and their maintenance.
3.4	Head QC or his designee shall be responsible for overall compliance
	of the SOP.

3.22	µL	: microliter
3.23	µm	: micrometer
3.24	System	: System suitability tests are an integral part of gas and
	liquid chromatographic methods. They are used to verify	
	the resolution and reproducibility of the	
	chromatographic system are adequate for the analysis to be	
	done.	
	The tests are based on the concept that the equipment,	
	electronics, analytical operations and samples to be	
	analyzed constitute an integral system that can be	
	evaluated as such.	
 4. |Procedure: |
 |4.1 |Precautions to be taken: | | |
 | |4.1.1 |Always use filtered solutions. Filtration of solution |
 | |should be done in order to eliminate the entry of possible |
 | |particles, if any, into the system as well as the column. |
 | |4.1.2 |Degas all solutions. |
 | |4.1.3 |Avoid entry of bubbles into the system as well as column. |
 | |4.1.4 |All the solution bottle openings should be well covered |
 | |with aluminum foil. |
 | |4.1.5 |Check the calibration status of all equipment and |
 | |instrument. |
 |4.2 |Requirement: |
 | |4.2.1 |Equipment: |
 | | |4.2.1.1 |Calibrated HPLC System with Chem Station software. |
 | | |4.2.1.2 |Ultrasonic Cleaner |
 | | |4.2.1.3 |Vacuum Pump |
 | | |4.2.1.4 |Refrigerator |
 | |4.2.2 |Instrument: |
 | | |4.2.2.1 |pH Meter |
 | | |4.2.2.2 |Magnetic stirrer |
 | | |4.2.2.3 |Precision balance |
 | | |4.2.2.4 |Analytical balance |
 | |4.2.3 |Material: |
 | | |4.2.3.1 |TSK gel G5000PWxl column {30 cm (l), 7.8 mm (i.d)} |
 | | |4.2.3.2 |Laboratory Glassware |
 | | |4.2.3.3 |Screw cap vials |
 | | |4.2.3.4 |Solvac Filter Holder |
 | | |4.2.3.5 |Nylon 6,6 membrane 0.20/0.22/0.45 µm membrane filter |
 | | |4.2.3.6 |Autopipette (2-20µL), (20-200(L), (100-1000(L) |
 | | |4.2.3.7 |Tips for the Autopipette |
 | | |4.2.3.8 |Aluminium foil |
 | |4.2.4 |Reagents: |
 | | |4.2.4.1 |Sodium Chloride (NaCl) |
 | | |4.2.4.2 |Disodium hydrogen phosphate anhydrous (Na₂HPO₄) |
 | | |4.2.4.3 |Sodium dihydrogen phosphate monohydrate |
 | | |4.2.4.4 |Purified water |
 | | |4.2.4.5 |Sodium azide |
 | | |4.2.4.6 |Salmon DNA |
 | | |4.2.4.7 |2-Propanol |
 |4.3 |Preparation of solutions: |
 | |Prepare all the solutions and Carry out the labelling of the prepared |
 | |solutions and assign the lot numbers to the solutions. |
 | |4.3.1 |Isopropyl alcohol 70% |
 | | |Take 700 mL of 2-propanol in a volumetric flask and make up |
 | | |the volume upto 1000 mL with Purified Water. This solution can |
 | | |be stored at room temperature for 3 months. |
 | |4.3.2 |Solution I: [Na₂HPO₄ (0.1M), NaCl (0.1M)] |
 | | |For a volume of 1000 mL, weigh: |

||| |Na₂HPO₄ |14.19 g |
||| |NaCl |5.84 g |

		Dissolve in 700mL of purified water in a volumetric flask and
		make up the volume upto 1000mL. Prepare fresh solution before
		use.

		4.3.3	Solution II: NaH₂PO₄.H₂O, 0.1 M
		For a volume of 500 mL, weigh:	
		NaH₂P0₄.H₂O	6.85g
		Dissolve in 400mL of purified water in a volumetric flask and	
		make up the volume upto 500mL. Prepare fresh solution before	
		use.	

		4.3.4	0.1M Sodium Phosphate buffer
			(0.1 M Na₂HPO₄,0.1M NaCl +0.1M NaH₂PO₄.H₂O, pH 7.0)
			For a volume of 1000mL, take approximately 600mL of Solution I
			and 400mL of Solution II. The pH of the solution should be 7.0
			± 0.2. Use the mobile phase within four days from the date of
			preparation if it remains clear and no turbidity or fibers
			observed in it.

		4.3.5	Void Volume Marker (Salmon DNA):	
			For a volume of 5 mL, weigh:	
			Salmon DNA	5 mg
			Dissolve in purified water and make up volume upto 5 mL with	
			purified water in a volumetric flask. Store at -20 °C ± 5°C	
			for 1 month.	

		4.3.6	Total volume marker (Sodium Azide):	
			For a volume of 10 mL, weigh:	
			Sodium Azide	10 mg
			Dissolve in purified water and make up volume upto 10 mL with	
			purified water in a volumetric flask. Store at 2-8 °C for 1	
			month.	

		4.3.7	Column Preservation Solution:
			Note: All the solutions prepared for use are vacuum filtered
			using Nylon 6, 6 membrane 0.20 µm or 0.22 µm , depending upon
			the nature of solution to be filtered. For organic solvents
			0.45µm filters should be used.

|| |4.4 |Preparing the HPLC System for run, Agilent Series: |
|| |4.5 |Run Conditions: |

		4.5.1	Load method HIBTT.M.
		4.5.2	Flow Rate: 0.5 mL/min
		4.5.3	Injection Quantity : 2.5µg
		4.5.4	Detection Wavelength: 214nm
		4.5.5	Run time: 30 minutes

		4.6	Equilibration of the system and the column:
			Equilibrate the column with mobile 0.1 M sodium phosphate buffer at
			214nm until a stable baseline is observed on the online plot window.

|| |4.7 |Sample Preparation and Application: |

		4.7.1	Test sample and standards are loaded in screw cap vials and
			placed against the appropriate no. on the sample tray by
			clearly marking the screw cap vial.

		4.7.2	Load the required volume of sample as per the PRP
			concentration equivalent to 2.5 µg in the sample vial.
			Example: If a sample has a PRP concentration of 0.5 mg/mL, to
			calculate volume required for 2.5 µg of protein,
			0.5 mg (500 µg) ----1 mL
			2.5 µg-----X mL
			X mL = 2.5 µg x 1 mL
			500 µg
			X mL = 5 µL
			Therefore, 5 µL of volume is taken for sample having PRP
			concentration of 0.5 mg/mL.

|| |4.8 |Running of sequence: |

|| |4.8.1 |Load sequence HIBTT.S. |

|| |4.8.2 |Open the sequence parameter option by clicking Sequence menu. |

|| |4.8.3 |Enter information about the data directory and operator name. |

|| |4.8.4 |In the shutdown option, click on the post-sequence option and |
|| | |select LAMPOFF/STANDBY. |

|| |4.8.5 |In sequence table option, specify the sample names, methods |
|| | |and vials to run in the sequence as per the following table: |

S No	Sample Code	Sample details	No. of Injection
1	Blank	Eluent Blank	1
2	Sodium azide (Total	System	6
		volume marker)	Suitability
3	Blank	Eluent Blank	1
4	Salmon DNA	Void volume	1
5	Blank	Eluent Blank	1
6	Test Sample (s)	Sample	1

			Inject	volume (µL)			
				ons			
			1	Blank	Eluent Blank	1	10
			2	Sodium azide (Total	System	6	1
				volume marker)	Suitability		
			Test				
			3	Blank	Eluent Blank	1	10
			4	Salmon DNA	Void volume	1	10
				marker			
			5	Blank	Eluent Blank	1	10
			6	Test Sample (s)	Sample	1	2.5µg of PRP
			Click on run sequence option in run control menu to start				
			the sequence.				

|| |5.8.8|Each sample run will be of 30 min and after running all |
|| | |the samples the sequence will automatically stop. |

		4.9	Calculations :
			Area under curve for the standards/sample is analyzed by
			Chemstation software.

|| |4.9.1|The retention time of the void volume is determined with |
|| | |Salmon DNA. |

|| |4.9.2|The Retention time of the component (total volume) which |

				has full access to the pores of stationary phase is	
				determined with sodium azide.	
				4.9.3	Elution time of PRP-TT (Te) at KD = 0.50
				The calculations are made as per the following equation:	
				Te = KD (Tt - To) + To or Te = 0.50 (Tt -	
				To) + To	
				Where,	
				Te = Elution time of PRP-TT Bulk Conjugate at KD = 0.50	
				Tt = Retention time of sodium azide	
				To = Retention time of Salmon DNA	
				KD = Distribution Coefficient	
				Note: Take average RT of sodium azide as Tt from EXCEL	
				for calculation of SST.	
				4.9.4	Calculation of percentage of sample eluted before a given
				KD:	
				The percentage of sample eluted before a given KD is	
				calculated using ChemStation software.	
				4.9.4.1	Open the acquired chromatogram in the data
				analysis view in the offline copy of the	
				software.	
				4.9.4.2	Optimize integration with initial events in the
				signal specific events table.	
				4.9.4.3	Enter the value of Elution time (Te) calculated
				in step 5.9.3 in integration with timed events	
				option or with manual integration and select	
				split peak option.	
				4.9.4.4	The percentage of sample eluted at $KD \leq 0.5$ is
				calculated by adding the values of percentage of	
				area (Area %) obtained for bulk conjugate curve	
				till Te.	
				4.9.5	Calculations for System Suitability Test:
				4.9.5.1	Note the values of area under the curve and
				retention time for sodium azide (SST standard) in	
				Annexure 1 and also in EXCEL format for	
				calculation of Relative standard deviation.	
				4.9.5.2	Every time a sample is run with system
				suitability test, calculate the results for	
				system suitability.	
				4.9.5.3	Attach the hard print of SST calculation along
				with chromatograms and the record form.	
		4.10	Acceptance Criteria :		
		4.10.	For System Suitability Test :		
			1		
			4.10.1.	RSD calculated for Retention time should be <	
			1	5.0%.	
			4.10.1.	RSD calculated for Area should be < 5.0%.	
			2		
			4.10.	For ARM of Haemophilus Influenzae type b conjugate	
		2	vaccine Samples: KD (Molecular Size distribution): $\geq 85\%$,		
			KD ≤ 0.50

[5.	Procedure:
[5.1	Preparation of Calibration Curve:
	The concentration of cesium chloride in the test sample (s) is
	calculated by comparing results of its absorbance obtained against
	the plotted calibration curve of known cesium concentration (0.5 –
	3.0ppm) Vs absorbance. The solutions for making cesium calibration
	curve (0.5 – 3.0ppm) are prepared as follows:
	S.No.
	1
	2
	3
	Prepare a blank solution for calibration curve by taking 2 ml of 10%
	KCl solution and make up the volume to 50 ml with purified water.
[5.2	Take 4.8 ml of phosphate buffer diluent and add 0.2 ml of 10% KCl
	solution. Treat this solution as sample blank.
[5.3	Take 4.8 ml of sample and add 0.2 ml of 10% KCl solution. Treat this
	solution as sample for taking absorbance.
[5.4	Conditions for Atomic absorption spectrophotometer:
	Flame
	Slit width
	Wavelength
	Calibration Type
	Integration time
	Replicates
	Read delay
	Technique
[5.5	The instrument aspirates the standards and samples to be tested and a
	standard curve is generated by the system by taking absorbance vs
	concentration.
	Cesium content (ppm) in sample is displayed directly.
[5.6	Calculations:
	Instrument reading (ppm) x total volume (5 ml)
	Cesium content (ppm) =

	Actual sample taken (4.8ml)
	Cesium content (ppm) x
	mol.wt. of CsCl
	Cesium chloride (ppm) =

	mol. wt. Of Cesium
[5.7	Acceptance criteria:

	5.7.1	The coefficient of variation (CV) between the replicates of
		the samples should be $\leq 5\%$.
	5.7.2	Cesium chloride content in the sample should be within the
		specified limits if specified.

[7.	Preparation of solutions:
7.1	Phosphate Buffered Saline Solution 10 X (PBS 10X)
	NaCl 1.37M, KCl 0.0261 M, Na₂HPO₄ 0.0845 M, KH₂PO₄ 0.0169 M
	For a final volume of 1litre, weigh:
	Reagent
	Quantity
	NaCl
	80.0 g
	KCl
	2.0 g
	Na₂HPO₄ or
	Na₂HPO₄·7H₂O
	11.5 g or
	21.5 g
	KH₂PO₄
	2.4 g
	Dissolve the reagents in 750 ml of purified water, with magnetic
	stirring along with heat in order to make dissolution of reagents
	easier. Cool the solution to room temperature and adjust the pH
	to 7.2 with 40% NaOH. Make up the final volume to 1 litre with
	purified water. This solution can be stored at 2-8°C for 2
	months.

	7.2	Phosphate Buffered Saline Solution 1X (PBS 1X)	
		NaCl 0.137 M, KCl 0.00261 M, Na₂HPO₄ 0.00845 M, KH₂PO₄ 0.00169	
		M]	
		For a final volume of 1 litre take 100 ml of PBS 10X and add 750	
		ml of purified water. Mix well and make up the final volume with	
		purified water. This solution can be stored at 2-8°C for 1 month.	
	7.3	Semi-dry transfer buffer with SDS [48 mM Tris, 39 mM Glycine,	
		20 % Methanol and 1.3 mM SDS]	
		For a final volume of 1000 ml:	
		Reagent	
		Quantity	
		Tris	
		5.81 g	
		Glycine	
		2.93 g	
		SDS	
		0.0375 g	
		Methanol	
		200 ml	
		Dissolve the reagents, except methanol in 600 ml of purified	
		water and check that the pH is between 8.5 and 9.0, otherwise	
		discard the solution. Now add 200 ml methanol and make up the	
		final volume to 1litre with purified water. It can be stored at	
		room temperature for 1 week.	
		Note: Do not adjust the pH of the transfer buffer.	
	7.4	Washing Solution [0.1 % of Nonidet P-40 (v/v) in PBS-1X]	
		Using an autopipette, take 1000 µl of Nonidet P-40 and mix well	
		in 800 ml of PBS (1X). Make up the final volume to 1 litre using	
		PBS (1X). This solution can be stored at room temperature for 1	
		month.	
	7.5	Blocking Solution.	
		For a final volume of 100 ml:	
		Reagent	
		Quantity	
		Skimmed Milk powder	
		5.0 g	
		Tween-20	
		50 µl	
		Dissolve the skimmed milk powder in 80 ml of PBS (1X) and add	
		Tween-20. Mix thoroughly and dilute finally to 100 ml with PBS	
		(1X). This solution should be freshly prepared at the time of	
		use.	
	7.6	Substrate solution:	
		Dissolve 15 mg of 3,3'-Diaminobenzidine in 30 ml of PBS 1X and	
		just prior to use, add 15 µl H₂O₂ peroxide. This solution should	
		be freshly prepared.	
	7.7	NaOH (40%) solution:	
		Dissolve 40 g of NaOH in 80 ml of purified water and dilute	
		finally to 100 ml using purified water. This solution can be	
		stored at room temperature for two months.	
8.	Procedure:		
	8.1	Electrophoresis: Electrophoresis is carried out in the	
		Electrophoresis and Chromatography laboratory. The test sample	
		(ARM of Hepatitis-B vaccine (rDNA)) and a Reference ARM are	
		treated with reducer buffer and then applied on polyacrylamide	
		gel containing SDS. After the electrophoretic run is over, the	
		gel is handed over to Immunochemistry laboratory for further	
		processing.	
	8.2	Electro transfer (Semi-dry):	
		8.2.1	Cut a nitrocellulose membrane and two extra thick blotting
			sheets according to the size of the gel.
		8.2.2	Cut the upper left corner of the gel and the nitrocellulose
			membrane to identify the order in which samples were
			applied.
		8.2.3	Wet the nitrocellulose membrane, blotting sheets and the
			gel in the transfer buffer.
		8.2.4	Place one blotting sheet wetted in transfer buffer on a
			clean surface and place the nitrocellulose membrane on top
			of it. Now neatly place the gel above the nitrocellulose
			membrane, avoiding any air bubbles. Then place another
			blotting sheet wetted in transfer buffer, on top of the
			gel. This results in a gel and membrane sandwich between
			two blotting sheets.
			Note: The nitrocellulose membrane and the blotting sheets
			should be handled with gloves and there should be no air
			bubbles between the different layers of the gel-membrane
			sandwich.
		8.2.5	Lift the cover and the electrode plate of the transfer
			equipment carefully. Clean the electrode plate using a
			tissue paper soaked in purified water.
		8.2.6	Place the sandwich in the centre of the electrode plate
			such that the nitrocellulose membrane is on the lower side
			(anode) and the gel is on the upper side (cathode).

	8.2.7	The current is calculated by multiplying the area of the	
		gel by a factor (For a small gel this factor is 5.5 and for	
		bigger gels it is 3).	
	8.2.8	Place back the cathode plate and the safety cover.	
	8.2.9	Confirm the polarity of the electrodes.	
	8.2.10	Run the transfer for 30 minutes for both small and bigger	
		gels.	
	8.2.11	After the transfer is over, turn off the power supply,	
		disassemble the system and separate the sandwich carefully.	
	8.2.12	Again clean the electrode plate using a tissue paper soaked	
		in purified water.	
	8.2.13	Stain the gel. The absence of bands in the gel is an	
		indication of the complete transfer of proteins onto the	
		nitrocellulose membrane.	
	8.2.14	Proceed for the immunoidentification step.	
	8.3	Immunoidentification:	
	8.3.1	Blocking:	
		Put the nitrocellulose membrane in a PVC bag and seal from	
		three sides using a PVC thermal sealer. Add adequate volume	
		of blocking solution, so as to cover the entire membrane.	
		Remove air bubbles if any present and then seal the fourth	
		side of the PVC bag. Incubate for one hour at 37.0 + 2°C or	
		overnight at 2-8°C under gentle shaking conditions.	
		Note: After the blocking step, if required, the	
		nitrocellulose membrane can be kept between two blotting	
		sheets and stored in a sealed PVC bag for 24 hours at	
		2-8°C.	
	8.3.2	Treatment with Hepatitis B monoclonal antibody:	
	8.3.2.1	Dilute monoclonal antibody against Hepatitis-B	
		surface antigen, using blocking solution (without	
		Tween-20) as diluent to a most effective	
		concentration as determined by titration	
		(Annexure-1).	
	8.3.2.2	Put the nitrocellulose membrane in a PVC bag, add	
		adequate volume of antibody solution so as to cover	
		its entire surface and seal the PVC bag using a	
		thermal sealer.	
	8.3.2.3	Incubate for 1 hour 30 minutes at room temperature	
		for 16 hours at 2-8°C under gentle shaking	
		condition.	
	8.3.3	Washing:	
		Note: The washing is carried out under gentle agitation at	
		room temperature and the solution is discarded every time	
		after washing.	
	8.3.3.1	Wash the nitrocellulose membrane twice for 10	
		minutes with PBS (1X)	
	8.3.3.2	Wash the nitrocellulose membrane once for 10	
		minutes with Washing solution (1X).	
	8.3.3.3	Wash the nitrocellulose membrane twice for 10	
		minutes with PBS (1X).	
	8.3.4	Immunological visualization of results:	
	8.3.4.1	Protein-A peroxidase conjugate is used. Dilute the	
		conjugate in PBS (1X) as per its titration	
		(Annexure-2). The conjugate solution must be	
		prepared just before use.	
	8.3.4.2	Place the nitrocellulose membrane in the PVC bag	
		and add adequate volume of the conjugate solution	
		so as to cover the entire membrane and seal the	
		fourth side of the PVC bag using a thermal sealer.	
		Incubate for 1 hour at room temperature under	
		gentle conditions.	
	8.3.5	Washing:	
		Repeat the washing steps as mentioned in the step 8.3.3 of	
		the procedure.	
	8.3.6	Development of blot:	
	8.3.6.1	Submerge the nitrocellulose membrane in the	
		substrate solution and rock gently until the	
		bands become clearly visible but the background	
		remains clear.	
	8.3.6.2	Rinse the nitrocellulose membrane with purified	
		water and then dry it between two blotting	
		sheets.	
	8.3.7	Analysis of the results:	
		Compare the bands of the samples with that of the	
		Reference (an Active Raw Material previously	
		characterized).	
	9.	Abbreviations:

[illegible]

I - Current (mA).
L - Length of the gel (cm).
A - Breadth of the gel (cm).
C - Constant that can be:
C1 - for small gels = 5.5 mA/cm²
C2 - for big gels = 3 mA/cm²

[1.0]Objective |
 |To lay down the procedure for determining the Minimum Lethal Dose (MLD) of |
 |tetanus toxin. |
 [2.0]Scope |
 |This Standard Operating Procedure is applicable to all batches of Tetanus |
 |toxin. |
 [3.0]Responsibility |
3.1	The QC analyst shall be responsible for performing the described
	procedure correctly.
3.2	Supervisor shall be responsible for verifying that the same has been
	carried out correctly.
3.3	Head Animal House/Veterinarian/supervisor shall be responsible for
	supply of quality animals and their maintenance.
3.4	Head QC or his designee shall be responsible for overall compliance of
	the SOP.
[4.0]Abbreviations and Definitions	
4.1	SOP
4.2	QA

[6.0]Forms and Records	
Determination of Minimum Lethal Dose (MLD) of Tetanus Toxin.	
 [7.0]References |

1. |Purpose: |
 |To lay down the procedure for the determination of 2-phenoxyethanol by High |
 |Performance Liquid Chromatography (HPLC). |
 2. |Applicable to: |
 |This Standard Operating Procedure is applicable to samples in which |
 |2-Phenoxyethanol is to be determined. |
 3. |Equipments: |
 |3.1 |Chromatographic column (Eclipse XDB-C18, 25cm (l) x 4.6 mm (i.d.) |
 |3.2 |HPLC-Agilent (1100 Series) |
 |3.3 |Chem Station Software |
 |3.4 |Laboratory Centrifuge |
 |3.5 |Refrigerator |
 |3.6 |pH Meter |
 |3.7 |Vacuum Pump |
 4. |Materials and Reagents: |
 |4.1 |Materials: | |
 | |4.1.1 |Screw cap vials (2.0ml) |
 | |4.1.2 |Solvac Filter Holder |
 | |4.1.3 |Nylon 6,6 membrane 0.45µm membrane filters |
 | |4.1.4 |Autopipettes (10-100(l), (20-200(l), (100-1000(l) |
 | |4.1.5 |Tips for the Autopipettes |
 | |4.1.6 |Laboratory Glassware |
 |4.2 |Reagents: |
 | |4.2.1 |Tetrahydrofuran |
 | |4.2.2 |Methanol |
 | |4.2.3 |Acetonitrile |
 | |4.2.4 |Purified Water |
 | |4.2.5 |2-Phenoxyethanol |
 | |4.2.6 |2-propanol |
 5. |Preparation of solutions: |
 |Prepare all the solutions as described below |
 |5.1 |Mobile phase | | | | | | |
 | |For 1 litre volume of mobile phase: |
 | |Tetrahydrofuran50 ml |
 | |Water600 ml |
 | |Methanol100 ml |
 | |Acetonitrile.....250 ml |
 | |This solution can be stored at room temperature for 1 month. |
 |5.2 |Isopropyl Alcohol 70% Solution |
 | |For storing and purging the HPLC system) |
 | |Take 700 ml of 2-propanol and make up the volume to 1000 ml with |
 | |Purified Water. |
 | |This solution can be stored at room temperature for 3 months. |
 | |Note: All the solutions prepared for use are vacuum filtered using |
 | |Nylon 6, 6 membrane 0.45 µm filters to eliminate the entry of possible |
 | |particles, if any into the system as well as the column. |
 |5.3 |100 mg/ml 2-Phenoxyethanol stock |
 | |5.3.1 |Take 9.09 ml 2-phenoxyethanol in a 10 ml volumetric flask and |
 | | |make up the volume to 10 ml with purified water. (1000 mg/ml) |
 | |5.3.2 |Take 1 ml of the above mentioned solution (step 7.3.1) and make |
 | | |up the volume to 10 ml in a 10ml volumetric flask. |
 |5.4 |Preparation of calibration standards (1-15 mg/ml): |

 6. |Procedure: |
 |6.1 |Preparing the HPLC System for run, Agilent 1100 Series: | | |
 | |6.1.1 |Mount the Chromatographic column on Agilent 1100 Series HPLC |
 | | |System. |
 | |6.1.2 |Establish On-Line connection of Agilent 1100 Series HPLC System |
 | | |with Chem Station online and offline software. |
 | |6.1.3 |Switch ON the Agilent 1100 Series HPLC System. |
 | |6.1.4 |Click on the Chem Station online software. |
 | |6.1.5 |Method and Run control mode which is the default window shall be |
 | | |displayed or it can be selected from the view menu. |
 | | |Note: Run Control, Sample injection and online data acquisition |
 | | |shall be done in Method and Run Control mode. |
 | |6.1.6 |Bring the pump flow to 0.0 ml/min and then click on the ON |
 | | |option on the Method and Run control mode window and activate |
 | | |the auto sampler, Quaternary pump and DAD Detector. |
 | |6.1.7 |Control of the instrument i.e pump (flow rate setting), |
 | | |autosampler (sample injection) and detector (UV-Vis wavelength) |
 | | |selection) is done through Instrument menu. |
 | |6.1.8 |Purging the system: |
 | | |6.1.8.1|Open the purge valve of pump (by turning it counter |
 | | | |clockwise) and set flow rate to 3-5ml/min |
 | | |6.1.8.2|Flush the vacuum degasser and all tubes with at least |
 | | | |30ml of Isopropyl alcohol 70%. |
 | |6.1.9 |After purging the pump set the flow at zero and mount the |
 | | |chromatographic column. |
 |6.2 |Equilibration of the column manually: |
 | |6.2.1 |Place the inlet tubing A in the reservoir for mobile phase. |
 | |6.2.2 |In Set up pump option in instrument menu, mention the desired |
 | | |flow rate of 1.5 ml/min and write 100% of Solvent A in the |
 | | |solvents field. |
 | |6.2.3 |In Set up DAD Signal option in instrument menu, enter the |
 | | |required wavelength of which is 280nm. |
 | |6.2.4 |Keep on running the column with mobile phase until a stable |
 | | |baseline at 280nm is obtained which can be viewed with the |

||| |online plot window in the Method and Run control mode. |

|6.3 |Preparation and application of the test sample and calibration |

|| |standards: |

|| |6.3.1 |Load 1 µl of each of the calibration standards (step 5.4) |

|| |6.3.2 |Centrifuge the test sample at 10000 rpm, for 3 to 5 minutes. |

|| |6.3.3 |Transfer the supernatant of the test samples into screw cap |

|| |vials placed against the appropriate no. on the sample tray. |

|| |6.3.4 |Load 1 µl of test sample. |

|6.4 |Running a sample manually. |

|| |6.4.1 |Fill the sample details in Sample Info option of Run Control |

|| |menu. |

|| |6.4.1. |Write the name of operator under Operator Name option. |

|| |1 |

|| |6.4.1. |In Data File field, click on prefix/counter and fill the |

|| |2 |prefix option alphabetically or alphanumerically. Fill |

|| |the counter option numerically. |

|| |6.4.1. |In subdirectory, specify name of the directory where the |

|| |3 |data file of the sample to be run should be stored. |

|| |6.4.1. |In sample parameters field, specify sample name, location|

|| |4 |of the sample vial and sample amount in the respective |

|| |options. |

|| |6.4.2 |Click on run method option in run control menu to start the run.|

|6.5 |Automatic injection of samples by running a sequence. |

|| |6.5.1 |In case of running samples automatically, load sequence |

|| |2-phenoxy.S. |

|| |6.5.1.1 |Open the sequence parameter option by clicking Sequence |

|| |menu. |

|| |6.5.1.2 |Enter information about the data directory and operator |

|| |name. |

|| |6.5.1.3 |Choose, According to run time check-time checklist in the|

|| |part of method to run option. |

|| |6.5.1.4 |In the shutdown option, click on the post-sequence option|

|| |and select LAMPOFF. |

|| |6.5.1.5 |In sequence table option, specify the sample names, |

|| |methods and vials to run in the sequence. |

|| |6.5.1.6 |Click on run sequence option in run control menu to start|

|| |the sequence. |

|6.6 |Finishing the Run |

|| |6.6.1 |Click on stop run option in the run control menu upon complete |

|| |elution of the injected sample as indicated by a stable UV |

|| |baseline or run will stop automatically if stop time (5min) is |

|| |specified. |

|| |6.6.2 |In case of running sequence, each sample run will be of 5 min |

|| |and after running all the samples the sequence will |

|| |automatically stop. |

|6.7 |Results of the sample are calculated from the calibration standards |

|| |using the chemstation software. |

|| |6.7.1 |Open the chromatogram corresponding to 1µg/µl calibration |

|| |standard in the offline copy of chemstation software in the Data|

|| |Analysis mode. |

|| |6.7.2 |From the calibration menu select calibration settings and write |

|| |µg/µl in the Amount units option. |

|| |6.7.3 |Select New Calibration Table from Calibration menu and enter |

|| |value1 in default amount option and value 1 in level option. |

|| |6.7.4 |Now open the chromatogram for 2.5µg/µl. Select add level option |

|| |from calibration menu and enter value 2.5 in default amount and |

|| |value 2 in level option. |

|| |6.7.5 |Similarly open chromatograms for 5.0µg/µl 10.0µg/µl and |

|| |15.0µg/µl and keep adding default amount and appropriate value |

|| |of level. |

|| |6.7.6 |Select calibration task icon and the calibration table with |

|| |required concentrations and levels can be viewed in the |

|| |calibration table view. A calibration curve is also displayed in|

|| |the calibration curve field with value of correlation |

|| |coefficient of the curve. |

|| |6.7.7 |Save the calibration method under appropriate name. |

|| |6.7.8 |Open the chromatogram of test sample and select the above |

|| |created calibration method for integration of the test sample. |

|| |6.7.9 |In the specify report option of Report menu, select ESTD in the |

|| |Calculate field. |

|| |6.7.10 |In the report layout view, create a new template or open an |

|| |existing template. |

|| |6.7.11 |Click on the show report preview with current template, method |

|| |and data file icon and view the result of the test sample in |

|| |terms of concentration (µg/µl). |

|| |6.7.12 |Click on the print icon to take print out of the chromatogram |

|| |with the results. |

|| |6.7.13 |The printed report is signed by the analyst who does the |

|| |analysis and also checked by the other analyst. |

|6.8 |Preservation and storage of the Column |

|| |When the column is not to be used for longer period then preservation |

|| |of the column is required. To preserve the column, pass acetonitrile |

|| |through the column at the flow rate of 1.5ml / minute. Dismount the |

|| |column and seal both ends of the column with the protective plugs |

|| |before keeping it at room temperature. |

|7. |Abbreviations: |

1.0	Objective		
	To lay down the procedure to check the viability of the Master/Working Cell		
	Bank by determining the number of viable cells used for the production of		
	recombinant Hepatitis B surface antigen.		
2.0	Scope		
	This Standard Operating Procedure is applicable to check the viability of		
	the Master/ Working Cell Bank by determining the number of viable cells in		
	the microbiology lab of Quality Control used for the production of		
	recombinant Hepatitis B surface antigen.		
3.0	Responsibility		
	3.1	Trained trainee scientific officer/ scientific officer shall be	
	responsible for carrying out the established procedure and reporting		
	the results on the same day of analysis after appropriate incubation		
	for on the next working day, if there is a holiday.		
	3.2	The senior scientific officer/ section head who is well versed with	
	the procedure shall be responsible for ensuring that the same is		
	carried out correctly.		
	3.3	The Departmental Head shall be responsible for overall compliance of	
	the SOP.		
4.0	Abbreviations and Definitions		
	4.1	CV	:Coefficient of variation
	4.2	CFU	:Colony forming unit
	4.3	°C	:Degree centigrade
	4.4	g	:Gram
	4.5	h	:Hours
	4.6	Kg/cm2	:Kilogram per centimetre square
	4.7	mg	:Milli gram
	4.8	µL	:Micro liter
	4.9	µm	:Micro meter
	4.10	ml	:Milli liter
	4.11	N	:Normal
	4.12	PN	:Part Number
	4.13	QA	:Quality Assurance
	4.14	QC	:Quality Control
	4.15	SOP	:Standard operating procedure
5.0	Procedure		
	5.1	Materials	
		5.1.1	General glassware
		5.1.2	Sterile tips
		5.1.3	Syringe Filters
	5.2	Reagents	
		Name	
		5.2.1	Purified Water
		5.2.2	NaCl
		5.2.3	Sabouraud Dextrose Agar
		5.2.4	Gram Reagents
		5.2.5	HCl
	5.3	Preparation of solutions:	
		5.3.1	Peptone Water Saline
		5.3.2	Solution of 1 N HCl
		5.3.3	Solution of NaOH 0.1 N
		5.3.4	Sabouraud Dextrose Agar (Yeast Culture medium):
		5.3.5	Gram Reagents
	5.4	Sampling	
		5.4.1	Carry out the sampling and Reception and storage of the sample
		shall be done.	
	5.5	Viability test of cell bank:	
		Note: If the testing for viability check of cell bank is not performed	
		on the day of receipt, the cell bank shall be kept in deep freezer at	
		-200C. The cell banks must be tested within 5 days of receipt of cell	
		bank.	
		5.5.1	Initial Control:
			For Initial analysis of new Master Cell Bank (MCB) or Working
			Cell Banks at least 6 vials shall be used.
		5.5.2	Take 0.5 ml of sample from each vial and add to a test tube
			containing 4.5 ml of peptone water saline; this is dilution
			10-1.
		5.5.3	Starting from the above dilution make serial dilutions up to
			10-8.
		5.5.4	For making serial dilutions, take 1 ml from the previous
			dilution and add it to the next tube containing 9 ml of
			peptone water/ saline solution and so on. To check viability
			of the master/ working cell bank, last three dilutions i.e.
			10-6, 10-7 and 10-8 shall be used for plating.
		5.5.5	Once the dilutions are over, the culture shall be inoculated
			on the Sabouraud Dextrose Agar plate by spread plate
			technique. At least 5 replicates for each dilution shall be
			performed.
		5.5.6	For spread plate, pipette out 0.1 ml of the dilutions on
			Sabouraud Dextrose Agar plates and using the sterile L-shaped
			rod and rotameter spread the culture on the surface of the
			agar.
		5.5.7	Incubate the plates in inverted position at 22.5 ± 2.5°C, for
			a period of 72 hours.
		5.5.8	After incubation for 72 hours, count the no. of colonies
			observed in the plates.
		5.5.9	All the colonies should show homogeneous growth with respect
			to morphology and appearance.
		5.5.10	All the plates which show CFU less than 30 or more than 300
			shall be rejected and not counted.

			Note: Significant no. of colony forming units (CFU) between 30	
			and 300.	
		5.5.11	If more than one type of colonies is observed, it indicates	
			contamination and in this case, repeat the test with same	
			number of samples.	
		5.5.12	Determine the total number of viable colony count for each	
			vial in the selected dilutions by counting the colony forming	
			units (CFU) from all the replicate.	
		5.5.13	Calculate the Mean number of viable cells, by dividing the	
			cumulative value of all replicates with 5.	
		5.5.14	This way 6 values will be obtained one for each vial, add	
			them and determine the average value of these by dividing	
			with 6 and multiply it by the inverse of the dilution for	
			which count was carried out. This value corresponds to CFU	
			per 0.1 ml in the bank. To convert into ml multiply by 10.	
		5.5.15	Determine the coefficient of variation for individual vial	
			(this value should not be more than 20%).	
		5.5.16	Evaluation of the homogeneity of the bank:	
			The cell bank is considered homogeneous if the dilution	
			selected for the viable cell counting is same for all the six,	
			sampled vials.	
		5.5.17	Acceptance Criteria for Initial Control:	
			5.5.17.1	For Yeasts the average CFU/ml should be more or equal
			to 10⁶.	
			5.7.17.2	The bank should be homogeneous.
		5.5.18	Follow up control:	
			For the follow up control 2 vials are to be checked.	
		5.5.19	The banks shall be analysed annually starting from the initial	
			control	
		5.5.20	Follow the steps 5.5.2 to 5.5.13 of the Initial Control, to	
			verify the follow up viability.	
		5.5.21	This way 2 values shall be obtained one for each vial, add	
			them and determine the average value of these by dividing by	
			2 and multiply it by the inverse of the dilution for which	
			count was carried out. This value corresponds to CFU per 0.1	
			ml in the bank. To convert into ml multiply by 10.	
		5.5.22	Determine the coefficient of variation for individual vial	
			(this value should not be more than 20%).	
		5.5.23	Interpretation of results:	
			An alert shall be given in writing when the viability of cell	
			bank falls to 10⁴ CFU/ml or if there is 2 log reductions from	
			the results of the viable count in the previous check of the	
			viability of the cell bank.	
		5.5.24	Reporting of the Result:	
			For both Initial control and Follow up control report the	
			results as CFU/ml.	
		5.6	Handling of results out of specification:	
		5.6.1	If the results are found out of specification, a team shall be	
			prepared from Quality Control and Quality Assurance and	
			investigations shall be carried out.	

1.0 |Objective: |
 | |Determination of phosphorus content of Meningococcal polysaccharide |
 | |serotype A and in turn to determine polysaccharide content. |
 2.0 |Scope: |
 | |This SOP is applicable to Men A polysaccharide, Men A polysaccharide in |
 | |conjugates (bulk or final lots) and stability samples. |
 3.0 |Responsibility: |
	3.1	The analyst of the quality control laboratory shall be responsible
	for executing the described procedure correctly.	
	3.2	The supervisor of the laboratory shall be responsible for verifying
	that the procedure is followed correctly and for checking the	
	results.	
	3.3	The Departmental Head shall be responsible for the overall
	compliance of the SOP and shall ensure that the SOP is reviewed	
	every two years or if required earlier.	
3.0	Abbreviations and Definitions:	
	3.1	SOP
	3.2	UV
	3.3	WFI
4.0	Procedure:	
	4.1	Materials, reagents & Equipments
	4.1.1	Laboratory vortex mixer
	4.1.2	Furnace
	4.1.3	UV-Vis Spectrophotometer
	4.1.4	Water bath, 37°C
	4.1.5	Glass test tubes (12 x 75 mm e.g. Borosil)
	4.1.6	Pipettes and tips (e.g. Eppendorf)
	4.1.7	Phosphorus standard, 20 µg/ml
	4.1.8	Sulfuric Acid
	4.1.9	Perchloric acid
	4.1.1	Hydrogen peroxide free from phosphorus
	0	
	4.1.1	Ascorbic acid sodium salt
	1	
	4.1.1	Ammonium molybdate tetra hydrate
	2	
	4.2	Preparation of Solution
	4.2.1	Reagent A (Sulphuric acid +Perchloric acid): Mix 2 volume of
	sulphuric acid and 1 volume perchloric acid. Prepare freshly	
	4.2.2	Reagent B (3 M sulphuric acid): Take 180 ml of Milli Q water
	in volumetric flask, to this adds 40.5 ml of conc. Sulphuric	
	acid slowly. Make up volume to 250 ml with WFI. Store at room	
	temperature. Expiry 6 months.	
	4.2.3	Reagent C (2.5% ammonium molybdate): Dissolve 5.0 g of
	ammonium molybdate in 200 ml of Milli Q water. Store at 4°C.	
	Expiry 6 month.	
	4.2.4	Reagent D (10 % ascorbic acid): Dissolve 10 g of ascorbic
	acid in 80 ml of Milli Q water. Make up final volume to 100	
	ml with Milli Q water. Store at 4°C expiry 1 month.	
	4.4.5	Reagent E: Mix 2 volume of milli Q water, 1 volume of reagent
	B, 1 volume of reagent C, 1 volume of reagent D. prepare	
	freshly before use.	
	4.3	Test Principle:
	This method requires a preliminary ashing step, in order to release	
	all organically bound phosphate. The conventional method involve	
	drying and burning of organic sample over Bunsen burner, in	
	presence of perchloric acid and sulphuric acid. A high temperature	
	Furnace is now used instead. The characteristic blue colour, which	
	is formed from reduction of phosphomolybdo complex by ascorbic	
	acid, is detected using a spectrophotometer at 825 nm. The method	
	is sensitive and gives reproducible results.	
	4.4	Preparation of Assay:
	4.4.1	Place series of standard solution from 20µg/ml Phosphorus
	standard solution on the day of measurement into 5 ml glass	
	tubes in duplicate according to the following table.	
	S.No.	Volume of 20µg/ml
		phosphorus standard
		(µl)
	Blank	0
	S 1	25
	S 2	50
	S 3	75
	S 4	100
	S 5	150
	S 6	200
	4.4.2	Add prediluted samples in duplicate, and make final volume to
	200 µl in 5 ml test tubes.	
	Note: The sample dilutions can vary depending upon the Sialic	
	acid concentration. If there is any sample outside the range	
	of the calibration curve, carry out the calculation for more	
	appropriate dilution.	
	In case of dry polysaccharide prepare a solution containing	
	about 1 mg/ml of polysaccharide in Lal reagent water.	
	4.4.3	Add 50µL reagent A to each tubes and vortex.
	4.4.4	Heat the tubes in a Furnace to 250°C for 4 1/2 hours. If
	charring occurs, add hydrogen peroxide and heat further.	
	4.4.5	Remove the tubes from the heating block. Cool down the tubes
	to room temperature. Add 200µL Milli Q H2O to each tube.	
	4.4.6	Add 1 ml Reagent E to each tube and vortex. Incubate in a
	37°C water bath for 2 hours.	

		4.4.7	Measure the absorbance of each tube at 825 nm with a
		spectrophotometer.	
		4.4.8	Note that all the readings of the assay tubes should be taken
		within 30 mins. of completion of the assay.	
		4.5	Calculations:
		4.5.1	Once the absorbance of the standards and the test samples
		have been taken, calculation shall be done using the excel	
		sheet carrying formulas for the required calculation.	
		4.5.2	Always copy the master excel sheet (sheet carrying formulas
		for the required calculation), never use the previously used	
		excel sheet for new calculations.	
		4.5.3	Copy the master excel sheet, keep it for use in respective
		folder and then fill in the required sample details (Batch	
		number), sample dilution (if applicable), name of analyst,	
		date, etc.	
		4.5.4	Calculate the phosphorous concentration of the samples using
		following formula: Phosphorous concentration	
		(μM/ml)= {(abs-intercept)/slope}*dilution factor	
		4.5.5	In case of dry polysaccharide, Phosphorous content (%) in
		polysaccharide on dry weight basis:	
			Phosphorous content in dry Polysacc. (μg/ml) =
			Phosphorous content in Polysacc. sol. (μg/ml) X 1 –
			{Moisture (%) / 100}
			Phosphorous content (%)
			= Phosphorous content in dry polysaccharide (μg/ml)
			_____ X
			100
			Conc. of polysaccharide solution (μg/ml)
		4.5.6	To calculate the pure polysaccharide content (mg) present in
		dry polysaccharide sample in of each serotype based on the	
		Sialic acid content obtained, following formula is applied:	
		Pure Polysaccharide content(mg) / Dry polysaccharide content	
		(mg)	
		= (Phosphorous content in dry Polysacc (mg) X Conversion	
		factor)	
		4.5.7	Calculate the polysaccharide concentration of the samples
		using following formula: Polysaccharide concentration=	
		Phosphorous concentration *11.11	
		4.6	Assay Specification:
		4.6.1	The linearity of the standard curve is NLT 0.99
		4.6.2	The absorbance value of test samples should fall inside the
		range of standard curve.	
		4.6.3	A coefficient of variation of less than 10% should be
		observed within the replicates.

Sr.No. | SOP TITLES

- 1 | Detection and quantification of mouse immunoglobulin (IgG) contaminants in samples by using kit from Cygnus Technologies, Inc.
- 2 | Determination of traces of yeast DNA in samples of active raw material of Hepatitis B vaccine (recombinant) by DOT- BLOT method
- 3 | Determination Of Cesium Chloride Content By Atomic Absorption Spectrophotometry
- 4 | Determination of Potassium Thiocyanate content in active raw material of recombinant Hepatitis b Vaccine
- 5 | Determination of Protein concentration by Lowry's method
- 6 | Determination Of Total Carbohydrate Content In Active Raw Material Of Recombinant Hepatitis B Vaccine
- 7 | Determination of total lipid content in active raw material of recombinant hepatitis b vaccine.
- 8 | Immunoenzymetric Assay for the measurement of Pichia pastoris Host cell proteins.
- 9 | Procedure for detection of surface antigen of the hepatitis b samples by enzyme immunoassay techniques.
- 10 | Procedure for preparation of active raw material Hepatitis b vaccine sample by desorption of aluminium hydroxide gel.
- 11 | Procedure for separation of proteins by Sodium Dodecyl Sulphate Polyacrylamide Gel Electrophoresis (SDS-PAGE)
- 12 | Procedure for testing of Bacterial Endotoxin by Lal Gel Clot method using reagents from associates of cape cod, inc. (Qualitative Lal test)
- 13 | Spectrophotometric determination of Thiomersal concentration in recombinant hepatitis b vaccine

1.0	Objective:		
	To lay down the procedure for detection of surface Antigen of the Hepatitis		
	B samples by enzyme immunoassay technique.		
2.0	Scope:		
	This Standard Operating Procedure is applicable to all the samples of Active		
	Raw Material of recombinant Hepatitis B surface antigen, received in the		
	Quality control department.		
3.0	Responsibility:		
	3.1	The analyst shall be responsible for executing the described	
	procedure correctly.		
	3.2	Supervisor shall be responsible for verifying that the procedure is	
	complied with and the results are checked.		
	3.3	HOD shall be responsible for overall compliance of this SOP.	
4.0	Abbreviations and Definitions		
	4.1	QC	:Quality Control
	4.2	QCR	:Quality Control Record
	4.3	SD	:Standard Deviation
	4.4	SOP	:Standard Operating Procedure
	4.5	ARM	:Active Raw Material
	4.6	CV	:Coefficient of variation
	4.7	g	:Gram
	4.8	ID	:Identification
	4.9	mg	:Milligram
	4.10	ml	:Millilitre
	4.11	µl	:Micro litre
	4.12	µg	:Microgram
	4.13	nm	:Nanometer

5.0	Procedure:			
	5.1	Reagents, Equipments and other materials		
		5.1.1	Reference standard	
		5.1.2	Test solution: HBsAg bulk protein	
		5.1.3	Sterile micro centrifuge tubes	
		5.1.4	Tube rack	
		5.1.5	Variable volume micropipettes and tips	
		5.1.6	Bead dispenser	
		5.1.7	Plate incubator (Commander from Abbott) or water bath or	
		Incubator oven		
		5.1.8	Quick wash (Abbott) or ELISA plate washer	
		5.1.9	Quantum II reader (Abbott) or ELISA plate reader or UV-Vis	
		Spectrophotometer		
		5.1.10	Computer with Parallel line assay software	
	5.2	Preparation of solutions		
		5.2.1	Phosphate buffered saline (PBS) pH 7.4	
			5.2.1.1	Dissolve 1.183 g Disodium hydrogen phosphate
				dihydrate, 0.19 g potassium dihydrogen phosphate
				and 8.0 g sodium chloride in about 800 ml of
				purified water.
			5.2.1.2	Adjust pH to 7.4 using dilute NaOH solution or
				dilute HCl.
			5.2.1.3	Adjust the final volume to 1000ml using a measuring
				cylinder.
		5.2.2	Diluent {PBS with 0.2 % w/v BSA}	
			5.2.2.1	Dissolve 0.2 g Bovine serum albumin in about 80 ml
				of PBS (pH 7.4) and make up the volume to 100 ml
				using PBS (pH 7.4).
			5.2.2.2	Auszyme monoclonal kit for HBsAg detection or any
				other validated kit (e.g. Monolisa Ag HBs Plus).
	5.3	Principle		
		Monoclonal or polyclonal antibodies coated on ELISA plates or on		
		beads capture HBsAg. After wash, second antibody conjugated to HRP is		
		added. A sandwich complex is formed wherein HBsAg is sandwiched		
		between the antibody and antibody HRP conjugate. After removing		
		excess conjugate substrate for HRP such as OPD or TMB is added. The		
		amount of color developed is directly proportional to content of		
		HBsAg in sample.		
	5.4	Dilution for test using Auszyme kit:		
		5.4.1	Dilute In House standard and test HBsAg (aq) bulk to 20	
			µg/ml of total protein (obtained from Lowry analysis) using	
			PBS with 0.2% BSA, in quadruplicate, as follows:	
		5.4.2	E. g., HBsAg protein concentration = 2.24 mg/ml,	
			100 µl bulk + 124 µl diluent → (1 mg/ml) -1	
			100 µl of 1 + 900 µl diluent → (100µg/ml) - 2	
			200 µl of 2 + 800 µl diluent → (20 µg/ml) -3	
		5.4.3	Dilute Standard further 1:1000 with diluent, in	
			quadruplicate, as follows:	
		5.4.4	100 µl of 20µg/ml Std + 900 µl diluent → (1:10 Dilution) -	
			1	
			100 µl of 1 + 900 µl diluent → (1:100 Dilution) - 2	
			100 µl of 2 + 900 µl diluent → (1:1000 Dilution) -3	
		5.4.5	Discard 1 and 2 dilutions after 3 have been made. Use 3	
			(1:1000 Dilution) for plating in the assay.	
		5.4.6	Dilute test sample of HBsAg further to 1:1000 dilution	
			using PBS with 0.2% BSA, in quadruplicate, as follows	
		5.4.7	100 µl of 20µg/ml sample + 900 µl diluent → (1:10 Dilution)	
			-1	
			100 µl of 1 + 900 µl diluent → (1:100 Dilution)-2	
			100 µl of 2 + 900 µl diluent → (1:1000 Dilution) -3	
		5.4.8	Discard 1 and 2 dilutions after dilution 3 has been made.	
			Use 3 (1:1000 Dilution) for plating in the assay.	

| | 5.5 | Assay |

| | 5.5.1 | Plate standard and test HBSAg sample in a total of 200 µl |

| | | in a manner that each plate will hold dilutions in |

| | | following manner. |

| | | For example: |

| | 5 µl of dilution 1:1000 + 195 µl diluent → 1: 40000 dilution |

| | 10 µl of dilution 1:1000 + 190 µl diluent → 1: 20000 dilution |

| | 20 µl of dilution 1:1000 + 180 µl diluent → 1: 10000 dilution |

| | 40 µl of dilution 1:1000 + 160 µl diluent → 1: 5000 dilution |

| | 80 µl of dilution 1:1000 + 120 µl diluent → 1: 2500 dilution |

| | (optional) |

| | 5.5.2 | Add 200 µl of kit positive control in two wells and 200 µl |

| | | of kit negative control in three wells. |

| | 5.5.3 | Add 50 µl of kit conjugate solution in each of the wells. |

| | 5.5.4 | Add one anti-HBs (mouse) monoclonal-coated bead provided in |

| | | the kit with the help of bead dispenser, to each well. |

| | 5.5.5 | Apply cover seal and gently tap the plate so as to remove |

| | | any air bubble trapped beneath the bead. |

| | 5.5.6 | Incubate the plate at 40°C ± 10°C for 3 Hrs ± 10 minutes in |

| | | commander incubator (Abbott) or water bath. |

| | 5.5.7 | During the last 5-10 minutes of incubation period, prepare |

| | | appropriate volume of OPD substrate solution depending on |

| | | number of beads used (1 tablet of OPD in 5 ml of OPD |

| | | diluent) considering a volume of 300 µl per bead. |

| | 5.5.8 | At the end of incubation period, remove the plates from |

| | | incubator and discard the cover seals. |

| | 5.5.9 | Wash the beads once with at least 12 ml of Milli-Q water |

| | | using Quick Wash (Abbott) or 3 times with penta wash II |

| | | (Abbott). |

| | 5.5.10 | Immediately transfer the beads to properly identified tubes |

| | | in boxes. |

| | 5.5.11 | Pipette 300 µl of freshly prepared OPD substrate solution |

| | | into two empty tubes (Blanks) and then into each tube |

| | | containing a bead. |

| | 5.5.12 | Cover the tubes (black cover plates provided with kit) and |

| | | incubate at room temperature for 30 ± 2 minutes. |

| | 5.5.13 | Stop the reaction by adding 1 ml of 1 N H₂SO₄ into each |

| | | tube. |

| | 5.5.14 | Blank spectrophotometer (e.g. Quantum II, Module A, Mode 0, |

| | | Abbott) with substrate blank at 492 nm. |

| | 5.5.15 | Measure absorbance of all the tubes at 492 nm within 2 |

| | | hours after addition of acid. |

| | 5.6 | Dilution for test using BIORAD Kit (Monolisa Ag HBs Plus): |

| | 5.6.1 | Dilute Standard HBSAg (aq) bulk & test sample of HBSAg to |

| | | 20 µg/ml of total protein (obtained from Lowry analysis) |

| | | using PBS with 0.2% BSA, in quadruplicate. |

| | | For example: HBSAg protein concentration = 2.29 mg/ml, |

| | | 100 µl bulk + 129 µl diluent -- (D) (1 mg/ml) |

| | | 100 µl D + 900 µl diluent -- (E) (100 µg/ml) |

| | | 200 µl E + 800 µl diluent -- (F) (20 µg/ml) |

| | 5.6.2 | Further dilute STANDARD & test sample of 20 µg/mL as |

| | | follows: |

| | | 100 µl (of 20 µg/mL) + 900 µl diluent -- 1:10 |

| | | 100 µl of 1:10 + 900 µl diluent -- 1:100 |

| | | 500 µl of 1:100 + 500 µl diluent -- 1:200 |

| | | 500 µl of 1:200 + 500 µl diluent -- 1:400 |

| | | 500 µl of 1:400 + 500 µl diluent -- 1:800 |

| | | 500 µl of 1:800 + 500 µl diluent -- 1:1600 |

| | | 500 µl of 1:1600 + 500 µl diluent -- 1:3200 |

| | | 500 µl of 1:3200 + 500 µl diluent -- 1:6400 |

| | | 500 µl of 1:6400 + 500 µl diluent -- 1:12800 |

| | | 500 µl of 1:12800 + 500 µl diluent -- 1:25600 |

| | | 500 µl of 1:25600 + 500 µl diluent -- 1:51200 |

| | | 500 µl of 1:51200 + 500 µl diluent -- 1:102400 |

| | | Use last four dilutions in quadruplicate for ELISA. |

| | 5.7 | Assay |

| | 5.7.1 | Take out the protective packing the support frame and the |

| | | necessary number of strip. Put the unused strip back in |

| | | their packing and close it. |

| | 5.7.2 | Add 100 µl of respective samples, 4 negative controls & 1 |

| | | positive control into respective wells as per plate layout. |

| | 5.7.3 | Add 50 µl of working conjugate solution in all wells. Shake |

| | | the plate gently. |

| | 5.7.4 | Cover the plate with adhesive tape and incubate at 37° C ± |

| | | 1°C for 120 ± 5 minutes |

| | 5.7.5 | Prepare Washing Solution and conjugate solution as per kit |

| | | manual. |

| | | Distribute the wells in the following order: |

| | | Wells A1, B1, C1 and D1: negative control |

| | | Well E1: Positive Control |

| | | Well F1 onwards for unknown samples |

| | 5.7.6 | After incubation is complete wash the plate five times with |

| | | washing buffer in ELISA plate washer. |

| | 5.7.7 | Prepare the enzymatic development solution as per the |

| | | instructions in the kit leaflet and dispense 100 µl of |

| | | development solution in each well. |

| | 5.7.8 | Incubate in dark for 30 minutes at room temperature. |

| | 5.7.9 | After completion of incubation add 100 µl stopping solution |

| | | in each well |

| | 5.7.10 | Read the plate at 450/620 nm, within the 30 minutes of |

| | | stopping reaction. |

| | 5.8 | Interpretation of results. |

		5.8.1	Validity of Kit
		5.8.1.1	Calculate average negative control absorbance value
		5.8.1.2	Calculate average positive control absorbance value
			for Auszyme kit only.
		5.8.1.3	Value of P-N should be ≥ 0.4 for the test to be
			valid for Auszyme kit. If not, technique or
			deterioration of reagents may be suspected and the
			run must be repeated.
		5.8.1.4	For Bio-Rad Kit average value of negative control
			should be lower than or equal to 0.080 O.D value
			and positive control should be over or equal to
			1.00 O.D value
		5.8.2	Calculation
		5.8.2.1	Parallel line assay software has to be used for
			calculation of potency of HBsAg.
		5.8.2.2	While feeding the data into the software assign a
			potency of 1.0 to the Standard.
		5.8.2.3	For the standard or test sample feed the
			quadruplicate absorbance for each dilution.
		5.8.2.4	If one of the values is significantly out of the
			linear fit it must be marked as an outlier and must
			not be used for calculation. Use the absorbance
			value of other three replicates of particular
			dilutions.
		5.8.2.5	Configure the software to consider log values for
			dose provided for ELISA.
		5.8.2.6	Results are reported in the form of the printout
			generated by parallel line assay
		5.8.3	Validity of results
		5.8.3.1	The analysis should not fail for parallelism and
			linearity, which is also printed on the report. If
			so, repeat the analysis.
		5.8.3.2	The percentage of lower and upper fiducial limits
			of the assay should lie between 80% to 125%
			respectively. If not, the assay and results are
			invalid and the test has to be repeated.
		5.8.4	Acceptance criteria
			The antigenic ratio should be ≥ 1.0

	5.1.9	Physiological saline (0.9% w/v)
	5.1.10	Working Standard of Tetanus Antitoxin for Flocculation (100
		Lf/ml)
5.2	Preparation of solutions	
	5.2.1	Physiological saline (0.9% w/v)
		Add 0.9 gm of Sodium Chloride to 50ml of purified water, mix
		well and make up it to 100ml.
5.3	Preparation of sample	
	5.3.1	Based on the target concentration, dilute tetanus toxin/toxoid
		sample of which the Lf /ml is to be determined, in
		physiological saline (0.9% w/v) in such a way that it
		contains less than 100 Lf / ml.
	5.3.2	Dilute the sample with 0.9 % (w/v) physiological saline as
		prescribed in table - 1 prior to testing and mix thoroughly
		with the help of vortex mixer.
		Sample Description
		Crude toxin/Clarified Toxin
		Concentrated Toxin & Crude
		toxoid
		Purified toxoid
5.4	Test procedure	
	5.4.1	Set the temperature of the water bath at 50 + 2° C.
	5.4.2	Take 5–6 dry flocculation tubes of equal size, diameter and
		thickness.
	5.4.3	Label the flocculation tubes serially.
	5.4.4	Broad range test
		5.4.4.1
		5.4.4.2
		5.4.4.3
		5.4.4.4
		5.4.4.5
		5.4.4.6
		5.4.4.7

			second flocculation.	
			5.4.4.8	If flocculation occurs in the first tube increase the
			dilution fold or it occurs in the last tube decrease	
			the dilution fold of the sample.	
			5.4.4.9	Observe for first and second flocculation. The tube
			in which first flocculation occurs is the Lf value of	
			the sample. Record the time taken (Kf) for first and	
			second flocculation.	
			5.4.4.10	Multiply this by the dilution factor to get the Lf/ml
			of the original sample. Example:-	
			Tube No	
			5.4.4.12	If the first or the last tube flocculates most rapidly
			then the test has to be repeated in such a way that	
			the middle tube flocculates most rapidly.	
			5.4.4.13	After determining the broad range test perform narrow
			range test/ confirmatory test.	
			5.4.5	Narrow range test (Applicable for purified bulk)
			For narrow range test keep 2 Lf difference between subsequent	
			tubes and perform the assay as described above.	
			5.4.6	Confirmatory test
			For confirmation, perform with 2 or 1 Lf difference between the	
			tubes as shown in Table above and record the results.	
	5.5	Calculation/ Formula:		
	Limes floccules (Lf/mL) = TATF unit of tube which flocculate first X			
	dilution fold of sample.

	(BLG/UNDP/77.2 Rev 1)			

1.0 |Objective |
 |To lay down the procedure for estimation of residual formaldehyde content. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to all the samples in which|
 |residual formaldehyde content is to be determined. |
 3.0 |Responsibility |
3.1	The analyst is responsible for executing the described procedure
	correctly.
3.2	Supervisor is responsible for verifying that the procedure is carried
	out correctly and check the results.
3.3	HOD shall be responsible for overall compliance of this SOP and shall
	ensure that the SOP is reviewed every two years or if required
	earlier.
4.0	Abbreviations and Definitions

||| |the supernatant collected. |

|| |5.3.8|Test Procedure: |

|| |5.3.8.|Prepare the sets of formaldehyde standards, check sample,|

|| |1 |in house control sample and test sample with buffer |

|| | |solution and acetylene acetone solution as mentioned in the|

|| | |table below: |

|| |Test |Vol. of Standard, Sample and |Vol. of |Vol. of |

|| |tube |Controls |Buffer sol. |acetyl |

|| |no. | |acetone sol. |

|| |1 |Purified water |-- |5.0 ml |

|| | |5.0 ml | | |

|| |2 |Std (10.0 µM/lit) |-- |5.0 ml |

|| | |5.0 ml | | |

|| |3 |Std (30.0 µM/lit) |-- |5.0 ml |

|| | |5.0 ml | | |

|| |4 |Std (50.0 µM/lit) |-- |5.0 ml |

|| | |5.0 ml | | |

|| |5 |Std (80.0 µM/lit) |-- |5.0 ml |

|| | |5.0 ml | | |

|| |6 |Std (100.0 µM/lit) |-- |5.0 ml |

|| | |5.0 ml | | |

|| |7 |Check sample (80 µmol/lit) |-- |5.0 ml |

|| | |5.0 ml | | |

|| |8 |In house control A |-- |5.0 ml |

|| | |5.0 ml | | |

|| |9 |In house control B |-- |5.0 ml |

|| | |5.0 ml | | |

|| |10 |In house control C |5.0 ml |-- |

|| | |5.0 ml | | |

|| |11 |Test sample A |-- |5.0 ml |

|| | |5.0 ml | | |

|| |12 |Test sample B |-- |5.0 ml |

|| | |5.0 ml | | |

|| |13 |Test sample C |5.0 ml |-- |

|| | |5.0 ml | | |

|| |5.3.8.|The test tube no. 10 and 13 are the color correction |

|| |2 |tubes of respective samples and hence acetyl acetone is |

|| | |not added to these tubes. |

|| |5.3.8.|After addition of all the components as mentioned above, |

|| |3 |place all these test tubes in a water bath at 37±1° C for|

|| | |50 minutes. |

|| |5.3.8.|On completion of incubation period, remove the test tubes|

|| |4 |and cool them under running water for 2 minutes. |

|| |5.3.8.|Read the absorbance of each tube within 30 mins. at 415 |

|| |5 |nm under a UV/VIS spectrophotometer. |

|| |5.3.8.|The standard tube no. 1 of purified water is considered |

|| |6 |to be as blank. |

|| |5.3.8.|The concentration of formaldehyde in the test sample(s) |

|| |7 |is calculated by comparing results of its absorbance |

|| | |obtained against the plotted calibration curve of known |

|| | |formaldehyde concentration (10 to 100 µM/lit) Vs |

|| | |absorbance difference at 415 nm |

|| |5.3.8.|Note that all the readings of the assay tubes should be |

|| |8 |taken within 30 mins. of completion of the assay and |

|| | |maximum 5 samples should be analysed in one single assay.|

|| |5.4 |Calculations: |

|| |5.4.1|Once the absorbance of the standards and the test samples have |

|| | |been taken, calculation shall be done using the excel sheet |

|| | |carrying formulas for the required calculation. |

|| |5.4.2|Always copy the master excel sheet (sheet carrying formulas for |

|| | |the required calculation), never use the previously used excel |

|| | |sheet for new calculations. |

|| |5.4.3|Copy the master excel sheet, keep it for use in respective |

|| | |folder and then fill in the required sample details (Batch |

|| | |number), sample dilution (if applicable), name of analyst, date,|

|| | |etc. |

|| |5.4.4|Proceed for calculations starting from the Calibration curve. |

|| | |The calculations are done according to the equation after |

|| | |subtractions blank OD. |

|| | |Y = mX + b. |

|| | |Where: m = slope |

|| | |b = intercept |

|| | |Y = absorbance |

|| | |X = concentration |

|| |5.4.5|To determine the formaldehyde concentration in mM/lit following |

|| | |formula is applied, |

|| | |Formaldehyde [Sample Conc. (µM/lit) – Color correction |

|| | |Conc. (µM/lit)] |

|| | |Concentration = |

|| | |

|| | |(mM/lit) 1000 X |

|| | |Dilution factor |

|| |5.4.6|Record all the calculations in the data record form and also |

|| | |attach the hard copy of the excel sheet used for calculation |

|| | |along it. |

|| |5.5 |Acceptance criteria: |

|| |5.5.1|Regression of the standard curve should not be less than 0.99. |

|| |6.4.2|The calculated check sample concentration of 80 µmol/lit should |

|| | |be within 10% of the true value. |

|| |6.4.3|The variation in OD values between the two replicates of same |

|| | |sample should not be more than 10%. |

CERTIFICATE OF ANALYSIS
For BioBridge Healthcare Solutions Pvt. Ltd.
Authorized Signatory
Product: | Bulk of Tetanus Toxoid
Product code no.: | B/TT 002
Appearance: | Clear, Yellow to brownish solution without any suspended particles
Form: | Liquid
Buffer: | Physiological Saline
Manufacturing Date: | Feb 2015
Expiry Date: | Jan 2020
Antigen Content: | 2100 Lf/ml
Antigenic Purity: | 1250 Lf/mg of Protein Nitrogen
Sterility: | Sterile Product
pH: | 6.6
Specific Toxicity: | Complied
Identity: | Positive
Free formaldehyde: | 0.08g/ L
Irreversibility of toxoid: | Complied (No irreversibility observed)
Storage: | 5±3°C (Do not freeze)
Note: To be used for research or in-vitro testing purpose only | Note: To be used for research or in-vitro testing purpose only

1.0 |Purpose: |
 |To lay down the procedure for the determination of CDAP |
 |(1-cyano-4-dimethylaminopyridinium tetrafluoroborate) by high performance |
 |liquid chromatography (HPLC). |
 2.0 |Applicable to: |
 |This Standard Operating Procedure is applicable for the analysis of the |
 |samples in which CDAP (1-cyano-4-dimethylaminopyridinium tetrafluoroborate)|
 |is to be determined. |
 3.0 |Abbreviations and Definitions |
3.1	CDAP	: 1-cyano-4-dimethylaminopyridinium tetrafluoroborate
3.2	cm	: centimetre
3.3	DNA	: Deoxyribonucleic acid
3.4	g	: Gram
3.5	HIBTT	: Haemophilus Influenzae type b - Tetanus toxoid
3.6	HPLC	: High Performance Liquid Chromatography
3.7	i.d	: Internal diameter
3.8	l	: length
3.9	m	: meter
3.10	mg	: milligram
3.11	mL	: Millilitre
3.12	mm	: millimetre
3.13	nm	: Nano meter
3.14	ng	: Nano gram
3.15	No.	: number
3.16	PRP-TT	: Polyribosyl Ribitol Phosphate - Tetanus Toxoid
3.17	RSD	: Relative Standard Deviation
3.18	SST	: System Suitability Test
3.19	°C	: Degree centigrade
3.20	µg	: microgram
3.21	µL	: Micro litre
3.22	µm	: Micro meter
3.23	System	: System suitability tests are an integral part of gas
	Suitability	and liquid chromatographic methods. They are used to
	Test	verify that the resolution and reproducibility of the
		chromatographic system are adequate for the analysis
		to be done.
	The tests are based on the concept that the equipment,	
	electronics, analytical operations and samples to be	
	analyzed constitute an integral system that can be	
	evaluated as such.	
4.0	Procedure	
4.1	Precautions to be taken:	
	4.1.1	Always use filtered solutions. Filtration of solution should
	be done in order to eliminate the entry of possible particles,	
	if any, into the system as well as the column.	
	4.1.2	Degas all solutions.
	4.1.3	Avoid entry of bubbles into the system as well as column.
	4.1.4	All the solution bottle openings should be well covered with
	aluminum foil.	
	4.1.5	Handle acids carefully and always manipulate in fume hood.
	4.1.6	Check the calibration status of all equipment and instrument.
4.2	Requirements	
	4.2.1	Equipment:
		4.2.1.1
		4.2.1.2
		4.2.1.3
		4.2.1.4
		4.2.1.5
	4.2.2	Instrument:
		4.2.2.1
		4.2.2.2
		4.2.2.3
		4.2.2.4
	4.2.3	Materials:
		4.2.3.1
		4.2.3.2
		4.2.3.3
		4.2.3.4
		4.2.3.5
		filters.
		4.2.3.6
		4.2.3.7
		4.2.3.8
	4.2.4	Reagents:
		4.2.4.1
		4.2.4.2
		4.2.4.3
		4.2.4.4
		4.2.4.5
		tetrafluoroborate)
		4.2.4.6
		4.2.4.7
4.3	Preparation of solutions:	
	Prepare all the solutions and carry out the labelling of the prepared	
	solutions and assign the lot numbers to the solutions.	
	4.3.1	Solution A
		(NaH₂PO₄. H₂O, 200mM)
		For a volume of 1 liter, weigh
		NaH₂PO₄. H₂O
		Adjust the pH to 3.0 with HCl 37%.

			Make up the solution to 1litre with purified water. Prepare			
			fresh before use.			
		4.3.2	Mobile phase for CDAP:			
			Take 700mL of methanol in a measuring cylinder and 300mL of			
			solution A to make the volume to 1000mL. Use the mobile phase			
			within four days from the date of preparation if it remains			
			clear and no turbidity or fibers observed in it.			
		4.3.3	Isopropyl Alcohol 70% Solution			
			(For storing and purging the HPLC system)			
			Take 700 mL of 2-propanol using a measuring cylinder and make			
			up the volume to 1000 mL with Purified Water in a volumetric			
			flask. This solution can be stored at room temperature for 3			
			months.			
		4.3.4	1 mg/mL of CDAP calibration standard stock:			
			Weigh 5mg of CDAP and make up the volume to 5mL with purified			
			water in a volumetric flask. This solution can be stored as			
			aliquots at -20°C for 2months.			
		4.3.5	Preparation of working calibration standard of 10µg/mL or			
			10ng/µL:			
			Take 10µL of 1 mg/mL of CDAP calibration standard stock and			
			add 990µL of purified water to make 1mL of solution in an			
			eppendorf or HPLC vial. Mix thoroughly. Prepare fresh before			
			use.			
			Note: The working calibration standard is prepared fresh			
			before use. All the solutions prepared for use are vacuum			
			filtered using Nylon 6, 6 membrane 0.20/0.22/0.45 µm filters			
			to eliminate the entry of possible particles, if any into the			
			system as well as the column. For organic solvents 0.45µm			
			filters should be used (filtration not necessary if the			
			solution is prepared in 0.2 µ filtered purified water).			
		4.4	Preparing the HPLC System for run:			
		4.5	Run Conditions:			
		4.5.1	Load method CDAP.M.			
		4.5.2	Flow Rate: 1.0 mL/min			
		4.5.3	Detection wavelength: 280 nm			
		4.5.4	Run time: 4 minutes			
		4.5.5	Mobile Phase: mobile phase for CDAP			
		4.6	Equilibration of the system and the column:			
		Equilibrate the system and column with mobile phase for CDAP until a				
		stable baseline at 280 nm is obtained which can be viewed with the				
		online plot window.				
		4.7	Sample Preparation and Application:			
		Test sample and standards are loaded in screw cap vials and placed				
		against the appropriate no. on the sample tray by clearly marking				
		the screw cap vial.				
		4.8	Running of sequence:			
		4.8.1	Load sequence CDAP.S.			
		4.8.2	Open the sequence parameter option by clicking Sequence menu.			
		4.8.3	Enter information about the data directory and operator name.			
		4.8.4	In the shutdown option, click on the post-sequence option and			
		select LAMPOFF/STANDBY.				
		4.8.5	In sequence table option, specify the sample names, methods			
		and vials to run in the sequence as per the following table:				
		S. No	Sample Code	Sample details	No. of	Injection
			injections	n volume		
			per Vial			
		1	Blank	Eluent Blank	1	10 µL
		2	Standard 3	System	6	0.5 µL
		(5ng/µL)	Suitability			
		Test standard				
		3	Blank	Eluent Blank	1	10 µL
		4	Standard 1	1ng/µL	1	0.1 µL
		Standard				
		5	Standard 2	3ng/µL	1	0.3 µL
		Standard				
		6	Standard 3	5ng/µL	1	0.5 µL
		Standard				
		7	Standard 4	10ng/µL	1	1.0 µL
		Standard				
		8	Standard 5	20ng/µL	1	2.0 µL
		Standard				
		9	Blank	Eluent Blank	1	10 µL
		10	Test Sample	Sample	1	1.0 µL
		(s)				
		4.8.6	Click on run sequence option in run control menu to start the			
		sequence.				
		4.8.7	Each sample run will be of 4 minutes and after running all			
		the samples the sequence will automatically stop.				
		4.8.8	Inject the eluent blank after every 20 injections.			
		Note: Here, eluent blank refers to mobile phase. One extra				
		vial with same SST sample can be used if 6 injections are not				
		possible from single vial.				
		4.9	Calculations:			
		4.9.1	Results of the sample are calculated from the calibration			
		standards using the chemstation software.				
		4.9.1.1	Open the chromatogram corresponding to 1ng/µL			
		calibration standard in the offline copy of				
		chemstation software in the Data Analysis mode.				
		4.9.1.2	From the calibration menu select calibration			
		settings and write ng/µL in the Amount unit's				
		option.				
		4.9.1.3	Select New Calibration Table from Calibration menu			

			and enter value1 in default amount option and value	
			1 in level option.	
			4.9.1.4	Now open the chromatogram for 3.0 ng/μL. Select add
			level option from calibration menu and enter value	
			3.0 in default amount and value 2 in level option.	
			4.9.1.5	Similarly open chromatograms for 5.0ng/μL,
			10.0ng/μL and 20.0ng/μL and keep adding default	
			amount and appropriate value of level.	
			4.9.1.6	Select calibration task icon and the calibration
			table with required concentrations and levels can	
			be viewed in the calibration table view. A	
			calibration curve is also displayed in the	
			calibration curve field with value of correlation	
			coefficient of the curve.	
			4.9.1.7	Save the calibration method under appropriate name.
			4.9.1.8	Open the chromatogram of test sample and select the
			above created calibration method for integration of	
			the test sample.	
			4.9.1.9	In the specify report option of Report menu, select
			ESTD in the Calculate field.	
			4.9.1.10	In the report layout view click on the show report
			preview with current template, method and data file	
			icon and view the result of the test sample in	
			terms of concentration (ng/μL).	
			4.9.1.11	Calculations for Standard curve and samples:
			The calculations are made according to the equation	
			of minimum squares.	
			$Y = mX + b.$	
			Where: m = slope	
			b = intercept	
			Y = absorbance	
			X = concentration	
		4.9.2	The calculations for determination of amount of CDAP per dose	
		(10μg) of ARM of Haemophilus Influenzae type b conjugate		
		vaccine is as follows:		
		Example: If a sample has a PRP concentration of 1.0 mg/mL and		
		the amount of CDAP present in the sample is 5ng/μL or 5μg/mL.		
		The amount of CDAP present per dose(10μg) is calculated as		
		follows:		
		1000μg -----5μg		
		10 μg(dose)----- X		
		$X = 5\mu\text{g} \times 10 \mu\text{g}$		
		1000 μg		
		= 0.05μg or		
		$X = 50 \text{ ng/dose}$		
		4.9.3	Calculations for System Suitability Test:	
		4.9.3.1	Note the values of area under the curve and	
		retention time for standard 3(SST standard) .		
		4.10	Acceptance Criteria System Suitability Test:	
		4.10.1	RSD calculated for Retention time of standard 3(5ng/μL)	
		should be <5.0%.		
		4.10.2	RSD calculated for Area of standard 3(5ng/μL) should be	
		<5.0%.		
		4.11	Result Reporting:	
		4.11.1	Open CDAP.FRP template and take print out of the report.	
		4.11.2	Print report: Click on print option to take a printout of a	
		ChemStation report using the current report template and data		
		from the currently loaded data file.		
		4.11.3	Report the results of quantity of CDAP present/dose (10μg).	
		4.11.4	The report generated can be viewed with report review icon.	
		4.11.5	The printed report is signed by the analyst who does the	
		analysis and also checked by the other analyst/supervisor.		
		5.0	Forms and Records:	
		5.1	Determination of CDAP by high performance liquid chromatography.	
		6.0	References:	
		6.1	European pharmacopoeia.	

[SHEET: MnPs QC]

QC Requirements for analysis of 16 batches of meningococcal polysaccharides (4 serotypes) | | | | |

S. No. | Equipments | Quantity | Reagents | Quantity | Consumables | Quantity |

1 | Analytical balance | 2 | PASTOREX MENINGITIS INDIVIDUAL LATEX TEST KIT, code 61608 | 5 | Disposable glass test tubes (approximately 12 100 mm) with disposable plastic caps are recommended. | 500 |
2 | Laboratory vortex mixer | 2 | Resorcinol reagent | 10 gm | Auto Pipettes tips (e.g. Eppendorf) | 5000 each |

3 | pH-Meter | 1 | Butanol | 2 lit | Volumetric flasks, 100–1000 mL. | 5 each |

4 | UV-Vis Spectrophotometer with Cuvettes | 1 | Butyl acetate | 5 lit | Measuring cylinders, 10–1000 mL. | 5 each |

5 | Water bath 100 deg. | 1 | N-acetyl neuraminic acid (NANA) | 2 gm | Glass test tubes (12 x 75 mm e.g. Borosil) | 200 |

6 | Furnace | 1 | Phosphorus standard, 20 µg/ml | 100 gm | Screw cap HPLC vials with/without inserts | 200 |

7 | Water bath, 37°C | 1 | Sulfuric Acid | 2 lit | Solvac Filter Holder | 20 |

8 | Calibrated HPLC system with RI detector | 1 | Perchloric acid | 2 lit | Nylon 6,6 membrane 0.2µm membrane filter | 20 |

9 | Precision balance | 1 | Hydrogen peroxide free from phosphorus | 1 lit | Syringe filters 0.2 µm | 500 |

10 | Vacuum Pump | 1 | Ascorbic acid sodium salt | 100 gm | Aluminum Foil | 20 |

11 | Refrigerator | 1 | Ammonium molybdate tetra hydrate | 25 gm | Volumetric flasks (10ml, 25ml & 50ml) | 5 each |

12 | Magnetic stirrer | 1 | Hydrochloric acid, 37% | 2 lit | Screw capped test tubes (30 ml) with stand | 100 |

13 | Ultrasonic Cleaner | 1 | Iron (III) chloride hex hydrate 399% | 100 gm | Glass Pipettes (5ml, 10ml & 25 ml) | 100 |

14 | Rocking and Tumbling Shaker | 1 | Sodium Hydroxide 399 % | 5000 gm | Eppendorf (1.5ml & 2ml) | 5000 |

15 | Sugar KS-804 (Shodex Column) | 1 | Sodium Acetate anhydrous ≥ 99.5 % | 50 gm | Gloves | 1000 |

16 | Sugar KS-805 (Shodex Column) | 1 | Hydroxylamine hydrochloride ≥ 99.0 % | 100 gm | Glass tubes 25 ml | 50 |

17 | Guard Column KS-G (Shodex) | 1 | Dextran | 1 gm | Depyrogenized glass dilution tubes | 100 |

18 | Auto pipettes with Tips (20-200µl, 100 to 1000 µl & 1000 to 5000 µl)r | 2 each size | Sodium azide | 50 gm | Depyrogenized glass reaction tubes | 100 |

19 | Vortex Mixer | 1 | Deuterium Oxide | 100 ml | Depyrogenized tips | 1000 |

20 | BDS Hypersil C18 silica column (250 x 4.6mm, Particle size:5µm) | 1 | Sodium Chloride | 5000 gm | Test tube rack | 10 |

21 | Laboratory Centrifuge | 1 | Sodium dihydrogen phosphate, dihydrate | 500 gm | | |

22 | Fume Hood | 1 | Disodium hydrogen phosphate, anhydrous | 500 gm | | |

23 | 96 well Maxisorp Nunc ELISA plates (Nunc Cat No. 439454) | 20 | Copper sulphate pentahydrate | 10 gm | | |

24 | Micro plate ELISA reader | 1 | Sodium tartarate | 10 gm | | |

25 | Incubator | 1 | Sodium hydroxide | 100 gm | | |

26 | Auto titrator | 1 | Sodium Carbonate | 100 gm | | |

27 | Multichannel auto pipette (50 to 300 µl) | 1 | Folin & Ciocalteu's phenol reagent | 500 ml | | |

28 | Tube heating block (37° C) | 1 | Bovine Serum Albumin | 100 gm | | |

29 | Deep Freezer (- 20.0 ± 5°C) | 1 | Deoxycholic acid (DCA) | 2 gm | | |

30 | Timer | 1 | Methanol | 2 lit | | |

31 | Thermogravimetric analyser to determine LOD | 1 | Acetonitrile | 2 lit | | |

32 | | | Sodium Acetate anhydrous | 20 gm | | |

33 | | | Orthophosphoric Acid | 100 ml | | |

34 | | | | |

35 | | | Ammonium acetate | 10 gm | | |

36 | | | acetic acid (glacial) | 100 ml | | |

37 | | | Acetyl acetone | 20 ml | | |

38 | | | Formaldehyde standard solution | 50 ml | | |

39 | | | Anti CWPS Polyclonal rabbit Antisera (Staten Serum Institute, Cat No. 3653) | 2 vials | | |

40 | | | Purified CWPS (Staten Serum Institute, Cat No. 3459) | 2 vials | | |

41 | | | Monoclonal antibodies against Phosphoryl Choline (Staten Serum Institute, Cat No. 87214) | 2 vials | | |

42 | | | Polyclonal Goat anti-mouse Immunoglobulin HRP conjugates (Dako Cat No. P0447) | 1 vial | | |

43 | | | Bovine Serum Albumin (Fraction V, Sigma Cat No. A9647) | 100 gm | | |

44 | | | Tween 20 | 100 ml | | |

45 | | | TMB Substrate (Sigma, Cat No. T4444) | 200 ml | | |

46 | | | Conc. Sulphuric acid | 1 lit | | |

47 | | | NaCl | 2000 gm | | |

4.1	ml	: Milliliter
4.2	g	: Gram
4.3	°C	: Degree Celsius
4.4	%	: Percent
4.5	QC	: Quality Control
4.6	QA	: Quality Assurance
4.7	AH	: Animal House
4.8	SOP	: Standard Operating Procedure
5.0	Procedure:	
5.1	Equipment, Materials and Reagents	
	5.1.1	Standard Tetanus Toxoid Vaccine (NIBSC code: 08/218)
	5.1.2	Weighing balance
	5.1.3	Laminar air flow cabinet
	5.1.4	Autoclave
	5.1.5	Autopipettes
	5.1.6	Test tubes
	5.1.7	Test tube racks
	5.1.8	Glass vials, 10 ml
	5.1.9	Disposable syringes (2 ml, 5 ml)
	5.1.10	Peptone
	5.1.11	Sodium chloride
	5.1.12	Sodium Hydroxide
	5.1.13	Hydrochloric acid
5.2	Preparation of Normal saline:	
	Weigh 0.9 g of sodium chloride and dissolve in 60 ml of the purified	
	water. Make up the volume up to 100 ml with purified water. Adjust the	
	pH between 7.0 to 7.2 using 0.1 M sodium hydroxide/Hydrochloric acid	
	solution. Sterilize by autoclaving at 1210 C for 20 minutes.	
5.3	Peptone water:	
	Weigh 1 g of peptone and 0.5 g of sodium chloride. Dissolve in 60 ml of	
	purified water. Make up the volume up to 100 ml with purified water.	
	Adjust the pH between 7.0 to 7.2 using 0.1 M sodium	
	hydroxide/Hydrochloric acid solution. Sterilize by autoclaving at 1210C	
	for 20 minutes.	
5.4	Selection of test animals:	
	5.4.1	Select 116 Swiss albino mice each weighing between 13 to 17 g at
	least one day before immunization.	
	5.4.2	Preferably choose mice of the same sex. Otherwise distribute
	males and females equally in each group.	
	5.4.3	Make six groups of 16 mice each and four groups of 5 mice each.
	Allocate three groups out of six to each of three dilutions of	
	reference vaccine and other three groups to each of three	
	dilutions of the test vaccine. Four groups of 5 mice each are to	
	be used for LD50 determination.	
	5.4.4	Distribute all the mice in various groups by randomization.
	5.4.5	Mark each group of mice with appropriate color scheme.
5.5	Preparation of Vaccine dilution	
	5.5.1	Preparation of dilutions of reference vaccine:
	5.5.1.1	Suitable dilutions of the reference vaccine are selected
	1	in such a way so as that 80% to 90% protection is
	conferred in first dilution containing highest antigen	
	concentration, 40% to 60% protection is conferred in	
	middle dilution and 10% to 20% protection is conferred in	
	last dilution containing lowest antigen concentration.	
	5.5.1.1	Dilute reference vaccine in normal saline so as to
	2	contain 200 –300 IU/ml. Make further dilutions of the
	reference vaccine as detailed below	
	1/10 dilution: Add 0.5 ml of vaccine to 4.5 ml of normal	
	saline and mix thoroughly.	
	1/50 dilution: Add 4 ml of 1/10 dilution of vaccine	
	(section 8.2.1.1) to 16 ml of normal saline and mix	
	thoroughly	
	1/100 dilution: Add 10 ml of 1/50 dilution of vaccine	
	(section 8.2.1.2) to 10 ml of normal saline and mix	
	thoroughly.	
	1/200 dilution: Add 10 ml of 1/100 dilution of vaccine	
	(section 8.2.1.3) to 10 ml of normal saline and mix	
	thoroughly	
	5.5.2	Preparation of dilutions of test vaccine:
	Take test vaccine and dilute it following steps 8.2.1.1	
	to 8.2.1.4.	
5.6	Immunization:	
	5.6.1	Inject subcutaneously each of 16 Swiss mice in each group with
	0.5 ml of appropriate dilution (1/50, 1/100 and 1/200) of test	
	and reference vaccine allocated to that group.	

	5.6.2	Keep the four groups of 5 mice each as uninoculated.
	5.6.3	Keep the immunized animals under observations for 28 days. The
		animals should show normal growth and good health during the
		observation period.
	5.7	Preparation of Challenge tetanus toxin:
		Suitably dilute the stabilized tetanus toxin in peptone water in such a
		way so as to contain approximately 100 LD50/ml.
	5.7.1	1/10 dilution of challenge toxin: Add 1 ml of challenge toxin to
		9 ml of peptone water. Mix it thoroughly. (10 LD50/ml)
	5.7.2	1/50 dilution of challenge toxin: Add 3 ml of 1/10 dilution of
		challenge toxin to 12 ml of peptone water. Mix it thoroughly. (2
		LD50/ml)
	5.7.3	1/100 dilution of challenge toxin: Add 6 ml of 1/50 dilution of
		Challenge toxin to 6 ml of peptone water. Mix it thoroughly. (1
		LD50/ml)
	5.7.4	1/200 dilution of challenge toxin: Add 6 ml of 1/100 dilution of
		challenge toxin to 6 ml of peptone water. Mix it thoroughly.
		(1/2 LD50/ml)
	5.8	Inoculation of challenge toxin:
		After twenty-eight days of immunization, inject all groups of mice
		subcutaneously with 1.0 ml of the challenge dose containing
		approximately 100 LD50 per ml. Mice are challenged subcutaneously over
		the lumbar region of the spine where it produces distinctive hind limb
		paralysis which can be recognized at an early stage.
	5.9	LD50 estimation:
		Take four groups each consisting of 5 mice (selected on the day of
		immunization). Inject subcutaneously 1.0 ml of challenge dose
		containing approximately 100 LD50 and dilutions of challenge toxin
		containing 2 LD50, 1 LD50 and ½ LD50 dose per ml respectively in four
		groups of 5 mice each.
	5.10	Observations: Observe all the injected mice daily and record the deaths
	5.11	Calculations:
		Count the number of surviving mice 5 days after injection of the
		challenge toxin and calculate the potency of the vaccine being examined
		relative to the potency of the standard preparation. This may be done
		on the basis of the number of surviving animals in each of the six
		groups of sixteen, using standard statistical methods. (By probit
		analysis as per software programme evolved by F.R. Marsman RIVM,
		Bilthoven, Netherland).
	5.12	Validity criteria:
	5.12.1	The slopes of the dose – response curves of the vaccine under
		test and the standard are linear and parallel.
	5.12.2	The 50% effective dose of each vaccine lies between the
		largest and smallest immunizing doses.
	5.12.3	Challenge toxin was approximately 100 times the 50% lethal
		dose.
	5.13	Acceptance criteria:
	5.13.1	The estimated potency is not less than 40 I.U. per single
		human dose and not less than 60 I.U. per single human dose in
		case of combined vaccines containing whole cell pertussis.
	5.13.2	The limit of 95% confidence intervals of the estimate of
		potency is within 50-200% unless the lower limit of the 95%
		confidence interval of the estimated potency is not less than
		40 I.U. per single human dose and not less than 60 I.U. per
		single human dose in case of combined vaccines containing
		whole cell pertussis.
	6.0	Forms and Records

BioBridge Master Knowledge — Page 2426

[1.0]Objective: |
	To lay down the procedure for determination of cell wall polysaccharide
	content in purified capsular polysaccharide of Neisseria meningitidis
	samples by ELISA technique.
[2.0]Scope:	
	This Standard Operating Procedure is applicable for determination of
	cell wall polysaccharide content in purified capsular polysaccharide of
	Neisseria meningitidis.
[3.0]Responsibility:	
	3.1
	executing the described procedure correctly.
	3.2
	that the procedure is carried out correctly and for checking the
	results.
	3.3
	compliance of the SOP.

	5.4.1
	standard stock solution add 10 ml of WFI in the 10 mg vial

			Pneumococcal Cell wall Polysaccharide Standard, keep the
			vial overnight at 2 to 8°C overnight with shaking. Prepare
			the aliquots as 1000 µl of 1 mg/ml, 100 µl of 1 mg/ml, and
			100 µl of 10 µg /ml. Store the standard aliquots at -70°C.
		5.4.2	Phosphate Buffered Saline (10X): Weigh 85.0 gm of NaCl, 22.8
			gm of Na2HPO4 and 63.6 gm of NaH2PO4 and dissolve in 800 ml
			of purified water. After complete dissolution of reagents,
			make up the total volume to 1000ml with purified water.
			Filter sterilizes the solution by passing through 0.22 µm
			filter.
		5.4.3	Phosphate Buffered Saline (1X): Add 100ml of Phosphate
			Buffered Saline (10X) to 900 ml sterile purified water.
		5.4.4	Dilution buffer (PBST): Add 50 µl (0.05% v/v) of Tween 20 to
			100 ml of PBS 1X solution.
		5.4.5	Blocking buffer (PBST with 1% BSA): Add 1 gm (1% w/v) of
			Bovine Serum Albumin (BSA) to 100 gm PBST solution. Do not
			agitate the solution for mixing.
		5.4.6	Carbonate / Bicarbonate buffer: Prepare 0.5 M stock solution
			of Na2CO3 and NaHCO3 by weighing 5.3 gm/100ml and 4.2
			gm/100ml respectively. Prepare the working stock of
			Carbonate / Bicarbonate buffer by adding 120 µl Na2CO3
			solution and 880 µl of NaHCO3 solution in 9 ml of purified
			water. pH of this buffer should be 9.6.
		5.4.7	Secondary antibody dilution: Calculate the total volume of
			working dilution of secondary antibody required for the
			assay. Prepare the working dilution of Polyclonal Goat
			anti-mouse Immunoglobulin HRP conjugate in PBST as 1:2000
			folds.
		5.4.8	Stop Solution: To prepare stop solution (1N H2SO4), add 2.8
			ml of H2SO4 to 97.2 ml of purified water.
		5.5	Test Method:
		5.5.1	Coating of wells:
		5.5.1.1	The ELISA plates are coated with anti CWPS
			polyclonal antibodies. Determine the number of wells
			to be coated. Prepare a 1: 32000 fold dilution of
			anti-CWPS polyclonal antibody dilution in carbonate
			/ bicarbonate coating buffer.
		5.5.1.2	Add 100 µl/ well of polyclonal antisera solution to
			each well. Incubate the plates at 2 to 8°C over
			night.
		5.5.2	Blocking of wells:
		5.5.2.1	On the next day, remove the coated plate from at 2
			to 8°C; discard the coating solution by flicking.
			Add 150 µl/ well of blocking buffer to each coated
			well.
		5.5.2.2	Incubate the plate at 37 ± 2°C for 30 minutes.
		5.5.3	Preparation of Polysaccharide Standard and Test sample
			dilutions:
		5.5.3.1	During the incubation for blocking of wells, prepare
			the dilutions for polysaccharide standards.
		5.5.3.2	Prepare 3 fold dilutions of polysaccharide standard
			in dilution buffer to get a concentrations of 1000
			ng/ml, 333.33 ng/ml, 111.11 ng/ml, 37.04 ng/ml,
			12.35 ng/ml, 4.12 ng/ml, 1.04 ng/ml and 0.46 ng/ml.
		5.5.3.3	Prepare 1: 10, 1: 100 and 1: 1000 fold dilution of
			test sample in dilution buffer.
		5.5.4	Washing of wells:
		5.5.4.1	After completion of 30 min. incubation of the
			blocked plate at 37°C, remove the plate from the
			incubator.
		5.5.4.2	Discard the blocking buffer from the wells by
			flicking. Wash the wells by adding 250 µl/ well of
			PBS 1X. After 30 sec. discard the PBS from wells by
			flicking and then gently tap the plate on to a
			blotting paper. Ensure that the washing solution is
			removed completely, do not allow the wells to dry.
			Repeat the procedure for three times.
		5.5.5	Addition of Standard, sample and controls to wells:
		5.5.5.1	Add 100 µl of all the eight dilutions of standard in
			column A and B of the plate in duplicate.
		5.5.5.2	Add 100 µl of each sample, in duplicate that is to
			be analysed in consecutive wells of column C.
		5.5.5.3	Add 100 µl of dilution buffer in duplicate; this
			will act as a negative control.
		5.5.5.4	After addition of all standards, samples and
			controls, seal the plate with plate sealer and
			incubate it in 37 ± 2°C for next 90 min.
		5.5.6	Addition of Primary antibody:
		5.5.6.1	Prepare 1: 1200 dilution of Monoclonal antibody for
			Phosphoryl Choline in dilution buffer as per the
			volume required.
		5.5.6.2	After completion of 90 min. of incubation period,
			remove the plate from incubator.
		5.5.6.3	Wash the wells for four times by PBS 1X as mentioned
			in the step no. 5.5.4
		5.5.6.4	Add 100 µl of 1: 1200 fold diluted Monoclonal
			antibody solution for Phosphoryl Choline to each
			well.
		5.5.6.5	After addition, seal the plate with plate sealer and
			incubate it in 37 ± 2°C for next 90 min.
		5.5.7	Addition of secondary antibody:
		5.5.7.1	Prepare 1:2000 dilution of Polyclonal Goat anti

			mouse Immunoglobulin / HRP conjugate solution in	
			dilution buffer as per the volume required.	
			5.5.7.2	After completion of 90 min. of incubation period,
			remove the plate from incubator.	
			5.5.7.3	Wash the wells for four times by PBS 1X as mentioned
			in the step no. 5.5.4.	
			5.5.7.4	Add 100 µl of 1: 2000 fold diluted secondary
			antibody solution to each well.	
			5.5.7.5	After addition, seal the plate with plate sealer and
			incubate it in 37 ± 2°C for next 60 min.	
			5.5.8	Addition of TMB Substrate:
			5.5.8.1	After completion of 60 min. of incubation period,
			remove the plate from incubator.	
			5.5.8.2	Wash the wells for four times by PBS 1X as mentioned
			in the step no. 5.5.4.	
			5.5.8.3	Add 100 µl of TMB Substrate, in dark to each well.
			5.5.8.4	After addition incubate the plate at room
			temperature for next 15 min. in dark.	
			5.5.9	Addition of Stop solution:
			After completion of 15 min. of incubation period, add 100 µl	
			of stop solution (1N H2SO4) to each well above the TMB	
			substrate to stop the reaction.	
			5.5.10	Reading of Plate:
			5.5.10.	After addition of stop solution, read the Optical
			1	density (OD) values of the wells on a Micro plate
			ELISA reader.	
			5.5.10.	Read the plate at a dual wavelength of 450 and 630
			2	nm. The readings should be taken after 5 mins but
			within 15 min from addition of stop solution.	
			5.5.11	Data analysis:
			5.5.11.1	Import the raw data from the software of ELISA
			reader into the window Excel file and get the	
			average OD values of the duplicate wells and	
			compile the data sheets comprising of standard	
			curve concentration and sample details along with	
			the average OD as per the plate design. For	
			standard curve, take concentration on X-axis and	
			its corresponding OD on Y-axis.	
			5.5.11.2	Prepare Standard curve using Standard CWPS ranging
			from 0.46 ng/ml to 1000 ng/ml concentration. The	
			Coefficient of correlation (R2) which should be ≥	
			0.98.	
			5.5.11.3	Once compiled data sheet is ready, use sigma plot
			software for finding concentration of CWPS in the	
			samples by extrapolating the standard curve values	
			i.e. concentration and its corresponding OD.	
			5.5.11.4	Open Sigma plot software, click on create new blank
			notebook and press ok.	
			5.5.11.5	Copy standard curve from compiled excel sheet onto
			the sigma plot note book and save the note book.	
			5.5.11.6	Click 'Pharmacology' and select 'standard curve
			analysis'. Window showing standard curve will	
			arrive. For curve, select 'Four parametric' options	
			and click for 'log X axis scale' and press OK.	
			Software will automatically process the data in the	
			form of three sheets below the notebook. Three	
			sheets will be named as	
			Data 2. Graph	
			3. Report	
			5.5.11.7	R2 for the standard curve will be determined from
			the report sheet.	
			5.5.11.8	Standard graph can be obtained from Graph sheet,
			where heading, X-axis and Y-axis information could	
			be incorporated by right clicking and opting 'Edit'	
			option.	
			5.5.11.9	Data sheet will give all the extrapolated values of
			concentration (X-axis) on column-6 and OD (Y-axis)	
			on column-7. Match OD of samples from excel	
			compiled sheets from column-7 of sigma plot and its	
			corresponding concentration from column-6.	
			Note: In case, the software gives two different	
			concentrations of CWPS for similar OD values of the	
			sample, higher dilutions should be considered for	
			this assay.	
			5.5.11.1	Similarly note the concentrations for all the
			0	samples and determine cell wall polysaccharide
			concentration by multiplying the dilution factor	
			with the concentration from the sigma plot.	
			5.5.12	Validity criteria:
			5.5.12.	Regression of standard curve (R2) should be ≥ 0.98.
			1	
			5.5.12.	Coefficient of Variation (%CV) for replicates should
			2	be < 15%.

1.0 |Objective |
 |To lay down the procedure for estimation of protein content in |
 |Meningococcal polysaccharide conjugate vaccine samples by Lowry's method. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to all the samples of |
 |Meningococcal polysaccharide conjugate vaccine in which protein |
 |concentration is to be determined by Lowry's method. |
 3.0 |Responsibility |
3.1	The analyst is responsible for executing the described procedure
	correctly.
3.2	Supervisor is responsible for verifying that the procedure is carried
out correctly and check the results.	
3.3	HOD shall be responsible for overall compliance of this SOP and shall
ensure that the SOP is reviewed every two years or if required	
earlier.

5.2	Preparation of Calibration Curve:
	5.2.1

			20	50	450
			40	100	400
			80	200	300
			160	400	100
	5.3	Test Procedure:			
	5.3.1	Take 500 µl of the standard dilutions from calibration curve,			
			Test Sample and Blank (0.1M sodium hydroxide) in duplicates in		
			separate test tubes. In case of dry polysaccharide prepare a		
			solution containing about 1-5 mg/ml of polysaccharide in Lal		
			reagent water and use it as test sample.		
			Note: The sample dilutions can vary depending upon the protein		
			concentration. If there is any sample outside the range of the		
			calibration curve, carry out the calculation for more		
			appropriate dilution.		
	5.3.2	Add. 2.5 ml of Cupric-tartaric solution to each of the standard			
			blank (0.1M Sodium hydroxide) and sample.		
	5.3.3	Vortex and incubate the test tubes in dark at room temperature			
			for 10 min.		
	5.3.4	Add 250 µl of 1 N Folin & Ciocalteu's phenol reagent and mix			
			well.		
	5.3.5	Incubate the test tube at room temperature for 30 minutes in			
			dark.		
	5.3.6	Observe for blue color which can vary with the concentration.			
	5.3.7	Take absorbance of the sample at 730nm against the blank using			
			spectrophotometer.		
	5.3.8	Note that all the readings of the assay tubes should be taken			
			within 30 mins. of completion of the assay and maximum 10		
			samples should be analysed in one single assay.		
	5.4	Calculations:			
	5.4.1	Once the absorbance of the standards and the test samples have			
			been taken, calculation shall be done using the excel sheet		
			carrying formulas for the required calculation.		
	5.4.2	Always copy the master excel sheet (sheet carrying formulas for			
			the required calculation), never use the previously used excel		
			sheet for new calculations.		
	5.4.3	Proceed for calculations starting from the Calibration curve.			
			The calculations are done according to the equation,		
			Y = mX + b.		
			Where: m = slope		
			b = intercept		
			Y = absorbance		
			X = concentration		
			(Multiplication by dilution factor)		
	5.4.4	Use EXCEL programme for the preparation of calibration curve			
			and Calculation of the results (Multiply by the dilution		
			factor. Divide with 1000 to change µg/ml to mg/ml).		
	5.4.5	In case of dry polysaccharide,			
			Protein (%) in polysaccharide on dry weight basis:		
			Protein in dry polysacc. (µg/ml) =		
			Protein in Polysacc. sol. (µg/ml) X 1 – {Moisture (%) / 100}		
			Protein in dry polysaccharide (µg/ml)		
			Protein (%) = _____		
			x 100		
			Concentration of polysaccharide solution (µg/ml)		
	5.5	Acceptance criteria:			
	5.5.1	The test is valid if Regression of the standard curve is ≥0.99			
			and the percentage of Coefficient of Variation is ≤ 15% within		
			the replicates.		
	5.5.2	Protein content in Purified Meningococcal polysaccharide and			
			conjugate should meet the laid specifications for each		
			serotype.

|6.2 |Reagents: |
| |6.2.1 |Copper Sulphate Pentahydrate |
| |6.2.2 |Sodium potassium tartrate tetrahydrate |
| |6.2.3 |Folin-Ciocalteu reagent |
| |6.2.4 |Sodium Carbonate |
| |6.2.5 |Bovine serum albumin Fraction V |
7. |Preparation of solutions: |
|7.1 |Alkaline Copper Sulphate solution: | |
| |7.1.1 |Weigh 40 g of anhydrous sodium carbonate and dissolve it |
| | |in 400 ml of purified water. |
| |7.1.2 |Weigh 0.6 g of sodium and potassium tartrate and dissolve |
| | |in 100 ml of purified water and add 0.46 g of copper |
| | |sulphate pentahydrate to it, shake until it dissolves |
| | |completely. Mix the above two solutions gently. |
| |7.1.3 |Transfer it to a 1000 ml volumetric flask and make up the |
| | |volume to 1000 ml with purified water. |
| |7.1.4 |This solution should be stored in an amber coloured |
| | |bottle at 2 - 8°C and should be used within 2 months. |
|7.2 |1 N Folin-Ciocalteu Solution: |
| |7.2.1 |Dilute 2N Folin-Ciocalteu reagent to 1N. For this, take |
| | |250 ml of the 2N Folin-Ciocalteu reagent and pour it in |
| | |a 500 ml amber flask and make up the volume to 500 ml |
| | |with purified water. |
| |7.2.2 |Store the solution in a screw cap amber bottle at 2 to 8 |
| | |°C, for a maximum of 6 months. |
|7.3 |1 mg/ml Bovine serum albumin Solution: |
| |7.3.1 |Weigh 50 mg of Bovine Serum Albumin and transfer it to a |
| | |50 ml volumetric flask. |
| |7.3.2 |Dissolve and make up the volume to 50 ml with Purified |
| | |water. |
| |7.3.3 |Make aliquots of 1.5ml and maintain at –20°C, for a |
| | |maximum of 6 months. |
8. |Procedure: |
|8.1. |Preparation of Calibration Curve: | |
| |The concentration of Protein in the test sample(s) is calculated |
| |by comparing results of its absorbance obtained against the |
| |plotted calibration curve of known Protein concentration (10-100 |
| |µg/ml) Vs absorbance at 730 nm. The solutions for making Protein |
| |calibration curve (10-100 µg/ml) are prepared as follows: |
| |8.1.1 |Thaw the 1.5 ml vial of BSA by keeping at room |
| | |temperature. |
| |8.1.2 |Now dilute the above material 10 times. (This is done by |
| | |taking 1 ml of BSA and adding to it 9 ml of purified |
| | |water) A final concentration of 100µg/ml is obtained. |
| | |This dilution is used for the preparation of calibration |
| | |curve (10-100 µg/ml). |

			Concentration	10	20	40	60	80	100
			(µg/ml)						
			BSA100µg/ml (µl)	100	200	400	600	800	1000
			Volume of purified	900	800	600	400	200	-
			water added (µl)						
			Note: The Calibration curve is accepted if it is meeting						
			the acceptance criteria of correlation coefficient.						
		8.2	Test:						
		8.2.1	Dilute the sample to 1/10 dilution. (For preparing 1/10						
		dilution of sample take 100 µl of sample and add 900µl							
		purified water)							
		In case of dry polysaccharide prepare a solution							
		containing about 1-5 mg/ml of polysaccharide in purified							
		water and use it as test sample.							
		Note: The dilutions mentioned can vary depending upon the							
		protein concentration. If there is any sample outside the							
		range of the calibration curve, carry out the calculation							
		for more appropriate dilution.							
		8.2.2	Take 400 µl from 10 to 100 µg/ml BSA solutions from						
		calibration curve, Test Sample (already diluted) and							
		Blank (Purified water used as Blank) in duplicates in							
		separate test tubes.							
		8.2.3	To these test tubes add 2 ml of Alkaline copper sulphate						
		solution							
		8.2.4	Vortex the tubes and incubate in water bath at 37°C for						
		30 minutes.							
		8.2.5	Allow the tubes to cool and add 200 µl of 1N						
		Folin-Ciocalteu solution to all tubes.							
		8.2.6	Vortex the tubes and incubate in water bath at 37°C for						
		20 minutes.							
		8.2.7	Allow these tubes to cool at room temperature.						
		8.2.8	Measure the absorbance at 730 nm against the blank.						
		8.3	Calculations:						
		8.3.1	Proceed for calculations starting from the Calibration						
		curve prepared between 10 and 100 g/ml of BSA solution.							
		The calculations are done according to the equation of							
		minimum squares.							
		$Y = mX + b$.							
		Where: m = slope							
		b = intercept							
		Y = absorbance							
		X = concentration							
		(Multiply by dilution factor)							
		8.3.2	Use EXCEL programme for the preparation of calibration						
		curve and Calculation of the results (Multiply by the							
		dilution factor. Divide with 1000 to change µg/ml to							
		mg/ml).							
		8.4	Acceptance criteria:						
		8.4.1	The coefficient of variation (CV) between the replicates						
		of the samples should be $\leq 5\%$.							

1.0 |Objective: |
 |This method is used to determination of Sialic acid content in |
 |meningococcal polysaccharide of serotypes C, W135 and Y. |
 2.0 |Scope: |
 |This SOP is applicable to determination of Sialic acid content in |
 |meningococcal polysaccharide of serotypes C, W135 and Y samples. |

	5.2.1
	5.2.2
	5.2.3
	5.2.4
5.4	Assay Procedure:
	Place series of standard solution from 100µg/ml NANA standard
	solution on the day of measurement into 10 ml glass tubes in
	duplicate according to the following table:
	Working standard
	Volume (µl)
	0
	200
	400
	600
	800
	1000
	5.4.1
	5.4.2
	5.4.3
	5.4.4
	5.4.5
	5.4.6
	5.4.7

		5.4.8	Collect the upper phase carefully into other test tubes.
		Take care that the lower phase does not get mixed with the	
		upper phase.	
		5.4.9	Take absorbance of the sample at 580 nm against the blank
		using spectrophotometer.	
		5.4.10	Note that all the readings of the assay tubes should be
		taken within 30 mins. of completion of the assay, the test	
		tubes should be kept in a n ice tray during the readings	
		and maximum 10 samples should be analysed in one single	
		assay.	
		5.5	Calculations
		5.5.1	Once the absorbance of the standards and the test samples
		have been taken, calculation shall be done using the excel	
		sheet carrying formulas for the required calculation.	
		5.5.2	Always copy the master excel sheet (sheet carrying
		formulas for the required calculation), never use the	
		previously used excel sheet for new calculations.	
		5.5.3	Copy the master excel sheet, keep it for use in respective
		folder and then fill in the required sample details (Batch	
		number), sample dilution (if applicable), name of analyst,	
		date, etc.	
		5.5.4	Calculate the sialic acid concentration of the samples
		using following formula: Sialic acid concentration	
		(µg/ml)= {(abs-intercept)/slope}*dilution factor	
		5.5.5	In case of dry polysaccharide, Sialic acid (%) in
		polysaccharide on dry weight basis:	
			Sialic acid Conc. in dry Polysacc. (µg/ml) =
			Sialic acid in Polysacc. sol. (µg/ml) X 1 – {Moisture
			(%) / 100}
			Sialic acid in dry polysaccharide (µg/ml)
			Sialic acid (%) = _____
			X 100
			Conc. of polysaccharide solution (µg/ml)
		5.5.6	To calculate the pure polysaccharide content (mg) present
		in dry polysaccharide sample in of each serotype based on	
		the Sialic acid content obtained, following formula is	
		applied:	
		Pure Polysaccharide content(mg) / Dry polysaccharide	
		content (mg)	
		= (Sialic acid Conc. in dry Polysacc (mg) X Conversion	
		factor)	
		5.5.7	The sialic acid present in each serotype of C, W135 and Y
		is 80%. Therefore the polysaccharide content conversion	
		factor for each serotype shall be 1.25.	
		5.6	Assay specifications
		5.6.1	The linearity of the standard curve is NLT 0.99
		5.6.2	The absorbance value of test samples should fall inside
		the range of standard curve.	
		5.6.3	A coefficient of variation of less than 10% should be
		observed within the replicates.

1.0 |Purpose: |
 |To lay down the procedure for the quantification of ribose concentration. |
 2.0 |Applicable to: |
 |This Standard Operating Procedure is applicable to all the samples of PRP |
 |and PRP-TT bulk conjugate of Haemophilus Influenzae type b in which ribose |
 |concentration is to be determined. |
 3.0 |Abbreviations |
3.1	Abbreviations:		
	3.1.1	CV	:Coefficient of variation
	3.1.2	g	:Gram
	3.1.3	mg	:Milligram
	3.1.4	mL	:Millilitre
	3.1.5	µl	:Micro litre
	3.1.6	µg	:Microgram
	3.1.7	nm	:Nanometer
	3.1.8	PRP	:Polyribosyl Ribitol Phosphate
	3.1.9	TT	:Tetanus Toxoid
	3.1.10	g/l	:Grams per Litre
	3.1.11	w/v	:Weight by Volume
4.0	Procedure:		
4.1	Preparation of Solutions:		
	Prepare all the solutions as described below and label the solutions.		
	4.1.1	0.5 g/l Ferric chloride solution:	
		4.1.1.1	Weigh 50 mg of Ferric Chloride hexahydrate and
			transfer it to 100 mL volumetric flask.
		4.1.1.2	Dissolve and make up the volume to 100 mL with
			concentrated hydrochloric acid.
		4.1.1.3	Store the solution in a screw cap amber bottle, for a
			maximum of 6 months at room temperature.
	4.1.2	100 g/l Orcinol solution:	
		4.1.2.1	Weigh 1gm of Orcinol monohydrate and transfer it to 10
			mL volumetric flask.
		4.1.2.2	Dissolve and make up the volume to 10 mL with absolute
			ethanol.
		4.1.2.3	Store the solution in a screw cap amber bottle at 2 to
			8 °C, for a maximum of 15 days.
	4.1.3	1 mg/ml Ribose Solution:	
		4.1.3.1	Weigh 25 mg of D-Ribose and transfer it to a 100 mL
			volumetric flask.
		4.1.3.2	Dissolve in purified water and make up the volume to
			100 mL with purified water.
		4.1.3.3	Prepare fresh prior to use.
	4.1.4	25 µg /mL Ribose Solution:	
		4.1.4.1	Take 1 mL of 1 mg/ml of Ribose solution and transfer
			it to a 10 mL volumetric flask.
		4.1.4.2	Make up the volume to 10 mL with purified water.
		4.1.4.3	Prepare fresh prior to use.
	4.1.5	10% w/v Cetyltrimethylammonium bromide (CTAB) Solution:	
		4.1.5.1	Weigh 1gm of Cetyltrimethylammonium bromide and
			transfer it to 10 mL volumetric flask.
		4.1.5.2	Dissolve and make up the volume to 10 mL with Purified
			water.
		4.1.5.3	Solution shall be prepared freshly.
	4.1.6	0.25 M Sodium hydroxide:	
		4.1.6.1	Weigh 1gm of Sodium hydroxide and dissolve in
			sufficient amount of purified water and make up the
			volume to 10 mL with Purified water.
		4.1.6.2	Store the solution in a screw cap bottle, for a
			maximum of 6 months at room temperature.
	4.2	Preparation of Calibration Curve:	
	4.2.1	Prepare calibration curve (2.5-25 µg) with freshly prepared	
		ribose solution (25 µg /ml) in previously labelled test tubes	
		of 20 mL.	
	4.2.2	Calibration Curve (2.5 - 25µg) is prepared in duplicates as	
		follow:	
		Ribose content (µg)	2.5
		25µg/ml ribose (µl)	100
		Purified water (µl)	900
	4.2.3	Make up the volume to 2 mL using purified water.	
		Note: The Calibration curve is accepted if it is meeting the	
		parameters of correlation coefficient ie. ≥ 0.990 .	
	4.3	Test:	
	4.3.1	Take sample volume such that the sample volumes used in test	
		contain 2.5 to 25 µg of ribose i.e. lies within the	
		calibration curve.	
		In case of dry polysaccharide prepare a solution containing	
		about 1-5 mg/mL of polysaccharide use it as test sample)	
	4.3.2	Make up the volume to 2 mL using purified water respectively.	
		Note: In case of fermentation samples, treat 1 mL of the sample with	
		50µl 10 % CTAB, vortex and keep for 10 minutes, centrifuge at 7000	
		RPM for 5 minutes. Discard the supernatant; add 1 mL purified water,	
		vortex and again centrifuge for 5 minutes at 7000 RPM. Discard the	
		supernatant and let the pellet air dry. Solubilise pellet with 1 mL	
		0.25 M NaOH. Treat this as sample for ribose estimation.	
	4.3.3	Treat 2 ml purified water as blank in thermoresistant test	
		tube.	
	4.3.4	Add 2 ml of 0.5 g/l Ferric Chloride solution to tubes of	
		calibration curve, Blank and sample.	
	4.3.5	Vortex and add 0.2 ml of 100 g/l Orcinol Solution to all test	
		tubes.	

	4.3.6	Close the tubes with aluminium foil and place the test tubes
		in boiling water bath for 20 minutes.
	4.3.7	Take out the tubes and cool in ice cold water.
	4.3.8	Allow the tubes to come at room temperature.
	4.3.9	Set the wavelength in spectrophotometer at 670 nm. Zero the
		absorbance of blank and then measure the absorbance of
		calibration curve and test samples.
	4.4	Calculations:
	4.4.1	Once the absorbance of the standards and the test samples
		have been taken, calculation shall be done using the excel
		sheet carrying formulas for the required calculation.
	4.4.2	Enter the absorbance for calculations starting from the
		Calibration curve prepared between 2.5 and 25 g of Ribose and
		test samples. The calculations are made according to the
		equation of minimum squares.
		$Y = mX + b$.
		Where: m = slope
		b = intercept
		Y = absorbance
		X = concentration
		(Multiply by dilution factor)
	4.4.3	Calculate the content of ribose in the test solution for each
		volume tested.
	4.4.4	Conversion factor for PRP:
		PRP content = Ribose content / 0.434
	4.4.5	In case of PRP,
		Ribose (%) in PRP on dry weight basis:
		Ribose content in dry PRP ($\mu\text{g/ml}$) =
		Ribose content in PRP($\mu\text{g/mL}$) X $1 - \{\text{Moisture} (\%) / 100\}$
		Ribose content in dry PRP ($\mu\text{g/mL}$)
		Ribose (%) = $\frac{\text{Ribose content in dry PRP } (\mu\text{g/mL})}{\text{Concentration of PRP solution } (\mu\text{g/mL})} \times 100$
		Concentration of PRP solution ($\mu\text{g/mL}$)
	4.5	Acceptance criteria:
	4.5.1	The coefficient of variation (CV) between the replicates of
		the samples should be $\leq 5\%$.
	4.5.2	Ribose content in the sample should be within the acceptance
		limits.
	5.0	Forms and Records:
		Determination Of Ribose Concentration By Orcinol Method .
	6.0	References:
		European pharmacopoeia.

[1.0 |Objective: |
| |To lay down the procedure for identification of Meningococcal |
| |Polysaccharide Antigens by agglutination method. |
[2.0 |Scope: |
| |This SOP is applicable to Meningococcal polysaccharide, Meningococcal |
| |conjugate bulk and final lot. |
[3.0 |Responsibility: |
	3.1	The analyst of the Immunochemistry laboratory shall be responsible
	for executing the described procedure correctly.	
	3.2	The supervisor of the laboratory shall be responsible for verifying
	that the procedure is followed correctly and for checking the	
	results.	
	3.3	The Departmental Head shall be responsible for the overall
	compliance of the SOP and shall ensure that the SOP is reviewed	
	every two years or if required earlier.	
[4.0	Abbreviations and Definitions:	
	4.1	QA
	4.2	QC
	4.3	SOP
[5.0	Procedure:	
	5.1	Material and Equipments
	5.1.1	PASTOREX MENINGITIS INDIVIDUAL LATEX TEST KIT, code 61608
	5.1.2	Pipettes and tips
	5.1.3	Laboratory vortex mixer
	5.2	Note:
	5.2.1	All reagents and the sample should be used at a temperature
	of between 18°C – 30°C.	
	5.2.2	Do not touch the reaction surface of the agglutination card.
	5.2.3	Shake the bottle of latex before use.
	5.2.4	Wipe the tip of the reagent dropper bottle in order to obtain
	a well calibrated drop	
	5.2.5	Hold the reagent bottle vertical to deposit drop.
	5.3	Principal of the Test
	Antigen contained in the specimen tested is identified using latex	
	particles coated with specific homologous antibodies. In the	
	presence of the homologous antigen, latex particles agglutinate. In	
	the absence of antigen, they remain in a homogenous suspension	
	5.4	Test Method
	5.4.1	Deposit two drop of latex reagent R6 on the black circle of
	the reaction slide.	
	5.4.2	Also deposit two drops of latex reagent R6 on the white
	circle of the reaction slide. This act as a negative control.	
	5.4.3	Added two drops of sample to the black circle and Diluent
	Solution R11 to the white circle.	
	5.4.4	Mix the sample and latex reagent with disposable mixing
	stick.	
	5.4.5	Observe the appearance of agglutination within 1 minute.
	5.5	Interpretation of results:
	5.5.1	Positive reaction is detected by the formation of clumps
	visible to the naked eye.	
	5.5.2	The negative control should be homogenous suspension, without
	clump

||| |5| |

|4.3 |Preparation of solutions: |

| |Prepare all the solutions as described below and label of the |

| |prepared solutions. |

| |4.3.1 |0.4% Sodium Chloride solution: |

| | |For a volume of 2litre, weigh: |

| | |NaCl |8.0 g |

| | |Dissolve in 700 mL of purified water in a beaker. Make up the |

| | |volume to 2 litres with purified water in a volumetric flask. |

| | |Use the mobile phase within four days from the date of |

| | |preparation if it remains clear and no turbidity or fibers |

| | |observed in it. |

| |4.3.2 |Void volume marker (Salmon DNA): |

| | |For a volume of 5 mL, weigh: |

| | |Salmon DNA |10 mg |

| | |Dissolve in 3mL of 0.2µm filtered purified water and make up |

| | |the volume to 5mL in a volumetric flask. Store at -20 °C ± 5 |

| | |°C for 1 month. |

| |4.3.3 |Total volume marker (Acetone): |

| | |Take 10µL of acetone and dissolve in 990µL of 0.2µm filtered |

| | |purified water in an eppendorf. Mix thoroughly. Prepare fresh |

| | |before use. |

| |4.3.4 |Column Preservation Solution: |

| | |Note: All the solutions prepared for use are vacuum filtered |

| | |using Nylon 6, 6 membrane 0.20/0.22/0.45 µm, depending upon |

| | |the nature of solution to be filtered (filtration not |

| | |necessary if the solution is prepared in 0.2µ filtered |

| | |purified water). For organic solvents filtration not |

| | |necessary if the solution is HPLC grade. |

|4.4 |Preparing the HPLC System for run. |

|4.5 |Run Conditions: |

| |4.5.1 |Load method HIBTT RI.M. |

| |4.5.2 |Flow Rate: 0.5 mL/min |

| |4.5.3 |Detector used: RID |

| |4.5.4 |Run time: 60 minutes |

| |4.5.5 |Mobile Phase: 0.4% sodium chloride solution |

|4.6 |Equilibration of the system and the column: |

| |Equilibrate the system and column with 0.4% sodium chloride solution |

| |unless a stable baseline for RID is obtained which can be viewed with |

| |the online plot window. |

|4.7 |Sample Preparation and Application: |

| |4.7.1 |Test sample and standards are loaded in screw cap vials and |

| | |placed against the appropriate no. on the sample tray by |

| | |clearly marking the screw cap vial. |

| |4.7.2 |Take 3 mg/mL solution of Purified polysaccharide and obtain |

| | |the value of PRP concentration. |

| |4.7.3 |Load the required volume of sample as per the PRP |

| | |concentration equivalent to 200µg in the sample vial. |

| | |Example: If a sample has a PRP concentration of 2mg/mL, to |

| | |calculate volume required for 200µg of polysaccharide, |

| | |2mg (2000µg) -----1mL |

| | |200µg-----X mL |

| | |

| | |X mL = 200µg x 1mL |

| | |2000µg |

| | |X mL = 0.1mL |

| | |Therefore, 100µL of volume is injected for sample having PRP |

| | |concentration of 2mg/mL. |

| | |Note: The application of the Calibration standards is carried |

| | |out every time whenever a test sample is applied. If several |

| | |samples are applied in one sequence then only one application |

| | |of the Calibration standards is enough. |

|4.8 |Running of sequence: |

| |4.8.1 |Load sequence PRP RI.S. |

| |4.8.2 |Open the sequence parameter option by clicking Sequence menu. |

| |4.8.3 |Enter information about the data directory and operator name. |

| |4.8.4 |In the shutdown option, click on the post-sequence option and |

| | |select LAMPOFF/STANDBY. |

| |4.8.5 |In sequence table option, specify the sample names, methods |

| | |and vials to run in the sequence as per the following table: |

| | |S |Sample Code |Sample details |No. of |Injection |

| | |No | | |injection |Volume |

| | | | |ns | |

| | |1 |Blank |Eluent Blank |1 |10 µL |

| | |2 |Acetone |System |6 |1 µL |

| | | | |(Total volume |Suitability Test| | |

| | | | |marker) | | |

| | |3 |Blank |Eluent Blank |1 |10 µL |

| | |4 |Salmon DNA |Void volume |1 |50 µL |

| | | | |marker | | |

| | |5 |Blank |Eluent Blank |1 |10 µL |

| | |6 |Test Sample |Sample |1 |200 µg of |

| | | |(s) | |PRP |

| |4.8.6 |Click on run sequence option in run control menu to start the |

| | |sequence. |

| |4.8.7 |Each sample run will be of 60 min and after running all the |

| | |samples the sequence will automatically stop. |

| |4.8.8 |Inject the eluent blank after every 20 injections. |

| | |Note: One extra vial with same SST sample can be used if 6 |

| | |injections are not possible from single vial. |

|4.9 |Calculations: |

| |4.9.1 |The retention time of the unretained compound is determined |

			with Salmon DNA.
		4.9.2	The Retention time of the component which has full access to
		the pores of stationary phase is determined with Acetone.	
		4.9.3	Proceed for calculating KD value.
		The calculations are made as per the following equation:	
		$KD = T_e - T_o$	
		$T_t - T_o$	
		Where,	
		T_e = Retention time of peak maxima of purified polysaccharide	
		sample	
		T_t = Retention time of Acetone	
		T_o = Retention time of Salmon DNA	
		Note: Take average RT of acetone as T_t from EXCEL for	
		calculation of SST.	
		4.9.4	Calculation of percentage of sample eluted before a given KD:
		The percentage of sample eluted before a given KD is	
		calculated using ChemStation software.	
		4.9.4.1	Open the acquired chromatogram in the data analysis
		view in the offline copy of the software.	
		4.9.4.2	Optimize integration with initial events in the
		signal specific events table.	
		4.9.4.3	Enter the value of Elution time (T_e) calculated in
		step 5.9.3 in integration with timed events option	
		or with manual integration and select split peak	
		option.	
		4.9.4.4	The percentage of sample eluted before a given KD
		is the value of percentage of area (Area %)	
		obtained for polysaccharide curve till the	
		retention time of peak maxima.	
		4.9.5	Calculations for System Suitability Test:
		4.9.5.1	Note the values of area under the curve and
		retention time for Acetone (SST standard).	
		4.9.5.2	Every time a sample is run with system suitability
		test, calculate the results for system suitability	
		and record the same.	
		4.9.5.3	Attach the hard print of SST calculation along with
		chromatograms and the record form.	
		4.10	Acceptance Criteria:
		4.10.1	For System Suitability Test:
		4.10.1.1	RSD calculated for RT of Acetone should be <5.0%.
		4.10.1.2	RSD calculated for area of Acetone should be <5.0%.
		4.10.2	For purified polysaccharide samples:
		KD (Molecular Size distribution): $\geq 40\%$, $KD \leq 0.3$	
		Reporting:	
		Molecular sizing of polyribosyl ribitol phosphate (PRP) by high performance	
		size exclusion chromatography.	
		6.0	Reference:
		European pharmacopoeia.	

* PS: Polysaccharide

S.No | Tests | Specifications

1 | Appearance | White powder or lump

2 | Serological Identity | Positive

3 | Methyl pentose content | $\geq 37\%$ of dry weight of PS

4 | Phosphorus content | 3.0-4.5 % of dry weight of PS

5 | Total nitrogen content | 0-1.0% of dry weight of PS

6 | Kav_g determination (SEC-HPLC with RI detector) | $Kav_g \leq 0.3$

7 | Protein content | ≤ 2.0 % of dry weight of PS

8 | Nucleic acid content | ≤ 2.0 % of dry weight of PS

9 | Cell wall polysaccharide content | ≤ 0.5 % of dry weight of PS

10 | Endotoxin content | < 0.5 IU/ μ g of PS

11 | Residual CTAB Content | ≤ 1.0 % of dry weight of PS

12 | Residual Formaldehyde content | ≤ 1.0 % of dry weight of PS

13 | Residual DOC Content | ≤ 1.0 % of dry weight of PS

14 | Moisture content | To report results

1.0	Objective		
	To lay down the procedure for analysis of Meningococcal polysaccharide		
	samples by High Performance Size Exclusion Chromatography.		
2.0	Scope		
	This Standard Operating Procedure is applicable for evaluating Kavg of		
	meningococcal polysaccharide samples at in process stage and lyophilized		
	purified polysaccharide of Meningococcal vaccine.		
3.0	Responsibility		
	3.1	The analyst shall be responsible for carrying out the described	
	procedure correctly.		
	3.2	The Supervisor of the laboratory shall be responsible for verifying	
	that the procedure is complied with and for checking the results.		
	3.3	The departmental head/designee shall be responsible for overall	
	compliance of the SOP.		
	3.4	Head QA/Designee shall be responsible for final approval and	
	subsequent compliance of the SOP.

5.0	Procedure		
	5.1	Precautions to be taken:	
		5.1.1	Always wear laboratory coat
		5.1.2	Always use solutions and samples filtered through 0.2 µm
			Membrane
		5.1.3	Degas all solutions
		5.1.4	Avoid entry of bubbles into the system as well as column
		5.1.5	All the solution bottle openings should be well covered with
			aluminum foil
		5.1.6	Check the calibration status of all equipment and instrument
		5.1.7	Handle acids carefully wearing gloves and always manipulate in
			fume hood.
	5.2	Equipment and Instruments	
		5.2.1	Calibrated HPLC system with RI detector
		5.2.2	Analytical balance
		5.2.3	Precision balance
		5.2.4	Vacuum Pump
		5.2.5	pH Meter
		5.2.6	Refrigerator
		5.2.7	Magnetic stirrer
		5.2.8	Ultrasonic Cleaner
		5.2.9	Rocking and Tumbling Shaker
	5.3	Material:	
		5.3.1	Sugar KS-804 (Shodex Column)
		5.3.2	Sugar KS-805 (Shodex Column)
		5.3.3	Guard Column KS-G (Shodex)
		5.3.4	Laboratory Glassware
		5.3.5	Screw cap HPLC vials with/without inserts
		5.3.6	Solvac Filter Holder
		5.3.7	Nylon 6,6 membrane 0.2µm membrane filter
		5.3.8	Auto pipettes (10-100 (l), (20-200 (l), (100-1000 (l)
		5.3.9	Tips for the Auto pipettes
		5.3.10	Syringe filters 0.2 µm
		5.3.11	Aluminum Foil
		5.3.12	Gloves
	5.4	Reagents:	
		5.4.1	Dextran
		5.4.2	Sodium azide
		5.4.3	Deuterium Oxide
		5.4.4	Sodium Chloride
		5.4.5	Purified water
		5.4.6	Sodium dihydrogen phosphate, dihydrate
		5.4.7	Disodium hydrogen phosphate, anhydrous
	5.5	Preparation of solutions: Prepare all the solutions as described	
		below. Carry out the labelling of the prepared solutions and assign	
		the lot numbers.	
		5.5.1	100mM Sodium dihydrogen phosphate, dihydrate, stock Solution:
			Take 15.602g of Sodium dihydrogen phosphate in 1L of purified
			water. Mix well and store the solution at room temperature for
			not more than one month.
		5.5.2	100mM Disodium hydrogen phosphate, anhydrous, stock Solution:
			Take 14.196g of Disodium hydrogen phosphate in 1L of purified
			water. Mix well and store the solution at room temperature for
			not more than one month.

		5.5.3	100mM Phosphate Buffer stock Solution:	
			Add 280 mL of 100mM Sodium dihydrogen phosphate, dihydrate and	
			720mL of 100 mM Disodium hydrogen phosphate, anhydrous.	
			Add 280mL of 100mM Sodium dihydrogen phosphate and 720mL of	
			100mM Disodium hydrogen phosphate. Store the solution at room	
			temperature for not more than one month.	
		5.5.4	10mM Phosphate buffer saline:	
			Add 100ml of 100 mM of phosphate buffer (pH-7.2) to 800 mL of	
			purified water and then add 8.5g of Sodium Chloride and adjust	
			the pH to 7.2 by adding 100mM Disodium hydrogen phosphate	
			solution. Make the final volume to 1000mL.	
			Filter the PBS solution with 0.2µm filter under vacuum and	
			degas the solution using the ultra-sonication bath.	
		5.5.5	Dextran (1 mg/mL) and Deuterium oxide (2.5 v/v) standard to	
			obtain void volume (Vo): Add 9.75mL of 10mM PBS slowly to 10mg	
			of Dextran in a clear glass bottle. Do not mix the solution.	
			Leave the glass bottle at 2-8°C for 2 hours Then add 0.25mL D2O	
			and gently shake the tube for 30 minutes on shaker.	
			Note: Prepare the standard solution fresh just prior to use	
			with the same 10mM PBS which is to be used during the run.	
		5.5.6	Sodium azide standard to obtain the total volume (Vt): Take	
			10mg of sodium azide, dissolve in 20mL of WFI/10mM Phosphate	
			Buffer Saline and then filter through 0.2µm syringe filter.	
			Note: Prepare this solution fresh just prior to use.	
		5.5.7	Purified polysaccharide sample preparation (Test sample):	
			Weigh the lyophilized purified sample and dissolve in 0.2µm	
			purified water to make 1mg/mL of sample. Keep it overnight at	
			2-8°C on shaker before use. Store at -20°C for not more than	
			one month.	
		5.5.8	Preservation Solution (Sodium azide 0.05%):	
			Weigh 1g of Sodium Azide and dissolve in approximately 1800 mL	
			of purified Water. Make up the volume to 2L with purified	
			water. This solution can be stored at room temperature for 2	
			months.	
			Note: All the solutions prepared for use are vacuum filtered	
			using Nylon 6,6 membrane 0.2µm filters to eliminate the entry	
			of possible particles into the system as well as the column.	
		5.6	HPLC method Run:	
		5.6.1	Mount Shodex guard column, Shodex 805 column and Shodex 804	
			column in series on calibrated HPLC system.	
		5.6.2	Place the inlet tubing A in the reservoir for 10 mM phosphate	
			buffer saline solution.	
		5.6.3	Establish On-Line connection of HPLC System with chromatography	
			software.	
		5.6.4	Switch ON the HPLC System.	
		5.6.5	Click on the chromatography software.	
		5.6.6	Purging the system:	
			5.6.6.1	Open the purge valve of pump (by turning it counter
				clockwise) and set flow rate to 3-5ml/min.
			5.6.6.2	Flush the vacuum degasser and all tubes with 10mM PBS
				for ten minutes.
			5.6.6.3	Set flow to at 0.0ml/min and close the purge valve. The
				flow shall be directed to the column.
		5.6.7	Run conditions:	
			5.6.7.1	Set the flow to 1.0ml/min
			5.6.7.2	Detector used: RID
			5.6.7.3	RID optical unit temperature : 30°C
			5.6.7.4	In case of running sample manually/sequence, run time
				is 30min.
		5.6.8	Purge reference cell of RID for 40 minutes after solvent	
			change. Further purging of reference cell may be required to	
			achieve stable baseline.	
		5.6.9	Keep on running the column with 10 mM phosphate buffer saline	
			solution unless a stable baseline for RID is obtained which can	
			be viewed on the chromatographic software.	
		5.7	Sample Preparation and injection to the system:	
		5.7.1	In process samples of meningococcal polysaccharide:	
			5.7.1.1	Filter the samples with 0.2 µm syringe filter in HPLC
				glass vials.
			5.7.1.2	Inject 50 µl of the sample on HPLC.
			Note: For the samples of this step if absorbance of the samples	
			in nRI Units observed is greater than 7000 nRI ,then the volume	
			of sample injected may be reduced accordingly and vice-versa.	
		5.7.5	Lyophilized purified polysaccharide:	
			5.7.5.1	Filter the samples with 0.2 µm syringe filter in HPLC
				glass vials.
			5.7.5.2	Inject 100 µl of the sample (1mg/ml) on HPLC.
		5.7.6	Inject 100µl of the Dextran standard for void volume	
			determination for final Lyophilized sample.	
		5.7.7	Inject 100µl of the sodium azide standard for total volume	
			determination for final Lyophilized sample.	
		5.8	Results Evaluation:	
		5.8.1	Proceed for calculating Kavg value of sample.	
			The calculations are made as per the following equation:	
			Kavg = Vr - Vo	
			Vt - Vo	
			Vr = Retention time of meningococcal polysaccharide sample.	
			Vt = Retention time of Sodium azide.	
			Vo = Retention time of Dextran(1st peak).	
		5.9	Reporting Results:	
		5.9.1	Open the report template showing retention time, area, height	
			of each sample.	

	5.9.2	Report the results of Kav_g with the retention time values of
		all the samples.
	5.9.3	Print report: Click this option to take a printout of the
		report generated for each sample, void volume marker and total
		volume marker.
	5.9.4	The printed report is signed by the analyst who does the
		analysis and also checked by the other analyst.
	5.10	Acceptance criteria:
	5.10.1	≥ 65 % KD= 0.5 for Polysaccharide of Meningococcal A serotype
	5.10.2	≥ 75 % KD= 0.5 for Polysaccharide of Meningococcal C serotype
	5.10.3	≥ 80 % KD= 0.5 for Polysaccharide of Meningococcal W135
		serotype
	5.10.4	≥ 80 % KD= 0.5 for Polysaccharide of Meningococcal Y serotype

6.2	WHO TRS 594: Requirement for Meningococcal polysaccharide vaccine.	

1.0 |Purpose: |
 |To lay down the procedure for receipt and storage of samples at Quality |
 |Control department. |
 2.0 |Applicable to: |
 |This Standard Operating Procedure is applicable for receipt and storage of |
 |Retention samples, Stability Study samples, Reference Standards and under |
 |test samples from all the in process, Bulk, Formulated and Finished |
 |products, manufactured at Manufacturing dept. |
 3. |Responsibility: |
3.1	The analyst is responsible for executing the described procedure
	correctly.
3.2	Supervisor is responsible for verifying that the procedure is
	followed. HOD shall be responsible for overall compliance of this SOP.
3.3	Departmental head shall ensure that the SOP is reviewed every two
	years or if required earlier.
 4. |Safety consideration: |
 |4.1 |Wear laboratory coat and gloves while working. |
 |4.2 |Handle all the samples aseptically. |
 3.0 |Abbreviations: |
 |3.1 |FB: |Formulated Bulk |
 |3.2 |FP: |Finished Product |
 4.0 |Procedure: |
 |4.1 |Receipt of Samples: | | |
 | |4.1.1 |All the samples that are to be sent to the quality control |
 | | |department from the production facility shall be sent in |
 | | |carrier boxes in recommended storage temperatures. |
 | |4.1.2 |On receipt of the samples at QC dept, the analyst shall check |
 | | |the request form along with the sample label. |
 | |4.1.3 |The analyst shall physically verify the sample, the |
 | | |container's condition, the closure of the container and accept |
 | | |the samples only if all the parameters are meet. |
 | |4.1.4 |The QC analyst shall enter the details of the sample in the |
 | | |receipt note book and forward the samples to concerned |
 | | |sections within the QC or store it as per recommended. |
 | |4.1.5 |All the products, samples that are manufactured are to be |
 | | |stored at recommended storage conditions as mentioned in the |
 | | |table below. |
 | |4.1.6 |The containers that are used for the storage of samples should |
 | | |be clean and sterilized as per the approved sterilization |
 | | |procedures. |
 | |4.1.7 |The containers used for storage should be appropriately closed |
 | | |/ sealed by approved container closure systems. |
 | |4.1.8 |Label the containers with complete details mentioning; |
 | | |Product Name, Batch No., Date of Manufacturing, Quantity of |
 | | |sample, Storage Temperature and Signature of Stored by. |
 |4.2 |Stability Study sample: |
 | |4.2.1 |Label all the stability study vials as mentioned above also |
 | | |mention the type of stability study on the labels. |
 | |4.2.2 |The volume of each stability study vial, the duration of |
 | | |storage and the storage conditions are to be followed as |
 | | |mentioned in the respective stability study protocol. |
 |4.3 |Retention samples: |
 | |4.3.1 |The samples that are stored at quality control department as |
 | | |stand by samples are called as retention samples. |
 | |4.3.2 |The volume of each retention sample should be such that it |
 | | |should be sufficient to carry out of all assays, as per |
 | | |approved specification for 2 times. |
 | |4.3.3 |Store all the retention samples at recommended storage |
 | | |conditions after labeling it appropriately. |
 |4.4 |Reference Standards: |
 | |4.4.1 |The recommended storage conditions for reference standards is |
 | | |mentioned in the inserts or the documents provided by their |
 | | |suppliers. |
 | |4.4.2 |Follow all the instructions as per for the storage of reference |
 | | |standards. |
 |4.5 |Inprocess Samples: |
 | |Store all the in process samples at recommended storage conditions |
 | |until the analysis is completed. |
 |4.6 |Recommended storage conditions: |
 | |Following table mentions the storage conditions for all the samples. |
 | |Product |Sample |Storage Conditions |
 | |PolyRibosyl |Inprocess |(-25 °C ± 5) In screw capped |
 | |Ribitol Phosphate |glass bottles. |
 | |(PRP) | |
 | |Lyophilized PRP |(-25°C ± 5) glass vials with |
 | | |rubber bungs and flip off |
 | | |aluminum seals. |
 | |Hib-TT |Inprocess and Final |2 to 8°C In screw capped glass |
 | | |bottles. |
 | |Diphtheria toxoid |Inprocess and Bulk |2 to 8°C In screw capped glass |
 | | |bottles. |
 | |Tetanus toxoid |Inprocess and Bulk |2 to 8°C In screw capped glass |
 | | |bottles. |
 | |Pertussis whole |Inprocess and Bulk |2 to 8°C In screw capped glass |
 | | |cell |bottles. |
 | |Hepatitis B |Inprocess and Bulk |2 to 8°C In screw capped glass |
 | | |bottles. |
 | |Meningococcal |Inprocess |(-25 °C ± 5) In screw capped |
 | |Polysaccharide |glass bottles |
 | |Lyophilized |(-25 °C ± 5) glass vials with |

		polysaccharide rubber bungs and flip off	
			aluminum seals.
	Meningococcal Monovalent Bulk,	2 to 8°C In screw capped glass	
	Polysaccharide Pooled bulk,	bottles.	
	conjugated with Formulated Bulk,		
	TT Final Lot		
5.0 Reporting:			
Not applicable			

1.0 |Objective |
 |To lay down the procedure for the determination of total Carbohydrate |
 |content in Active Raw Material of Hepatitis B vaccine. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable for the analysis all the |
 |samples of Active Raw Material of Hepatitis B vaccine, received in the |
 |Quality control department. |
 3.0 |Responsibility |
 |3.1 |The analyst shall be responsible for executing the described |
 |procedure correctly. |
 |3.2 |Supervisor shall be responsible for verifying that the procedure is |
 |complied with and the results are checked. |
 |3.3 |HOD shall be responsible for overall compliance of this SOP. |
 4.0 |Abbreviations and Definitions |
4.1	Abbreviations:		
	4.1.1	ARM	:Active Raw Material
	4.1.2	CV	:Coefficient of variation
	4.1.3	g	:Gram
	4.1.4	mg	:Milligram
	4.1.5	mL	:Millilitre
	4.1.6	μL	:Micro litre
	4.1.7	μg	:Microgram
	4.1.8	nm	:Nanometer
	4.1.9	QC	:Quality Control
	4.1.10	QCR	:Quality Control Record
	4.1.11	SD	:Standard Deviation
	4.1.12	SOP	:Standard Operating Procedure
4.2	Definitions:		
		Not Applicable.	
5.0	Procedure:		
5.1	Preparation of Solutions:		
	5.1.1	1 mg/mL Anthrone solution :	
		5.1.1.	Weigh 100 mg of Anthrone and dissolve in sufficient
		1	quantity of conc. Sulphuric acid and make up to 100 mL
		with concentrated Sulphuric acid in a 100 mL volumetric	
		flask	
		5.1.1.	This solution must be prepared freshly.
		2	
	5.1.2	2 mg/mL Glucose solution :	
		5.1.2.	Weigh 100 mg of previously dried glucose and transfer
		1	it to a 50 mL volumetric flask and dissolve in
		sufficient quantity of purified water.	
		5.1.2.	Make up the volume to 50 mL using Purified water.
		2	
		5.1.2.	This solution must be prepared freshly.
		3	
5.2	Preparation of Calibration curve:		
	5.2.1	Take 5 volumetric flasks of 25 mL each and label the details	
		with pen marker. Prepare carbohydrate calibration curve	
		(20-100μg/mL) by adding 2mg/mL Glucose solution to purified	
		water as per the following table:	
		Concentration (μg/mL)	20
		Glucose Solution 2 mg/mL	250
		(μL)	
		Volume Make up with Purified	25
		water in a volumetric flask	
		(mL)	
		Note: The Calibration curve is accepted if it is meeting the	
		validated parameters of intercept, slope and correlation coefficient.	
5.3	Test:		
	5.3.1	Dilute the sample ½ using purified water as the diluent.	
		However reference ARM treated like test sample can be used in	
		the assay as control, occasionally. Use purified water as a	
		blank.	
	5.3.2	Take 1mL each from 20 to 100 μg/mL carbohydrate calibration	
		curve, previously diluted test sample, blank and control in	
		duplicates in labeled test tubes	
	5.3.3	Keep all the tubes in ice bath.	
	5.3.4	Add 3 mL of 1mg/mL Anthrone solution to each tube kept in ice	
		bath.	
	5.3.5	Take out the tubes from ice bath and transfer the tubes to	
		water bath. Heat all the tubes in boiling water for ten	
		minutes.	
	5.3.6	Take out the tubes from boiling water bath and allow it to	
		cool at room temperature.	
	5.3.7	Set the wavelength in spectrophotometer at 585 nm, Zero the	
		absorbance of blank and then measure the absorbance of	
		calibration curve and test samples.	
		Note: If absorbance of the sample falls outside the range of	
		calibration curve, dilute the sample appropriately so that it comes	
		under the range of calibration curve.	
5.4	Calculations:		
	5.4.1	Once the absorbance of the standards and the test samples have	
		been taken, calculation shall be done using the excel sheet	
		carrying formulas for the required calculation.	
	5.4.2	Enter the absorbance for calculations starting from the	
		Calibration curve prepared between 20 and 100 g/mL of	
		Glucose Solution and test samples. The calculations are made	
		according to the equation of minimum squares.	
	5.4.3	Y = mX + b.	

			Where: m = slope
			b = intercept
			Y = absorbance
			X = concentration
			(multiply with the dilution factor)
		5.4.4	Taking into account the equivalence between the ARM volume and
			the antigen concentration, express the result per 20 g of
			protein. Enter the protein concentration estimated by OD at
			280nm in the excel sheet.
			If the Protein concentration of Active Raw Material of
			Hepatitis B Vaccine by Absorbance at 280 nm. Is 1.40 mg/mL
			calculations are done as given below:
		5.4.5	C = $20 \times X / 1.40 / 1000$
		5.4.6	Where:
			C = Carbohydrate Concentration per 20µg of Protein
			20 =Dose of Hepatitis B vaccine (20µg)
			X =Total concentration of Carbohydrate calculated from the
			calibration curve (µg/mL)
			1.40mg/mL = Concentration of protein in the sample by
			Absorbance at 280 nm)
			1000 = Conversion factor
		5.5	Acceptance criteria:
		5.5.1	The coefficient of variation (CV) between the replicates of
			the samples should be $\leq 5\%$.
		5.5.2	The value of the control should be within the acceptance
			limits.
		5.5.3	Carbohydrate content in the sample should be within the
			specified limits.

- 2 phenoxy ethanol is missing in the spec.
- | |
- 1 | Physical appearance | White or almost white translucent suspension with mineral carrier, free from extraneous particles/floccules. Settles into a clear liquid and gel phase on sedimentation
- 2 | Preservative (Polysorbate) | 5mg/ml (Not less than 85% and Not greater than 115% of intended amount)
- 3 | Sterility | Sterile
- 4 | Identification | Positive when tested by immunochemical method
- 5 | Abnormal toxicity | All mice and Guinea pigs Should survive test with no sickness
- 6 | Aluminum content (Al3+) | 0.25mg/ml (acceptable range)
- 7 | Pyrogens | Inject each rabbit with 1 ml of dilution containing 2.5 µg of each polysaccharide.
- 8 | pH | 5.5 to 6.5
- 9 | Polysorbate 20 | 0.2mg/ml (acceptable range)
- 10 | Assay | Vaccine shall contain not less than 70% and not more than 130 % as per stated label of polysaccharide content.
- The confidence interval of assay shall be 80-120% of estimated content.
- 10 | Assay |
- 10 | Assay |

[1.0]Objective: |
|To lay down the procedure for the detection and quantification of |
|Hepatitis-B surface antigen using Bio-Rad Monolisa HBsAg ELISA kit. |
[2.0]Scope: |
|This Standard Operating Procedure is applicable to determine the antigen |
|content in all the In process and Active Raw Material for Hepatitis B |
|vaccine (rDNA) samples. |
[3.0]Responsibility: |
|3.1 |The analyst of the Quality control laboratory shall be responsible for |
|executing the described procedure correctly. |
|3.2 |The supervisor of the laboratory shall be responsible for verifying |
|that the procedure is followed correctly and for checking the results. |
|3.3 |The Departmental Head shall be responsible for the overall compliance |
|of the SOP and shall ensure that the SOP is reviewed every two years or |
|if required earlier. |

|: |
|Standard Operating Procedure |
| |
| |
| |
| |
[5.0] Procedure |
|5.1 |Prepare the dilutions of the test sample and reference standard in |
|PBS (1X) with 1%BSA solution. |
|If ARM is to be analyzed, then prepare 4 dilutions of reference |
|standard, namely 10, 5, 2.5 and 1.25 ng/ml, with 3 independent |
|replicates each and for in process samples, 4 dilutions of reference |
|standard namely 10, 5, 2.5, 1.25, 0.65, 0.3125 and 0.156 ng/ml in |
|duplicate. |
|5.2 |If the sample is ARM, prepare 4 dilutions of the sample namely 10, 5, |
|2.5 and 1.25 ng/ml, with 3 independent replicates each while in case |
|of inprocess samples, prepare a working concentration of 5 ng/ml. |
|Protein concentration of ARM is estimated by lowry method, while for |
|in process samples, a pre-determined target concentration/absorbance |
|at 280 nm or results from Lowry can be used. |
|5.3 |Select the no. of ELISA strips that are required to conduct the |
|assay. Add 100µl of each dilution of Reference standard and the test |
|sample into the pre-coated ELISA wells, provided in the Bio-Rad |
|Monolisa ELISA kit. |
|5.4 |Add 100 µl of appropriate positive and negative controls also to the |
|pre determined ELISA wells. |
|5.5 |Prepare the conjugate solution as mentioned in the kit insert and add |
|50 µl of the conjugate solution into each well over the assay |
|controls, standard and sample solutions. |
|5.6 |Mix the conjugate solution properly by shaking and incubate the ELISA |
|plate at 37°C for next 90 mins. of duration. |
|5.7 |On completion of the incubation period, remove the plate from the |
|incubator and discard the contents in the wells. The wash solution |
|should be prepared before the completion of the incubation period. |

		Add 300 µl of wash solution and shake the plate for around 15 sec.		
		Discard the wash solution with a jerk and tap the plates on an		
		absorbent paper to remove all the residual was solution. Repeat the		
		process of washing for four more times (a total of five washes).		
		5.8	Freshly prepare the TMB substrate solution as per the instructions	
		given in the kit insert. Avoid direct exposure of solution to light.		
		On completion of washing steps, add 100 µl of TMB solution to each		
		well. And incubate the plate at room temperature in dark for 10 to 15		
		mins.		
		5.10	On completion of the incubation period add 100 µl of stop solution	
		into each well to stop the colour reaction.		
		5.11	Read the OD of wells at 450-620 nm on a ELISA plate reader.	
		5.12	Proceed to analyze the results. The analysis of results depends on	
		the type of sample.		
		5.12.1	In Process samples:	
		5.12.1.1	Proceed for calculations starting from the	
			Calibration curve prepared between 0.156 and 10 ng/ml	
			of Reference Standard solution.	
		5.12.1.2	$Y = mX + b$.	
			Where: m = slope	
			b = intercept	
			Y = absorbance	
			X = concentration	
			(Multiply by dilution factor)	
		5.12.1.3	Use EXCEL programme for the preparation of	
			calibration curve and Calculation of the results	
			(Multiply by the dilution factor. Divide with 1000 to	
			change ng/ml to µg/ml).	
		5.12.1.4	Validity criteria: For an assay to be valid	
			The coefficient of regression must be greater than	
			0.98.	
			The coefficient of variation between the replicates	
			of same point of standard curve must be less than	
			10%.	
		5.12.2	Active Raw Material:	
		5.12.2.1	The calculation of antigen content for ARM samples is	
			done by using Combistat software.	
		5.12.2.2	Entre the initial concentration of the Reference	
			standard, the dilution folds and the OD values	
			obtained for each replicate.	
		5.12.2.3	Enter the test sample dilution folds and the OD	
			values obtained for each replicate.	
		5.12.2.4	Pres on the calculate icon on the top of the screen	
			and the software shall directly give the antigen	
			content present in the sample.	
		5.12.2.5	Validity criteria of the assay:	
			The reference standard dilutions should pass in the	
			criteria for linearity.	
			The test sample dilutions should pass in the criteria	
			for linearity	
			The reference standard and the test sample should	
			pass the criteria for parallelism.	
		5.12.2.6	If all the above criteria are fulfilled, the assay is	
			valid otherwise reject it and repeat the assay. If	
			the assay is valid report the results.

1.0 |Objective: |
 |To lay down the procedure for quantifying Total and unconjugated (free) |
 |PRP concentration. |
 2.0 |Scope: |
 |This Standard Operating Procedure is applicable for the analysis of all |
 |the samples of PRP and PRP-TT bulk conjugate of Haemophilus Influenzae |
 |type b in which Total and unconjugated (free) PRP concentration is to be |
 |determined, received in the Quality control department. |
 3.0 |Abbreviations and Definitions |
3.1	Abbreviations:		
	3.1.1	CV	:Coefficient of variation
	3.1.2	g	:Gram
	3.1.3	mg	:Milligram
	3.1.4	mL	:Millilitre
	3.1.5	µL	:Micro litre
	3.1.6	µg	:Microgram
	3.1.7	nm	:Nanometer
	3.1.8	PRP	:Polyribosyl Ribitol Phosphate
	3.1.9	TT	:Tetanus Toxoid
	3.1.10	TNBS	: 2, 4, 6-Trinitrobenzenesulfonic acid
	3.1.11	DMF	: Dimethylformamide
3.2	Definitions:		
	Not Applicable.		
4.0	Procedure:		
4.1	0.5 g/l Ferric chloride solution:		
	4.1.1	Weigh 50 mg of Ferric Chloride hexahydrate and transfer it to	
		100 mL volumetric flask.	
	4.1.2	Dissolve and make up the volume to 100 mL with concentrated	
		hydrochloric acid.	
	4.1.3	Store the solution in screw cap amber bottle, for a maximum 6	
		months at room temperature.	
4.2	100 g/l Orcinol solution:		
	4.2.1	Weigh 1g Orcinol monohydrate and transfer it to 10 mL	
		volumetric flask.	
	4.2.2	Dissolve and make up the volume to 10 mL with absolute	
		ethanol.	
	4.2.3	Store the solution in a screw cap amber bottle at 2 to 8 °C,	
		for maximum of 15 days.	
4.3	0.1% w/v TNBS-10% DMF:		
	4.3.1	Take 1 mL of commercial TNBS solution (1%w/v in DMF) and	
		transfer it to a 10 mL volumetric flask.	
	4.3.2	Make up the volume to 10 mL with purified water.	
	4.3.3	Prepare fresh prior to use.	
4.4	0.25 g/1 Ribose Solution:		
	4.4.1	Weigh 25 mg of D-Ribose and transfer it to a 100 mL	
		volumetric flask.	
	4.4.2	Dissolve in purified water and make up the volume to 100 mL	
		with purified water.	
	4.4.3	Prepare fresh prior to use.	
4.5	25 µg /mL Ribose Solution:		
	4.5.1	Take 1 mL of 0.25 g/1 Ribose solution and transfer it to a 10	
		mL volumetric flask.	
	4.5.2	Make up the volume to 10 mL with purified water.	
	4.5.3	Prepare fresh prior to use.	
4.6	1% w/v Sodium deoxycholate (DOC):		
	4.6.1	Dissolve 250 mg sodium deoxycholate in 25 mL purified water	
		and make up the volume to 25 ml.	
	4.6.2	Adjust the pH to 6.8 by adding about 100 µL of 1M	
		hydrochloric acid drop wise.	
	4.6.3	The solution is prepared freshly.	
4.7	1 M Hydrochloric acid:		
	4.7.1	Take 85 mL of concentrated hydrochloric acid and make up the	
		volume to 1000 mL with purified water.	
	4.7.2	The solution should be stored at room temperature for maximum	
		6 months.	
4.8	Preparation of Calibration Curve:		
	4.8.1	Prepare calibration curve (2.5-25 µg) with freshly prepared	
		ribose solution (25 µg /mL) in previously labelled test	
		tubes of 20 ml.	
	4.8.2	Calibration Curve (2.5 - 25µg) is prepared in duplicate as	
		follow:	
		Ribose content	2.5
		(µg)	
		25 µg/ml Ribose	100
		(µl)	
		Purified water	900
		(µl)	
	4.8.3	Make up the volume to 2 mL using purified water.	
	Note: The Calibration curve is accepted if it is meeting the		
	parameters of correlation coefficient i.e. ≥ 0.990 .		
4.9	Preparation of sample for total PRP content:
