	4.9.1	Take sample volume such that the sample volumes used in test	
		contain 2.5 to 25 µg of ribose i.e. lies within the	
		calibration curve.	
	4.9.2	Make up the volume to 2 mL using purified water respectively.	
	Note: The sample volume can vary depending upon the ribose		
	concentration. If there is any sample outside the range of the		
	calibration curve, prepare an appropriate dilution of the sample.		
4.10	Unconjugated (Free) PRP:		

		4.10.1	Take 1 mL of sample (dilute if required) having about
		100-150 µg PRP in micro centrifuge tube in duplicate, add	
		100 µL of 1% DOC and mix it.	
		4.10.2	Put this tube in an ice bath for 30 minutes.
		4.10.3	Take out and add 50 µL 1M HCl and mix thoroughly.
		4.10.4	Centrifuge the mixture at 4°C for 15 minutes at 4000 RPM.
		4.10.5	Take 1 mL of supernatant in 20 mL labeled test tube.
		4.10.6	Make up the volume to 2 mL using purified water
		respectively.	
		4.10.7	The test is performed in duplicate for each sample.
		4.11	Treat 2 mL purified water as blank in thermoresistant test tube.
		4.12	Add 2 ml of 0.5 g/l Ferric Chloride solution to tubes of calibration
		curve, Blank and samples.	
		4.13	Vortex and add 0.2 mL of 100 g/l Orcinol Solution to all test tubes.
		4.14	Close the tubes with aluminium foil and place the test tubes in
		boiling water bath for 20 minutes.	
		4.15	Take out the tubes and cool in iced water.
		4.16	Allow the tubes to come at room temperature and set the wavelength
		in spectrophotometer at 670 nm. Zero the absorbance of blank and	
		then measure the absorbance of calibration curve and test samples.	
		4.17	Calculations:
		4.17.1	Once the absorbance of the standards and the test samples
		have been taken, calculation shall be done using the excel	
		sheet carrying formulas for the required calculation.	
		4.17.2	Always copy the master excel sheet (sheet carrying formulas
		for the required calculation), never use the previously	
		used excel sheet for new calculations.	
		4.17.3	Copy the master excel sheet, keep it for use in respective
		folder and then fill in the required sample details for	
		total & free sample treatments, sample dilution, name of	
		analyst, date, etc.	
		4.17.4	Enter the absorbance for calculations starting from the
		Calibration curve prepared between 2.5 and 25 g of Ribose	
		and test samples. The calculations are made according to	
		the equation of minimum squares.	
		Y = mX + b.	
		Where: m = slope	
		b = intercept	
		Y = absorbance	
		X = concentration	
		(Multiply by dilution factor)	
		4.17.5	Calculation of actual dilution for free PRP:
		Sample volume taken = 1000µL	
		Total volume = 1150µL (1000µL sample + 100µL 1% DOC + 50µL	
		1M HCl)	
		Correction Factor = 1150µL / 1000µL = 1.15	
		Actual dilution = dilution factor x 1.15	
		4.17.6	Calculate the content of ribose in the test solution for
		each volume tested and PRP content by the formula :	
		PRP content = Ribose content / 0.434	
		4.17.7	Record all the calculations in the data record form and
		also attach the hard copy of the excel sheet used for	
		calculation along it.	
		4.18	Acceptance criteria:
		The coefficient of variation (CV) between the replicates of the	
		samples should be ≤ 5%.	
5.0	Forms and Records:		
5.1	Determination of Total and Free PRP Concentration

1. OBJECTIVE

This Standard Testing Procedure (STP) describes the test method

1.1 For the estimation of total protein nitrogen content by using semi-automatic Kjeldahl apparatus.

1.2 For the calculation of antigenic purity of purified Diphtheria toxoid bulk in terms of Lf units per mg of protein nitrogen.

2. SCOPE

This STP is applicable for

2.1 The estimation of total protein nitrogen content in in-process samples and purified bulks of Diphtheria toxoid and calculation of their antigenic purity.

2.2 The calculation of antigenic purity of purified Diphtheria toxoid bulk in terms of Lf units per mg of protein nitrogen.

3. RESPONSIBILITY

3.1 Analysts and supervisors of Quality Control Department are responsible for performing the test.

3.2 Quality Control In-Charge to ensure that this STP is followed.

4. EQUIPMENT/INSTRUMENTS

1. Semiautomatic Kjeldahl apparatus (GERHARDT)

2. Micro Pipettes

3. Centrifuge

4. Vortex mixer

5. Fume hood

4.6 Weighing balance

5. MATERIALS

1. Chemicals

1. Trichloro acetic acid (Grade-SQ. Make - Qualigens, Fischer scientific. Cat No.28445)

2. Potassium sulphate (Grade-. Make ExcelsaR - Qualigens, Fischer scientific. Cat No.13685)

3. Copper (II) sulphate (Grade-ExcelsaR. Make - Qualigens, Fischer scientific. Cat No.12515) (Make-Merck Cat NO.1.02790.0250)

4. Selenium dioxide (Grade-SQ. Make - Qualigens, Fischer scientific. Cat No.27243)

5. Nitrogen free concentrated Sulphuric acid (Grade-ExcelsaR. Make - Qualigens, Fischer scientific. Cat No.29997)

6. Ammonium sulphate (Grade-ExcelsaR. Make - Qualigens, Fischer scientific. Cat No.11535) and (Grade-SQ Make-Qualigens, Fischer scientific. Cat No.21495)

7. Glycine (Grade-SQ. Make - Qualigens, Fischer scientific. Cat No.24755)

(Grade-ExcelsaR. Make – Qualigens, Fischer scientific. Cat No.12835)

8. Sodium hydroxide (Grade-ExcelsaR. Make - Qualigens, Fischer scientific. Cat No.1589E)
(Grade-SQ. Make – Qualigens, Fischer scientific. Cat No.27815)

5.1.9 Hydrochloric acid (Grade-ExcelsaR. Make-Qualigens, Fischer scientific. Cat No.29507)
(Grade-SQ. Make-Qualigens, Fischer scientific. Cat No.29147)

5.1.10 Dextrose (Make-Merck, Cat No.61780905001730)

5.1.11 Methyl red (Make – LOBACHemie, Cat. No. 47012)

5.1.12 Bovine serum albumin (Make-Sigma Cat No.1000828615)

5.2 Reagents

5.2.1 70% Trichloroacetic acid

5.2.2 10 M Sodium hydroxide

5.2.3 1M Sodium hydroxide

5.2.4 0.01 M Sodium hydroxide

5.2.5 0.01M Hydrochloric acid

5.2.6 Water collected from WFI loop

5.2.7 Methyl red solution

5.3 Glassware and other materials

5.3.1 Conical flask – 250 mL

5.3.2 Centrifuge tubes (15.0 mL)

5.3.3 Digestion tubes

5.3.4 Sterile tips

5.3.5 Pestle and Mortar

6. ABBREVIATIONS

Abbreviation	Full form
STP	Standard Testing Procedure
RST	Record Sheet Template
SOP	Standard operating procedure
Lf	Limes Flocculation / Limits of
	flocculation
BSA	Bovine serum Albumin
PN2	Protein Nitrogen
RT	Room Temperature
DIP	Diphtheria

7. PROCEDURE

1. Preparation of digestion mixture

1. Weigh 100g of Potassium sulphate, 5 g of Copper (II) sulphate and 2.5 g of Selenium dioxide in a clean butter paper.

2. Pulverize the Copper (II) sulphate crystals in a Pestle and Mortar and transfer on to a clean butter paper.

3. Intermittently add above three chemicals in small quantities while mixing them in a Pestle and Mortar. Mix thoroughly.

4. After thorough mixing transfer the digestion mixture to an amber colored bottle and label with RST No.8610.

5. Store the digestion mixture at room temperature.

6. Use this mixture on or before one month from the date of preparation.

2. Preparation of Controls

1. For each assay prepare the standards freshly.

7.2.2 Weigh and dissolve 943 mg of Ammonium sulphate or 1072 mg of Glycine or 1214.3 mg of BSA in water collected from WFI loop and make up the volume to 100 mL.

Note: 1mL of each solution is equivalent to 2 mg of Total Protein Nitrogen.

7.3 Preparation of reagents

7.3.1 70% Trichloro acetic acid

7.3.1.1 Weigh 70 g of Trichloro acetic acid and dissolve in water collected from WFI loop and make up the volume to 100 mL.

7.3.1.2 Transfer the solution to an amber colored bottle and label the container with RST No.8610.

7.3.1.3 Store this reagent at room temperature and use it on or before one month from the date of preparation.

2. 10 M Sodium hydroxide solution

7.3.2.1 Weigh 400 g of Sodium hydroxide pellet and dissolve in sufficient quantity of water collected from WFI loop and make up the volume to 1000 mL.

7.3.2.2 Transfer the solution to a glass container and label with RST No.8610.

7.3.2.3 Store this reagent at room temperature and use it on or before one month from the date of preparation.

3. 0.01 M Sodium hydroxide solution

7.3.3.1 Weigh 400 mg of Sodium hydroxide pellet and dissolve in sufficient quantity of water collected from WFI loop and make up the volume to 1000 mL.

7.3.3.2 Standardize the solution to determine the exact molarity of solution.

7.3.3.3 Transfer the solution to a glass container and label with RST No.QC/8069.

7.3.3.4 Store this reagent at room temperature and use it on or before three months from the date of preparation.

4. 0.01 M Hydrochloric acid

7.3.4.1 Measure 0.85 mL of concentrated Hydrochloric acid and mix with sufficient quantity of water collected from WFI loop and make up the volume to 1000 mL.

7.3.4.2 Transfer the reagent to a glass bottle and label with RST No.QC/8069.

7.3.4.3 Store this reagent at room temperature and use it on or before three months from the date of preparation.

5. Preparation of Methyl red solution

7.3.5.1 Dissolve 50 mg of methyl red in a mixture containing 1.86 mL of 0.1M Sodium hydroxide and 50 mL of ethanol (96 %) and add sufficient quantity of water collected from WFI loop to make up to 100 mL.

1. Transfer the reagent to a glass bottle and label with RST No.8610.

2. Store this reagent at room temperature and use it on or before one year from date of preparation.

7.3.6 1M / 1N Sodium hydroxide

7.3.6.1 Weigh 40 g of Sodium hydroxide pellets and dissolve in sufficient quantity of water collected from WFI loop and make up the volume to 1000 mL.

7.3.6.2 Transfer the solution to a glass container and label with RST No.8610.

7.3.6.3 Store this reagent at room temperature and use it on or before one month from the date of preparation.

7.4 Preliminary checks

7.4.1 Safety

7.4.1.1 Follow appropriate dress code wherever applicable.

7.4.1.2 Wear gloves and safety goggles while performing the test.

7.4.1.3 Ensure that fume hood door is closed properly.

7.4.1.4 While carrying out the distillation process ensures that the door of the distillation unit is closed properly.

CAUTION

The chemicals and reagents used in this test are hazardous in nature. Avoid direct contact with any parts of the body. Perform the whole test with gloved hand. If any direct contact occurs wash the area with ample quantities of water and immediately contact the Physician for treatment.

7.4.2 Equipment and reagents

7.4.2.1 Ensure that the calibration or validation status of the equipment is within due date.

7.4.2.2 Ensure that the reagents are within expiry period.

7.5 Preparation of BSA and sample

7.5.1 Take 1.0 mL of BSA solution and 1.0 mL of sample in centrifuge tubes. Add 400µL of Trichloro acetic acid solution 70 % (w/v) and incubate at RT for 1 hour.

7.5.2 Centrifuge the incubated samples for 20 minutes at 6000 RPM and separate the precipitate and supernatant. Add 1.0 mL of 1M / 1 N NaOH and transfer the content to digestion flask.

7.5.3 Add an additional 400 µL of 70 % (w/v) Trichloro acetic acid to the supernatant to ensure the complete precipitation of protein.

7.5.4 If precipitation is observed centrifuge the treated supernatant for

20 minutes at 6000 RPM and discard the supernatant. Add 1.0 mL of 1M / 1 N NaOH and vortex the tube gently and transfer the content to digestion flask.

7.5.5 Rinse the tubes with minimum quantity of water collected from WFI loop and transfer the solution in the digestion tubes.

Note: BSA is used in each test as a control to ensure the activity of Trichloro acetic acid in precipitation of protein.

7.6 Digestion Process

7.6.1 Take 50.0 mg of Dextrose (blank) and 1.0 mL of freshly prepared Glycine or Ammonium Sulphate (equivalent to 2.0 mg of Protein Nitrogen) in duplicates in separate digestion tubes.

7.6.2 Add 4.0 g of digestion mixture and 5.0 mL of Sulphuric acid, allowing it to run down the sides of the tube to wash any adhering particles and mix the contents by swirling.

7.6.3 Place the digestion tubes (Kjeldatherm tubes) into the insert rack. Ensure that the insert rack is carrying all tubes in place for uniform 100% suction of fumes.

7.6.4 Place the insert rack onto lower support of the two – tier console.

7.6.5 Remove the drip tray and place the exhaust cassette on the insert rack containing the digestion tubes. Ensure that the exhaust cassette fits tightly to the insert rack. Switch on the suction device. Lower the combined insert rack and the exhaust cassette into the heating chamber of the equipment.

7.7 Operation of Digestion unit (Turbotherm)

7.7.1 Operate the fume hood as per SOP No. QC-047.

7.7.2 Programme and control the digestion unit via the key board of the control panel as per SOP No. QC-101.

7.7.3 Switch on the system.

7.7.4 Press programme button and enter into sub programmed h1 to set the conditions for heating step 1.

7.7.4.1 Set the heating capacity of the digestion unit as 100 % by using + or – key.

7.7.4.2 Bring the cursor to time mode by pressing the time button and set the time as 20 minutes by using + or – key.

7.7.5 Press programme button and enter into sub programme h2 to set the conditions for heating step 2.

7.7.5.1 Set the heating capacity of the digestion unit as 70 % by using + or – key to adjust the heating capacity.

7.7.5.2 Bring the cursor to time mode by pressing time button and set the time as 40 minutes by using + or – key.

7.7.6 Press the programme button and enter into sub programme h3 to set the conditions for heating step 3.

7.7.7 Set the heating capacity as 00 and time for digestion as 00 .

7.7.8 Enter the programme button to save the programme and come to main display (H2).

7.7.9 Press the run button to execute the saved programme.

7.7.10 After digestion, cool the digested sample before distillation.

7.8 Distillation

7.8.1 Prerequisites

7.8.1.1 Before transferring the digested material to distillation apparatus (Kjeldahl apparatus) wash the apparatus with steam for 7 minutes with 100 % steam capacity.

7.8.1.2 Ensure that the condensor is connected to water tap for condensation of distillate.

7.8.1.3 Ensure that the priming of distillation unit is done as per SOP No. QC-101.

7.9.2 Distillation process

7.9.2.1 Place an Erlenmeyer/conical flask into position containing 50.0 mL of 0.01M HCl with 0.2 mL of methyl red solution.

7.9.2.2 Place the steam inlet tube into the digested sample tube.

7.9.2.3 Place the quick clamping device and place the digestion tube

into position.

7.9.2.4 Check the tight fit of the tube against the Viton cone.

7.9.2.5 Close the protection door and switch the instrument on.

7.9.2.6 Programme the system as per SOP No. QC-101. Select the required steps given below and run the distillation unit.

Step 1: In programme 0, while programming skip the addition of boric acid by setting the time as 00 seconds as this addition is not required for this procedure.

Step 2: Set the time as 02 seconds to deliver approximately 25.0 mL of water (collected from WFI loop).

Step 3: Set the time as 03 seconds to deliver approximately 30.0 mL of 10M NaOH.

Step 4: Set the reaction time as 00 min and 00 seconds.

Step 5: Set the distillation time as 04 min 00 seconds.

Step 6: Set the steam power as 80 %.

Step 7: Set the sample suction power as 20 seconds.

7.9.2.7 After completion of distillation and evacuation of distilled sample from the tube. Remove the conical flask from the distillation apparatus and titrate.

7.9.2.8 Clean the system as per SOP No. QC-101.

7.10 Titration

7.10.1 Observe the distillate and if the Hydrochloric acid is neutralized by the ammonia during distillation process, as indicated by yellow color of the distillate. In this case dilute the sample to two fold and perform the test.

7.10.2 Titrate the distillate of blank, followed by controls and sample collected in collection flask against 0.01 M Sodium hydroxide using 0.2 mL of Methyl red solution as an indicator.

7.10.3 The difference between the first and second titration value should not exceed 0.5 mL.

7.10.4 Record the results in RST No. QC-F-0277.

7.11 Calculation

Note:

a. Each mL of 0.01 M Hydrochloric acid is equivalent to 0.1401 mg of Nitrogen.

7.11.1 Calculate the protein nitrogen content by using the following formula.

$$PN2 = \frac{(\text{Blank} - \text{Sample}) \times 0.1401 \times \text{Determined molarity of } 0.01 \text{ N NaOH} \times \text{Dilution fold}}{\text{Volume of the sample} \times 0.01 \text{ N HCl}}$$

= _____ mg PN2 / mL

7.11.2 Calculate the Antigenic Purity of purified toxoid by the following formula.

Lf content of toxoid (Lf / mL)

Protein Nitrogen / mL

= _____ Lf / mg PN2

7.11.3 Calculate the percent recovery of standard by using the following formula.

$$\% \text{ Recovery} = \frac{\text{Observed content of PN2}}{\text{Expected content of PN2 (2 mg)}} \times 100$$

Expected content of PN2 (2 mg)

7.11.4 Enter the results in RST No. QC-F-00277.

7.12 Validity

7.12.1 The difference between the first and second titration value should not exceed 0.5 mL.

7.12.2 The test is valid only when the recovery of the standard is 95 to 105%.

7.13 Acceptance criteria

The antigenic purity of Diphtheria toxoid for vaccine should be $\geq 1500 \text{Lf/mgP N2}$.

[5.0] Procedure: Note: Make sure that all the reagents are at room temperature	
before use.	
5.1	Pipette 25µl of Standards, controls and samples into wells. Prepare
	1:10 dilution of test ARM. (100µl of test ARM is taken and 900µl of
	PBS-1X is added to it).
5.2	Pipette 100µl of anti-P. pastoris: HRP into each well.
5.3	Cover and incubate on dancing shaker at room temperature for 1 hour.
5.4	Aspirate the contents to waste. Blot and vigorously bang out residual
	liquid over absorbent paper. Wash generously with diluted wash
	solution by flooding the wells with solution by pipeting in 300µl.
	Dump and bang again. Repeat for a total of 4 washes. Wipe off any
	liquid from the bottom outside of the microtiter wells as any residue
	can interfere in the reading step.
5.5	Pipette 100µl of TMB substrate provided in the kit into the wells.
	Take care to add TMB in dark.
5.6	Cover and incubate the plate for 30 minutes at room temperature. Do
	not shake.
5.7	Pipette 100µl of stopping solution provided in the kit.
5.8	Read absorbance at 450/655nm using a ELISA reader.
5.9	Follow the given pathway to save the Absorbance obtained from ELISA
	reader:
	5.9.1

	3.1.3	mg	:Milligram
	3.1.4	mL	:Millilitre
	3.1.5	µl	:Micro litre
	3.1.6	µg	:Microgram
	3.1.7	nm	:Nanometer
	3.1.8	PN	:Part Number
	3.1.9	SD	:Standard Deviation
	3.1.10	PRP	:Polyribosyl Ribitol Phosphate
4.0	Procedure:		
4.1	Preparation of solutions:		
	4.1.1	100 µg/mL phosphorus solution:	
		4.1.1.	Weigh 0.2194 g of potassium dihydrogen phosphate and
		1	transfer it to 500 mL volumetric flask.
		4.1.1.	Dissolve and make up the volume to 500 mL with purified
		2	water.
		4.1.1.	This solution is stored at room temprature and used
		3	within 6 months.
	4.1.2	5 µg/mL Phosphorus solution:	
		4.1.2.	Take 5 mL of 100 µg/mL phosphorus solution and make up
		1	the volume to 100 mL with purified water. This solution
			is freshly prepared.
	4.1.3	25 mg/mL ammonium molybdate solution:	
		4.1.3.	Weigh 625 mg of ammonium molybdate and transfer it to
		1	25 mL volumetric flask.
		4.1.3.	Dissolve and make up the volume to 25 mL with purified
		2	water.
		4.1.3.	This solution is stored at room temperature and used
		3	within 6 months.
	4.1.4	100 mg/mL ascorbic acid solution:	
		4.1.4.	Weigh 2.5 g of ascorbic acid and transfer it to 25 mL
		1	volumetric flask.
		4.1.4.	Dissolve and make up the volume to 25 mL with purified
		2	water.
		4.1.4.	This solution is freshly prepared.
		3	
	4.1.5	3 M Sulphuric acid:	
		4.1.5.	Take approximately 500 mL of purified water in a 1
		1	litre volumetric flask. To this add 162 mL concentrated
			Sulphuric acid slowly.
		4.1.5.	Make up the volume to 1 litre with purified water.
		2	
		4.1.5.	This solution is stored at room temperature and used
		3	within 6 months.
	4.1.6	Ammonium molybdate reagent:	
		5.1.6.	Take 1 volume of 25g/l solution of ammonium molybdate,
		1	1 volume of 100 g/l solution of ascorbic acid, 1 volume
			of 3 M Sulphuric acid and 2 volumes of purified
			water. This solution is freshly prepared.
4.2	Preparation of Calibration Curve:		
	4.2.1	Prepare calibration curve (2.5-10 µg) with freshly prepared	
		5µg/mL phosphorus solution in previously labelled micro	
		centrifuge tube. Calibration curve is prepared in duplicates	
		as follow:	
		Phosphorus content (µg)	2.5
		5µg/mL phosphorus solution (µl)	500
		Note: The Calibration curve is accepted if it is meeting the	
		parameters of correlation coefficient i.e. ≥ 0.990	
4.3	Test:		
	4.3.1	Dilute the sample so that the sample volumes (1mL) used in	
		test contain about 6 µg of phosphorus i.e. lies within the	
		calibration curve.	
		(In case of dry polysaccharide prepare a solution containing	
		about 1-5 mg/mL of polysaccharide and use it as test sample)	
	4.3.2	Treat 2 mL purified water as blank in thermoresistant test	
		tube.	
	4.3.3	Add 0.2 mL of concentrated sulphuric acid to tubes of	
		calibration curve, Blank and sample.	
	4.3.4	Heat the tubes in oil bath or turbotherm at 120°C for 1 hour	
		and then at 160°C until white fumes appear (about 1 hour).	
	4.3.5	Add 0.1 mL of perchloric acid to all the tubes and heat the	
		tubes at 160°C until the solution is decolourised (about 90	
		minutes).	
	4.3.6	Cool at room temperature and add 4 mL of purified water and 4	
		mL of ammonium molybdate reagent.	
	4.3.7	Heat in water bath at 37°C for 90 minutes and cool.	
	4.3.8	Transfer the contents of each tube to 10 mL volumetric flasks	
		and make up the volume of each tube to 10 mL with purified	
		water.	
	4.3.9	Set the wavelength in spectrophotometer at 820 nm. Zero the	
		absorbance of blank and then measure the absorbance of	

		calibration curve and test samples. The blue colour is stable
		for several hours.
	4.4 Calculations:	
	4.4.1 Once the absorbance of the standards and the test samples	
	have been taken, calculation shall be done using the excel	
	sheet carrying formulas for the required calculation.	
	4.4.4 Enter the absorbance for calculations starting from the	
	Calibration curve prepared between 2.5 and 10 g of phosphorus	
	and test samples. The calculations are made according to the	
	equation of minimum squares.	
	$Y = mX + b$.	
	Where: m = slope	
	b = intercept	
	Y = absorbance	
	X = concentration	
	(Multiply by dilution factor)	
	4.4.5 Calculate the content of phosphorus (per mL) in the test	
	sample by multiplying with the dilution factor.	
	4.4.6 In case of PRP,	
	Phosphorous (%) in PRP on dry weight basis:	
	Phosphorous content in PRP($\mu\text{g/ml}$)	
	Phosphorous content in dry PRP =	

	$(\mu\text{g/mL}) \times 1 - \{\text{Moisture}\}$	
	$(\%) / 100$	
	Phosphorous content in dry PRP ($\mu\text{g/mL}$)	
	Phosphorous (%) = _____ x	
	100	
	Concentration of PRP solution ($\mu\text{g/mL}$)	
	4.5 Acceptance criteria:	
	The coefficient of variation (CV) between the replicates of the	
	samples should be $\leq 5\%$.	
	5.0 Forms and Records:	
	Determination of Phosphorous Concentration	
	6.0 Reference:	
	European pharmacopoeia.	

1.0 |Objective |
|To lay down the procedure for estimation of residual formaldehyde content. |
2.0 |Scope |
|This Standard Operating Procedure is applicable to all the samples in which|
|residual formaldehyde content is to be determined. |
3.0 |Responsibility |
3.1	The analyst is responsible for executing the described procedure
	correctly.
3.2	Supervisor is responsible for verifying that the procedure is carried
	out correctly and check the results.
3.3	HOD shall be responsible for overall compliance of this SOP and shall
	ensure that the SOP is reviewed every two years or if required
	earlier.

		5.1.3
		5.1.4
		5.1.5
		5.1.6
		5.1.7
	5.2	Place request for Dunken hartley Guinea pigs (250-350g) and Swiss
	mice (17-22g) to the Head Animal House. Receive the animals after	
	health status evaluation of animals by Veterinary officer.	
	5.3	Selection of animals for test:
		5.3.1
		pigs weighing 250-350 g.
		5.3.2
		of Swiss mice.
		5.3.3
		AH/005.
		5.3.4
		labels as per SOP AH/093.
	5.4	Injection:
		Note: Put the test number in Annexure 1 before preparation of
	dilutions as XXXX/YNNN	
		Where, XXXX is ABTX (Abnormal Toxicity Test),YY is the last two digit
	of the year e.g. 12 for year 2012 and NNN is consecutive test number	
	for the year YY.	
		5.4.1
		intraperitoneally. In case the vaccine contains pertussis as
		one of the components inject each mouse with half of the
		single humane dose of vaccine intraperitoneally.
		5.4.2
		intraperitoneally.
	5.5	Observations:
		5.5.1
		pigs twice daily for 7 days, remove and euthanize all the
		animals in moribund stage and mark it as dead. Record in daily
		observation sheet as per Annexure 2.
		5.5.2
		day and 7th day. Compile the report as per Annexure 1 in
		reference with Annexure 2.
		5.5.3
	5.6	Acceptance criteria:
		The sample passes the test, if none of animals dies or shows signs of
	ill health in seven days following the injection.	
	5.7	Retest Criteria:
		5.7.1
		health. The preparation passes the test if none of the animals
		in the repeat test dies or shows signs of ill health in seven
		days following the injection.
	5.8	Upon completion of the test and approval of the test results by Head
	QC.	

1.0 |Objective |
 |To lay down the procedure for testing the potency of whole cell pertussis |
 |vaccine by challenge method in Swiss albino mice. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to all the batches of whole |

5.1.28	Casein acid hydrolysate	
5.1.29	Thermal box	
5.2	Preparation of solutions	
5.2.1	Physiological saline	
Add 0.9 gm of weighed Sodium Chloride to 50ml of purified water,		
mix well and make up it to 100ml.		
5.2.2	1% Casamino Acid Solution	
5.2.3	Bordet Gengou Medium	
5.3	Place request for Swiss Albino mice (13-16g) to the Head Animal House.	
After health status evaluation of animals by Veterinary officer, receive		
the animals.		
5.4	Selection of animals for test:	
5.4.1	Select 24 Swiss albino mice per dilution weighing 13-16 g.	
Difference in the weight of mice should not be more than 4 g.		
5.4.2	Preferably choose mice of the same sex; otherwise equally	
distribute males and females in each group.		
5.4.3	Distribute mice in three groups of 24 mice each per dilution for	
each batch of test sample and reference standard. Four groups of		
10 mice each are to be used for LD50 determination. All the mice		
in various groups should be distributed randomly.		
5.4.4	Mark each group of mice with appropriate color scheme. The cages	
housing the mice shall bear labels		
5.5	Preparation of reference dilution :	
Raise the request for Reference Standard required for testing and record		
its utilization. Take the vial of reference standard stored in		
temperature 5±3°C and place the reference standard in thermal box with		

		ice pack and transfer the reference material to room no. 15 of Animal				
		House Experimental for the preparation of dilutions in biosafety				
		cabinet.				
		5.5.1	Prepare the biosafety cabinet for aseptic operation.			
		5.5.2	Reconstitute the reference standard with normal saline so as to			
		contain 8 I.U. per mL.				
		5.5.3	Take 3 glass vials and label them as 1:4, 1:20, and 1:100.			
		Add 15 mL of physiological saline in to 1st vial and 16 mL				
		remaining 2nd, 3rd vials.				
		5.5.4	Add 5.0 mL of the reconstituted reference vaccine to the 1st vial,			
		mix properly with vortex mixer. (1/4 dilution)				
		5.5.5	Take 4 mL of 1/4 dilution and mix it thoroughly in 16 mL of			
		physiological Saline (2nd vial) with vortex				
		mixer (1/20 dilution).				
		5.5.6	Take 4 mL of 1/20 dilution and mix it thoroughly in 16 mL of			
		physiological Saline (3rd vial) with vortex mixer (1/100				
		dilution).				
		5.6	Preparation of test vaccine dilution:			
		5.6.1	Based on the Opacity units (IOU/mL) of the Pertussis Bulk samples,			
		formulate the sample to contain 32 IOU/mL with adjuvant as per				
		Annexure 4.				
		5.6.2	Take 3 vials and label them 1:4, 1:20 and 1:100			
		5.6.3	Add 15 mL of physiological saline in to 1st vial and 16mL each in			
		remaining 2nd and 3rd vial.				
		5.6.4	Add 5.0 mL of the formulated vaccine to the 1st vial, mix properly			
		with vortex mixer. (1/4 dilution)				
		5.6.5	Take 4 mL of 1/4 dilution and mix it thoroughly in 16 mL of			
		physiological Saline (2nd vial) with vortex				
		mixer (1/20 dilution).				
		5.6.6	Take 4 mL of 1/20 dilution and mix it thoroughly in 16 mL of			
		physiological Saline (3rd vial) with vortex mixer (1/100				
		dilution).				
		5.7	Immunization:			
		5.7.1	Inject each mouse in each group with 0.5 mL of appropriate			
		dilution of reference and vaccine intraperitoneally.				
		5.7.2	Keep the four groups of 10 mice each as uninoculated for LD50			
		(control group).				
		Keep the immunized animals under observations for 14 days. The				
		mortality, if any in the immunized mice before challenge should				
		not exceed 6% in each dilution of test as well as reference				
		vaccine.				
		5.7.3	Observe the animals daily twice (morning and evening) and record			
		the observation in Annexure 2 and 3				
		5.8	Preparation of Challenge culture:			
		5.8.1	Start preparing the challenge culture under aseptic conditions six			
		days prior to challenge. All the activities are to be carried out				
		in biosafety cabinet.				
		5.8.2	Reconstitute one ampoule of Bordetella pertussis challenge strain			
		(WC) 18323 in 6 – 7 drops of sterilized casamino acid solution.				
		5.8.3	Inoculate two B.G. plate with the reconstituted B.pertussis			
		challenge culture. Incubate the plate at 35 ± 2 0 C for				
		three days.(Revival)				
		5.8.4	On completion of incubation, check the growth and its purity			
		microscopically after Gram staining and subculture on two fresh				
		B.G. slopes/plates. Record the Grams staining observations.				
		Incubate the slopes/plates at 35 ± 2 0 C for 48 hours. (1st				
		subculture)				
		5.8.5	Check the purity of 48 hour growth microscopically after Gram			
		staining and make fresh subcultures on B. G. slopes/plates. Record				
		the Grams staining observations. Incubate the slopes/plates at 35				
		± 2 0 C for 24 hours. (2nd subculture)				
		5.8.6	Check the purity of 20- 24 hours old culture of B. pertussis			
		microscopically after Gram staining. Record the Grams staining				
		observations. This culture will be used for the challenge.				
		5.9	Preparation of challenge dose:			
		5.9.1	On the day of challenge, take the culture and wrap the slants/			
		plates of Bordet Gengou media in aluminium foil carefully and				
		keep it in thermal box. Take the thermal box to Animal house				
		experimentation, room no. 15 for preparation of dilutions in				
		biosafety cabinet.				
		5.9.2	Harvest the growth of B. pertussis culture obtained using curved			
		Pasteur pipette and suspends it into 5 mL Casamino acid in				
		sterile test tube with some glass beads.				
		5.9.3	Vortex the tube containing culture and filter the bacterial			
		suspension through sterile nylon cloth under strict aseptic				
		conditions to remove any clumps from the suspension.				
		5.9.4	Adjust the opacity of the suspension to 10 I.O.U. per mL by			
		comparing the opacity with International Opacity Reference				
		Standard visually.				
		5.9.5	From the preparation at (5.9.4), prepare the following dilutions			
		of challenge				
		Culture.				
		S.No.	No. of Organisms	Dilution	Challenge organism	Diluent in
				suspension in mL	mL	
		A	109/mL	10 Fold	1.0 (10 IOU/mL)	9.0
		B	108/mL	100 Fold	1.0 (A)	9.0
		C	107/mL	1000 Fold	2.0 (B)	18.0
		D	1,00,000/ 0.03 mL	3000 Fold	10.0 (C)	20.0
				(Approximately)		
				Challenge dose		
		E	10,000 / 0.03 mL	30000 Fold	1.0 (D)	9.0
		F	2,000 / 0.03 mL	1.5 × 105	2.0 (E)	8.0

			Fold						
		G	400 / 0.03 mL	7.5 × 10⁵	2.0 (F)	8.0			
			Fold						
		H	80 / 0.03 mL	37.5 × 10⁵	2.0 (G)	8.0			
			Fold						
		5.9.6	Vortex well each dilution and transfer each dilution to vial						
		individually.							
		5.10	Inoculation of challenge dose:						
		5.10.1	14-17 days after immunization, inject intracerebrally 0.03 mL						
		of the challenge dose(1,00,000 organisms/0.03mL) into all the							
		groups of immunized mice using Hamilton Microlab 501A dispenser							
		system or Hamilton syringe and 25 G, 5.1 mm needles.							
		5.10.2	Observe the animals twice daily for 14 days and record the						
		deaths. If any animal found in moribund stage euthanize the							
		animal and mark them as dead. Exclude the animals for							
		calculation dying within three days from the day of challenge.							
		5.11	LD50 Control:						
		5.11.1	Mark four groups of 10 mice each (selected on the day of						
		immunization with reference and test vaccine) appropriately.							
		5.11.2	Inject each of four groups with 0.03 mL of dilutions containing						
		10000, 2000, 400 and 80 organisms per 0.03 mL respectively.							
		5.11.3	Observe the animals twice daily for 14 days and record the						
		deaths on each day.							
		5.11.4	Exclude the deaths occurring within three days from the day of						
		challenge.							
		5.12	Percent Viable Count Determination:						
		5.12.1	Spread 0.1 mL of dilution containing 80 organisms per 0.03 mL						
		on two B.G. plates before challenge and on two plates after							
		completion of the challenge.							
		5.12.2	Incubate the plates at 35 ± 2 °C for 72 hours.						
		5.12.3	On completion of incubation period, count the number of						
		colonies on each plate and calculate the average.							
		5.12.4	Calculate the percent viable count by dividing the average no.						
		of colonies by 266 (total no. of organisms present in 0.1 mL of							
		dilution containing 80 organisms per 0.03 mL) and multiplying							
		with 100.							
		5.13	Observations:						
		Daily observe all the inoculated mice twice and record the sick and							
		deaths.							
		5.14	Calculations:						
		Count the number of surviving mice 14 days after the injection of the							
		challenge dose and calculate the potency of the test sample being							
		examined relative to the potency of the standard preparation on the							
		basis of the number of surviving mice in each of the three groups of							
		twenty-four, using standard statistical method (CombiStats Software,							
		EDQM). Determination of LD50 value by Reed and Muench formula.							
		Example : Suppose four groups of ten mice in each are injected with							
		doses expressed in number of organisms i.e. 10,000; 2000; 400; 80 (The							
		immunized mice are challenged with the virulent pertussis bacteria in a							
		dose containing 1,00,000 organisms)							
		Dose (No	Total	Observations for	Accumulated	Total	%		
		of	No of	14 days	observations	Mortality	Mortality		
		organisms)	animals			y	y		
			Deaths	Survival	Deaths	Survival			
				s	s				
		2000	10	9	1	17	1	17/18	94.44
		400	10	7	3	8	4	8/12	66.66
		80	10	1	9	1	13	1/14	7.14
		Proportional Distance (P.D.) = 50 – less than 50 x Log 5							
		More than 50 – less than 50							
		= (50 – 7.14)/ (66.66-7.14) x 0.69897							
		= 0.5033							
		Log LD50= Log of dose just below 50 % mortality + P.D.							
		= Log 80 + P. D							
		= 1.9030 + 0.5033= 2.406							
		LD50 = Antilog (2.406)							
		= 254 organisms							
		Total LD50 used = 100000/254 = 393							
		5.15	Validity of the test: The test is considered valid, if						
		5.15.1	It fulfills the criteria of Linearity.						
		5.15.2	It fulfills the criteria of Parallelism.						
		5.15.3	50 % protective doses lie between the largest and smallest						
		doses of the preparation.							
		5.15.4	The challenge dose contains 100 -1000 LD50.						
		5.15.5	The percent viable count ranges from 12.5% to 62.5%.						
		5.16	Criteria for acceptance: The sample passes the test, if:						
		The sample passes the test the requirement for potency, if the results							
		of the statistically valid assay so that the estimated potency of the							
		vaccine is not less than 4.0 IU per single human dose and the lower							
		fiducial limit (P=0.95) of the estimated potency is not less than 2.0							
		IU							
		5.17	Retest policy: Repeat the test if:						
		5.17.1	The test is invalid; it does not fulfill one or more validity						
		criteria.							
		5.17.2	The test is valid but the results are out of specification.						
		repeat the test once. The results of all valid tests are							
		combined to calculate the potency by the geometric mean							
		estimation and its lower fiducial limit.							
		5.17.3	The geometric mean of the valid tests is within the prescribed						
		limits, the vaccine batches pass the test. But in case the							
		geometric mean is still below the prescribed limit, the vaccine							
		batches fail the potency test.

1.0	Objective			
	To lay down Procedure of Citrate Utilization Test.			
2.0	Scope			
	This Standard Operating Procedure is applicable to identification of			
	citrate utilization organism for all samples.			
3.0	Responsibility			
	3.1	The Analyst shall be responsible for carrying out the procedure as		
	established in this SOP.			
	3.2	Supervisor shall be responsible for verifying that the same has been		
	carried out correctly.			
	3.3	Head QC or his designee shall be responsible for overall compliance		
	of the SOP.			
4.0	Abbreviations and Definitions			
	4.1	SOP	: Standard Operating Procedure	
	4.2	QA	: Quality Assurance	
	4.3	QC	: Quality control	
	4.4	mL	: milliliter	
	4.5	µL	: microliter	
5.0	Procedure:			
	5.1	Equipment, Materials and Reagents		
		5.1.1	Autoclave	
		5.1.2	Positive control: Klebsiella pneumoniae ATCC 13883	
		5.1.3	Citrate Negative: Escherichia coli ATCC 25922	
		5.1.4	Simmons Citrate Agar (M099,Himedia)	
		5.1.5	Physiological saline (0.9% w/v)	
		5.1.6	Glass tubes for slant	
		5.1.7	Weighing balance	
		5.1.8	pH meter	
		5.1.9	Magnetic stirrer with hot plate	
	5.2	Preparation of solutions		
		5.2.1	Simmons Citrate Agar	
			5.2.1.1	Weigh the 28.24g Simmons Citrate Agar powder and
				dissolve in 700ml of Deionized water.
			5.2.1.2	Deionized water pH should between 6.5-7.0
			5.2.1.3	Gently heat, with mixing, to boiling until agar is
			dissolved.	
			5.2.1.4	Dispense the media 4.0 to 5.0 ml into 16-mm tubes.
			5.2.1.5	Autoclave at 121 degree C under 15 psi pressure for 15
			minutes	
			5.2.1.6	Cool in slanted position (long slant, shallow butt).
			5.2.1.7	Store the slant in refrigerator (2-8°C).
	5.3	Test procedure		
		5.3.1	Streak the slant with a light inoculum picked from the center	
			of a well-isolated colony and Parllely streak the negative and	
			positive control organism the slants.	
		5.3.2	Incubate the slants aerobically at 35 to 37°C for 4-7 days.	
		5.3.3	Observe a color in the slants.	
	5.4	Interpretation of results		
		5.4.1	Positive Reaction: Growth with color change from green to	
			intense blue in the slant.	
		5.4.2	Negative Reaction: No growth and No color change; Slant remains	
			green.

5.11	Limulus Amoebocyte Lysate, Pyrotell
5.12	Standard Endotoxin {Concentration as per certificate of analysis
	(when reconstituted with LAL reagent water)}
5.13	LAL reagent water (LRW)
6.0	Preparation of solutions:
Not applicable	
7.0	Procedure:
Note: Make sure that all the reagents are at room temperature before use.	
7.1	Clean the working shelf properly with 70% Isopropyl alcohol and keep
	all the materials and reagents.
7.2	Preparation of Limulus Amoebocyte Lysate:
7.2.1	This reagent must be reconstituted just prior to use.
7.2.2	Reconstitute the lyophilized lysate by adding LAL reagent
	water as per label directions. Swirl gently but thoroughly for
	at least 30 seconds.
	Note: Do not shake, as the contents will foam.
7.2.3	The reconstituted lysate can be stored for 24 hours at 2-8°C
	without loss of sensitivity or at -20°C for four weeks. Frozen
	liquid lysate should be thawed immediately before use and
	repeated thawing should be avoided.
7.3	Preparation of endotoxin standard.
7.3.1	Take an endotoxin vial. Reconstitute endotoxin control with
	LAL reagent water, as per label directions. The Concentration
	of standard endotoxin is as per the Certificate of Analysis
	(when reconstituted with LAL reagent water). For example, the
	concentration of endotoxin is 2500 EU/vial as per Certificate
	of Analysis. When reconstituted with 5 ml of LAL reagent water
	as per the label instructions, the concentration becomes
	2500EU/5ml or 500EU/ml
7.3.2	Vortex the vial vigorously for 1 minute, and then at 5-10
	minute intervals over a 30-60 minutes period at room
	temperature.
7.3.3	Dilute the reconstituted endotoxin with LAL reagent water to a
	concentration of 1 EU/ml.
7.3.4	Using 1 EU/ml endotoxin solution, prepare a serial two-fold
	dilution series in LAL Reagent water till two points lower than
	the endpoint of the lysate is reached.
	Dilution series of Standard endotoxin
	Tube
	number
	water
	1.
	2.
	3.
	4.
	5.
	6.
	Note: Each dilution should be vortex for at least 30 seconds
	prior to proceeding to the next dilution.
7.4	Preparation of samples:
For this, calculate the Maximum Valid Dilution (MVD) of the sample in	
which endotoxin has to be detected. The formula for calculating the MVD	
value is given below:	
	pic

	where:				
		[pic] = Endotoxin limit of sample			
		[pic] = Potency (concentration) of sample in 1 ml			
		[pic] = Sensitivity of LAL			
	Then the sample is diluted to its MVD value using LAL Reagent water.				
	7.5	Preparation of Product Positive Control (PPC):			
	For this, dilute the samples according to MVD/2 value with LAL Reagent				
	Water. Then take 0.2 ml of this dilution and add 0.2 ml of 4 λ standard				
	endotoxin.				
	7.6	Mark the reaction tubes for different dilutions of standard endotoxin,			
	all product positive controls, samples and negative controls in				
	duplicates.				
	7.7	Carefully transfer 0.1 ml of different dilutions of standard endotoxin,			
	sample (appropriately diluted to MVD value), PPCs and negative control				
	into the appropriately marked reaction tubes.				
	7.8	Then add 0.1 ml of the reconstituted lysate to each tube beginning with			
	the highest concentration of standard endotoxin followed by negative				
	control, test samples and PPCs.				
	7.9	Following the addition of lysate, incubate the tubes at 37°C for 1 hour			
	in a tube heating block.				
	Note: Assay tubes should not be disturbed prior to the specified time				
	of 1 hour.				
	7.10	After 1 hour of incubation examine each reaction tube for gelation.			
	7.11	A positive reaction is indicated by a firm gel that remains intact			
	momentarily when tube is inverted at 180°.				
	7.12	Results:			
	Gel Clot Method: The results are expressed as endpoint (the endpoint				
	dilution is the last dilution of endotoxin which still yields a				
	positive result).				
	Example for reporting results with Lysate of sensitivity 0.06 EU/ml.				
	Rep.	Endotoxin Dilutions (EU/ml)		PPC	Endpoint
		LRW	Sample		EU/ml

1.0|Objective: |
 |To lay down the procedure for the Determination of Yeast DNA in Samples of |
 |Active Raw Material of Hepatitis B vaccine (Recombinant) by PCR Method. |
 2.0|Scope: |
 |This Standard Operating Procedure is applicable to the Active Raw Material |
 |(ARM) of Hepatitis-B vaccine (rDNA). |
 3.0|Responsibility: |
3.1	The analyst shall be responsible for executing the described
	procedure correctly.
3.2	The supervisor of the laboratory shall be responsible for verifying
	that the procedure is followed correctly and for checking the results.
3.3	The Departmental Head shall be responsible for the overall compliance
	of the SOP .

				7 ng	
				0.7ng	
				0.07 ng	
				7pg	
		5.6.2	These dilutions shall be used as template for DNA		
			amplification by PCR as positive control. Purified water		
			shall be used as template in case of the negative control.		
		5.6.3	Prepare the PCR reaction as follows:		
			(for 9 rxns)		
			Reagents		
			Volume to be added		
			Taq polymerase		
			4.5 μ L		
			Yeast DNA F1 primer		
			4.5 μ L		
			Yeast DNA R1 primer		
			4.5 μ L		
			10 X PCR buffer		
			45 μ L		
			dNTPs		
			36 μ L		
			Purified water		
			357 μ L		
		5.6.4	Distribute the reaction mixture in 8 PCR tubes (45 μ L each)		
			and label them as 10-1, 10-2, 10-3, 10-4, 10-5,10-6 ,		
			Negative and Test		
		5.6.5	Add 5 μ L of each dilution prepared in 5.6.3 in the respective		
			PCR tube. Thus the concentration of DNA in the PCR reaction		
			comes out as:		
			10-1 : 175 ng		
			10-2 : 17.5 ng		
			10-3 : 1.75 ng		
			10-4 : 0.175 ng		
			10-5 : 17.5 ng		
			10-6 : 1.75 ng		
		5.6.6	Add 5 μ L of Purified water in the PCR tube labeled as		
			Negative.		
		5.6.7	Add 5 μ L of the ARM sample to be tested in PCR tube labeled		
			as Test.		
		5.6.8	Incubate the PCR tubes shall be incubated for 5 min at the		
			room temperature.		
		5.6.9	Switch ON the Mastercycler as per procedure.		
		5.6.10	Set the thermal cycler program as:		
			Cycles		
			Temperature/time		
			1 cycle		
			94°C for 2 min		
			40 cycles		
			94°C for 30 sec		
			54.3°C for 1 min		
			72°C for 45 sec		
		5.6.11	After the PCR reaction is completed take out the PCR tubes

- || Eppendorf No. 7: 10 μ L of PBS 1X + 10 μ L from Eppendorf No.6 |
- || Eppendorf No. 8: 10 μ L of PBS 1X + 10 μ L from Eppendorf No.7 (discard |
- || 10 μ L) |
- || 5.6.6 |Add 90 (L of PBS (1X) to each Eppendorf so as to obtain a |
- || |final volume of 100 (L. |
- || 5.7 |Preparation of the test samples: |
- || |Taking into account that the dose to be evaluated is equivalent to |
- || |100 μ g of |
- || |protein, divide 100 by the protein concentration of the sample as |
- || |determined by UV absorption at 280. The quotient obtained, gives |
- || |the volume in μ L of the sample, which is to be evaluated. Once this|
- || |volume has been determined, the next step is to make a 10 times |
- || |dilution of the sample with PBS (1X). |
- || 5.8 |DNase free BSA (10 mg/mL) is used as negative control. Treat it, as|
- || |the test sample was treated above. The quotient in this case is |
- || |equal to 10 (L. To obtain a 10-fold dilution, make up the volume to|

[100 µL with 90 (L of PBS (1X).]
[5.9 [Wet the Nylon Hybond-N membrane in SSC (10X) for 5 minutes.]
[5.10 [Prepare the Dot-blot apparatus (Vacuum manifold) for applying the]
[samples and controls. For this, take the pre-wetted membrane and]
[place in the apparatus. Properly cover the wells that are not to be]
[used for loading any sample, with a plastic sheet. This shall be]
[done very precisely so that the wells are perfectly covered with]
[the sheet and there is no possibility of any leakage of vacuum.]
[5.11 [Denature the DNA of the standard, controls and test samples by]
[heating at 95°C]
[for 5 minutes in the tube-heating block. Apply the samples using an]
[auto pipette]
[in to the wells of the Dot-blot apparatus (Vacuum manifold). Create]
[vacuum in the apparatus with help of external vacuum pump. After]
[all the desired volume of the samples have been applied in the]
[required wells, switch off the vacuum pump and carefully dismount]
[the manifold system to remove the nylon membrane having samples on]
[it.]
[5.12 [Submerge the membrane (without agitation) in a container containing]
[denaturing solution for 5 minutes. Volume of the solution shall be]
[enough to completely cover the membrane.]
[5.13 [Transfer the membrane to a container containing neutralizing]
[solution and submerge it for 5 minutes. Do not agitate. Ensure]
[that the volume of the solution is sufficient to submerge the]
[membrane completely.]
[5.14 [Remove the membrane from neutralizing solution and place it on a]
[Whatman Paper No.1. Incubate the membrane in an Oven at 80°C for]
[10 min.]
[5.15 [Expose the membrane to UV light for 3 minutes ensuring that sample]
[side is facing UV Light.]
[5.16 [Prepare the pre-hybridization solution as follows:]
[For a volume of 2ml add:]
[Solutions]
[Volume to be added]
[SSC 20X]
[600 µL]
[Denhardt's reagent (50X)]
[200 µL]
[Formamide]
[1000 µL]
[SDS (20%)]
[50 µL]
[Calf thymus DNA or tRNA]
[20 µL]
[Sterile purified Water]
[130 µL]
[This solution is enough for membrane having dimensions of 8 cm X 2]
[cm. If the membrane is larger, prepare more volume of solution.]
[This solution must be prepared freshly, just prior to use to]
[prevent any of its components from precipitating.]
[5.17 [Put the membrane in a plastic bag and transfer 2 mL of]
[pre-hybridization solution, carefully remove all bubbles and seal]
[the bag with a PVC Bag Sealer. The pouch containing the membrane]
[and prehybridisation solution is then incubated at 42°C. The]
[incubation time can vary from 2 hours to 12 hours.]
[5.18 [Preparing the probe:]
[5.18.1 [Digest the plasmid pRSP3 (which acts as the probe) with]
[enzyme EcoRI at concentration 5 I.U. of enzyme per µg of]
[DNA. The procedure is as follows:]
[Mix the following in an Eppendorf:]
[Solutions]
[Volume to be added]
[plasmid pRSP3 (50ng)]
[2 µL]
[Buffer EcoRI (10X) in a way so that a concentration of 1X]
[remains]
[3 µL]
[5U of EcoRI]
[1 µL]
[Sterile purified water]
[25 µL]

			Incubate for 1 hour at 37°C.	
		5.18.2	Afterwards, check for the completion of digestion by	
		running agarose gel electrophoresis in 0.8% gel at 80V		
		using TBE (1X). Adjust the concentration of probe to		
		50ng/μL.		
		5.19	The procedure for Labeling the probe pRSP3 of concentration	
		50ng/μL with (-dATP32 (10μCi/μL) while the membrane is in the		
		pre-hybridization solution is as follows:		
		5.19.1	Add the following in an Eppendorf:	
		Solutions		
		Volume to be added		
				Probe (pRSP3 at 50 ng/μL)
		digested with EcoR I		
				1μL
				Nick translation buffer 10X
		3μL		
				dCTP 10 mM
		1μL		
				dGTP 10 mM
		1μL		
				dTTP 10 mM
		1μL		
				Klenow fragment 10U/μL(
		1 μL		
				(-dATP32 (10(Ci/μL)
		4 μL		
		Sterile purified water		
		18 μL		
		Final volume of the reaction		
		30μL		
		((If the concentration of the enzyme is more than 10U/μL,		
		then dilute with sterile purified water to a concentration		
		of 10U/μL)		
		5.20	Place the tube in a thermostat-regulated water bath at 37oC for 1	
		hour and then		
		add 70 μL of stopping solution to make up to 100 μL of final		
		volume.		
		5.21	Prepare Sephadex G-25 column:	
		5.21.1	Take one Eppendorf and with the help of a sterile needle	
		make a small hole at the base.		
		5.21.2	Put glass wool at the base and add 1 mL of Sephadex G-25.	
		5.21.3	Centrifuge at 6000 rpm for 30 seconds.	
		5.21.4	Wash the column with 200μL of sterile water and centrifuge	
		at 6000 rpm for 30 seconds.		
		5.21.5	Add 200μL of sterile water containing 2μL of tRNA of	
		concentration 10mg/mL or 2μL of calf thymus DNA (in this		
		case calf thymus DNA should be denatured at 95oC).		
		5.21.6	Centrifuge at 6000 rpm for 4 min (to saturate the column).	
		5.22	Pass 100μL of labeled probe through the Sephadex G-25 column.	
		Centrifuge at 6000 rpm for 4 min. Recover the elute and preserve at		
		-20oC if it is not to be used immediately.		
		Note: the labeled probe should not be stored for more than 24		
		hours.		
		5.23	Calculating the Specific Activity (S.A.) of the probe:	
		For this purpose, apply 1μL of the eluate on a disc of Whatman		
		filter paper No.1 (2 cm in diameter) and place it in a		
		scintillation vial. Determine the cpm (counts per minute) in a		
		(-liquid scintillation counter (model 1409 DSA).		
		After determining the cpm of the probe, calculate the specific		
		activity by means of the following formula:		
		S.A. = cpm incorporated(X total vol. of the probe (100μL)		
		μg of probe added (0.05μg) = cpm/μg of DNA		
		(cpm incorporated: the cpm value obtained from the Scintillation		
		counter.		
		Note: If the S.A. is less than 10 8 cpm/μg, which indicates low		
		sensitivity, it is not advisable to use the labeled probe.		
		Therefore it will be discarded in the acrylic bins provided for		
		this purpose in the lab and a new probe will be prepared.		
		5.24	Prepare the hybridization solution as follow:	
		Solutions		
		Volume to be added		
				SSC (20X)
		600μL		
				Formamide
		1.0 mL		
				SDS (20X)

5.2 | Preparation of Solutions | Preparation of Solutions

|| Prepare all the solutions as described below. Carry out the labelling of the prepared solutions and assign the lot numbers. | Prepare all the solutions as described below. Carry out the labelling of the prepared solutions and assign the lot numbers.

|| 5.2.1 | 0.01M EDTA solution: - Take 1.47g EDTA in 500 mL of purified water. Mix well and store the solution at room temperature for not more than one month.

|| 5.2.2 | Sodium Acetate Solution: - Take 0.64 g of sodium acetate in 100 mL of purified water. Mix well and store the solution at room temperature for not more than one month.

|| 5.2.3 | Glacial acetic acid solution: - Take 1.5 mL of glacial acetic acid and made upto 100 mL with purified water.

|| 5.2.4 | Acetate buffer (pH 4.6 $\pm$ 2): - Take exactly 36.2 mL of sodium acetate solution into 250 mL flask and add 14.8 mL of glacial acetic acid solution, make the volume 100 ml using distilled water using purified water.

|| 5.2.5 | 0.005 M Copper Sulphate solutions: - Take 0.79g of Copper Sulphate in 1000 mL of purified water. Mix well and store the solution at room temperature for not more than one month.

5.3 | Sample preparation | Sample preparation

|| 5.3.1 | Dilute the sample and control (Reference Vaccine) to 1/10 dilution.

Note: For preparing the 1/10 dilution of the sample and control, take 1mL of sample / control and add 9 mL of Purified water.

|| 5.3.2 | Carry out the analysis of sample in triplicate and for control and blank in duplicate.

5.4 | Test Procedure | Test Procedure

|| 5.4.1 | Transfer 3 mL of purified water to 2 thermo resistant test tubes which are treated as Blank.

|| 5.4.2 | Transfer 3 mL of previously diluted sample to 3 thermo resistant test tubes.

|| 5.4.3 | Transfer 3 mL of previously diluted control to 2 thermo resistant test tubes.

|| 5.4.4 | To each tube add 1 mL of conc. Sulphuric acid and 125 μL of conc. Nitric Acid.

|| 5.4.5 | Place the tubes in a beaker containing boiling water and heat for ten minutes.

|| 5.4.6 | Take out the tubes and allow cooling at room temperature.

|| 5.4.7 | Transfer the content from each tube to separate Erlenmeyer flask and rinse the remaining material of the tube with 10 mL of purified water and add to the respective Erlenmeyer flask.

|| 5.4.8 | Add 2 drops of Methyl orange to each Erlenmeyer flask, pink colour will appear.

|| 5.4.9 | Add 50% Sodium hydroxide solution drop by drop until the colour of the contents of each Erlenmeyer flask changes from pink to light yellow.

|| 5.4.10 | Add 25 ml of purified water, 10 mL of 0.01M EDTA solution and 5 mL of the acetate buffer solution to each.

|| 5.4.11 | Boil the solution in the Erlenmeyer flask for about three minutes (Start the time count when the solution begins to boil). In the meantime fill 0.005 M Copper Sulphate solutions in a burette.

|| 5.4.12 | After heating is over remove the flask from the hot plate.

|| 5.4.13 | Add 1 mL of 1-pyridyl-2-azonaphthol solution to the Erlenmeyer flask and carry out the titration (while the solution is hot) with 0.005 M Copper Sulphate solution, until the colour of sample changes to purple - red colour, this colour is compared to the colour of Blank.

|| 5.4.14 | Note the volume of 0.005M Copper Sulphate solution used in the titration.

5.5 | Calculations | Calculations

|| 5.5.1 | Calculate V_b as the average volume of Copper Sulphate consumed in the titration of blank.

|| 5.5.2 | Calculate the volume of Copper Sulphate (0.005 M) consumed for titrating each replicate of Sample/Control. For this, subtract the average value of blank from each replicate of the sample/control independently. At the end, take mean of these values.

|| 5.5.3 | Concentration of the Al^{3+} ion:

$$C \text{ (mg/ml)} = (V_b - V_m)/A \times 0.1349 \times 10$$

Concentration of Aluminium Hydroxide:

Multiply with a factor of 4.52 to obtain the concentration of aluminium phosphate.

$C \text{ (mg/ml)} = (V_b - V_m)/A \times 0.1349 \times 10 \times 2.89$

| | 5.5.4 | Here:

V_b: Average volume of Copper Sulphate solution (0.005 M) consumed in the titration of blank.

V_m: Volume of Copper Sulphate solution (0.005M) consumed in the titration of each replicate of the sample.

A: Sample volume taken to perform the test.

0.1349: Mass of Aluminum equivalent to 1 ml Solution of Copper Sulphate (0.005 M).

4.52: Conversion factor of Aluminum ion to Aluminium Phosphate.

10: Dilution factor of the Sample.

| 5.6 | Acceptance criteria for the test | Acceptance criteria for the test

| | 5.6.1 | The Aluminium content in the control should be within the acceptable limits.

| | 5.6.2 | The Aluminium content in the sample should be within the specified limits.

 |3.4 USP |: United State Pharmacopeia |
 |3.5 EP |: European Pharmacopoeia |
 4. Procedure: |
 |4.1 Equipments, Materials and Reagents |
 |4.1.1 Laminar airflow cabinet |
 |4.1.2 Incubators at 32.5 + 2.5°C and 22.5 + 2.5°C |
 |4.1.3 Sterile syringes |
 |4.1.4 Sterile pipettes |
 |4.1.5 Sterile gloves |
 |4.1.6 Sterile forceps |
 |4.1.7 McCartney bottles |
 |4.1.8 Purified water |
 |4.1.9 Tryptone Soya Broth |
 |4.1.10 Fluid Thioglycollate Medium |
 |4.1.11 Soya Bean Casein Digest media |
 |4.2 Preparation of Sterility Media: |
 |4.2.1 Fluid Thioglycollate Medium (FTM): |
 |4.2.1.1 Media for the test may be prepared as described |
 |below, or equivalent commercial media may be used |
 |provided that they comply with the growth promotion |
 |test. |
 |4.2.1.2 Prepare FTM media is prepared as per the produce |
 |mentioned below: |
 |Ingredient |Content |
 |L-Cystine |0.5 g |
 |Agar |0.75 g |
 |Sodium chloride |2.5 g |
 |Glucose monohydrate/anhydrous |5.5/5.0 g |
 |Yeast extract (water-soluble) |5.0 g |
 |Pancreatic digest of casein |15.0 g |
 |Sodium thioglycollate or |0.5 g |
 |Thioglycollic acid |0.3 ml |
 |Resazurin sodium solution (1 g/l |1.0 ml |
 |of resazurin sodium), freshly | |
 |prepared | |
 |Water R |1000 ml |
 |4.2.1.3 Mix the L-cystine, agar, sodium chloride, glucose, |
 |water-soluble yeast extract and pancreatic digest of |
 |casein in 700 ml of purified water R and heat until |
 |the components are completely dissolved. |
 |4.2.1.4 Dissolve the sodium thioglycollate or thioglycollic |
 |acid in the solution and, if necessary, add sodium |
 |hydroxide (1 mol/l) so that, after sterilization, |
 |the solution will have a pH of 6.9 to 7.3. |
 |4.2.1.5 Add the resazurin sodium solution, mix and place the |
 |medium in suitable vessels which provide a ratio of |
 |surface to depth of medium such that not more than |
 |the upper half of the medium has undergone a colour |
 |change indicative of oxygen uptake at the end of the |
 |incubation period. |
 |4.2.1.6 Make up the volume of the media to 1000 ml with |
 |purified water and distribute the media in suitable |
 |bottles / containers |
 |4.2.1.7 Fill the media in sterile glass bottles / containers |
 |in a volume of 80 to 100ml. The volume of the media |
 |is validated such that the sample that needs to be |
 |analyzed does not get over diluted. If any |
 |antimicrobials or preservatives are present in the |
 |test sample should get sufficiently diluted so that |
 |their inhibitory effect is lost. |
 |4.2.1.8 Sterilize the bottles by autoclaving, after |
 |sterilization, store the media at a temperature |
 |between 2 °C and 25 °C. Do not use the medium for a |
 |longer storage period than has been validated. |
 |4.2.2 Soyabean Casein Digest Medium (SCDM): |
 |Media for the test may be prepared as described below, or |
 |equivalent commercial media may be used provided that they |
 |comply with the growth promotion test. |
 |Prepare SCDM media is prepared as per the produce mentioned |
 |below: |
 |Ingredient |Content |
 |Pancreatic digest of casein |17.0 g |
 |Papain digest of soya-bean |3.0 g |
 |meal | |

		Sodium chloride	5.0 g
		Dipotassium hydrogen	2.5 g
		phosphate	
		Glucose monohydrate/anhydrous	2.5/2.3 g
		Water R	1000 ml
		4.2.2.1	Dissolve the solids in 700 ml of purified water R,
			warming slightly to dissolve the contents.
		4.2.2.2	Cool the solution to room temperature and add sodium
			hydroxide (1 mol/l) VS, if necessary, so that after
			sterilization the solution will have a pH of 7.1 to
			7.5.
		4.2.2.3	Make up the volume of the media to 1000 ml with
			purified water and distribute the media in suitable
			bottles / containers to sterilize the media by
			autoclaving.
		4.2.2.4	Fill the media in sterile glass bottles / containers
			in a volume of 80 to 100ml. The volume of the media
			is validated such that the sample that needs to be
			analyzed does not get over diluted. If any
			antimicrobials or preservatives are present in the
			test sample should get sufficiently diluted so that
			their inhibitory effect is lost.
		4.2.2.5	Sterilize the bottles by autoclaving, after
			sterilization; store the media at a temperature
			between 2 °C and 25 °C. Do not use the medium for a
			longer storage period than has been validated.
	4.3	Growth Promotion Test (GPT): Each batch of medium prepared either	
		from dehydrated medium or from ingredients has to be tested for	
		growth promotion test of aerobes, anaerobes and fungi.	
	4.3.1	GPT for Fluid Thioglycolate Media:	
	4.3.1.1	Prepare suspensions of Clostridium sporogenes,	
		Pseudomonas aeruginosa and Staphylococcus aureus and	
		inoculate each suspension into separate containers	
		of FT media.	
	4.3.1.2	Inoculate each suspension as not more than 100 CFUs.	
	4.3.1.3	Incubate the containers at 30–35 °C for next 3 days.	
	4.3.1.4	The media is considered suitable for use if a	
		clearly visible growth of the microorganisms occurs	
		at the end of incubation period.	
	4.3.2	GPT for Soyabean Casein Digest Medium:	
	4.3.2.1	Prepare suspensions of Aspergillus brasiliensis,	
		Bacillus subtilis and Candida albicans. and	
		inoculate each suspension into separate containers	
		of SCD media.	
	4.3.2.2	Inoculate each suspension as not more than 100 CFUs.	
	4.3.2.3	Incubate the containers at 20–25 °C for not more	
		than 3 days in the case of bacteria and not more	
		than 5 days in the case of fungi.	
	4.3.2.4	The media is considered suitable for use if a	
		clearly visible growth of the microorganisms occurs	
		at the end of incubation period.	
	Strains of the test microorganisms suitable for use in the Growth		
	promotion test:		
	Aerobic bacteria:		
	Staphylococcus aureus	ATCC 6538, CIP 4.83, NCTC	
		10788, NCIMB 9518, NBRC 13276,	
		NBRC 13276	
	Bacillus subtilis	ATCC 6633, CIP 52.62, NCIMB	
		8054, NBRC 3134	
	Pseudomonas aeruginosa	ATCC 9027, NCIMB 8626, CIP	
		82.118, NBRC 13275	
	Anaerobic bacterium		
	Clostridium sporogenes	ATCC 19404, CIP 79.3, NCTC 532	
		or ATCC 11437, NBRC 14293	
	Fungi		
	Candida albicans	ATCC 10231, IP 48.72, NCPF	
		3179, NBRC 1594	
	Aspergillus brasiliensis	ATCC 16404, IP 1431.83, IMI	
		149007, NBRC 9455	
	4.3.3	Execution of the test for liquid culture media:	
	4.3.3.1	Test each sterilized lot of the liquid media.	
		Transfer 1 ml of inoculum in each test bottle of	
		dilution having 10-100 CFU/ml of each test	
		microorganism listed in the Table, and its previous	
		dilution.	
	4.3.3.2	Simultaneously transfer 0.1 ml of the selected	
		dilution having 10-100 CFU/ml on Tryptone Soya Agar	
		Plate, which will act as control plate, with the	
		purpose of checking the viability and the presence	
		of contamination in the Inoculum.	
	4.3.3.3	Spread the inoculum with the help of spreader and	
		thoroughly spread it to dry	
	4.3.3.4	Incubate the inoculated media bottles and Petri	
		plates according to the requirement of test	
		microorganisms.	
	4.3.3.5	Count the cfu in the control plates, calculate the	
		productivity ratio and % efficiency as described	
		below. Observe the turbidity in case of the	
		bottles and record the findings.	
	The Productivity Ratio is calculated in the following		
	way:		

			P.R = A x B			
			C x D			
			where: A: Average Count in the Test Plate			
			B: Dilution Factor of Test Plate			
			C: Average Count in the Control Plate			
			D: Dilution factor of the Control Plate			
			Calculate the % Efficiency as follows:			
			% Efficiency = P.R x 100			
		4.3.5	Procedure for checking the Growth Promotion Properties of			
		Culture Medium/Media in case of Clost. sporogenes:				
		4.3.5.1	Take 48 hours growth of C. sporogenes in cooked meat			
		medium. Make serial dilution of the culture up to				
		10-8 dilution to determine the dilution containing				
		10 to 100 cfu.				
		4.3.5.2	Transfer 0.1 ml aliquot of the dilutions 10-5, 10-6,			
		10-7 and 10-8 in duplicate to Tryptone Soya Agar				
		(with Glucose) to confirm the viability and number				
		of organisms in the dilution.				
		4.3.5.3	Place the plates in Anaerobic Gas Jar in an inverted			
		position.				
		4.3.5.4	Place an oxygen-absorbing pack inside the Gas jar			
		for maintaining an anaerobic environment and for the				
		detection of an anaerobic environment in the Gas jar				
		place an indicator tablet. Use the pack and				
		indicator tablet according to the supplier's				
		directions. Properly seal the Gas jar.				
		4.3.5.6	Incubate the Gas jar with plates at 36 + 2 °C for 48			
		to 72 hours.				
		4.3.5.7	Count the CFU in the plates and the growth should be			
		verified by Gram Staining for its purity and				
		determination of any contamination.				
		4.3.5.8	In case of Fluid Thioglycollate Medium, transfer 1			
		ml aliquot of the dilution having 10–100 CFU and the				
		preceding dilution in the respective bottles and				
		incubate at 33.0 ± 2°C for 48-72 hours				
		4.3.5.9	Observe for growth/turbidity at the completion of			
		the incubation period.				
		4.3.6	Interpretation of the results:			
		4.3.6.1	The test media are satisfactory if clear evidence of			
		growth or turbidity appears in the test media				
		container within specified period for bacteria and				
		fungal cultures as per specification. Follow the				
		table to interpret the results.				
		Sr.No	Observation	Test	Control	Result
			bottle	plate		
		1.	Growth	Positive	Positive	Passes
		2.	Growth	Negative	Positive	Fails
		3.	Growth	Negative	Negative	Repeat
					the test	
		4.	Negative	Negative	Positive	Passes
			control *			
		4.3.6.2	The growth should be verified by Gram Staining for			
		its purity and determination of any				
		contamination.				
		4.4	Control of the culture media:			
		4.4.1	Control of Fluid Thioglycollate Medium and Tryptone Soya			
		Broth (used in Sterility Testing):				
		4.4.2	Incubate the entire sterilized lot of the medium, Fluid			
		Thioglycollate at 33.0 ± 2°C and Tryptone Soya Broth at 22.5				
		± 2°C, for 48-72 h.				
		4.4.3	If 2 % or more of the batch is contaminated discard the			
		whole batch after decontamination otherwise re-incubate two				
		bottles of each media and observe for sterility for 14 days				
		along with the Sterility test.				
		4.4.4	However, the sterility test of the test media is considered			
		invalid if the growth promotion test fails.				
		4.5	Preliminary Operations for Sterility test:			
		Switch "ON" the laminar airflow cabinet for at least half an hour				
		before starting with the test.				
		4.5.1	Preparation of Material and equipment for sterility testing:			
		4.5.1.1	Label the previously prepared media bottles for			
		Fluid Thioglycollate Medium and Tryptone Soya Broth				
		Medium with the sample name and code.				
		4.5.1.2	Remove the first paper wrapping from all the			
		sterilized materials required in the test and place				
		them in the material transfer hatch of sterility				
		testing room from the sterilization and material				
		preparation laboratory.				
		4.5.1.3	Remove the second wrapping from the materials			
		whenever required, inside the laminar airflow				
		cabinet.				
		4.6	Procedure for performing the Sterility Test by membrane filtration			
		method:				
		4.6.1	Ensure that all three valves of the sterilized membrane			
		filtration assembly are in closed position.				
		4.6.2	Connect a sterilized filtration flask to the drain pipe of			
		the sterilized membrane filtration assembly.				
		4.6.3	Open the filtration funnels and place pre-sterilized 0.45			
		micron membrane filters with the help of sterile forceps.				
		Close the funnel lid.				
		4.6.4	Open the lid of the manifold of membrane filtration assembly			

			and add approximately 5 ml of sterile purified water/rinse	
			solution in all the funnels to wet the membrane filters.	
		4.6.5	Switch "ON" the vacuum Pump and open the valves of membrane	
			filtration assembly for drainage.	
		4.6.6	Close the valves and switch "OFF" the vacuum pump. Add the	
			required amount of sample. Now rinse with enough volume of	
			sterile rinse solution for ARM and Final Bulk of Vaccine.	
			Switch ON the vacuum pump and allow it to pass through the	
			membrane filter.	
		4.6.7	After filtration switch "OFF" the vacuum pump and open the	
			latch of the funnel. Aseptically remove the membrane(s) from	
			the holder, transfer the membrane in Fluid Thioglycollate	
			Medium and in Tryptone Soya Broth Medium	
		4.6.8	System suitability for membrane filtration method	
			After transferring the content of the container or	
			containers under test to the membrane, add an inoculum of a	
			small number of viable microorganisms (not more than 100	
			CFU) to the final portion of sterile diluent used to rinse	
			the filter.	
		4.7	Sterility by direct inoculation method	
		4.7.1	With sterile syringe(s) or pipette(s) withdraw the test	
			sample as per the specification for the test sample.	
		4.7.2	Dispense 1 ml aliquots of the sample in one bottle each of	
			Fluid Thioglycollate Medium and Tryptone Soya Broth	
			Medium/SCDM media.	
		4.7.3	System suitability for direct inoculation method	
			After transferring the contents of the container or	
			containers under test to the culture medium, add an inoculum	
			of a small number of viable microorganisms (not more than	
			100 CFU) to the medium.	
		4.7.4	In both system suitability tests, use the same	
			microorganisms as those described above under Growth	
			promotion test of aerobes, anaerobes and fungi.	
		4.7.5	Incubation conditions:	
			Incubate bottles containing Tryptone Soya Broth Medium at	
			22.5 + 2.5°C and those containing Fluid Thioglycollate	
			Medium at 32.5 + 2.5°C for 14 days.	
		4.7.6	Minimum quantity of sample to be used for each medium	
		Quantity per container	Minimum quantity to be used for	
		each medium unless otherwise		
		justified and authorized		
		Liquids		
			Less than 1 ml	The whole contents of each
			container	
			1-40 ml	Half the container of each
			container but not less than 1 ml	
			Greater than 40ml and	20ml
			not greater than 100ml	
			greater than 100ml	10 % of the content of the
			container but not less than 20ml	
			Antibiotic liquids	1ml
		Solids		
			Less than 50mg	The whole contents of each
			container	
			50 mg or more but not	Half the contents of each
			less than 300mg	container but not less than 50 mg
			300 mg -5 g	150mg
			Greater than 5g	500mg
		Final Lot (Vials, ampoules, PFS)		
		Batch Size	Sample quantity for sterility	
			assay	
			Not more than 100	10% or 4 containers whichever is
			containers	greater
			More than 100 but less	10 containers
			than 500 containers	
			More than 500 containers	2% or 10 containers whichever is
			less	
		4.8	Observations and Interpretation of the results:	
		4.8.1	During the incubation period and at its conclusion, examine	
			the media for evidence of microbial growth/turbidity.	
		4.8.2	When the material/sample being tested renders the medium	
			turbid so that the presence or absence of microbial growth	
			cannot be determined by visual examination, then transfer 1	
			ml of the medium to fresh bottles of the same medium at the	
			end of incubation period of 3 days.	
		4.8.3	Incubate the original and fresh bottles for a period of next	
			14 days.	
		4.8.4	If no evidence of microbial growth is found, the product	
			examined complies with the test for sterility.	
		4.8.5	If evidence of microbial growth is found the product	
			examined does not comply with test for sterility, unless it	
			can be clearly demonstrated that the test was invalid for	
			causes unrelated to the examined product.	
		4.8.6	If test is declared to be invalid, it is repeated using	
			sterility retention sample.	
		4.8.7	If no evidence of microbial growth is found in the sterility	
			repeat test, the product examined complies with the test for	
			sterility.	
		4.8.8	If microbial growth is found in the repeat test, the product	
			examined does not comply with the test for sterility.	
		4.9	Bacteriostasis and Fungistasis assay:	
		4.9.1	Before starting to analyze of a new product it should be	

		ensured that no inhibitory substances for bacterial or	
		fungal growth are present in it, therefore, it is necessary	
		to demonstrate that no inhibitory substances are present or	
		the test conditions are to be adjusted / modified to nullify	
		these effects. The bacteriostasis and fungistasis assay	
		shall be carried out one time.	
	4.9.2	Preparation of the inoculum for Bacteriostasis and	
		Fungistasis assay:	
		Take slants of strains, listed in Table 1 below, from	
		culture bank stored at 2-8°C. Streak them on fresh slants of	
		Tryptone Soya Agar and incubate at the temperature optimum	
		for that strain as mentioned in the respective dossier. To	
		the growth, add 9 ml of Peptone Water Saline and mix gently.	
		From this suspension make serial dilutions in Peptone Water	
		Saline for all organisms. Take Tryptone Soya Agar Petri	
		plates and spread dilutions 10⁻⁵ to 10⁻⁸. Incubate at the	
		optimum temperature for that microorganism as mentioned in	
		the respective dossier for the microorganism and enumerate	
		the Colony Forming Units at the end of the incubation	
		period. Select the dilution that has 10 to 100 CFU/ml	
	TABLE 1		
	Media	Microorganisms	
	Fluid	Bacillus subtilis	ATCC 6633, CIP 52.62, NCIMB 8054,
	Thioglycollate		NBRC 3134
	Medium		
	Clostridium sporogenes	ATCC 19404, CIP 79.3, NCTC 532 or	
		ATCC 11437, NBRC 14293	
	Pseudomonas aeruginosa	ATCC 9027, NCIMB 8626, CIP	
		82.118, NBRC 13275	
	Candida albicans	ATCC 10231, IP 48.72, NCPF 3179,	
		NBRC 1594	
	Staphylococcus aureus	ATCC 6538, CIP 4.83, NCTC 10788,	
		NCIMB 9518, NBRC 13276, NBRC	
		13276	
	Tryptone Soya	Bacillus subtilis	ATCC 6633, CIP 52.62, NCIMB 8054,
	Broth Medium		NBRC 3134
	Candida albicans	ATCC 10231, IP 48.72, NCPF 3179,	
		NBRC 1594	
	Aspergillus	ATCC 16404, IP 1431.83, IMI	
	brasiliensis	149007, NBRC 9455	
	4.9.3	Perform the test with the same volume of each medium as is	
		to be used in the sterility test and introduce in it the	
		same volume of sample whose sterility is to be checked as in	
		the main test. Also inoculate 1 ml aliquot of the dilution	
		containing 10 to 100 viable microorganisms/ml of each test	
		microorganism mentioned in Table 1. Incubate all bottles of	
		Fluid Thioglycollate Medium at 33.0 ± 2°C and that of	
		Tryptone Soya Broth at 22.5 + 2°C. Observe for appearance of	
		growth for 3 days in case of bacteria and 5 days in case	
		fungi.	
	4.9.4	Control: Take same volume of each medium as is to be used in	
		the sterility test. Inoculate it with 1 ml of the dilution	
		containing 10 to 100 viable microorganisms per ml of each	
		test microorganism mentioned in Table 1. Incubate all	
		bottles of Fluid Thioglycollate Medium at 33.0 + 2°C and	
		that of Tryptone Soya Broth at 22.5 + 2°C. Incubate for 3	
		days in case of bacteria and for 5 days for fungi.	
	4.9.5	Interpretation of results	
	4.9.5.1	If clearly visible growth of microorganisms is	
		obtained after the inoculation, visually comparable	
		to that in the control bottle, the test for	
		sterility can be carried out without further	
		modification in the amount of the sample and in the	
		medium to be used.	
	4.9.5.2	If clearly visible growth is not obtained in	
		presence of the sample under examination, visually	
		comparable to that in the control bottle without the	
		sample, the sample possesses Bacteriostasis and	
		Fungistasis activity. A neutralising agent may be	
		used adjusting the concentration of neutralizing	
		agent till the inhibitory effect of Bacteriostasis	
		and Fungistasis activity is completely neutralized.	
	4.9.5.3	If a neutralizing agent is not available modify the	
		amount of the sample and medium to be used in order	
		to eliminate Bacteriostasis and Fungistasis activity	
		and repeat the test.	
	4.9.5.4	When the sample exhibits antimicrobial activity in	
		the medium, increase the quantity of the medium so	
		that, the sample is sufficiently diluted to prevent	
		inhibition of growth	
	4.9.5.5	If no growth is present in both the control and test	
		bottles, repeat the test.

1.0 |Objective |
 |To lay down the procedure for the determination of residual Cetyl Trimethyl|
 |Ammonium Bromide (CTAB) concentration in Meningococcal Purified |
 |Polysaccharide samples by Titration Method. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to the final purified |
 |Polysaccharide samples. |
 3.0 |Responsibility |
3.1	The analyst is responsible for executing the described procedure
	correctly.
3.2	Supervisor is responsible for verifying that the procedure is carried
out correctly and check the results.	
3.3	HOD shall be responsible for overall compliance of this SOP and shall
ensure that the SOP is reviewed every two years or if required	
	earlier.

[1.0 |Purpose: |
 ||To lay down the procedure for the quantification of ribose concentration. |
 [2.0 |Applicable to: |
	This Standard Operating Procedure is applicable to all the samples of PRP
	and PRP-TT bulk conjugate of Haemophilus Influenzae type b in which ribose
	concentration is to be determined.
[3.0	Abbreviations
	3.1
[4.0	Procedure:
	4.1
[4.3	Test:
	4.3.1

	4.3.6	Close the tubes with aluminium foil and place the test
		tubes in boiling water bath for 20 minutes.
	4.3.7	Take out the tubes and cool in ice cold water.
	4.3.8	Allow the tubes to come at room temperature.
	4.3.9	Set the wavelength in spectrophotometer at 670 nm. Zero the
		absorbance of blank and then measure the absorbance of
		calibration curve and test samples.
	4.4	Calculations:
	4.4.1	Once the absorbance of the standards and the test samples
		have been taken, calculation shall be done using the excel
		sheet carrying formulas for the required calculation.
	4.4.2	Enter the absorbance for calculations starting from the
		Calibration curve prepared between 2.5 and 25 g of Ribose and
		test samples. The calculations are made according to the
		equation of minimum squares.
		$Y = mX + b$.
		Where: m = slope
		b = intercept
		Y = absorbance
		X = concentration
		(Multiply by dilution factor)
	4.4.3	Calculate the content of ribose in the test solution for each
		volume tested.
	4.4.4	Conversion factor for PRP:
		PRP content = Ribose content / 0.434
	4.4.5	In case of PRP,
		Ribose (%) in PRP on dry weight basis:
		Ribose content in dry PRP ($\mu\text{g/ml}$) =
		Ribose content in PRP($\mu\text{g/mL}$) $\times$ $1 - \{\text{Moisture} (\%) / 100\}$
		Ribose content in dry PRP ($\mu\text{g/mL}$)
		Ribose (%) = $\frac{\text{Ribose content in dry PRP } (\mu\text{g/mL})}{\text{Concentration of PRP solution } (\mu\text{g/mL})} \times 100$
		Concentration of PRP solution ($\mu\text{g/mL}$)
	4.5	Acceptance criteria:
	4.5.1	The coefficient of variation (CV) between the replicates of
		the samples should be $\leq 5\%$.
	4.5.2	Ribose content in the sample should be within the acceptance
		limits.
	5.0	Forms and Records:
		Determination Of Ribose Concentration By Orcinol Method .
	6.0	References:
		European pharmacopoeia.

1.0 |Objective |
 |To analyze purified and lyophilized polysaccharide samples of Neisseria |
 |meningitides for the determination of any residual Deoxycholic acid by |
 |reversed phase liquid chromatography with RI detector (HPLC). |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable for purified and |
 |lyophilized polysaccharide samples of Neisseria meningitides in the QC. |
 3.0 |Responsibility |
 |3.1 |The analyst shall be responsible for carrying out the described |
 |procedure correctly. |
 |3.2 |The Supervisor of the laboratory shall be responsible for verifying |
 |that the procedure is complied with and for checking the results. |
 |3.3 |The departmental head/designee shall be responsible for training of |
 |the staff and for overall compliance of the SOP. |
 |3.4 |Head QA/Designee shall be responsible for final approval and |
 |subsequent compliance of the SOP. |
 4.0 |Abbreviations and Definitions |

4.26	System Suitability test: System suitability tests are an integral	
part of gas and liquid chromatographic methods. They are used to		
verify that the resolution and reproducibility of the chromatographic		
system are adequate for the analysis to be done.		
The tests are based on the concept that the equipment, electronics,		
analytical operations and samples to be analyzed constitute an		
integral system that can be evaluated as such.		
5.0	Procedure	
5.1	Precautions to be taken:	
5.1.1	Always wear laboratory coat.	
5.1.2	Always use filtered solutions. Filtration of solution should be	
done in order to eliminate the entry of possible particles, if		
any, into the system as well as the column.		
5.1.3	Degas all solutions. Avoid entry of bubbles into the system as	
well as column.		
5.1.4	All the solution bottle openings should be well covered with	
aluminum foil.		
5.1.5	Check the calibration status of all equipment and instrument.	
5.1.6	Handle acids carefully wearing gloves and always manipulate in	
fume hood.		
5.2	Requirement:	
5.2.1	Equipment:	
5.2.1.1	Calibrated HPLC system with RI detector	
5.2.1.2	Laboratory Centrifuge	
5.2.1.3	Refrigerator	
5.2.1.4	Vacuum Pump	
5.2.1.5	Fume Hood	
5.2.2	Instrument:	
5.2.2.1	Analytical balance	
5.2.2.2	Precision balance	
5.2.2.3	pH Meter	
5.2.2.4	Magnetic stirrer

5.2.4.2	Methanol	

||| 5.2.4.3 |Acetonitrile |

||| 5.2.4.4 |Purified Water |

||| 5.2.4.5 |Sodium Acetate anhydrous |

||| 5.2.4.6 |Orthophosphoric Acid |

|| 5.3 |Preparation of solutions: |

|| |Prepare all the solutions as described below. Carry out the labelling|

|| |of the prepared solutions and assign the lot numbers to the |

|| |solutions. |

|| |5.3.1 |0.02M Sodium acetate Solution: To prepare 250mL of 0.02M sodium|

|| |acetate solution, weigh 410.2mg of sodium acetate anhydrous and|

|| |dissolve in 250mL of 0.2µm filtered purified water. |

|| |5.3.2 |1M Phosphoric Acid: To prepare 50mL of 1M phosphoric Acid, take|

|| |3.2mL of Orthophosphoric acid and dissolve in 46.8mL of 0.2µm |

|| |filtered purified water. |

|| |5.3.3 |Mobile phase for DCA |

|| |5.3.3.1 |To prepare 1 litre of mobile phase, add 375mL of |

|| |methanol and 375mL of acetonitrile to 250mL of 0.02M |

|| |sodium acetate solution. |

|| |5.3.3.2 |Adjust the pH to 4.3 using 1M Phosphoric acid. Filter |

|| |the mobile phase using 0.2µm nylon membrane filter and|

|| |degas the solution for 20 minutes using sonicator. The|

|| |mobile phase solution can be stored at room |

|| |temperature only for two days. |

|| |5.3.4 |3mg/mL DCA stock: |

|| |5.3.4.1 |Take 30mg of DCA in a 10mL volumetric flask and |

|| |dissolve in 7mL of mobile phase and make up the volume|

|| |to 10mL with mobile phase. |

|| |5.3.4.2 |Vortex the mixture until a clear solution is formed |

|| |and then filters it using 0.2µ inorganic membrane |

|| |filter. |

|| |5.3.5 |Working standard solutions: |

|| |5.3.5.1 |Prepare 2.0mL of 1200µg/mL standard solution by adding|

|| |800µL of 3mg/mL DCA stock in 1200µL of mobile phase. |

|| |5.3.5.2 |Make 5 concentrations of standard solutions (600µg/mL,|

|| |300µg/mL, 150µg/mL, 75µg/mL and 37.5µg/mL) as per |

|| |below table: |

S No	Standard	Volume of standard	Volume of Mobile
	Conc.	solution	Phase used
1	600µg/mL	750µL of 1200µg/mL	750µL
		solution	
2	300µg/mL	750µL of 600µg/mL	750µL
		solution	
3	150µg/mL	750µL of 300µg/mL	750µL
		solution	
4	75µg/mL	750µL of 150µg/mL	750µL
		solution	
5	37.5µg/mL	750µL of 75µg/mL	750µL
		solution	

|| |5.3.6 |Preparation of Lyophilized polysaccharide sample for HPLC |

|| |analysis: |

|| |5.3.7 |Prepare 1mg/ml of polysaccharide sample in 0.2µm filtered |

|| |purified water. Keep the sample at 2-8°C for overnight on gel |

|| |rocker. |

|| |

|| |5.3.8 |All the solutions prepared for use are vacuum filtered using |

|| |Nylon 6, 6 membrane 0.20 µm/0.22 µm, depending upon the nature |

|| |of solution to be filtered. For organic solvents 0.45µm filters|

|| |should be used (filtration not necessary if the solution is |

|| |prepared in 0.2 µ filtered purified water). |

|| 5.4 |Preparing the HPLC System for run: |

|| |5.4.1 |Flow Rate: 1.0 mL/min |

|| |5.4.2 |Detection using: RID at 30°C |

|| |5.4.3 |Run time: 18 minutes |

|| |5.4.4 |Load method : DCA.M |

|| |5.5 |Equilibration of the system and the column: |

|| |Equilibrate the column and the system at 1mL/min flow rate of mobile |

|| |phase until the RID baseline is stabilized. |

|| |5.6 |Transfer the blank, test sample(s) and standards into screw cap vials|

|| |and place against the appropriate no. on the sample tray. |

|| |5.7 |Running of sequence |

|| |5.8.1 |Load sequence DCA.S. |

|| |5.8.2 |Open the sequence parameter option by clicking Sequence menu. |

|| |5.8.3 |Enter information about the data directory and operator name. |

|| |5.8.4 |In the shutdown option, click on the post-sequence option and |

|| |select LAMPOFF/STANDBY. |

|| |5.8.5 |In sequence table option, specify the sample names, methods and|

|| |vials to run in the sequence as per the following table: |

S No	Sample Code	Sample details	No. of Injections
			Injections on
			Volume
1	Blank	Eluent Blank	1 20 µL
2	DCA Standard	3 System Suitability 6	20 µL
		test	
3	Blank	Eluent Blank	1 20 µL
4	DCA Standard	1 37.5 µg/mL	2 20 µL
		Standard	
5	DCA Standard	2 75 µg/mL Standard	2 20 µL
6	DCA Standard	3 150 µg/mL Standard	2 20 µL
7	DCA Standard	4 300 µg/mL Standard	2 20 µL
8	DCA Standard	5 600 µg/mL Standard	2 20 µL
9	Blank	Eluent Blank	1 20 µL
10	Test Sample (s)	Sample	2 20 µL

		5.8.6	Click on run sequence option in run control menu to start the
		sequence.	
		5.8.7	Each sample run will be of 18 min and after running all the
		samples the sequence will automatically stop.	
		5.8.8	Inject the eluent blank after every 20 injections of sample.
		Note: One extra vial with same SST sample can be used if 6	
		injections are not possible from single vial.	
		5.9	Calculations :
		5.9.1	Results of the sample are calculated from the calibration
		standards using the EXCEL worksheet.	
		5.9.1.1	Area under curve and retention time for the
		standards/sample is analyzed by Chemstation software.	
		5.9.1.2	Calculations for Standard curve and samples
		The calculations are made according to the equation of	
		minimum squares. $Y = mX + b$	
		Where: m = slope	
		b = intercept	
		Y = absorbance	
		X = concentration	
		5.9.1.3	Use EXCEL program for the preparation of calibration
		curve and calculation of the results.	
		5.9.1.4	Note the values of area under the curve and retention
		time for standards to prepare standard curve in	
		Annexure 1 and also in EXCEL format for calculation of	
		standard curve.	
		5.9.1.5	Prepare standard curve by creating a copy of Master
		EXCEL in the desired folder and record.	
		5.9.1.6	The amount of DCA present in the sample is calculated
		by using the formula	
		Concentration of DCA in sample (X) = $Y-b$	
		,	
		m	
		Where Y = peak area of DCA in test sample	
		b = intercept	
		m = slope	
		5.9.2	Calculations for System Suitability Test:
		5.9.2.1	Note the values of area under the curve and retention
		time for Standard 3 (SST standard) in Annexure 1 and	
		also in EXCEL format for calculation of Relative	
		standard deviation.	
		5.9.2.2	Every time a sample is run with system suitability
		test, calculate the results for system suitability.	
		5.10	Acceptance Criteria :
		5.10.1	For System Suitability Test :
		5.10.1.1	RSD calculated for Retention time of Standard 3 should
		be <5.0%.	
		5.10.1.2	RSD calculated for Area OF Standard 3 should be <5.0%.
		5.10.2	Parameters for Acceptance of the test:
		The Regression of the standard curve should be > 0.99.	
		5.10.3	The residual DCA content should be ≤1% of the dry weight of
		purified and lyophilized sample of meningitides polysaccharide.	
		5.11	Result Reporting :
		5.11.1	Using the File menu new reports can be templates, open existing
		templates, save completed reports, or print reports using the	
		current report template.	
		5.11.2	Open DCA.FRP template.
		5.11.3	The report generated can be viewed with report review icon.
		5.11.4	Print report: Click this option to take a printout of a
		Chemstation report using the current report template and data	
		from the currently loaded data file.	
		5.11.5	The printed report is signed by the analyst who does the
		analysis and checked by the other analyst/supervisor.	
		5.11.6	Report the results of DCA content of the sample(s).
		6.0	Forms and Records

	5.1	Preparation of solutions:
		5.1.1
		5.1.2
		5.1.3
		5.1.4
		5.1.5

			of 500µl and store at 20°C for 3 months.
		5.1.6	Gel running buffer (10X)
			Weigh 30.2 g Tris, 144 g Glycine and 10 g SDS & dissolve in
			800ml of Milli-Q water. Adjust the pH to 8.3 with HCl & make
			up the volume to 1000 ml.
		5.1.7	Sample Solubilising Buffer (6X)
			Mix 2.4 ml of 0.5M Tris (pH 6.8), 3 ml of Glycerol, 3 ml of
			20% SDS. 6 mg of Bromophenol blue. 1.6 ml of
			β-mercaptoethanol and make up the volume to 10 ml. Make
			aliquots of 1ml each and store at -20°C. For running samples
			in non reducing condition, do not add β-mercaptoethanol in
			sample solubilizing buffer.
		5.1.8	Coomassie Brilliant Blue stain:
			Weigh 1 g of Coomassie Brilliant Blue R250* and dissolve in
			100 ml of methanol, add 20 ml of glacial acetic acid and make
			up the volume to 200 ml with Milli-Q water Keep on magnetic
			stirrer for at least half an hour for proper dissolution.
		5.1.9	Destain Solution
			Mix 40 ml of methanol, 10 ml of glacial acetic acid and make
			up the volume to 100 ml with Milli-Q water. Prepare fresh at
			the time of destaining the gel.
		5.2	Casting of gel
		5.2.1	Clean the glass plates with detergent followed by washing
			with Milli-Q water and fix them in the casting frame.
		5.2.2	Prepare 12.5% Separating Gel mixture (7.5 ml) in a falcon
			tube consisting of following reagents:
			30% Acryl amide-3.125 ml
			1.5 M Tris (pH 8.8) — 1.875 ml
			20% SDS — 0.15 ml
			Milli-Q water — 2.275 ml
			10% APS- 75 µl
			TEMED- 5 µl
			Mix the contents gently by inverting the tube two-three times
		5.2.3	Immediately pour 12.5% Separating Gel mixture between the two
			glass plates leaving 4-5 cm space above for Stacking Gel and
			overlay it carefully with Milli-Q water.
		5.2.4	Prepare the Stacking Gel mixture (3.75 ml) in a tube
			consisting of following reagents:
			30% Acrylamide- 0.625 ml
			0.5 M Tris (pH 6.8) - 0.9375 ml
			20% SDS-0.075 ml
			Milli-Q water —2.0 ml
			10% APS-50 µl
			TEMED – 5 µl
		5.2.5	Pour the stacking gel mixture over the surface of the
			polymerized separating gel and immediately insert the 10-well
			comb of 0.75mm.
		5.2.6	Allow the gel to polymerize for 10 minutes.
		5.2.7	Dilute the 10X gel running buffer to 1 X by mixing 100 ml of
			the 10X stock solution in 900 ml of Milli-Q water.
		5.2.8	Remove the comb from the gel and fix the glass plate
			containing polymerized gel set on the gel cassette sandwich
			of the electrophoresis assembly.
		5.2.9	Add 1 X gel running buffer between and around the buffer tank
			of electrophoresis assembly.
		5.3	Standard and Sample Preparation :
		5.3.1	Take 0.05 mL of 10 mg/mL Reference solution/sample and
			diluted with 0.45 mL of purified water to obtain a
			concentration of 1 mg/mL.
		5.3.2	Take 5 µL of 1 mg/mL Reference solution/sample and added 8 µL
			of sample buffer (- β mercaptoethanol) and 27 µL of purified
			water to obtain a concentration of 5 µg.
		5.3.3	Loaded 20 µL of 5 µg Reference solution to obtain a
			concentration of 2.5 µg.
		5.4	Running SDS-PAGE gel:
			Connect the gel apparatus (the negative and positive electrodes)
			with the power pack and set the power pack at 300V for 45 min or
			until the dye front reaches at the bottom of the separating gel.
			Stop the power pack once dye front reaches at the bottom of the
			separating gel.
		5.5	Staining and de-staining of the gel:
		5.5.1	Once the gel run is over, remove the gel from the plate and
			place the gel in staining solution in a plastic tray for 20
			minutes with gentle agitation on gel rocker.
		5.5.2	De-stain the gel with de-staining solution to remove the
			extra stain till the gel background becomes clear and all the
			bands become clearly visible.
		5.6	Analysis of SDS-PAGE gel :
		5.6.1	After destaining, scan the gel in using densitometer and
			save for record

				100
			5.3.3.3	Then perform 1:100 dilutions for 5F and 10F diluted
				samples with sample diluent.
			5.3.3.4	Required further Dilution
				Volume of Test Sample (μL)
				Sample Diluent (μL)
				1:100
				5 μL of above 5F diluted sample
				495

				1:100
				5 µL of above 10F diluted sample
				495
		5.3.4	Internal Control:	
		5.3.4.1	Appropriate Internal control from In-House batches may	
				be considered or can use "CAL C" with 0.1 IU/mL as
				internal control. Consider the OD at 450 nm given in
				kit insert (acceptance range) as one of the control
				criteria and the second is activity obtained for 0.1
				IU/mL.
				Acceptance Criteria: The activity of internal control
				must be within 5% of the assigned value.
		5.3.6	Bring the kit to room temperature (18-25 °C) before performing	
		the test.		
		5.3.7	Before pipetting mix all reagents thoroughly by gentle tilting	
		for swinging. Vigorous shaking with formation of foam should be		
		avoided.		
		5.3.8	Place the required number of wells in the strip holder.	
		Position from well A1, filling columns from left to right		
		across the plate. When handling the plate squeeze the long		
		edges of the frame to prevent the wells falling out.		
		[Note: Return unused wells to the plastic bag immediately and		
		reseal tightly to minimize exposure to moisture. Store them dry		
		at 2-8 °C. Take care not to puncture or tear the foil bag.		
		WARNING: Exposure of wells to moisture or contamination by dust		
		or other particulate matter will result in antigen degradation,		
		leading to poor assay precision and potentially false results.		
		5.3.9	Dispense 100 µL of each calibrator, internal control and	
		diluted (1:100) samples into the appropriate wells of the plate		
		provided. Leave one well empty for the substrate blank.		
		[Note: samples should be added as quickly as possible to the		
		plate to minimize assay drift. Record the time for Incubation		
		after the addition of the last sample.		
		5.3.1	Cover plate with the enclosed foil and incubate at room	
		temperature for 60 minutes.		
		5.3.1	After incubation remove the plate and wash wells three times	
		with 300 µL wash buffer per well.		
		[Note: Avoid over dwelling of wells with wash buffer during wash		
		steps.		
		5.3.1	After the final wash invert the plate and tap the wells dry on	
		absorbent paper.		
		WARNING: The washing procedure is critical and requires special		
		attention. An improperly washed plate will give inaccurate		
		results with poor precision and high background.		
		5.3.1	Dispense 100 µL of conjugate into each well, blot the top of	
		the wells with tissue to remove any splashes. Leave one well		
		empty for the substrate blank.		
		[Note: To avoid contamination, never return the excess conjugant		
		to the reagent bottle.		
		5.3.1	Cover plate with the enclosed foil and incubate at room	
		temperature for 30 min.		
		5.3.1	After incubation remove the plate and wash wells three times	
		with 300 µL wash buffer per well.		
		5.3.1	Stop the reaction by dispensing 100 µL of Stop solution into	
		each well including substrate blank. This causes a change in		
		colour from Blue to yellow.		
		5.3.1	Read the optical density (OD) of each well at 450 nm on a micro	
		plate reader (using 620 nm as blank – optional), within 60 min		
		of stopping the reaction.		
		5.4	Calculations :	
		5.4.1	Plot the values using graph pad prism software using linear	
		concentrations on X-axis and absorbance values (O.D) values on		
		Y-axis. Multiply the extrapolated values obtained with the		
		dilution factor (initial 5 & 10 Folds only) to obtain final		
		concentration of antibodies to Diphtheria Toxoid Antigen in the		
		sample.		
		5.4.2	The sample dilution factor 1:100 must not be considered in the	
		calculation as it is already contained in the concentration		
		declaration of the standards.		
		5.4.3	In the same way calculate the concentration of Diphtheria	
		toxoid antibody in Manufacturing Pool Plasma sample and find		
		out the fold difference to determine the concentration of		
		Diphtheria antibodies in test sample to that of Manufacturing		
		Pool Plasma for fractionation.		
		5.4.4	Diphtheria Toxoid Antibodies in Drug Substance Sample:	
		Initial Conc. of Test sample (mg/mL)		
		Intermediate Dilutions		
		in folds		
		Activity		
		in IU/mL		
		Average		
		Activity in IU/L

		material) using the below formula:	
		AT Ws 5	
		50 P	
		Lauric acid (mg/ml)= ----- X ----- X ----- X	

		AS 10 50 WT 100	
	5.3.2	Lauric Acid (in %) in Polysorbate 20 (input material):	
		Conc. Of Lauric Acid	
		(mg/ml)	
		Lauric Acid (in %) = -----	
		X 100	
		Conc. Of Polysorbate 20 (input) (mg/ml)	
	5.3.3	Conversion factor (to convert Lauric acid content to	
		Polysorbate 20):	
		100	
		Conversion factor= -----	
		Lauric acid (in %) in Polysorbate 20	
	5.3.4	Determination of Lauric acid content (mg/ml) in Test sample:	
		AT	
		WS 5 10 P	
		Lauric Acid content (mg/ml) = ----- X ----- X ----- X	
			----- X ----- X D
		AS 10 50 WS 100	
	5.3.5	Polysorbate 20 content (mg/mL) in test sample:	
		Polysorbate 20 (mg/mL) = Lauric acid content (mg/mL) X	
		Conversion factor	
	5.3.6	Assay of Polysorbate 20 (in %)	
		Polysorbate 20 content	
		in test (mg/mL)	
		Polysorbate 20 (in %) =	
			----- X 100
		Label claim (mg/mL)	
		Where,	
		AT = Average peak area of Lauric acid in test preparation.	
		As = Average peak area of Lauric acid in standard preparation.	
		Ws = Weight of the Lauric acid standard in the standard	
		preparation (in mg).	
		WT = Weight of the Polysorbate 20 (input material) taken (in	
		mg).	
		P = Potency of Lauric acid standard (in %).	
		D = Weight per mL of test sample (in g) calculated as per	
		IP2007.	
	6.0	Report	
	6.1	Report the content of Polysorbate 20/Tween 20 in %	

1.. |Purpose: |
 |To lay down the procedure for quantitative determination of |
 |Polysaccharides by HPAEC-PAD in Pneumococcal-CRM conjugate for serotype 4. |
 2. |Applicable to: |
 |This Standard Operating Procedure is applicable for quantitative |
 |determination of Polysaccharides by HPAEC-PAD of ARM of bulk conjugate of |
 |Pneumococcal CRM conjugate for serotype 4. |
 3. |Responsibility: |
3.1	Research scientist shall be responsible for executing the described
	procedure correctly.
3.2	Department Head shall be responsible for implementation of this SOP.
 4. |Safety considerations: |
 |4.1 |Always wear laboratory coat. |
 |4.2 |Always use solutions filtered through 0.22 µm membrane. |
 |4.3 |Degas all solutions. |
 |4.4 |Avoid entry of bubbles into the system as well as column. |
 |4.5 |Always store the column in NaOH solution. |
 |4.6 |Do not allow purified water to pass through the column. |
 |4.7 |Nitrogen gas pressure in four eluent bottles should always be |
 | |maintained around 5 psi. |
 |4.8 |Never apply potential to the electrode unless a stream of eluent or |
 | |water is flowing through the cell. |
 |4.9 |Do not allow the reference electrode of electrochemical detector to |
 | |dry out. |
 |4.10 |Always store the reference electrode in the storage cap filled with |
 | |saturated KCl solution when the cell is not in use. This prevents |
 | |the reference electrode membrane from drying out and damaging the |
 | |electrode. |
 5. |Equipments: |
 |2.1 |Dionex Chromatographic System (ICS-3000) |
 |2.2 |CarboPac PA 10 column with CarboPac PA 10 pre-column guard |

 | |6.2.2 |Sodium Hydroxide solution 50% GR |
 | |6.2.3 |Hydrochloric acid 37 %(Fuming) |
 | |6.2.4 |Deoxycholic acid, Sodium Salt (DOC) |
 | |6.2.5 |Purified water (filtered through 0.20 (m filter) & vacuum |
 | | |degassed for at least 15 min.) |
 7. |Preparation of solutions: |
 |Prepare all the solutions as described below and label the prepared |
 |solutions. |
 |7.1 |Preparation of Standards: | | | |
 | |7.1.1 |Preparation of External Standard Galactose Solution (100 (g |
 | | |(ml) |
 | | |For a volume of 100 ml, weigh: |
 | | |Galactose: 10 mg |
 | | |Dissolve in 50 ml of filtered purified water and make up the |
 | | |volume to 100 ml. Filter the solution through 0.2 (m porosity |
 | | |nylon filters. Store the solution in 1.5 ml aliquots at minus |
 | | |20 0C ± 2 0C for not more than six months. |
 |7.2 |Preparation of Working Dilutions for External Standard solutions for |
 | |analysis: |
 | |Prepare the working dilutions of the external standard for analysis |
 | |as described below: |
 | |Standard |Volume of |Volume of |Final Concentration |
 | | |Galactose |Purified Water |(µg/ml) |
 | | |standard (µl) |(µl) | |
 | |Standard 1 |50 |950 |0.25 |
 | |Standard 2 |100 |900 |0.50 |
 | |Standard 3 |150 |850 |0.75 |
 | |Standard 4 |200 |800 |1.00 |
 |7.3 |Preparation of 18mM NaOH: |
 | |Take 1.88 ml of 50% stock solution and make up the volume to 2000 ml |
 | |with filtered and vacuum degassed WFI. Shake well and keep. |
 |7.4 |Preparation of 200mM NaOH: |
 | |Take 21 ml of 50% stock solution and make up the volume to 2000 ml |
 | |with filtered and vacuum degassed WFI. Shake well and keep. |
 |7.5 |5% DOC: |
 | |Weigh and dissolve 250 mg of sodium deoxycholate in purified water |
 | |and make up the volume to 5 ml. Prepare the solution freshly. |
 8. |Procedure: |
 |8.1 |Sample Preparation: | |
 | |8.1.1 |Preparation of blank sample: |
 | | |Take 50µl of filtered purified water in a glass test tube and |
 | | |treat this sample for acid hydrolysis as described in section |

		8.1.5.	
	8.1.2	Preparation of Standards:	
		8.1.2.	Take 50 µl each of the galactose standard dilutions
		1	prepared in step 7.2 in glass test tubes. (The
			effective galactose amount will be 0.25, 0.50, 0.75 and
			1.0 µg).
		8.1.2.	Treat them for acid hydrolysis as described in section
		2	8.1.5.
	8.1.3	Preparation of sample for total Polysaccharide determination:	
		8.1.3.	Dilute sample in filtered purified water to a final
		1	concentration of 20-50 (g/ml and take 50 µl of the
			diluted sample.
			Note: The dilution factor is entered in the sequence
			run for analysis of samples.
		8.1.3.	Use this solution as the sample for acid hydrolysis as
		2	described in section 8.1.5.
	8.1.4	Preparation of sample for free Polysaccharide determination:	
		8.1.4.	Take 1 ml of sample (dilute if required) having about
		1	100-150 µg Polysaccharide in a microfuge tube, add 100
			µl of 5% DOC and mix it.
		8.1.4.	Put this tube in an ice bath for 30 minutes.
		2	
		8.1.4.	Take out and add 50 µl 1M HCl and mix thoroughly.
		3	
		8.1.4.	Centrifuge the mixture at 2-8°C for 15 minutes at 10000
		4	RPM.
		8.1.4.	Take 50µl supernatant volume in a test tube for free
		5	Polysaccharide estimation.
		8.1.4.	Note: The dilution factor is entered in the sequence
		6	run for analysis of samples.
		8.1.4.	Use this solution as the sample for acid hydrolysis as
		7	described in section 8.1.5.
	8.1.5	Acid Hydrolysis:	
		8.1.5.	Add 50 (l of Conc. HCl to each sample.
		1	
		8.1.5.	Seal each test tube with parafilm and then with
		2	aluminum foil and vortex.
		8.1.5.	Store the samples in dry hot air oven at 80 0C ± 5 0C
		3	for 2 hours.
		8.1.5.	After 2 hours, take out the samples from the oven and
		4	keep at room temperature for 15 minutes.
		8.1.5.	Dry the samples using Nitrogen gas flow.
		5	
		8.1.5.	Reconstitute the dried samples in 500 µl filtered
		6	purified water.
		8.1.5.	Analyze each sample with the method described below.
		7	
	8.2	Test Methodology:	
	8.2.1	Preparation and setting of equipment:	
		8.2.1.	Install the PA10 Guard and Analytical column.
		1	
		8.2.1.	Add 18mM NaOH (Eluent A) solution to eluent container
		2	and insert in the line of eluent A. Similarly, fill up
			second eluent container with 200mM NaOH (Eluent B) and
			insert in the line of eluent B.
		8.2.1.	Open the priming knob (one to three turns), set the
		3	gradient level of the eluents on the control panel for
			Eluent Line B = 100 % and switch on the priming through
			of the chromoleon server.
		8.2.1.	After the priming is over for Eluent B, set the
		4	gradient level of the eluents on the control panel for
			Eluent Line A = 100 % and switch on the priming
			through of the chromoleon server.
		8.2.1.	Repeat the steps 8.2.1.3 & 8.2.1.4 two more times for
		5	effective priming of both the eluents.
		8.2.1.	After the priming is over, close the priming knob and
		6	set the gradient level and flow rate of the eluents as
			follows:
			Eluent Line A (18mM NaOH) = 100% (0-20 minutes)
			Eluent Line B (200mM NaOH) = 100% (21 – 40 minutes)
			Flow rate= 1.0 ml/min
		8.2.1.	The waveform used for Polysaccharide estimation is the
		7	carbohydrate Quadruple potential.
	8.2.2	Conditioning of the system:	
		8.2.2.	At the start of each test, set the pump as described in
		1	8.2.1.6 and leave at the flow of 1.0 ml/min for at
			least 30 minutes to stabilize the baseline.
		8.2.2.	Create the program, create a sequence and load the
		2	samples in the auto sampler as per the sequence.
		8.2.2.	Start the batch after 'Ready check'.
		3	
		8.2.2.	Inject eluent blank after every twenty injections and
		4	unknown blank after each set of samples.
		8.2.2.	Record the calculated concentration in the analysis
		5	report.
	8.2.3	Calculations for Polysaccharide content:	
		8.2.3.	The Polysaccharide content can be calculated by
		1	dividing the galactose conc. obtained by the factor
			(0.215).
		8.2.3.	Derivation of Dilution factor :
		2	Theoretical volume sample volume taken = 1000µl
			Actual volume of sample taken=50µl

			Dilution Factor in this case = $1000\mu\text{l} / 50\mu\text{l} = 20$
			Dilution factor = 20
		8.2.3. Calculation of actual dilution for free Polysaccharide:	
		3 Sample volume taken = $1000\mu\text{l}$	
			Total volume = $1150\mu\text{l}$ ($1000\mu\text{l}$ sample + $100\mu\text{l}$ 5%DOC +
			$50\mu\text{l}$ 1M HCl)
			Correction Factor = $1150\mu\text{l} / 1000\mu\text{l} = 1.15$
			Actual dilution = dilution factor x 1.15 (as calculated
			in total PS)
			For Example: If sample is diluted 10 times
			calculation for the free Polysaccharide:
			$100\mu\text{l}$ sample + $900\mu\text{l}$ purified water + $100\mu\text{l}$ DOC + $50\mu\text{l}$
			1M HCl = $1150\mu\text{l}$
			Actual volume of sample taken = $50\mu\text{l}$
			Actual dilution = $20 \times 1.15 \times 10$ (sample dilution) = 230
		8.2.3. Note: Total volume of sample dilution prepared in case	
		4 of free is $1000\mu\text{l}$, dilution factor can be derived	
			according to the actual volume of sample taken for
			total Polysaccharide determination.
	8.2.4 Acceptance Criteria:		
		8.2.4. The test is valid if correlation coefficient of the	
		1 standard curve is ≥ 0.95	
		8.2.4. % Free Polysaccharide: < 25% of Total Polysaccharide	
		2

	4.5	min	: Minute	
	4.6	µL	: Microliter	
	4.7	µg	: Microgram	
	4.8	°C	: Degree centigrade	
5.0	Procedure:			
	5.1	Equipment, Materials and Reagents		
		5.1.1	Multi scan Fc ELISA reader	
	5.2	Preparation of solutions:		
		5.2.1	Antibody coated microtitre plate strips	
			5.2.1.1	Each foil bag contains 2 plates of IgG Antibody-Coated
				Wells
			5.2.1.2	Each plate consists of 12 x 8 Well Strips (96 wells)
			5.2.1.3	Remove the number of strip-wells according to the
				experimental design
			5.2.1.4	Put the unused strips back into the bag
			5.2.1.5	Reseal the bag carefully and put it back into storage
				at 2 to 8°C to maintain plate integrity
			5.2.1.6	Storage and Validity: Once the vaccum sealed bag has
				been opened, carefully store the micro well strips at
				2-8 °C in the resealed bag
		5.2.2	Antibody	
			5.2.2.1	The kit contains 4 antibody vials each of 2.5 mL
				(liquid)
			5.2.2.2	Each vial consists of antibodies to 4 types of IgG
				subclasses.
				A vial of mAb Anti-Human IgG1
				A vial of mAb Anti-Human IgG2
				A vial of mAb Anti-Human IgG3
				A vial of mAb Anti-Human IgG4
			5.2.2.3	Storage and Validity: Store at 2-8 °C until expiration
				date
		5.2.3	Human Serum Control	
			5.2.3.1	The kit contains 2 lyophilized vials of human serum
				control contains 0.1% sodium azide
			5.2.3.2	Reconstitute the lyophilized control with 1.0 mL of
				diluent buffer provided in the kit
			5.2.3.3	Swirl or mix gently and allow to sit for 10 minutes to
				ensure complete reconstitution
			5.2.3.4	After reconstitution, the human serum control contains
				different IgG subtypes.
				Note: The different IgG subtypes concentration range
				for Human Serum Control vary for each lot
			5.2.3.5	Storage and Validity:
				Store the intact vials at 2-8 °C until expiration date.
				Use control within 1 hour of reconstitution
	5.2.4	Human IgG Subclass standard		
			5.2.4.1	The kit contains 2 lyophilized vials of standard
				contains 0.1% sodium azide
			5.2.4.2	Reconstitute each lyophilized standard vial with 1.0 mL
				of diluent buffer
			5.2.4.3	Swirl or mix gently and allow to sit for 10 minutes to
				ensure complete reconstitution
			5.2.4.4	When reconstituted in 1.0 mL using dilution buffer, the
				concentration of the standard is:
				13.72 µg/mL of IgG1,
				5.32 µg/mL of IgG2,
				1.34 µg/mL of IgG3, and
				0.76 µg/mL of IgG4
			5.2.4.5	Storage and Validity:
				Store the intact vials at 2-8 °C.
				Use control within 1 hour of reconstitution
	5.2.5	Secondary Antibody: Peroxidase Anti-Human IgG (50X Concentrate)		
			5.2.5.1	The kit contains 1 vial of 0.5 mL anti-human IgG
				peroxidase conjugate
			5.2.5.2	Dilute the secondary antibody in diluent buffer at a
				ratio of 1:50. For example, add 0.22 mL of conjugate to
				10.78 mL of diluent for each 96 well plate
				S.No
				Volume of 50X washing solution (mL)
				Volume of diluent buffer (mL)

5.2.5.3 Do not prepare more diluted antibody than required
5.2.5.4 Storage and Validity:
Store the intact vials at 2-8 °C until expiration date.
Discard any unused portion
5.2.6 Chromogen (TMB Solution)
5.2.6.1 The kit contains 1 vial of 25 mL TMB substrate solution
5.2.7 Stop Solution
5.2.7.1 The kit contains 1 vial of 25 mL stop solution
5.2.8 Diluent Buffer
5.2.8.1 The kit contains 1 vial of 135 mL diluent buffer
5.2.9 Wash Buffer Concentrate (25X)
5.2.9.1 The kit contains 1 bottle of 25X diluent buffer 100 mL
5.2.9.2 Dilute 1 volume of 25X wash buffer concentrate with 24
volumes of water.100 mL may be diluted to 2.5 L.

Storage & Validity: Store both the concentrate and the
working wash buffer in the refrigerator. Use the
diluted buffer within 14 days
5.2.1 Reference solution preparation
0
5.2.10. To generate a 6-point standard curve, make serial
1 dilutions of the standard using the diluent buffer
5.2.10. Take one lyophilized standard vial and with 1.0 mL of
2 diluent buffer to get 13.72 µg/mL of IgG1, 5.32 µg/mL
of IgG2, 1.34 µg/mL of IgG3, and 0.76 µg/mL of IgG4
5.2.10. Make five 2 fold serial dilutions of the standard to
3 get a series of concentrations for standard curve
construction
5.2.10. The concentrations of IgG subclasses in the diluted
4 series are as follows
Standard
Conc. in µg/mL
IgG1
IgG2
IgG3
IgG4

				Sample Diluent(μL)
				1:100
				5 μL of 25F diluted sample
				495
				1:100
				5 μL of 50F diluted sample
				495
				1:100
				5 μL of 100F diluted sample
				495
	5.3	Test method:		
	5.3.1	Bring the kit to room temperature (20-24°C)		
	5.3.2	Gently mix each kit component before use		
	5.3.3	Place the required number of wells in the strip holder.		
		Position from well A1, filling columns from left to right		
		across the plate. When handling the plate squeeze the long		
		edges of the frame to prevent the wells falling out.		
		Note: Return unused wells to the foil bag immediately with the		
		two desiccant pouches and reseal tigXXy to minimize exposure		
		to moisture. Take care not to puncture or tear the foil bag.		
		WARNING: Exposure of wells to moisture or contamination by dust		
		or other particulate matter will result in antigen degradation.		
		leading to poor assay precision and potentially false results		
	5.3.4	Add 50 μL of the appropriate human subclass specific antibody		
		(e.g., mAb Anti-Human IgG1, IgG2, IgG3 and IgG4 etc) to each		
		well in the strip.		
		Note: Take different coating antibodies for estimation of		
		different IgG subclasses		
		mAb Anti-Human IgG1 for IgG1 estimation		
		mAb Anti-Human IgG2 for IgG2 estimation		
		mAb Anti-Human IgG3 for IgG3 estimation		
		mAb Anti-Human IgG4 for IgG4 estimation		
	5.3.6	For the blank wells, add 50 μL of Diluent Buffer		
	5.3.7	Add 50 μL of diluted samples (8.3.12), standards (8.3.11), and		
		the ready-to-use Human Serum Control (8.3.3) to their		
		respective wells.		
		Note 1: Samples should be added as quickly as possible to the		
		plate to minimize assay drift.		
		Note 2: Different samples dilutions are to be added to the		
		assay plate for estimation of different IgG subclasses		
	5.3.8	Record the time for Incubation after the addition of the last		
		sample		
	5.3.9	Gently tap the plate on the side 10 times to mix		
	5.3.1	Incubate at room temperature for 30 min		
	0			
	5.3.1	After incubating for 30 min, wash the plate four times by		
	1	adding 300 μL of diluted wash buffer into each well. Soak for		
		10-15 seconds, then discard the wash buffer by inverting the		
		plate. Then remove excess wash buffer by inverting the plate		
		and tapping on absorbent paper.		
		Note: Avoid over dwelling of wells with wash buffer during wash		
		steps		
		WARNING: The washing procedure is critical and requires special		
		attention. An improperly washed plate will give inaccurate		
		results with poor precision and high back grounds.

				5.3.4	Test procedure: Conduct the experiment in 2 steps.
				Pre assay testing to check placebo interference	
				Main experiment	
				5.3.4.	Pre assay testing to check placebo interference
				1	
				5.3.4.1.1	Check placebo interference before conducting
				the main experiment.	
				5.3.4.1.2	Switch on the Coagulometer 15 minutes prior to
				analysis.	
				5.3.4.1.3	Place all the reagents in appropriate slots of
				the Start – 4 Coagulometer for warming at 37°C	
				(5 minutes prior to analysis).	
				5.3.4.1.4	Place a Cuvette strip in the incubation area
				and pre warm at 37°C at least for 3 minutes.	
				Then dispense one magnetic ball to each	
				cuvette	
				5.3.4.1.5	Add 50 μL of Placebo of test sample under
				testing, 50 μL of Factor IX deficient plasma	
				and 50 μL of C.K. Prest to each cuvette.	
				5.3.4.1.6	Immediately start the timer corresponding to
				the incubation column for an incubation of 180	
				sec.	
				5.3.4.1.7	After 170 sec beep sound was produced.
				5.3.4.1.8	Then transfer the cuvette from the incubation
				chamber to the test column area.	
				5.3.4.1.9	Then add 50 μL of 0.025 M calcium chloride
				solution pre warmed at 37°C to each cuvette	
				with the help of Micro pipette, while adding	
				calcium chloride press timer to start the	
				measurement.	
				5.3.4.1.1	A clot should be formed within the established
				0	clotting time.
				5.3.4.1.1	If the placebo is in compliance with the
				1	established spec, proceed for the main
				experiment.	
				5.3.4.	Main experiment:
				2	
				5.3.4.2.1	Once the pre assay testing is clear, follow
				the procedure mentioned below to test the	

				sample activity.	
				5.3.4.2.2	Follow section 5.3.4.1.2 to 5.3.4.1.4 of
				current STP upto addition of samples/standard.	
				5.3.4.2.3	Add 50 μ L of reference standard/test sample,
				50 μ L of Factor IX deficient plasma and 50 μ L	
				of C.K. Prest to each cuvette.	
				5.3.4.2.4	Follow section 5.3.4.1.6 to 5.3.4.1.10 of
				current STP upto addition of 0.025 M calcium	
				chloride solution.	
				5.3.4.2.5	A clot will be formed in the reaction cuvette
				based on the activity of the sample.	
				5.3.4.2.6	Note down the clotting times which comes in
				the print out and interpret the result using	
				respective software's for data analysis.	
	5.4	Calculation and analysis:			
	5.4.1	The calculations of potency and analysis of the graphs should			
		be performed using both Combistat and Graph pad prism Software.

Animal Experiments in Medicine

Animal houses, breeding of
experimental animals

József Kaszaki Ph.D
Institute of Surgical Research

HURO/0901/069/2.3.1. – 17th October 2011

1

An experimental animal can serve as a model for a human being in all those functions in which there is a considerable degree of genetic similarity. The experiments can be acceptable for everybody only if the results are unquestionable and reproducible, i.e. exact. This can be the case only if the experimental (treatment) and control groups differ in only one aspect, i.e. the aspect under investigation. There are significant differences in sensitivity between species because of their differing genetic backgrounds. This is the reason why different species are appropriate or not for a given experiment.¹

An important requirement for laboratory animals (apart from price) is that they should be easy to keep. Today, rodents meet this demand best. Of all the mammals, mice and rats have been most frequently used in laboratories (approximately 90%), but in the last 20 years the proportion has decreased to 1/10. As compared with these species, the number of animals that can be kept as pets, such as guinea pigs, rabbits and dogs, is very low. The reasons for this are the increasing frequency of experiments without the use of animals, or the use of animals with particular characteristics (e.g. inbred, SPF, see below), and the rising prices.¹

1. Biology of the most frequently used mammals

1.1. Mouse

Seventy per cent of all animals used in biomedical activities are mice. More than one thousand stocks and strains of mice have been developed, as have hundreds of mutant stocks that are used as models of human diseases. In terms of genetics, the mouse is the most thoroughly characterized mammal. The life span is 1.5-3 years. Mice are very active animals. They are sensitive to changes in temperature, draughts and high humidity. The incisors are open-rooted and grow continuously. Mice will bite or "pinch" with their sharp incisors if mishandled. Mice should be fed a commercial pelleted mouse or rodent diet and water ad libitum. Mice are polyestrous animals and breed the year round; ovulation is spontaneous. A fertile postpartum estrus occurs 14-24 h following parturition. The duration of the estrous cycle is 4-5 days. The average gestation period is 20 days. The average litter size is 10. The pups are weaned at 3 weeks of age.

1.2. Rat

The rat is the second most commonly used animal in biomedical activities, surpassed only by its relative, the mouse. Various stocks, strains and mutants are available, but much fewer than for the mouse. Most laboratory rats are outbred albinos. Rats are less active and aggressive than mice. They are typical rodents, with continuously growing incisors. Rats should be fed a commercial pelleted rat or rodent diet and water ad libitum. The life span is 2.5-3.5 years. They are sensitive to draughts, a high level of ammonia, low humidity and noise. They are susceptible to respiratory diseases. Rats too are polyestrous animals and breed the year round; ovulation is spontaneous. The duration of the estrous cycle is 4-5 days. The average gestation period is 22 days. A fertile postpartum estrus occurs within 48 h of parturition. The average litter size is 6-12. The pups are weaned at 3 weeks of age.

1.3. Hamster

Hamsters are the third most commonly used research animal. Ninety per cent of them are Syrian hamsters. Hamsters have a tendency to bite if roughly or improperly handled, startled, injured or awakened. Females tend to be larger and more aggressive than males. The life span is 1.5-2 years. The incisors are open-rooted and grow continuously. The cheek pouches of the hamster extend to the scapulae and can be everted. Hamsters should be fed commercial pelleted hamster or rodent diet and water ad libitum. The flank or scent glands

2

appear as dark patches on either flank. They are sebaceous glands that function in marking territory and mating behavior. The urethra of the female exists separately just ventral to the vulva. Breeding onset is at approximately 90 days. Hamsters are polyestrous animals and breed the year round; ovulation is spontaneous. The duration of the estrous cycle is 4 days. The average gestation period is 16 days. The average litter size is 5-9. Cannibalism is more common with hamsters than with other laboratory rodents. The young are weaned at 21 days.

1.4. Guinea pig

The most common stocks used in research are shorthairs. Guinea pigs panic easily in response to a new or frightening experience, scattering to the corner of the cage or freezing in place. Teeth-chattering of nervous guinea pigs can also be seen. The life span is 4-5 years. All teeth are open-rooted and grow continuously. The guinea pig has a large cecum. Guinea pigs have a dietary requirement for vitamin C, and should therefore be fed a commercial pelleted diet formulated specifically for guinea pigs. Guinea pigs are polyestrous and breed the year round; ovulation is spontaneous. The duration of the estrous cycle is 15-17 days and estrus itself lasts 24-48 h. The average gestation period is 65 days. The average litter size is 3-4. The young are precocious at birth 3-4; weaning occurs at 14-28 days.

1.5. Rabbit

The breeds of rabbit most commonly used in research are the New Zealand White and the Californian, which weigh 2-5 kg, i.e. they are large breeds. The life span is 5-6 years. All the teeth are open-rooted and grow continuously. The rabbit cannot vomit, like the rat and horse. The cecum is large, and terminates in the vermiform process or cecal appendix. This appendix contains a large amount of lymphoid tissue. Rabbits are coprophagous. They consume soft, moist fecal pellets produced at night (night stool). Rabbits should be fed a commercial pelleted rabbit diet; water should be provided ad libitum. Diets such as these are nutritionally complete and do not require supplementation. The highly vascularized ears are important in thermoregulation. The uterus is duplex with separate cervical and uterine openings. Breeding onset in the medium-sized breeds is at the age of 5-6 months. Rabbits are

induced ovulators with no regular estrus cycle. The vulva of the receptive doe is congested and purplish. The average gestation period is 32 days. Shortly prior to parturition (kindling), the doe builds a nest, pulling large amounts of hair from her mammary region and forelimbs. The average litter size is 7-8. Weaning occurs at 4-6 weeks.

1.6. Pig (potbellied pig, micropig, minipig)

Pigs are social animals and have a rigid dominance hierarchy. If pigs are group-housed, they will generally fight for the first 24-48 h to establish dominance, which is almost directly related to size. Pigs in general are friendly and docile, but will react severely to poor handling or a stressful environment. The life span of the potbellied pig (PBP) is probably 8-20 years with ~10-15 years typical. The PBP is sensitive to extremes of heat and cold and should be provided with a clean, dry, draught-free environment. Extended exposure to high temperatures combined with high humidity may be fatal to the PBP.

1.7. Cat

Cats are strict carnivores and predators. They have excellent vision and hearing, but their sense of smell is not as well developed as in the dog. Cats are generally solitary by nature, with strong territorial ties. At most they may form loose-knit social groups. Territories are marked by urine spraying and smearing surfaces with the scent glands located in the chin

3

and in the head, in front of the ears. Cats are generally non social, but can adapt to group living. An ideal group is approximately 20 individuals, as this enables a hierarchy to form which tends to be relatively stable. Cats have certain physiological features that are more in common with those in humans than the laboratory rabbit or rodent; hence, they have been extensively used in behavioral and biomedical research, particularly in the neurological sciences. Bred cats can generally live for 10 to 13 years. Cats cannot survive on diets adequate for other carnivores, unlike dogs (e.g. cats require taurine). The female cat (or queen) is seasonally polyestrous, but a small percentage can breed continuously. Queens can be run as a harem-mating system. The only way to detect estrus is via the behavior changes (and the vaginal smear). Estrus behavior lasts for 4-6 days. The queen is an induced ovulator. The gestation period is 59-65 days. The average litter size is 4-6 kittens. The kittens are generally weaned at 6-7 weeks.

1.8. Dog

The domestic dog is a species with a large number of breeds rather than genetically defined strains. There are marked differences between the various breeds in size, appearance and life expectancy. Dogs are highly social, smart, intelligent animals. Both nonspecific and human social contacts are extremely important for their well-being. Their social isolation and solitary housing are therefore considered to be important stressors. They do best when housed either in pairs or in small compatible groups in an environment affording some level of complexity and choice. Daily contact with caretakers is important. The dog has been used as a model of many human conditions in areas such as cardiovascular research, pharmacology and toxicology. The average life span is 8-12 years. Dogs used for research or teaching may be purpose-bred. The typical laboratory dog is the beagle, but other breeds are also used in large numbers. Dogs are carnivores with monogastric digestive systems. They should be fed only complete and balanced diets. Many commercially available dog foods contain all essential nutrients in their required proportions. These foods are manufactured in dry, semi-moist and canned forms. Reproductive data: the age of puberty is 7-10 months. The length of the estrus cycle (ovarian cycle) is 21-28 days. In most breeds the interval between estrus periods is 6-7 months. Females (bitches) ovulate spontaneously. The average length of gestation (pregnancy) is 63 days. The average litter size is 3-8. The puppies are generally weaned at 6-7 weeks. 1, 4-6

2. Housing of experimental animals

2.1. General principles

Proper housing and good management of animal facilities are essential for the animal well-being, the quality of the research data, and the health and safety of the personnel. At a minimum, an animal must have sufficient space to turn around and to express normal postural adjustments, it must have ready access to food and water, and it must have enough clean-bedded or unobstructed area in which to move and rest. Animals should have opportunities to exhibit species-typical activity patterns. Whenever appropriate, social animals should be housed in pairs or groups, rather than individually, provided that such housing is not contraindicated by the protocol in question and does not pose an undue risk to the animals. Highly social and many other domesticated animals benefit from positive human interaction.

2.2. Physical facilities

The microenvironment of an animal is the physical environment immediately surrounding it (the primary enclosure), with its own specific factors (such as a cage or pen).

4

The primary enclosure provides the limits of the animal's immediate environment. The macroenvironment is the physical environment of the secondary enclosure (such as an animal holding room, a barn, etc.). Basic types of establishments for animal keeping are breeding / supply establishments and user establishments. Important elements of the primary and secondary enclosures are as follows:

■ A cage is a permanently fixed or movable container that is enclosed by solid walls and, at least on one side, by bars or meshed wire, in which one or more animals are kept or transported; depending on the size of the container and the stocking density, the freedom of movement of the animals is relatively restricted.

■ A pen is an area enclosed by walls, bars or meshed wire, in which one or more animals are kept; depending on the size of the enclosure and the stocking density, the freedom of movement of the animals is usually less restricted than in a cage; pens must be designed for the well-being of the species; they must permit the satisfaction of certain ethological needs (for example, the need to climb, hide or shelter temporarily).

■ A run is an area enclosed by walls, fences and bars or meshed wire and frequently situated outside permanently fixed buildings, in which animals kept in cages or pens can move freely during certain periods of time.

■ An animal holding room is a room situated inside a building where animals are housed in cages or pens, either for breeding and stocking, or during the conductance of an experiment.

The majority of holding rooms are usually designed to house rodents. Such rooms may

also frequently be used to house larger species. Care should be taken not to house together species which are incompatible. Walls and floors should be smooth, impervious and have a non slippery, easily washable surface. Drains, if any, should be adequately covered. Such rooms should be provided with facilities for carrying out minor experiments and manipulations, where appropriate.

Service rooms are rooms for the storage of food, clean cages, bedding, cleaning and washing materials. The rooms for food and bedding must be cool and dry, and vermin- and insect-proof. The rooms for clean cages, instruments and other equipment must be adequately designed; the cleaning process must be arranged so as to separate the flow of clean and dry equipment in order to prevent the contamination of newly cleaned equipment. 1,2,4

2.3. Housing of the most frequently used species

Rodents, guinea pig, ferret

These animals are usually kept in plastic cages with solid bottom and walls, of different sizes (shoe-boxes), with roofs made of wire, and with bedding. Guinea pigs and ferrets may be housed in small pens, made of plastic, metal or concrete, enclosed by low walls, with open roof and with bedding (wood shavings). Ferrets and guinea pigs are social animals, and it is therefore best to keep them in pairs or in groups. They need a complex, dynamic environment. For guinea pigs, it is necessary to provide a shelter in their cage or pen, where they can seek safety.

Rabbit

Rabbits are usually kept individually in small cages with a solid or meshed-wire bottom. They are gregarious animals, and should therefore be housed in compatible groups in pens with bedding (indoor or indoor-outdoor).

Cat

Cats are kept in individual caging, or in group pens or cages. The housing of cats in cages should be strictly limited. They should be let out for exercising at least once a day, if this does

5

not interfere with the experiment. In the group situation, the most essential criterion for acceptable housing is the provision of an adequate number of hides and escapes for cats. Cat pens should be equipped with dirt trays, an amply raised shelf room for resting, and objects suitable for climbing and claw-trimming. In a closed pen, many non convertible windows are desirable.

Dog, swine (miniature pig)

There is a great range of possibilities as concerns housing: it may be situated in indoor or outdoor pen areas, with open access to the outside run, or in an indoor environment with some sort of complexity built into it. Single housing may be necessary because of the demands of an experiment. Dogs can be given opportunities for activity by having access to a run or being moved into another area (such as a large cage or outdoor pen), which provides more space for movement.

Monkeys (non human primates)

Non human primates are social animals which, when deprived of companionship for an extended time, develop unmistakable signs of depression and frustration (as do dogs and pigs). They are physiologically and anatomically adapted to live in a complex, dynamic environment. Housing such animals in pairs offers a practicable alternative to group-housing. Raised resting surfaces or perches are also desirable for monkeys and dogs.

3. Husbandry

The person in charge of the establishment must ensure regular inspection of the animals and supervision of the accommodation by a veterinarian (or other competent person).

3.1. Food, drinking water and bedding

Feed

Animals should be fed palatable, non contaminated and nutritionally adequate food, daily or according to their particular requirements, unless the protocol in which they are being used requires otherwise. Nowadays, the feed is 'standard' mixed feed, pressed into pellets for almost all species (dry laboratory-animal diets). Packing, transport and storage must be such as to avoid contamination, deterioration or destruction. The major problems with feed may be an increase in the number of bacteria, rancidity, and the appearance of toxins caused by fungi. The feed distribution process may vary according to the species, but it must be such as to satisfy the physiological needs of the animal: for rodents *ad libitum* (as much they like), but for cats, dogs and pigs in portions. Feeders should be designed and placed so as to allow easy access to food and to minimize contamination.1-6

Drinking water

Animals should have access to potable, uncontaminated drinking water according to their particular requirements. (During transport, it is acceptable to provide water as part of a moist diet.) Watering devices should be checked daily to ensure their proper maintenance, cleanliness and operation. The methods commonly used in watering involve bottles, dishes and automatic systems. Bottles are often used for small animals such as rodents and rabbits, while dishes are customary for cats, dogs or pigs. When bottles are used, they must be made from translucent material in order to allow their contents to be monitored. All bottles and accessories must be taken to pieces, cleaned and sterilized at appropriate and regular periods. It is better to replace water bottles than to refill them, because of the potential for microbiologic cross-contamination.

6

Bedding

Bedding must be dry, absorbent, non dusty, non toxic and free from infectious agents or vermin or any other form of contamination. Ordinarily, softwood shavings and chips are appropriate and used, made from non resinous wood. Special care must be taken to avoid sawdust or bedding material derived from wood which has been treated chemically. Bedding should be used in amounts sufficient to keep animals dry between cage changes.

Sanitation (cleaning)

Sanitation (the maintenance of conditions conducive to health) involves bedding changing (as appropriate), cleaning and disinfection. Cleaning removes excessive amounts of dirt and debris, and disinfection reduces or eliminates unacceptable concentrations of microorganisms. The standard of a facility depends very much on good hygiene. Clear instructions must be given for the changing of bedding in cages and pens, and adequate routines must be established for the cleaning, washing and decontamination of cages and

accessories, bottles and other equipment. All components of the animal facility, including animal rooms and support areas, should be cleaned regularly and disinfected as appropriate to the circumstances.

Contacts with the animals

The performance of an animal during an experiment depends very much on its confidence in man, something which has to be developed. It is therefore recommended that frequent contact should be maintained so that the animals become familiar with human presence and activity (adaptation). The staff must be sympathetic, gentle and firm when associating with the animals. 1-6

4. Factors in the macroenvironment

Temperature

The temperature must be measured continuously. The recommended (optimal) temperature range for mice, rats, guinea pigs and miniature pigs is 20–24 °C, while for dogs, cats and rabbits it is 15–21 °C. Some conditions might require an increased environmental temperature, such as postoperative recovery, the housing of some hairless rodents and the housing of neonates.

Humidity

Extreme variations in relative humidity (RH) have an adverse effect on the health and well-being of animals. The RH must ordinarily be maintained at 55–100%. Levels below 40% or above 70% for a prolonged period must be avoided.

Air ventilation

The purposes of ventilation are to supply adequate oxygen (fresh air); to remove thermal loads caused by animal respiration, lights and equipment; to dilute gaseous and particulate contaminants (e.g. ammonia or dust); to adjust the moisture content of the room air; and, where appropriate, to create static-pressure differentials between adjoining spaces. The air in the room should be changed at frequent intervals. A ventilation rate of 15–20 fresh-air changes per hour is normally adequate. The use of recycled air to ventilate animal rooms must be avoided. The ventilation system must be designed so as to avoid harmful draughts. The air used for ventilation should be heated in winter and cooled in summer. Frequent bedding changes and cage-cleaning, coupled with husbandry practices, such as a low animal

7

density within the room, and lower environmental temperature and humidity, can also reduce the concentration of toxic or odor-causing gases in the animal room air.1-6

5. Microbiological environment (microorganisms and infections)

Infectious agents may affect animal populations in various ways. Some are pathogenic and may induce clinical signs with variable morbidity and mortality. However, most microorganisms induce no or only mild disease. Silent, asymptomatic infections (adventitious pathogens and opportunistic organisms) are often activated by experimental procedures (stress, immunosuppressant, etc.) or environmental influences (transportation, toxic gases, etc.). Frequently, certain strains of a given species are more sensitive to an infection, whereas the same agent may cause only milder or different symptoms in other strains, or the infection may be asymptomatic.

The types of organisms that can infect (experimental) animals include bacteria, protozoa, fungi, viruses, helminthes and arthropods. Many agents (even in the event of clinically silent infections) may exert impacts on the physiological parameters and hence on the results of animal experiments. It is obvious that experimental data obtained from diseased animals should, if at all, be used only with maximal caution. The use of laboratory animals that are free from unwanted microorganisms is an important prerequisite for the acquisition of reliable and reproducible results with a minimum of animals and is a significant contribution to animal welfare.1

5.1. Microbiological quality and classifications of experimental animals

The presence of unwanted microorganisms and the suitability of an animal population for a specific experiment can be demonstrated only by comprehensive health monitoring before and during experimentation. The quality of animals is most commonly characterized in terms of the microbiological (hygienic) status and of the system used in raising animals to ensure that a specific microbiological status is maintained. There are three major types of maintenance (hygienic levels):

■ **Isolator-maintained:** The animals are kept in a sterilizable chamber with a sterilized air supply, a mechanism for introducing sterilized materials, and a series of built-in gloves.

■ **Barrier-maintained:** The animals are bred and kept in a dedicated space, behind a barrier. For these facilities, personnel enter through a series of locks and are usually required to shower and use disinfected clothing. All equipment, supplies and conditioned air are sterilized or disinfected. Barrier facilities are designed to exclude organisms for which animals are the primary or preferred hosts, but will generally not exclude organisms for which humans are hosts. Barrier maintenance can also be achieved at the cage or rack level with equipment that can be sterilized or otherwise disinfected.

■ **Conventionally-maintained:** The animals are raised in areas that have no special impediments to the introduction of microorganisms. This method of maintaining animals cannot ensure the stability of the microbiological status, because unwanted organisms can be introduced at any time. Micro-isolation cages are generally used to protect animals in otherwise conventional rooms.

Various classifications have been developed to define the microbiological quality of laboratory animals. The most important classifications (hygienic categories) are as follows:

■ **Germ-free (GF)** animals that are derived by Cesarean section or embryo transfer and reared and maintained in an isolator with aseptic techniques.

8

■ **Specified-pathogen-free (SPF)** animals that show no evidence (usually by serology, culturing or histopathology) of the presence of particular microorganisms. An animal can be classified as SPF if it is free of one or many pathogens. Commercial suppliers have coined various terms to indicate the SPF status. All terms are related to specified organisms from which the animals are stated to be free and for which they are regularly monitored.

■ **Virus-antibody-free (VAF)** animals that are free of antibodies to specified rodent

viruses. Animals might not be free of viruses other than those specified and might not be free of other microorganisms.

- Conventional animals in which the microbial burden is unknown, uncontrolled or both.
- Clean conventional or minimal disease (MD) animals that are maintained behind a low-security barrier and demonstrated to be free of selected pathogens. Use of this term should be avoided because of the lack of precision of its meaning.

5.2. Sources of infections / microbial contamination

The sources of microbial contamination include vermin, experimentally infected and spontaneously ill laboratory animals or their tissues or tumors, air, food, water, bedding, ancillary equipment and personnel. (The highest microbiological risk is man himself.) Good facility management practices and constant surveillance are necessary to minimize the introduction of unwanted microbes.

5.3. Zoonosis

Infectious diseases that may be transmitted from other animals, either wild or domestic, to humans, or from humans to animals, are called zoonoses (the latter is sometimes called reverse zoonosis). The list of potential zoonoses related to working with animals in research, teaching or testing is quite long, though in reality the risks are very low when the common small laboratory animal species are dealt with in the laboratory. There are a number of reasons for this low risk. Firstly, commercial suppliers of laboratory animals have done an excellent job of producing disease-free animals. Further, institutions have generally developed good occupational health and safety programs that include active veterinary monitoring and care programs. The risk of exposure to zoonotic diseases is greater for those who work with experimental animals from random sources (including cats, dogs and most livestock), and for field researchers studying wild animals in their habitat. Working with non human primates in the laboratory is a special case because of the many zoonotic concerns.¹⁻³

5.4. Animal quarantine and stabilization

Whenever possible, the health status of every animal should be ascertained before it is brought into the facility. Quarantine is the separation of a newly received animal from those already in the facility until the health of the new animal has been evaluated. Effective quarantine minimizes the introduction of disease agents into established colonies and prevents the possibility of zoonoses.

The quarantine period should be of sufficient duration to allow the expression of diseases present in the incubation stages. Some or all of the following should be achieved during the quarantine and stabilization period: diagnosis, control, prevention and treatment of diseases; physiological and nutritional stabilization; and grooming to include ectoparasite control (many zoonotic agents require an arthropod vector).

9

The period of quarantine is in some cases laid down in the national animal health regulations. In others, it varies according to the circumstances and should be determined by a competent person, normally the veterinarian appointed by the establishment. Even when the animals are believed to be in sound health or, in the case of a higher microbiological status, after transportation (receiving), it is good husbandry for them to undergo a period of acclimatization (physiological, psychological, and nutritional stabilization) before being used in an experiment.

5.5. Symptoms, diagnosis, standard procedure for infected, sick animals

At the beginning of an illness, there are only general symptoms. It is usually too late to save the stock (group of animals) when specific signs are present. Clinical examination is difficult in some species (e.g. rodents). An animal that appears sick must be isolated immediately (in an SPF facility, it must be removed), and its surroundings must be disinfected. Apparently sick animal must be examined. In a conventional environment, isolated cases or the whole animal population can be treated.

6. Social environment and other environmental factors

The social environment usually involves physical contact and communications among members of the same species (conspecifics), although it can include non contact communication among individuals through visual, auditory and olfactory signals.

6.1. Space recommendations and group size

An animal's space needs are complex, and considerations of only the animal's body weight or surface area are insufficient. Space needs are given high priority in animal welfare regulations, where the minimal space needs and cage sizes are specified in detail. Some species benefit more from wall space (e.g. rodents), shelters (e.g. primates) or cage complexities (e.g. cats and primates) than from simple increases in floor space. Whenever appropriate, social animals should be housed in pairs or groups, rather than individually, provided that such housing is not contraindicated by the protocol in question and does not pose an undue risk to the animals. Space for group-housed animals should be based on the individual space needs, the behavior, the compatibility of the animals, the number of animals, and the goals of the housing situation.

6.2. Other factors

Effects between and within species (sound, olfactory and microbiological effects) should be considered. Because of these effects, all animal species should be kept (housed) in separated areas (rooms and barns). Noisy animals, such as dogs, pigs and nonhuman primates, should be housed away from quieter animals, such as rodents, rabbits and cats. Other effects involve light, color and the biological rhythm.^{1,2,3}

7. Transport conditions

All animals must be acquired lawfully. The use of purpose-bred research animals might be desirable and, for the most frequently used animals, is obligatory by the regulations. As a rule, vendors of purpose-bred animals regularly provide information that describes the genetic and pathogen status of their colonies or individual animals. All transportation is a stressful experience for animals and as a consequence, the physiological parameters may be seriously modified. For normalization of these modifications, rodents need at least 2 weeks, while animals with a highly developed nervous system (e.g. primates) need at least one

10

month. All parts of the transportation process must be carried out according to the prevailing

animal health, transport and welfare regulations. All transportation of animals should be planned to minimize the transit time and the risk of zoonoses, to protect against environmental extremes, to avoid overcrowding, to provide food and water when indicated, and to protect against physical trauma. Animals must be in good health for transportation and it is the duty of the sender to ensure that they are so. Female animals which are likely to give birth during the transport must be excluded. Consignments of animals must be received and unpacked without avoidable delay. After inspection, the animals must be transferred to clean cages or pens and be supplied with feed and water as appropriate.1-3

1.0 |Objective |
 |To lay down the procedure for Estimation of Methyl pentose content in |
 |Pneumococcal polysaccharide samples. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to all the in process and |
 |polysaccharide samples of pneumococcal serotypes 6A, 6B, 7F, 18C, 19A, 19F |
 |and 23F in which the Methyl pentose content is to be determined. |
 3.0 |Responsibility |
3.1	The analyst is responsible for executing the described procedure
	correctly.
3.2	Supervisor is responsible for verifying that the procedure is carried
out correctly and check the results.	
3.3	HOD shall be responsible for overall compliance of this SOP and shall
ensure that the SOP is reviewed every two years or if required	
	earlier.
4.0	Abbreviations and Definitions
4.1	Abbreviations:
	4.1.1
	4.1.2
	4.1.3
	4.1.4
	4.1.5
	4.1.6
	4.1.7
	4.1.8

	4.3.1
	4.3.2
	4.3.3
	4.3.4
	4.3.5
	4.3.6
5.0	Procedure
5.1	Preparation of solutions: Prepare all the solutions as described below
and fill the form, label the solutions and assign lot numbers.	
	5.1.1
	5.1.2
	5.1.3
	5.1.4
5.2	Testing Procedure:
	5.2.1
	5.2.2

			outside the range of the calibration curve, carry out the	
			calculation for more appropriate dilution.	
			5.2.2.	Place the above test tubes in crushed ice and add 2.25 ml
			2	of cooled 15.7M Sulphuric acid drop-wise to each of the
			standard, blank and sample and mix well.	
			5.2.2.	Cool the test tubes to reach room temperature and
			3	incubate the tubes in water bath at 90°C for 7 min.
			5.2.2.	Allow the test tubes to cool down to room temperature for
			4	5 min and add 50µl of 0.2 M L- Cysteine hydrochloride
			solution and mix well.	
			5.2.2.	Incubate the test tube in dark at room temperature for
			5	two hours.
			5.2.2.	Observe for the appearance of greenish yellow color,
			6	which can vary with the concentration.
			5.2.2.	Measure the absorbance at the difference of 396nm and
			7	430nm against the blank using spectrophotometer.
			5.2.2.	Note that all the readings of the assay tubes should be
			8	taken within 30 mins. of completion of the assay and
			maximum 10 samples should be analysed in one single	
			assay.	
		5.3	Calculations:	
		5.3.1	Once the absorbance of the standards and the test samples have	
		been taken, calculation shall be done using the excel sheet		
		carrying formulas for the required calculation.		
		5.3.2	Always copy the master excel sheet (sheet carrying formulas for	
		the required calculation), never use the previously used excel		
		sheet for new calculations.		
		5.3.3	Copy the master excel sheet, keep it for use in respective	
		folder and then fill in the required sample details (Batch		
		number), sample dilution (if applicable), name of analyst, date,		
		etc.		
		5.3.4	Proceed for calculations starting from the Calibration curve.	
		The calculations are done according to the equation,		
		Y = mX + b.		
		Where: m = slope		
		b = intercept		
		Y = absorbance		
		X = concentration		
		(multiply with the dilution factor)		
		5.3.5	In case of dry polysaccharide,	
		Methyl pentose (%) in Polysaccharide on dry weight basis:		
		Methyl pentose in dry Polysaccharide. =		
		Methyl pentose in Polysaccharide. Sol. (µg/ml) X 1 – {Moisture		
		(%) / 100}		
		Methyl pentose in dry Polysaccharide (µg/ml)		
		Methyl pentose (%) = _____ x		
		100		
		Conc. of Polysaccharide solution (µg/ml)		
		5.3.6	To calculate the pure polysaccharide content (mg) present in dry	
		polysaccharide sample in of each serotype based on the methyl		
		pentose content obtained, following formula is applied:		
		Pure Polysaccharide content(mg) / Dry polysaccharide content		
		(mg)		
		= (Methyl pentose in dry polysacc (mg) X Conversion factor)		
		5.3.7	The conversion factor of each serotype is mentioned below	
		Serotype	Percentage of Methyl Pentose as	Conversion
		per WHO TRS 977	factor	
		6A	22.86 %	4.37
		6B	22.86 %	4.37
		7F	26.40 %	3.79
		18C	15.96 %	6.26
		19A	26.32 %	3.79
		19F	26.32 %	3.79
		23F	40.77 %	2.45
		5.3.6	Record all the calculations in the data record form and also	
		attach the hard copy of the excel sheet used for calculation		
		along it.		
		5.4	Acceptance criteria:	
		5.4.1	The test is valid if Regression of the standard curve is ≥0.99	
		and the percentage of Coefficient of Variation is ≤ 15% within		
		the replicates.		
		5.4.2	Methyl pentose content in Purified Pneumococcal polysaccharide	
		should meet the laid specifications for each serotype.		
		6.0	Forms and Records	
		Determination of Methyl Pentose content - Annexure 1		
		7.0	Reference	
		7.1	WHO TRS No. 977 Annexure 3: Recommendations to assure the quality,	
		safety and efficacy of pneumococcal conjugate vaccines.

			125
			250
			1:80
			125 µL of 1:40 dilution
			125
			250
			Perform serial dilutions of reference standard from 1:10
			dilution as per the below
			table.
		5.3.2	Test Solution preparation:
			Dilute the test sample 1:10 folds by taking 50 µL of Neat sample
			and 450 µL of Owren koller buffer.
		5.4	Test method:
		5.4.1	Switch on the Coagulometer 15 minutes prior to analysis
		5.4.2	Place all the reagents in appropriate slots of the Coagulometer
			for warming at 37°C (5 minutes prior to analysis).
		5.4.3	Place a Cuvette strip with required number of cuvettes in the
			incubation area and prewarm at 37°C at least for 3 minutes. Then
			dispense one magnetic ball to each cuvette.
		5.4.4	Add 50 µL of each of the dilution of reference standard, 50 µL
			of STA Deficient X into each cuvette.
		5.4.5	Immediately start the timer corresponding to the incubation
			column for an incubation of 60 sec.
		5.4.6	After 50 sec beep sound was produced. Then transfer the cuvette
			from the incubation chamber to the test column area.
		5.4.7	After 60 sec of incubation time, add 100 µL of Neoplastine CI
			Plus to each cuvette by pressing timer to start the measurement.
		5.4.8	Note down the clotting time in seconds.
		5.4.9	Then feed the Percentage of reference standard Factor X
			corresponding to its clotting time for each dilution in the
			instrument.
			Note: Instrument automatically plots the calibration curve.
		5.4.10	Then perform the test for the test samples as described above
			and note down the clotting time as well as Factor X activity
			which comes in the print out.
		5.5	Calculations:
		5.5.1	As calibration data is fed in Coagulometer, the instrument
			itself plots test sample clotting time on standard curve and
			calculates Factor X activity.
		5.5.2	Calculate % activity of Factor X to that of Factor IX using
			following formula
			[pic]

				2
				0.5 M Calcium Chloride
				1
				3
				Human Thrombin (500 IU/mL)
				0.06
				4
				Purified Water
				7.94

			5.2.4.2	Prepare the buffer freshly.
			NOTE: The above buffer preparation is based on 500 IU/mL of	
			Thrombin. If Thrombin activity is different calculate	
			accordingly. Also capture the thrombin details in ATDS.	
		5.2.5	Mixture of Dipotassium Sulphate and Copper sulphate in the	
			ratio of 10:1:	
			5.2.5.1	Mix 909 mg of Dipotassium Sulphate and 91 mg of Copper
			sulphate.	
		5.2.6	69 % Sulphuric acid:	
			5.2.6.1	Take 296 mL of purified water in a volumetric flask and
			make up the volume to 1000 mL by slowly adding 704 mL	
			of 98% H₂SO₄.Prepare the reagent freshly.	
		5.2.7	Boric acid – 4%	
			5.2.7.1	Take 40 g of Boric acid and dissolve in 500 mL of
			Purified water and adjust pH to 4.65 with 1 N NaOH and	
			make up the volume to 1000 mL with Purified water.	
			5.2.7.2	Filter sterilize by using 0.45µ membrane filter and
			store at room temperature for 2 months.	
		5.2.8	Methyl Red TS:	
			5.2.8.1	Dissolve 100 mg of Methyl red in 100 mL of alcohol, and
			filter if necessary.	
		5.2.9	Methylene Blue TS:	
			5.2.9.1	Dissolve 125 mg of Methylene blue in 100 mL of alcohol,
			and dilute with alcohol to 250 mL.	
		5.2.1	Methyl red- Methylene blue Indicator	
		0		
			5.2.10.	Add 10 mL of methyl red TS to 10 mL of Methylene blue
			1	TS, and mix.
			Note: Prepare the indicator freshly.	
		5.2.1	Sodium hydroxide Solution – 8 M	
		1		
			5.2.11.	Dissolve 1600 g of Sodium Hydroxide in 5000 mL of
			1	Purified water.
			NOTE :Filter the solution using 0.45 µm filter and store at	
			room temperature for 1 month.	
		5.2.1	Sulphuric acid 0.01 N	
		2		
			5.2.12.	Take 136 µL of 98% H₂SO₄ in Volumetric flask and make
			1	up the volume to 500 mL with Purified water.
			5.2.12.	Filter sterilize by using 0.45µ membrane filter and
			2	store at room temperature for 2 months. Prior to use,
			visually check Discard the solution if it is visually	
			unclear.	
		5.3	Test Method : This method consists of the following steps	
		Fibrin clot formation		
		Digestion, Distillation and Titration		
		5.3.1	Fibrin clot formation:	
			5.3.1.1	Mix 0.2 mL of the neat test sample/Reference standard
			with 2 mL of 50 mM Tris Cl pH 7.0 containing 50 mM	
			Calcium Chloride and 3 IU/mL Human Thrombin.	
			5.3.1.2	Incubate at 37 ° C for 20 min.
			5.3.1.3	Separate the Fibrin clot by centrifugation 5000 g (7200
			rpm) for 20 min.	
			5.3.1.4	Wash thoroughly with 9 g/L Sodium chloride R for two
			times.	
			5.3.1.5	Blank Solution :
			Add 2 mL of 9 g/L Sodium chloride (0.15 M) to the blank	
			digestion flask.	
		5.3.2	Digestion:	
			5.3.2.1	Set the required preheating temperature for speed
			digester (380°C) and let the system heat up for 10 to	
			15 minutes minimum.	
			5.3.2.2	Then transfer the Fibrin clot with 2 mL of Purified
			water to the digestion flask of the apparatus.	
			5.3.2.3	Add 1 g of a powdered mixture of potassium sulphate and
			cupric sulfate (10:1), and wash down any adhering	
			material from the neck of the flask with a fine jet of	
			water.	
			5.3.2.4	Add 7 mL of 69% sulphuric acid, allowing it to rinse
			down the wall of the flask, then while swirling the	
			flask, add 1 mL of 30 percent hydrogen peroxide	
			cautiously down the side of the flask. (Do not add	
			hydrogen peroxide during the digestion).	
			5.3.2.5	Heat the flask over a free flame or an electric heater
			for 90 min at 380 °C until the solution	
			has a clear blue colour and the sides of the flask are	
			free from carbonaceous material.	
		5.3.3	Distillation:	
			5.3.3.1	After cooling the flasks, add 80 mL of Purified water
			to the digested sample and to this add 30 mL of Sodium	
			Hydroxide solution 8 M by pressing reagent button	
			present in the distillation unit, in such manner as to	
			cause the solution, more alkaline. Close the apparatus,	
			and begin the distillation with steam immediately for 5	
			min.	
			5.3.3.2	Receive the distillate in 15 mL of 4% Boric acid
			solution to which 35 mL of Purified water has been	
			added, to which has been added 3 drops of methyl red –	
			methylene blue TS and check to cover the end of the	
			condensing tube in the Solution.	
			5.3.3.3	Remove the absorption flask; rinse the end of the
			condensing tube with a small quantity of water.	

		5.3.4	Titration:	
			5.3.4.1	Titrate the distillate with 0.01N sulphuric acid.
				Perform also a blank determination, and make any
				necessary correction.
			5.3.4.2	Each mL of 0.01N sulphuric acid is equal to 140.1 µg of
				nitrogen.
		5.3.5	Calculations:	
			5.3.5.1	Volume of 0.01 N Sulfuric acid consumed for blank = X
				mL
				Volume of 0.01 N Sulfuric acid consumed for Test sample
				= Y mL
				Final volume of 0.01 N Sulfuric acid consumed (Y-X) = Z
				mL
				Each mL of 0.01 N sulphuric acid VS is equivalent to
				140.1 µg of nitrogen.
				[pic]
				Nitrogen content (g) in 1.0 mL of sample (C) = A X B
				Nitrogen content (g) in 100.0 mL of sample or %Nitrogen
				(D) = C X100
				Clottable protein (mg/mL) = (D) X 6.0 X 10.0
				The suitable factor 6.0 is multiplied as per I.P. 2018.

1.0	Objective:			
	To lay down the Procedure for detection of Antibodies to HCV by Serology.			
2.0	Scope:			
	This Standard Operating Procedure is applicable to all the In- process and			
	finished product samples of IVIG.			
3.0	Responsibility			
	3.1	The QC analyst shall be responsible for executing the described		
	procedure correctly.			
	3.2	The QC supervisor shall be responsible for verifying that the		
	procedure is complied with and the results are checked.			
	3.3	The QC HOD shall be responsible for overall compliance of this SOP.		
4.0	Abbreviations and Definitions:			
	4.1	g: Grams		
	4.2	mL: Milliliter		
	4.3	mg: Milligram		
	4.4	M: Molarity		
	4.5	min: Minute		
	4.6	µL: Microliter		
	4.7	µg: Microgram		
	4.8	°C: Degree centigrade		
5.0	Procedure:			
	5.1	Equipment, Materials and Reagents		
		5.1.1	Multi scan Fc ELISA reader	
		5.1.2	Incubator	
		5.1.3	Laminar air flow unit	
	5.2	Preparation of solutions:		
		5.2.1	Preparation of Wash Buffer	
			5.2.1.1	Dilute 20 mL of 25X wash buffer to 1X concentrate with
			480 mL of water	
			Note: Wash buffer is stable for 2 months when stored at	
			2-80C	
			5.2.1.2	Check the buffer concentrate for the presence of salt
			crystals. If crystals are present in the solution,	
			resolubilize by warming at 370C until all crystals	
			dissolve	
		5.2.2	Preparation of 1X Working Conjugate	
			5.2.2.1	Dilute conjugate enzyme 1:100 in conjugate diluent. Do
			not store working conjugate	
			5.2.2.2	Prepare required amount of working conjugate solution
			from table given below.	
			pic	
			Note:	
			Do not store working conjugate. Prepare a fresh	
			dilution for each assay in a clean glass vessel.	
			In case any precipitate is found in conjugate	
			diluent/sample diluent, it should be allowed to settle	
			and the supernatant can be used for the test. The	
			precipitate does not interfere with the working of the	
			kit.	
		5.2.3	Preparation of working substrate solution	
			5.2.2.1	Mix TMB substrate and TMB diluent in 1:1 ratio to
			prepare working substrate	
			5.2.2.2	Prepare required amount of working substrate solution
			from table given below.	
			pic	
			Note: Do not store working substrate. Prepare a fresh	
			dilution for each assay in a clean plastic/glass	
			vessel. Mix solution thoroughly before use	
	5.3	Test method:		
		5.3.1	Switch on the laminar air flow unit	
		5.3.2	Wipe the laminar airflow unit with sterillium	
		5.3.3	Switch on the UV lamp for 5 to 10 min	
		5.3.4	Place the kit components in laminar air flow unit and bring the	
			kit components to room temperature (20 – 30 °C).	
			Note: Break off the required number of strips needed for the	
			assay and place in the well holder. Take the strip holder with	
			the required number of strips, taking into account that two	
			negative and two positive controls should be included in the	
			run while opening the fresh pack	
		5.3.6	Fit the strip holder with the required number of HCV Microlisa	
			strips	
		5.3.7	Add 100 µL of the sample diluent to one well as blank	
		5.3.8	Add 100 µL Negative Control, Positive Control & diluted test	
			sample to labelled wells. Negative control & Positive Control	
			is ready to use & hence no dilution is required	
		5.3.9	Carefully apply cover seal to the strips. Avoid spillage of the	
			contents	
		5.3.1	Then incubate at 37oC + 2oC for 30 mins + 2 minutes.	
		0	Note: While the samples are incubating, prepare working wash	
			solution and working conjugate	
		5.3.1	After the incubation is over, wash the wells 6 times with	
		1	working wash solution.	
			WASHING: Perform washing as mentioned below	
			5.3.11.	Incomplete washing will adversely affect the test
			1	outcome
			5.3.11.	Carefully aspirate the well contents completely into a
			2	waste container
			5.3.11.	Then fill the wells completely with wash buffer
			3	avoiding overflow of buffer from one well to another
			and allow to soak (approx. 30 seconds).	

		5.3.11.	Carefully aspirate completely and repeat the wash and
		4	soak procedure 4 additional times for a total of 5
			washes
		5.3.11.	Tap upside down on absorbent sheet till no droplets
		5	appear on the sheet, taking care not to dislodge the
			wells
	5.3.1	Add 100 µL of working conjugate solution in each well including	
	2	blank well	
	5.3.1	Carefully apply cover seal & incubate at 37°C ± 2°C for 30 mins	
	3	± 2 mins.	
		Note: While conjugate is incubating, prepare substrate solution	
		in last 5 minutes of incubation. Protect from light	
	5.3.1	Carefully aspirate and wash the wells after incubation as	
	4	described in section 5.3.11. Avoid spillage	
	5.3.1	Add 100 µL working substrate solution in each well including	
	5	blank well	
	5.3.1	Incubate at room temperature (20-30°C) in dark for 30 mins	
	6		
	5.3.1	Add 100 µL of stop solution	
	7		
	5.3.1	Read absorbance at 450 nm in ELISA reader. (Use of a reference	
	8	filter of 620 nm is preferred).	
		Note:	
		Care should be taken while performing the experiment in order	
		to avoid infection from plasma sample or positive control.	
		Wear nose mask and hand gloves throughout the experiment. Do	
		not reuse the gloves and masks; discard immediately after	
		completion of the experiment.	
		Discard the used tips in a beaker containing sodium	
		hypochlorite and close the beaker with aluminium foil.	
		Perform the experiment under laminar airflow unit	
	5.4	Calculations :	
	5.4.1	Cut-off value can be determined by using the following formula:	
		Cut-off Value = [pic]	
	5.5	Method Validation Criteria:	
	5.5.1	Blank acceptance criteria"	
		The OD value at 450/620 nm for Blank must be <0.100 in case of	
		differential filter being used. In case differential filter is	
		not available in the reader the blank value may go higher	
	5.5.2	Negative Control (NC) acceptance criteria:	
		The OD value at 450/620 nm for NC must be < 0.150. If it is not	
		so, the run is invalid and must be repeated.	
		Mean absorbance	
		[pic]	
	5.5.3	Positive Control (PC) acceptance criteria:	
		The OD value at 450/620 nm for PC or PCx must be >0.5. If it is	
		not so, the run is invalid and must be repeated.	
		Mean absorbance.	
		[pic]

1.0	Objective:		
	To lay down the procedure for osmolality test using osmometer method.		
2.0	Scope:		
	This Standard Operating Procedure is applicable to all the and finished		
	product samples.		
3.0	Responsibility		
	3.1	The QC analyst shall be responsible for executing the described	
	procedure correctly.		
	3.2	The QC supervisor shall be responsible for verifying that the	
	procedure is complied with and the results are checked.		
	3.3	The QC HOD shall be responsible for overall compliance of this SOP.	
4.0	Abbreviations and Definitions:		
	4.1	SOP	
	4.2	: Standard Operating Procedure	
	4.3		
	4.4	QA	
	4.5	: Quality Assurance	
		OE	
	: Operation of Equipment		
	mL		
	: milliliter		
	mOSm/Kg		
	: Milli Osmol per Kilogram of water		
5.0	Procedure:		
	5.1	Equipment, Materials and Reagents	
		5.1.1	Osmometer
		5.1.2	Sample tubes/tips
		5.1.3	Pipette
		5.1.4	Tissue paper
		5.1.5	Reference standard Clinitol™ 290mOSm/Kg
		5.1.6	Reference standard Clinitol™ 850mOSm/Kg
		5.1.7	Reference standard Clinitol™ 50mOSm/Kg
		5.1.8	Reference standard Clinitol™ 2000mOSm/Kg
	5.2	Preparation of solutions:	
		NA	
	5.3	Test Method:	
		5.3.1	Keep the osmometer in a clean dry level area.
		5.3.2	Plug in the power cord and switch on the electric supply.
		5.3.3	Turn the instrument on by pushing the rocker-style power
		switch on the instrument's back panel into the on position.	
		5.3.4	Run one minute self-diagnostic test by pressing the [yes]
		button. After completion of self-diagnostic test, the display	
		will read as "Osmometer Ready".	
		5.3.5	Run the Clinitol® 290 mOsm/kg H2O Reference Solution, before
		testing unknown samples. If the results meet the	
		specification i.e. 290 + 2 mOsm/kg H2O, the instrument is	
		considered ready to use. If the results do not meet the	
		specification then calibrate the instrument as per the	
		procedure given at step 5.3.4	
		5.3.6	For testing the sample, take the sampler and insert the
		sampler's tip into place ensuring that tip is straight and	
		firmly seated.	
		5.3.7	Depress the sampler's plunger and insert the sampler's tip at
		least ¼ inch (6 mm) below the surface of the fluid to be	
		tested.	
		5.3.8	Gently release the plunger to load a 20 µl sample. Visually
		inspect the sample to ensure that there are no large voids or	
		bubbles in the sample	
		5.3.9	Wipe the sides of the loaded sampler tip with a soft, no
		lint, non-ionic paper tissue to remove any clinging droplets	
		5.3.1	Quickly wipe the end of the sampler tip to remove any fluid
		0	protruding beyond the tip.
		5.3.1	Remove the chamber cleaner from the sample port and discard.
		1	
		5.3.1	Hold the sampler by barrel, insert the tip into the sample
		2	port then reset the sampler in the operating cradle.
		5.3.1	Start the test by pushing the operating cradle until it
		3	reaches a positive stop.
		5.3.1	Record the results which are presented in the format
		4	"Osmolality xxx mOsm".
		5.3.1	Pull back the operating cradle to a positive stop.
		5	
		5.3.1	Remove the sampler from the operating cradle and discard the
		6	used sampler tip.
		5.3.1	Insert a clean, dry chamber cleaner into the sample port and
		7	rotate it four or five times in both clockwise and
		counterclockwise direction. Withdraw the chamber cleaner and	
		insert the opposite end. Rotate the chamber cleaner in the	
		same manner and leave it in the sampler port until next test.	
		5.3.1	Calibrate the instrument as per operational manual
		8

				500
		5.3.3	Place a clean and dry 7.5 x 2.5 cm glass plate on a leveled	
		surface.		
		5.3.4	Prepare 5 mL of 10 g/L solution of agarose for	
		electrophoresis (1% agarose solution) by melting in a water		
		bath for 30 to 40 minutes.		
		5.3.5	Pour the gel onto a micro-slide strip and wait until it gets	
		solidified.		
		5.3.6	Pour 5 mL of this solution onto a glass plate.	
		5.3.7	Leave the gel at room temperature for 15 minutes to	
		facilitate proper solidification.		
		5.3.8	Cut 2 wells 1.5 mm in diameter 0.5 cm and 0.5 cm from either	
		side of the plate and 1 cm from the cathode.		
		5.3.9	Using a suitable commercial device, dig two wells about 1.5	
		cm apart from the cathode and about 0.5 cm away from the		
		sides and at the same level perpendicular to the direction of		
		electrophoresis.		
		5.3.10	Cut a trough of 1.0 mm in between the wells such that the	
		distance between the trough and each well should be not more		
		than 3.1 mm.		
		5.3.11	Place 1 μL of reference solution into one well and an equal	
		volume of test solution into the other.		
		5.3.12	Place the micro-slide containing 1% agar gel between the two	
		buffer reservoirs of a suitable Immuno electrophoresis		
		apparatus.		
		5.3.13	Pour 125 mL of electrophoresis buffer in each of the buffer	
		reservoir such that the buffer overflows on the gel placed in		
		the middle of the electrophoresis chamber.		
		5.3.14	Put the cover on the electrophoresis chamber and wait 30 to	
		60 seconds before applying current. This allows the plate(s)		
		to equilibrate with the buffer.		
		5.3.15	Electrophores the samples for about 35 min applying 90 volts	
		current across the agar-gel strip.		
		5.3.16	Place in the central slot about 50 μL of the 10 F diluted	
		antiserum specific to human plasma proteins.		
		5.3.17	Place this micro-slide in a Petridish containing wet cotton	
		and incubate at 2 - 8°C for at least 24 hours.		
		5.3.18	Precipitin arcs appear in the gel for both sample and	
		standard after 24 hours of incubation at 2 - 8°C.		
		5.3.19	After incubation, place the gel slide in a 0.85% saline and	
		wash to stop the precipitin reaction.		
		5.3.20	After washing, put the gel slide in Coomassie brilliant blue	
		staining solution for 30 min.		
		5.3.21	De-stain the gel slide by keeping in a destaining solution	
		for overnight.		
		Note: Ensure that the gel slide is covered completely with the		
		De-staining solution.		
		5.3.22	Make sure that the De-staining is complete to visualize clear	
		and prominent arcs. If the De-staining is not complete, keep		
		the gel slide in fresh De-staining solution for 1 hour.		
		5.3.23	Two precipitin arcs appear in the gel. One arc corresponds to	
		normal human serum and another arc corresponds to test		
		sample.		
		5.3.24	To capture the image of the gel for documenting, switch on	
		the Epson scanner and then double click.		
		5.3.25	Double click on the Epson scan software from the PC connected	
		to it.		
		5.3.26	Epson scan window appears.	
		Set the following parameters on the Epson scan window		
		.		
		Window Name		
		Selection of specific window from the drop down list		
		.		
		Settings		
		Name		
		Current settings		
		.		
		Original		
		Document Type		
		Reflective		
		.		
		.		
		Document Source		

			Document table
			Auto Exposure Type
			Document
			Destination
			Image Type
			24 bit colour
			Resolution
			240 dpi
			Document size
			No modifications
		5.3.27	Place the gel to be scanned on the flat surface of the
		scanner.	
		5.3.28	After setting the above parameters, click on the preview
		button of the window to adjust the exact alignment and	
		preview image of the gel.	
		Note: This preview avails proper positioning of the gel before it is	
		finally scanned and documented.	
		5.3.30	Then we can notice preview scan in progress giving the
		picture of the gel in preview window.	
		5.3.31	Wait for few seconds until the preview of the gel appears.
		5.3.32	Once the image looks fine in the preview image, click on the
		scan button of Epson scan window for final gel image.	
		5.3.33	Then File save settings" window will open asking the format
		of the image in which gel has to be saved.	
		5.3.34	Select Image Format type as JPEG(*.jpg) and click on OK.
		5.3.35	Then Scanning will start. (Progress: scanning pop up window
		will open showing the time remaining for the scan).	
		5.3.36	After the scan is completed, the image of the gel in JPEG
		format will be directly saved into My Documents folder.	
		5.3.37	This will complete the gel scanning.
		5.3.38	Then open the JPEG file and click on Edit settings to adjust
		the brightness and contrast of the gel picture for the	
		precipitin arcs to appear clearly against a contrast	
		background.	
		5.3.39	Once we can observed the precipitin arcs clearly, label the
		file with the batch number and immediately take a print out.	
		5.4	Interpretation of results:
		When observed the scanned gel using Gel scanner instrument,	
		the agarose gel shows an arc for test solution that	
		corresponds to the respective arc depending on the product	
		tested.

		5.3.11.
		4
		5.3.11.

		5	times on an absorbent tissue
	5.3.1	Tap dry the wells after washing and add 100 µL of working	
	2	substrate solution in all the wells including blank well	
	5.3.1	Cover the plate with an aluminium foil and incubate at room	
	3	temperature (20-25°C) for 30 minutes in dark	
	5.3.1	Stop the reaction by adding 100 µL of stop solution to each	
	4	well, mix gently	
	5.3.1	Read the absorbance of the wells at 450 nm in an ELISA Reader.	
	5	(Use of a reference filter of 620 nm is preferred)	
		Note:	
		Care should be taken while performing the experiment in order	
		to avoid infection from plasma sample or positive control.	
		Wear nose mask and hand gloves throughout the experiment. Do	
		not reuse the gloves and masks; discard immediately after	
		completion of the experiment.	
		Discard the used tips in a beaker containing sodium	
		hypochlorite and close the beaker with aluminium foil.	
		Perform the experiment under laminar airflow unit	
	5.4	Calculations :	
	5.4.1	Cut-off value can be determined by using the following formula:	
		Cut-off Value = [pic]	
	5.5	Method Validation Criteria:	
	5.5.1	Blank acceptance criteria"	
		The OD value at 450/620 nm for blank must be <0.100 in case of	
		differential filter being used. In case differential filter is	
		not available in the reader the blank value may go higher	
	5.5.2	Negative Control (NC) acceptance criteria:	
		The OD value at 450/620 nm for NC must be < 0.150. If it is not	
		so, the run is invalid and must be repeated.	
		Mean absorbance	
		[pic]	
	5.5.3	Positive Control (PC) acceptance criteria:	
		The OD value at 450/620 nm for PC or PCx must be >0.5. If it is	
		not so, the run is invalid and must be repeated.	
		Mean absorbance	
		[pic]

		5.1.5	Purified water
	5.2	Preparation of solutions:	
		5.2.1	Buffer solution, pH =4.00
		5.2.2	Buffer solution, pH =7.00
		5.2.3	Buffer solution, pH=9.20
	5.3	pH Electrode Calibration:	
		5.3.1	Check that the equipment is correctly connected to electrical
		supply.	
		5.3.2	Switch on the instrument by pressing ON/OFF key on front
		panel.	
		Use a combination of two standard buffer for calibration	
		according to requirements i.e.:	
		Case 1- For solution with pH less than 7.00 uses standard	
		buffers of 4.00 & 7.00.	
		Case 2- For solution with pH more than 7.00 use standard	
		buffers of 7.00 & 9.20	
			(Note: The pH meter shall be set for the different buffers to
		be used at the time of installation based on the future use.	
		This setting is changed only in case the range of pH readings	
		is different than preset.)	
		5.3.3	Clean pH electrode with purified water and blot dry.
		5.3.4	Put the standard buffers that are used in calibration in
		clean beakers.	
		5.3.5	Introduce pH electrode in first buffer according to case 1 or
		case 2 and wait for 2 seconds to stabilize the pH.	
		5.3.6	Remove pH electrode, rinse with purified water and blot dry
		and put in second standard buffer according to case 1 or case	
		2 and wait for 2 seconds to stabilize the pH.	
		5.3.7	Remove pH electrode, rinse with purified water and blot dry
		and put in potassium chloride solution.	
	5.4	pH Measurement:	
		5.4.1	Clean pH electrode with purified water and blot dry.
		5.4.2	Put the sample in clean beaker to check the pH.
		5.4.3	Introduce the pH electrode in beaker having sample solution
		5.4.4	Press [Read] key for pH measurement.
		5.4.5	Rinse, blot and store the electrode in a beaker having
		saturated KCl solution.

5.3	Sample preparation:
	5.3.1

			about 1 mg/ml of polysaccharide in Lal reagent water and use it		
			as test sample.		
			Note: The sample dilutions can vary depending upon the uronic		
			acid concentration. If there is any sample outside the range of		
			the calibration curve, carry out the calculation for more		
			appropriate dilution. Based on the expected uronic acid present		
			in the dry polysaccharide samples, the 1 mg/ml reconstituted		
			sample is further diluted as per the table below.		
			Serotype	Dilution fold	
			1	10 fold	
			3	10 fold	
			5	5 fold	
			9V	5 fold	
		5.3.2	In case on in process, take 1 ml of sample (dilute if required)		
			having about 100-150 µg Polysaccharide in eppendorf tube.		
		5.3.3	Add 100 µl of 5% DOC to the test sample and mix it, put this		
			tube in an ice bath for 30 minutes.		
		5.3.4	Take out the eppendorf and add 50 µl 1M HCl and mix thoroughly.		
			Centrifuge the mixture at 2-8°C for 15 minutes at 10000 RPM.		
			Collect the supernatant and use it as sample for uronic acid		
			estimation.		
		5.4	Test Procedure:		
		5.4.1	Take 500 µl of the standard dilutions from calibration curve,		
			Test Sample and Blank (Purified water) in duplicates in separate		
			test tubes.		
		5.4.2	Place the above test tubes in ice and add 2.5ml of cooled 9.94M		
			sodium tetraborate solution drop-wise to each tube of the		
			standard, blank and sample and mix well.		
		5.4.3	Cool the test tube to reach room temperature and incubate the		
			tubes in water bath at 80°C for 15 minutes.		
		5.4.4	Allow the test tube to cool down to room temperature for 5 min		
			and add 100 µl of 0.007M Carbazole solution to each tube.		
		5.4.5	Vortex the tubes and incubate in water bath at 80°C for 15		
			minutes.		
		5.4.6	Allow these tubes to cool at room temperature.		
		5.4.7	Observe for the appearance of purple pinkish color, which can		
			vary with the concentration.		
		5.4.8	Measure the absorbance at 530nm against the blank using		
			spectrophotometer.		
		5.4.9	Note that all the readings of the assay tubes should be taken		
			within 30 mins. of completion of the assay and maximum 10		
			samples should be analysed in one single assay.		
		5.5	Calculations:		
		5.5.1	Once the absorbance of the standards and the test samples have		
			been taken, calculation shall be done using the excel sheet		
			carrying formulas for the required calculation.		
		5.5.2	Always copy the master excel sheet (sheet carrying formulas for		
			the required calculation), never use the previously used excel		
			sheet for new calculations.		
		5.5.3	Copy the master excel sheet, keep it for use in respective		
			folder and then fill in the required sample details (Batch		
			number), sample dilution (if applicable), name of analyst, date,		
			etc.		
		5.5.4	Proceed for calculations starting from the Calibration curve.		
			The calculations are done according to the equation,		
			Y = mX + b, Where: m = slope		
			b = intercept		
			Y = absorbance		
			X = concentration		
			(Multiplication by dilution factor)		
		5.5.6	In case of dry polysaccharide,		
			Uronic acid (%) in polysaccharide on dry weight basis:		
			Uronic acid in dry polysacc. (µg/ml) =		
			Uronic acid in Polysacc. sol. (µg/ml) X 1 – {Moisture (%) / 100}		
			Uronic acid in dry polysaccharide (µg/ml)		
			Uronic acid (%) = _____		
			X 100		
			Conc. of polysaccharide solution (µg/ml)		
			To calculate the pure polysaccharide content (mg) present in dry		
			polysaccharide sample in of each serotype based on the Uronic		
			acid content obtained, following formula is applied:		
			Pure Polysaccharide content(mg) / Dry polysaccharide content		
			(mg)		
			= (Uronic acid in dry polysacc (mg) X Conversion factor)		
		5.5.7	The conversion factor of each serotype is mentioned below		
			Serotype	Percentage of Uronic acid as	Conversion factor
			per WHO TRS 977		
			1	55.17 %	1.81
			3	60.23 %	1.66
			5	23.59 %	4.24
			9V	22.33 %	4.47
		5.6	Acceptance criteria:		
		5.6.1	The test is valid if Regression of the standard curve is ≥ 0.99		
			and the percentage of CV is ≤ 15% within the replicates.		
		5.6.2	Uronic acid content in Purified Pneumococcal polysaccharide and		
			conjugate should meet the laid specifications for each serotype.		
		6.0	Forms and Records		
			Determination of Uronic Acid content - Annexure 1		
		7.0	Reference		
		7.1	WHO TRS No. 977 Annexure 3: Recommendations to assure the quality,		

	safety and efficacy of pneumococcal conjugate vaccines.

	Vaccine' 2.5.22.	

1.0 |Objective: |
 |To lay down a procedure to Procedure to determination of octanoic acid using |
 |HPLC method. |
 2.0 |Scope: |
 |This Standard Operating Procedure is applicable to all the In- process and |
 |finished product samples. |
 3.0 |Responsibility |
3.1	The QC analyst shall be responsible for executing the described
	procedure correctly.
3.2	The QC supervisor shall be responsible for verifying that the procedure
	is complied with and the results are checked.
3.3	The QC HOD shall be responsible for overall compliance of this SOP.

5.2	Preparation of solutions:
	5.2.1
5.3	Test procedure :
	5.3.1
	5.3.2
	5.3.2.

			Aspirate the supernatant from the pellet with the help of	
			a needle syringe and filter the sample using 0.45 µ	
			syringe filter and transfer into HPLC glass vial.	
				Note: No visible pellet is observed in the sample
				preparation of Reference solution.
		5.3.3	Test Sample Preparation:	
		5.3.3.	Take neat test sample.	
		1		
		5.3.3.	Dilute 0.4 mL of neat Test sample with 1.6 mL of Methanol	
		2	(HPLC grade) and vortex the solution for 3 minutes for	
			proper mixing. Then centrifuge the sample at 10,000 rpm	
			for 5 minutes. Aspirate the supernatant from the pellet	
			with the help of a needle syringe and filter the sample	
			using 0.45 µl syringe filter and transfer into HPLC glass	
			vial.	
			Note: A white precipitate is formed with the Test solution after	
			addition of Methanol. A visible pellet is observed after	
			centrifugation.	
		5.3.4	Analytical conditions	
			Wavelength : 214 nm	
			Flow rate : 0.8 mL/ min.	
			Run time : 12 min	
			Temperature : 40°C	
		5.3.5	Injection parameters	
			Injection volume : 50 µL	
		5.3.6	Method of Analysis:	
			5.3.6.1	Follow the Operation of Liquid Chromatography procedure
			as per SOP for Operation of Liquid Chromatography.	
			5.3.6.2	Initially purge the flow lines with purified water for 5
			min and then with mobile phase for 5 min.	
			5.3.6.3	Equilibrate the column initially with mobile phase and
			auto zero if the base line is not straight:	
			Flow rate: 0.8 mL/min	
			Column volumes: 3	
			Time: 40 min	
			5.3.6.4	First injection: Inject 50 µL of Reference Solution by
			down loading the respective method file.	
			Flow rate: 0.8 mL/min	
			Time: 12 min	
			5.3.6.5	Second injection: Inject 50 µL of Test solution by down
			loading the respective method file.	
			Flow rate: 0.8 mL/min	
			Time: 12 min	
			5.3.6.6	After completing analysis, clean the column with mobile
			phase	
			Flow rate: 0.8 mL/min	
			Column volumes: 3	
			Time: 15 min	
			5.3.6.7	After completion of analysis, remove the column and purge
			the flow lines with purified water for 5 min.	
			5.3.6.8	Analyze the results using various integration icons as
			per the SOP.	
		5.3.7	Calculation:	
			5.3.7.1	Compare the peak Area of Octanoic acid of test solution
			with that of Reference solution area and calculate in	
			terms of mmol/g of Protein (i.e. Octanoic acid) and	
			record the results in the analytical data sheet.	
			5.3.7.2	Octanoic acid 16 mM standard equals to 0.08 mmol/g of
			protein	
			Peak area of diluted 16 mM concentration of Octanoic acid	
			standard = X	
			Peak area of diluted Octanoic acid for Test sample = Y	
			[[pic]][pic][pic] mmol/g of protein

[5.0]Procedure	
	5.1
	5.2
	5.3
	5.4

			Pneumococcal Cell wall Polysaccharide Standard, keep the
			vial overnight at 2 to 8°C overnight with shaking. Prepare
			the aliquots as 1000 µl of 1 mg/ml, 100 µl of 1 mg/ml, and
			100 µl of 10 µg /ml. Store the standard aliquots at -70°C.
		5.4.2	Phosphate Buffered Saline (10X): Weigh 85.0 gm of NaCl, 22.8
			gm of Na₂HPO₄ and 63.6 gm of NaH₂PO₄ and dissolve in 800 ml
			of purified water. After complete dissolution of reagents,
			make up the total volume to 1000ml with purified water.
			Filter sterilizes the solution by passing through 0.22 µm
			filter.
		5.4.3	Phosphate Buffered Saline (1X): Add 100ml of Phosphate
			Buffered Saline (10X) to 900 ml sterile purified water.
		5.4.4	Dilution buffer (PBST): Add 50 µl (0.05% v/v) of Tween 20 to
			100 ml of PBS 1X solution.
		5.4.5	Blocking buffer (PBST with 1% BSA): Add 1 gm (1% w/v) of
			Bovine Serum Albumin (BSA) to 100 gm PBST solution. Do not
			agitate the solution for mixing.
		5.4.6	Carbonate / Bicarbonate buffer: Prepare 0.5 M stock solution
			of Na₂CO₃ and NaHCO₃ by weighing 5.3 gm/100ml and 4.2
			gm/100ml respectively. Prepare the working stock of
			Carbonate / Bicarbonate buffer by adding 120 µl Na₂CO₃
			solution and 880 µl of NaHCO₃ solution in 9 ml of purified
			water. pH of this buffer should be 9.6.
		5.4.7	Secondary antibody dilution: Calculate the total volume of
			working dilution of secondary antibody required for the
			assay. Prepare the working dilution of Polyclonal Goat
			anti-mouse Immunoglobulin HRP conjugate in PBST as 1:2000
			folds.
		5.4.8	Stop Solution: To prepare stop solution (1N H₂SO₄), add 2.8
			ml of H₂SO₄ to 97.2 ml of purified water.
		5.5	Test Method:
		5.5.1	Coating of wells:
		5.5.1.1	The ELISA plates are coated with anti CWPS
			polyclonal antibodies. Determine the number of wells
			to be coated. Prepare a 1: 32000 fold dilution of
			anti-CWPS polyclonal antibody dilution in carbonate
			/ bicarbonate coating buffer.
		5.5.1.2	Add 100 µl/ well of polyclonal antisera solution to
			each well. Incubate the plates at 2 to 8°C over
			night.
		5.5.2	Blocking of wells:
		5.5.2.1	On the next day, remove the coated plate from at 2
			to 8°C; discard the coating solution by flicking.
			Add 150 µl/ well of blocking buffer to each coated
			well.
		5.5.2.2	Incubate the plate at 37 ± 2°C for 30 minutes.
		5.5.3	Preparation of Polysaccharide Standard and Test sample
			dilutions:
		5.5.3.1	During the incubation for blocking of wells, prepare
			the dilutions for polysaccharide standards.
		5.5.3.2	Prepare 3 fold dilutions of polysaccharide standard
			in dilution buffer to get a concentrations of 1000
			ng/ml, 333.33 ng/ml, 111.11 ng/ml, 37.04 ng/ml,
			12.35 ng/ml, 4.12 ng/ml, 1.04 ng/ml and 0.46 ng/ml.
		5.5.3.3	Prepare 1: 10, 1: 100 and 1: 1000 fold dilution of
			test sample in dilution buffer.
		5.5.4	Washing of wells:
		5.5.4.1	After completion of 30 min. incubation of the
			blocked plate at 37°C, remove the plate from the
			incubator.
		5.5.4.2	Discard the blocking buffer from the wells by
			flicking. Wash the wells by adding 250 µl/ well of
			PBS 1X. After 30 sec. discard the PBS from wells by
			flicking and then gently tap the plate on to a
			blotting paper. Ensure that the washing solution is
			removed completely, do not allow the wells to dry.
			Repeat the procedure for three times.
		5.5.5	Addition of Standard, sample and controls to wells:
		5.5.5.1	Add 100 µl of all the eight dilutions of standard in
			column A and B of the plate in duplicate.
		5.5.5.2	Add 100 µl of each sample, in duplicate that is to
			be analysed in consecutive wells of column C.
		5.5.5.3	Add 100 µl of dilution buffer in duplicate; this
			will act as a negative control.
		5.5.5.4	After addition of all standards, samples and
			controls, seal the plate with plate sealer and
			incubate it in 37 ± 2°C for next 90 min.
		5.5.6	Addition of Primary antibody:
		5.5.6.1	Prepare 1: 1200 dilution of Monoclonal antibody for
			Phosphoryl Choline in dilution buffer as per the
			volume required.
		5.5.6.2	After completion of 90 min. of incubation period,
			remove the plate from incubator.
		5.5.6.3	Wash the wells for four times by PBS 1X as mentioned
			in the step no. 5.5.4
		5.5.6.4	Add 100 µl of 1: 1200 fold diluted Monoclonal
			antibody solution for Phosphoryl Choline to each
			well.
		5.5.6.5	After addition, seal the plate with plate sealer and
			incubate it in 37 ± 2°C for next 90 min.
		5.5.7	Addition of secondary antibody:
		5.5.7.1	Prepare 1:2000 dilution of Polyclonal Goat anti

				mouse Immunoglobulin / HRP conjugate solution in	
				dilution buffer as per the volume required.	
				5.5.7.2	After completion of 90 min. of incubation period,
				remove the plate from incubator.	
				5.5.7.3	Wash the wells for four times by PBS 1X as mentioned
				in the step no. 5.5.4.	
				5.5.7.4	Add 100 µl of 1: 2000 fold diluted secondary
				antibody solution to each well.	
				5.5.7.5	After addition, seal the plate with plate sealer and
				incubate it in 37 ± 2°C for next 60 min.	
				5.5.8	Addition of TMB Substrate:
				5.5.8.1	After completion of 60 min. of incubation period,
				remove the plate from incubator.	
				5.5.8.2	Wash the wells for four times by PBS 1X as mentioned
				in the step no. 5.5.4.	
				5.5.8.3	Add 100 µl of TMB Substrate, in dark to each well.
				5.5.8.4	After addition incubate the plate at room
				temperature for next 15 min. in dark.	
				5.5.9	Addition of Stop solution:
				After completion of 15 min. of incubation period, add 100 µl	
				of stop solution (1N H2SO4) to each well above the TMB	
				substrate to stop the reaction.	
				5.5.10	Reading of Plate:
				5.5.10.	After addition of stop solution, read the Optical
				1	density (OD) values of the wells on a Micro plate
				ELISA reader.	
				5.5.10.	Read the plate at a dual wavelength of 450 and 630
				2	nm. The readings should be taken after 5 mins but
				within 15 min from addition of stop solution.	
				5.5.11	Data analysis:
				5.5.11.1	Import the raw data from the software of ELISA
				reader into the window Excel file and get the	
				average OD values of the duplicate wells and	
				compile the data sheets comprising of standard	
				curve concentration and sample details along with	
				the average OD as per the plate design. For	
				standard curve, take concentration on X-axis and	
				its corresponding OD on Y-axis.	
				5.5.11.2	Prepare Standard curve using Standard CWPS ranging
				from 0.46 ng/ml to 1000 ng/ml concentration. The	
				Coefficient of correlation (R2) which should be ≥	
				0.98.	
				5.5.11.3	Once compiled data sheet is ready, use sigma plot
				software for finding concentration of CWPS in the	
				samples by extrapolating the standard curve values	
				i.e. concentration and its corresponding OD.	
				5.5.11.4	Open Sigma plot software, click on create new blank
				notebook and press ok.	
				5.5.11.5	Copy standard curve from compiled excel sheet onto
				the sigma plot note book and save the note book.	
				5.5.11.6	Click 'Pharmacology' and select 'standard curve
				analysis'. Window showing standard curve will	
				arrive. For curve, select 'Four parametric' options	
				and click for 'log X axis scale' and press OK.	
				Software will automatically process the data in the	
				form of three sheets below the notebook. Three	
				sheets will be named as	
				Data 2. Graph	
				3. Report	
				5.5.11.7	R2 for the standard curve will be determined from
				the report sheet.	
				5.5.11.8	Standard graph can be obtained from Graph sheet,
				where heading, X-axis and Y-axis information could	
				be incorporated by right clicking and opting 'Edit'	
				option.	
				5.5.11.9	Data sheet will give all the extrapolated values of
				concentration (X-axis) on column-6 and OD (Y-axis)	
				on column-7. Match OD of samples from excel	
				compiled sheets from column-7 of sigma plot and its	
				corresponding concentration from column-6.	
				Note: In case, the software gives two different	
				concentrations of CWPS for similar OD values of the	
				sample, higher dilutions should be considered for	
				this assay.	
				5.5.11.1	Similarly note the concentrations for all the
				0	samples and determine cell wall polysaccharide
				concentration by multiplying the dilution factor	
				with the concentration from the sigma plot.	
				5.5.12	Validity criteria:
				5.5.12.	Regression of standard curve (R2) should be ≥ 0.98.
				1	
				5.5.12.	Coefficient of Variation (%CV) for replicates should
				2	be < 15%.

1.0	Objective:			
	To lay down the test procedure for Fc Function of Immunoglobulin			
2.0	Scope:			
	This Standard Operating Procedure is applicable to all the In- process and			
	finished product samples of IVIG.			
3.0	Responsibility			
	3.1	The QC analyst shall be responsible for executing the described		
		procedure correctly.		
	3.2	The QC supervisor shall be responsible for verifying that the		
		procedure is complied with and the results are checked.		
	3.3	The QC HOD shall be responsible for overall compliance of this SOP.

||| |C1 |
||| |C2 |
||| |C3 |

```

			5.3.4.2	Mix well and incubate at 37°C for 60 min
			5.3.4.3	At the end of incubation, add 1.5 mL of Albumin PBS
			Solution and stir gently until homogenous	
			5.3.4.4	Collect the cells by centrifugation at 1000 g for 10
			min. Remove the supernatant and add approximately 3 mL	
			of Albumin PBS Solution. Repeat this operation up to 4	
			times in total, leaving a final volume of 300 µL	
		5.3.5	Complement-Initiated Haemolysis	
			5.3.5.1	To measure haemolysis, add 900 µL of Albumin PBS
			Solution warmed to 37°C to each test tube containing	
			300 µL of test/standard/complement treated cells and	
			re-suspend the cells carefully by repeated pipetting	
			(not fewer than 5 times)	
			5.3.5.2	The microtitre plate must be pre-warmed to 37°C before
			starting the test. Transfer 240 µL of each solution	
			into 4 microtitre plate wells	
			5.3.5.3	Incubate the microtitre plate at 37°C for 6 min
			5.3.5.4	Pre-warm diluted guinea pig complement for 30 sec at
			37°C.	
			Note: Use suitable dilution of guinea pig complement	
			5.3.5.5	To each microtitre plate well, add 60 µL of 1:50
			diluted guinea-pig complement	
			5.3.5.6	Mix for 10 s and immediately start recording the
			absorbance at 541 nm at 37°C measuring every 1 min	
			5.3.5.7	Stop the measurement if the absorbance as a function of
			time has clearly passed the inflexion point	
		5.4	Calculations :	
		5.4.1	For each well, determine the slope (S) of haemolysis curve at	
		the approximate inflexion point by segmenting the steepest		
		section in suitable time intervals Δt ($\Delta t=2$ min), and calculate		
		S between adjacent intersection points, expressed as ΔA per		
		minute		
		5.4.2	The largest value for S serves (S_{exp}). In addition, determine	
		the absorbance at the start of measurement (A_s) by		
		extrapolating the curve, which is almost linear and parallel to		
		the time axis within the first few minutes. Correct (S_{exp})		
		using the expression: $S' = S_{exp} / A_s$		
		5.4.3	Calculate the arithmetic mean of the values of S' for each	
		preparation(test & reference solution) .Calculate the index F_c		
		function (IF_c) from the expression.		
		[pic]		
		[pic]= Arithmetic mean of the corrected slope for the		
		preparation to be examined,		
		[pic]= Arithmetic mean of the corrected slope for the		
		reference preparation to be examined,		
		[pic]= Arithmetic mean of the corrected slope for the		
		complement control		
		5.4.4	Calculate the index of F_c function for the preparation to be	
		examined and record the result in the analytical test data		
		sheet.

1. |Purpose: |
 |To lay down the procedure for the estimation of molecular size of all |
 |serotypes of Pneumococcal CRM monovalent bulk conjugate of Pneumococcal |
 |conjugate vaccine. |
 2. |Applicable to: |
 |This Standard Operating Procedure is applicable for evaluating KD |
 |(molecular size distribution) of ARM of bulk conjugate of Pneumococcal CRM |
 |conjugate for all serotypes and for reporting of HPLC profile as obtained |
 |for inprocess Pneumococcal protein conjugate samples. |
 3. |Responsibility: |
 |The analyst is responsible for carrying out the described procedure |
 |correctly. Supervisor is responsible for ensuring that the procedure is |
 |carried out correctly and to check the results. |
 4. |Safety considerations: |
 |4.1 |Always wear laboratory coat. |
 |4.2 |Always use solutions and samples filtered through 0.2 µm membrane. |
 |4.3 |Degas all solutions. |
 |4.4 |Avoid entry of bubbles into the system as well as column. |
 |4.5 |All the solution bottle openings should be well covered with aluminum |
 || foil. |
 5. |Equipments: |
 |5.1 |TSKgelG5000PWxl column {30 cm (l), 7.8 mm (i.d)} |
 |5.2 |HPLC system with UV detector under routine calibration programme |
 |5.3 |HPLC software for evaluation of results |
 |5.4 |Analytical balance |
 |5.5 |Precision balance |
 |5.6 |Vacuum Pump |
 |5.7 |pH Meter |
 |5.8 |Refrigerator |
 |5.9 |Magnetic stirrer |
 |5.10 |Ultrasonic Cleaner |
 6. |Reagents: |
 |6.1 |Sodium Chloride (NaCl) |
 |6.2 |Sodium azide |
 |6.3 |Disodium hydrogen phosphate anhydrous (Na₂HPO₄) |
 |6.4 |Sodium dihydrogen phosphate monohydrate |
 |6.5 |Salmon DNA |
 |6.6 |Purified water |
 7. |Preparation of solutions: |
 |7.1 |Solution I: [Na₂HPO₄ (0.1M), NaCl (0.1M)] | |
 || |For a volume of 1000 ml, weigh 14.19 g of Na₂HPO₄ and 5.84 g of NaCl. |
 || |Dissolve in 700 ml of purified water. Make up the volume to 1000 ml |
 || |with purified water. |
 |7.2 |Solution II: (NaH₂PO₄. H₂O, 0.1 M) |
 || |For a volume of 500 ml, weigh 6.85 g of NaH₂PO₄. H₂O. Dissolve in 400 |
 || |ml of purified water. Make up the volume to 500 ml with purified |
 || |water. |
 |7.3 |0.1M Sodium Phosphate buffer: (0.1 M Na₂HPO₄, 0.1M NaCl +0.1M NaH₂PO₄ |
 || |.H₂O, pH 7.0) |
 || |For a volume of 1000 ml, take approximately 600 ml of Solution I and |
 || |400 ml of Solution II. The pH of the solution should be 7.0 ± 0.2. |
 || |This solution can be stored at room temperature for 1 month. |
 |7.4 |Void Volume Marker: |
 || |For a volume of 5 ml, weigh 5 mg of Salmon DNA. Dissolve in purified |
 || |water and make up volume to 5 ml with purified water. Prepare fresh |
 || |before use. |
 |7.5 |Total volume marker: For a volume of 10 ml, weigh 10 mg of Sodium |
 || |Azide. Dissolve in purified water and make up volume to 10 ml with |
 || |purified water. Prepare fresh before use. |
 |7.6 |Calibration Mixture: Take 1.6ml of void volume marker (step 7.4) and |
 || |400µl of total volume marker (step 7.5). Vortex for few seconds. |
 || |Prepare fresh before use. |
 |7.7 |Preservation Solution A: (Sodium azide 0.05%): Weigh 1 g of Sodium |
 || |Azide and dissolve in approximately 1800 ml of purified Water. Make up |
 || |the volume to 2.0 Litre with purified water. This solution can be |
 || |stored at room temperature for 2 months. |
 |7.8 |Preservation Solution B: (20% Ethanol): Take 200ml of ethanol and make |
 || |up the volume to 1.0 litre with purified water. This solution can be |
 || |stored at room temperature for 2 months. |
 || |Note: All the solutions prepared for use are vacuum filtered using |
 || |Nylon 6, 6 membrane 0.20 µm filters to eliminate the entry of possible |
 || |particles into the system as well as the column. |
 8. |Procedure: |
 |8.1 |Run conditions: | | |
 || |8.1.1 |Column: TSKgelG5000PWxl column{30 cm (l), 7.8 mm (i.d)} |
 || |8.1.2 |Buffer used: 0.1M sodium phosphate buffer |
 || |8.1.3 |Elution: Isocratic |
 || |8.1.4 |Flow rate: 0.5ml/min |
 || |Note: For in process samples of conjugation process, |
 || |the flow rate may be kept at 0.75ml/min. |
 || |8.1.5 |Run time: 35minutes or before if stable baseline is |
 || |obtained |
 || |8.1.6 |Sample Injection: |
 || |8.1.6.1 |Calibration of column: |
 || |1 |Calibration of the column is done to determine |
 || |void volume (retention time) and total volume |
 || | (retention time) every time when ever a test |
 || |sample is applied. |
 || |8.1.6.2 |After a stable baseline is obtained at 214nm, |
 || |2 |inject 5-20µl of calibration mixture. |

			8.1.6.	Injection of sample of Pneumococcal conjugate
			3	after sterile filtration:
			8.1.6.3.	Load 40-70µl of sample volume of
			1	pneumococcal polysaccharide conjugate.
			8.1.6.	Injection of sample of inprocess Pneumococcal
			4	conjugate samples.
			8.1.6.4.	For samples of Pneumococcal conjugate
			1	at 0hr, intermediate and final hour of
			conjugation, inject 10-20µl of sample	
			on the column.	
			8.1.6.4.	For samples received during
			2	concentration diafiltration cycles,
			inject 20-40µl of sample for retentate.	
			8.1.6.4.	For samples received before sterile
			3	filtration, inject 20-60µl of sample of
			purified pneumococcal conjugate.	
		8.1.7	Detector Used: UV detector at wavelength of 214nm.	
		8.2	Run procedure:	
		8.2.1	Equilibrate the column with 0.1M sodium phosphate	
		buffer for 2 hours and wait till a stable baseline is		
		obtained at 214nm.		
		8.2.2	For inprocess samples at various hours of conjugation	
		and concentration/diafiltration retentate, inject the		
		required volume of sample as mentioned in steps		
		8.1.6.4.		
		8.2.3	For samples of purified pneumococcal conjugate before	
		sterile filtration and after sterile filtration (Active		
		Raw Material) inject calibration standard and sample.		
		Note: If several production samples are applied in one		
		day then only one application of the Calibration		
		mixture is enough.		
		8.3	Column cleaning and storage:	
		8.3.1	Column storage: Pass 200ml of preservation solution A/	
		preservation solution B solution through the column for		
		long time storage.		
		8.3.2	Cleaning the column: If in case the peak shape observed	
		is not proper, then reverse the flow direction of		
		column and pass 200ml of purified water and then 200ml		
		of preservation solution B and then pass 200ml of		
		purified water with normal flow direction.		
		8.4	Chromatogram evaluation:	
		8.4.1	For samples received during conjugation hours:	
		8.4.1.1 For samples run with flow rate 0.5ml/min		
		8.4.1.1.	Open the acquired chromatogram.	
		1		
		8.4.1.1.	Optimize integration with various	
		2	integration parameters or manual	
		integration parameters by drawing		
		baseline under the curve obtained at		
		lower retention time (9-13minutes) and		
		curve obtained at little higher		
		retention time(~16-17minutes).		
		Note: Curve under the lower retention		
		time is the curve of conjugate.		
		8.4.1.1.	Baselines for peaks obtained at very	
		3	high retention times (20 minutes or	
		more) are not constructed.		
		8.4.1.1.	Acceptance Criteria: Area percentage	
		4	for curve under lower retention time	
		conjugated peak) with respect to		
		carrier protein peak should not be less		
		than 70% at 16-24 hrs. of conjugation		
		reaction.		
		8.4.1.	For samples run with flow rate: 0.75ml/min	
		2		
		8.4..2.1	Open the acquired chromatogram.	
		8.4.2.2	Optimize integration with various	
		integration parameters or manual		
		integration parameters by drawing		
		baseline under the curve obtained at		
		lower retention time (6-11minutes) and		
		curve obtained at little higher		
		retention time (~11.5-13minutes).		
		Note: Curve under the lower retention		
		time is the curve of conjugate.		
		8.4.2.3	Baselines for peaks obtained at very	
		high retention times (14minutes or		
		more) are not constructed.		
		8.4.2.4	Acceptance Criteria: Same as mentioned	
		in 8.4.1.1.4.		
		8.4.2	For samples received during concentration diafiltration	
		cycles:		
		8.4.2.	Flow rate: 0.5ml/min	
		1		
		8.4.2.1.	Open the acquired chromatogram.	
		1		
		8.4.2.1.	For a flow rate of 0.5ml/min optimize	
		2	integration with various integration	
		parameters or manual integration		
		parameters by drawing baseline under		
		the curve obtained at lower retention		
		time (9-13minutes) and curve obtained		

					at little higher retention	
					time(~16-17minutes).	
					8.4.2.1.	Also construct baseline under the
					3	curves obtained at higher retention
					times (20minutes or more).	
					8.4.2.1.	Acceptance Criteria: Area percentage
					4	for curve under lower retention time
					(conjugated peak) for final diafiltered	
					retentate should be $\geq 95\%$.	
					8.4.2.	Flow rate: 0.75ml/min
					2	
					8.4.2.2.	Open the acquired chromatogram.
					1	
					8.4.2.2.	For a flow rate of 0.75ml/min optimize
					2	integration with various integration
					parameters or manual integration	
					parameters by drawing baseline under	
					the curve obtained at lower retention	
					time (6-11minutes) and curve obtained	
					at little higher retention time	
					(~11.5-13minutes).	
					8.4.2.2.	Also construct baseline under the
					3	curves obtained at higher retention
					times (20minutes or more).	
					8.4.2.2.	Acceptance Criteria: Same as in
					4	8.4.2.1.4.
		8.4.3	For samples of purified conjugated material and ARM of			
		bulk conjugate:				
		Percentage of sample eluted at $KD=0.5$ is calculated for				
		these samples as per the below mentioned procedure:				
		8.4.3.	The retention time of the unretained compound			
		1	(To) is determined with Salmon DNA dissolved in			
		calibration mixture as the first peak in the				
		elution curve.				
		8.4.3.	The Retention time of the component which has			
		2	full access to the pores of stationary phase			
			(Tt) is determined with sodium azide dissolved			
		in calibration mixture as the second peak in the				
		elution curve or the peak of sodium azide if				
		applied separately.				
		8.4.3.	Calculations:			
		3	Elution time of Pneumococcal			
		polysaccharide-Protein (Te) at $KD = 0.5$				
		The calculations are made as per the following				
		equation:				
		$Te = KD(Tt - To) + To$ or $Te = 0.5$				
		$(Tt - To) + To$				
		Where,				
		Te= Elution time of PnPs -CRM Conjugate at KD				
		=0.5				
		Tt= Retention time of sodium azide				
		To= Retention time of Salmon DNA				
		KD= Distribution Coefficient				
		8.4.3.	Calculation of percentage of sample eluted at			
		4	KD = 0.5:			
		This is calculated using ChemStation software:				
		8.4.3.4.	Enter the value of Elution time (Te)			
		1	calculated in step 8.4.3.3 in			
		integration with timed events option or				
		with manual integration and select				
		split peak option.				
		8.4.3.4.	The percentage of sample eluted at $KD =$			
		2	0.5 is calculated by splitting the peak			
		at the Te and then taking the				
		percentage area for the first part of				
		the peak till Te.				
		8.4.3.4.	Acceptance Criteria: Percentage of			
		3	sample eluted at $KD = 0.5$ should be			
		$\geq 80\%$.				
		8.5	Reporting Results:			
		8.5.1	After optimizing integration, select Report Layout view			
		in the software.				
		8.5.2	For samples received during conjugation hours and			
		concentration/diafiltration samples, the print out of				
		integrated HPLC profile of sample is reported..				
		8.5.3	For samples received before and after sterile			
		filtration, the percentage of sample eluted at $KD = 0.5$				
		is reported. Also take printout of the sample and				
		calibration mixture with results.

		5.3.7	After completing analysis, clean the column with mobile phase.
			Flow rate: 0.5 mL/min
			Column volumes: 3
			Time: 1 Hour 30 min
		5.3.8	After completion of analysis, remove the column and purge the
			flow lines with purified water for 5 min.
		5.3.9	Analyze the results using various integration icons as per the
			SOP.
		5.4	System suitability:
		5.4.1	The reference solution injection is valid for 24 Hours.
		5.4.2	For checking System Suitability in between series of
			injections: Inject reference solution after every 6 injections
			of test solution.
		5.5	Method Validation Criteria:
		5.5.1	In the chromatogram obtained with reference solution, the
			principal peak corresponds to the IgG monomer and there is a
			peak corresponding to the dimer with a relative retention to
			the principal peak of about 0.85. Identify the peaks in the
			chromatogram obtained with the test solution by comparison with
			the chromatogram obtained with the reference solution; any peak
			with a retention time shorter than that of the dimer
			corresponds to polymers and aggregates
		5.5.2	Relative Retention time: For the monomer and for the dimer, the
			retention time relative to the corresponding peak in the
			chromatogram obtained with the reference solution is 1 ± 0.02 .
			Peak area: The sum of peak areas of the monomer and the dimer
			represent not less than 90 percent of the total area of the
			chromatogram and the sum of peak areas of polymers and
			aggregates represents not more than 3 percent of the total area
			of the chromatogram

|| | |5.2.4.7|Hydrochloric acid 37 % |

|| |5.3 |Preparation of solutions: |

|| |Prepare all the solutions as described below. Carry out the labelling|

|| |of the prepared solutions and assign the lot numbers to the |

|| |solutions. |

|| |5.3.1 |Solution A (NaH₂PO₄. H₂O, 200mM): For a volume of 1 liter, |

|| | |weigh and add 27.6g NaH₂PO₄, H₂O. |

|| | |

|| | |Adjust the pH to 3.0 with HCl (37%). Make up the solution to |

|| | |1litre with purified water. Prepare fresh before use. |

|| |5.3.2 |Mobile phase for CDAP: |

|| | |Take 700mL of methanol in a measuring cylinder and 300mL of |

|| | |solution A to make the volume to 1000mL. Use the mobile phase |

|| | |within four days from the date of preparation if it remains |

|| | |clear and no turbidity or fibers observed in it. |

|| |5.3.3 |Isopropyl Alcohol 70% Solution: (For storing and purging the |

|| | |HPLC system) |

|| | |Take 700 mL of 2-propanol using a measuring cylinder and make |

|| | |up the volume to 1000 mL with Purified Water in a volumetric |

|| | |flask. This solution can be stored at room temperature for 3 |

|| | |months. |

|| |5.3.4 |1 mg/mL of CDAP calibration standard stock: |

|| | |Weigh 5mg of CDAP and make up the volume to 5mL with purified |

|| | |water in a volumetric flask. This solution can be stored as |

|| | |aliquots at -20°C for 2months. |

|| |5.3.5 |Preparation of working calibration standard of 10µg/mL or |

|| | |10ng/µL: |

|| | |Take 10µL of 1 mg/mL of CDAP calibration standard stock and add|

|| | |990µL of purified water to make 1mL of solution in an eppendorf|

|| | |for HPLC vial. Mix thoroughly. Prepare fresh before use. |

|| | |Note: The working calibration standard is prepared fresh before|

|| | |use. All the solutions prepared for use are vacuum filtered |

|| | |using Nylon 6, 6 membrane 0.20/0.22/0.45 µm filters to |

|| | |eliminate the entry of possible particles, if any into the |

|| | |system as well as the column. For organic solvents 0.45µm |

|| | |filters should be used (filtration not necessary if the |

|| | |solution is prepared in 0.2 µ filtered purified water). |

|| |5.3.6 |Preparation of Dilutions for standard Curve: |

|| | |Standard |Standard Conc. |Working Std. volume |Diluent (Mobile |

|| | | |(10µg/mL or 10ng/µL)|phase) volume |

|| |5.4 |Preparing the HPLC System for run, Agilent Series: |

|| |5.5 |Run Conditions: |

|| |5.5.1 |Load method CDAP.M |

|| |5.5.2 |Flow Rate: 1.0 mL/min |

|| |5.5.3 |Detection wavelength : 280nm |

|| |5.5.4 |Run time: 4 minutes |

|| |5.5.5 |Mobile phase: mobile phase for CDAP |

|| |5.6 |Equilibration of the system and the column: |

|| | |Equilibrate the system and column with mobile phase for CDAP until a |

|| | |stable baseline at 280 nm is obtained which can be viewed with the |

|| | |online plot window. |

|| |5.7 |Sample Preparation and loading: |

|| |5.7.1|Based on the polysaccharide content obtained, dilute the sample|

|| | |to get a final working concentration of 100 µg/ml. |

|| |5.7.2|The injection volume for each standard, test sample and blank |

|| | |is of 10 µL, therefore load 20 µL of test sample, standards and|

|| | |blank in screw cap vials and place against the appropriate no. |

|| | |on the sample tray by clearly marking the screw cap vial. The |

|| | |sample of 10 µL which is loaded in the system contains 1 µg of |

|| | |polysaccharide. |

|| |5.8 |Running of sequence: |

|| |5.8.1 |Load sequence CDAP.S. |

|| |5.8.2 |Open the sequence parameter option by clicking Sequence menu. |

|| |5.8.3 |Enter information about the data directory and operator name. |

|| |5.8.4 |In the shutdown option, click on the post-sequence option and |

|| | |select LAMPOFF/STANDBY. |

|| |5.8.5 |In sequence table option, specify the sample names, methods and|

|| | |vials to run in the sequence as per the following table: |

|| | |S. No |Sample Code |Sample details |No. of injections |

|| | | |per Vial |

|| | |1 |Blank |Eluent Blank |1 X 10 µL |

|| | |2 |Standard 3 |System Suitability |6 X 10 µL |

|| | | |(5ng/µL) |test standard | |

|| | |3 |Blank |Eluent Blank |1 X 10 µL |

|| | |4 |Standard 1 |1ng Standard |1 X 10 µL |

|| | |5 |Standard 2 |3ng Standard |1 X 10 µL |

|| | |6 |Standard 3 |5ng Standard |1 X 10 µL |

|| | |7 |Standard 4 |10ng Standard |1 X 10 µL |

		8	Standard 5	20ng Standard	1 X 10 µL
		9	Blank	Eluent Blank	1 X 10 µL
		10	Test Sample (s)	Sample	1 X 10 µL
	5.8.6	Click on run sequence option in run control menu to start the			
		sequence.			
	5.8.7	Each sample run will be of 4 minutes and after running all the			
		samples the sequence will automatically stop.			
	5.8.8	Inject the eluent blank after every 20 injections.			
			Note: Here, eluent blank refers to mobile phase. One extra vial		
		with same SST sample can be used if 6 injections are not			
		possible from single vial.			
	5.9	Calculations :			
	5.9.1	Results of the sample are calculated from the calibration			
		standards using the chemstation software.			
		5.9.1.1	Open the chromatogram corresponding to 1ng calibration		
		standard in the offline copy of chemstation software in			
		the Data Analysis mode.			
		5.9.1.2	From the calibration menu select calibration settings		
		and write ng/µL in the Amount unit's option.			
		5.9.1.3	Select New Calibration Table from Calibration menu and		
		enter value1 in default amount option and value 1 in			
		level option.			
		5.9.1.4	Now open the chromatogram for 3.0 ng. Select add level		
		option from calibration menu and enter value 3.0 in			
		default amount and value 2 in level option.			
		5.9.1.5	Similarly open chromatograms for 5.0 ng, 10.0 ng and		
		20.0 ng and keep adding default amount and appropriate			
		value of level.			
		5.9.1.6	Select calibration task icon and the calibration table		
		with required concentrations and levels can be viewed			
		in the calibration table view. A calibration curve is			
		also displayed in the calibration curve field with			
		value of correlation coefficient of the curve.			
		5.9.1.7	Save the calibration method under appropriate name.		
		5.9.1.8	Open the chromatogram of test sample and select the		
		above created calibration method for integration of			
		the test sample.			
		5.9.1.9	In the specify report option of Report menu, select		
		ESTD in the Calculate field.			
		5.9.1.10	In the report layout view click on the show report		
		preview with current template, method and data file			
		icon and view the result of the test sample in terms			
		of concentration ng/µL or µg/mL.			
		5.9.1.11	Calculations for Standard curve and samples:		
		The calculations are made according to the equation of			
		minimum squares.			
		$Y = mX + b$.			
		Where: m = slope			
		b = intercept			
		Y = area of sample peak			
		X = concentration of sample (ng)			
	5.9.2	The calculations for determination of amount of CDAP per µg of			
	polysaccharide conjugate is as:				
		As the sample is diluted to a concentration of 1 µg/ 10 µL,			
		Therefore the CDAP content obtained for the sample shall be			
		considered in terms of ng/µg of polysaccharide.			
	5.9.3	Calculations for System Suitability Test:			
	5.9.2.1	Note the values of area under the curve and retention			
		time for standard 3(SST standard) in Annexure 1 and			
		also in EXCEL format for calculation of Relative			
		standard deviation.			
		Path for Master EXCEL format is			
		My Computer → D drive → SST Master EXCEL (folder) →			
		SST Master EXCEL QC/01/050 (File).			
	5.9.2.2	Every time a sample is run with system suitability			
		test, calculate the results for system suitability by			
		creating a copy of Master EXCEL in the desired folder			
		and record the same in Annexure 1.			
	5.9.2.3	Attach the hard print of SST calculation along with			
		chromatograms and the record form.			
	5.10	Acceptance Criteria :			
	5.10.1	RSD calculated for Retention time of standard 3(5ng) should be			
		< 5.0%.			
	5.10.2	RSD calculated for Area of standard 3(5ng) should be < 5.0%.			
	5.11	Result Reporting :			
	5.11.1	Open CDAP.FRP template and take print out of the report.			
	5.11.2	Print report: Click on print option to take a printout of a			
		ChemStation report using the current report template and data			
		from the currently loaded data file.			
	5.11.3	Report the results of quantity of CDAP present/µg.			
	5.11.4	The report generated can be viewed with report review icon.			
	5.11.5	The printed report is signed by the analyst who does the			
		analysis and also checked by the other analyst/supervisor.			
	5.11.6	The chromatogram and results for the sample and system			
		suitability test runs are attached along with the Annexure 1.			
	5.12	Preservation and storage of Column			
	5.12.1	Flush the column with 50mL of 100% Acetonitrile or 100			
		%Methanol at 1mL/min.			
	5.12.2	For long time storage, pass 100 mL of 100% Acetonitrile through			
		the column and screw the caps in both ends of the column.			

1.0	Objective:			
	To lay down the Procedure for detection anti-HBsAg antibodies using			
	Monolisa™ Anti HBsPLUS ELISA kit.			
2.0	Scope:			
	This Standard Operating Procedure is applicable to all the In- process and			
	finished product samples of IVIG.			
3.0	Responsibility			
	3.1	The QC analyst shall be responsible for executing the described		
		procedure correctly.		
	3.2	The QC supervisor shall be responsible for verifying that the		
		procedure is complied with and the results are checked.		
	3.3	The QC HOD shall be responsible for overall compliance of this SOP.

		5.3.4	Bring all reagents to room temperature (20-25°C) before	
		beginning the assay procedure.		
		5.3.6	Prepare conjugate working solution, working diluted substrate	
		solution and diluted washing solution.		
		5.3.7	Remove the microplate frame and strips from their protective	
		bag.		
		5.3.8	Add 25 μ L of Specimen diluent to each well first, followed by	
		75 μ L of Test sample or Calibrator or Control within 15		
		minutes. Then mix gently by a minimum of two aspirations to		
		avoid foaming.		
		Note: After adding the sample, the diluent will change from		
		purple to a blue colour.		
		5.3.9	Add directly the samples to the plate without prior washing of	
		the plate.		
		5.3.1	Cover the wells with adhesive film by pressing over the whole	
		0 surface to ensure tightness.		
		5.3.1	Incubate the plate for 60 $\pm$ 5 min at 37 $\pm$ 2°C.	
	1			
		5.3.1	Remove the adhesive film. Aspirate the contents of all wells	
		2 into a liquid waste container and add immediately a minimum of		
		300 μ L of washing solution to each well. Soak each well for 30		
		to 60 seconds between each wash cycle. Aspirate again. Repeat		
		the washing step 4 times (minimum of 5 washes).		
		Note: Blot the plate by turning it upside down on absorbent		
		paper.		
		5.3.1	Add quickly 100 μ L of the working diluted substrate solution to	
		3 each well. Allow the reaction to develop in the dark for 30 min		
		$\pm$ 5 min at room temperature.		
		Note: Do not use adhesive film during this incubation.		
		5.3.1	Add 100 μ L of stopping solution. Homogenize the reaction	
		4 mixture.		
		5.3.1	Carefully wipe the plate bottom. At least 4 min after stopping	
		5 solution addition and within 30 minutes of stopping the		
		reaction.		
		5.3.1	Read the optical density at 450/620 nm and 405/620 nm using a	
		6 plate reader.		
		5.4	Calculations :	
		5.4.1	Read the optical density at 450/620 nm using a plate reader.	
		5.4.2	For Absorbance values $\geq$ measured absorbance of 400 IU/L	
		calibrator, read the OD at 405/620 nm.		
		5.4.3	Plot the A450 of four calibrators C0, C1, C2 and C3 versus	
		their assigned concentrations, using a polynomial (quadratic)		
		regression.		
		Note:		
		The A450 of the 1000 IU/L Calibrator cannot be used in this		
		graph, as that absorbance value should be outside the range of		
		the spectrophotometer, hence the necessity of a second graph.		
		Samples with measured absorbance values less than 400 IU/L		
		calibrator are interpreted with the graph obtained with the		
		A450 of the four calibrators.		
		The A405 of 400 IU/L and 1000 IU/L calibrators are graphed		
		versus their assigned concentrations using point to point. A		
		straight line is drawn through the points.		

		5.4.4	Then the Anti-HBs concentration (IU/L) for each sample is read
		at the intersection of the respective absorbance values.	
		5.4.5	The A405 curve is used to determine the concentrations of
		samples whose are greater than 400 IU/L and less than or equal	
		to 1000 IU/L.	
		Note:	
		Samples with anti-HBs concentrations greater than 1000 IU/L can	
		be diluted using diluted washing solution and re-assayed.	
		5.5	Method Validation Criteria:
		5.5.1	The mean absorbance of the 10 IU/L calibrator (C1) is the
		cut-off value for the assay.	
		5.5.2	For Anti-HBs Negative Control, the measured absorbance value
		must be greater than 0.000 and less than or equal to 0.070.	
		5.5.3	For Positive Control, the measured absorbance value must be
		greater than 0.400.	
		Note: For Negative control and Positive control, if any of the	
		above criteria is not met, the assay is invalid and must be	
		repeated.	
		5.5.4	For 10 IU/L Calibrator, the measured absorbance value must be
		greater than or equal to 0.050 and less than or equal to 0.200.	
		Note: If one of the two ODs of 10 IU/L is outside the	
		acceptable range, the assay is invalid and must be repeated.	
		5.5.5	Each measured absorbance values must be greater than or equal
		to 1.5 the OD of the absorbance value of the Negative control.

|||The calculations are made according to the equation of |

|||minimum squares. $Y = mX + b$ |

|||Where: m = slope |

|||b = intercept |

|||Y = absorbance |

|||X = concentration |

||5.9.1.3|Use EXCEL program for the preparation of calibration |

|||curve and calculation of the results. |

||5.9.1.4|Note the values of area under the curve and retention |

|||time for standards to prepare standard curve in |

|||Annexure 1 and also in EXCEL format for calculation of |

|||standard curve. |

||5.9.1.5|Prepare standard curve by creating a copy of Master |

|||EXCEL in the desired folder and record. |

||5.9.1.6|The amount of DCA present in the sample is calculated |

|||by using the formula |

|||Concentration of DCA in sample (X) = $\frac{Y-b}{m}$ |

|||Where Y = peak area of DCA in test sample |

|||b = intercept |

|||m = slope |

||5.9.2|Calculations for System Suitability Test: |

||5.9.2.1|Note the values of area under the curve and retention |

|||time for Standard 3 (SST standard) in Annexure 1 and |

|||also in EXCEL format for calculation of Relative |

|||standard deviation. |

||5.9.2.2|Every time a sample is run with system suitability |

|||test, calculate the results for system suitability. |

||5.10|Acceptance Criteria : |

||5.10.1|For System Suitability Test : |

||5.10.1.1|RSD calculated for Retention time of Standard 3 should|

|||be <5.0%. |

||5.10.1.2|RSD calculated for Area OF Standard 3 should be <5.0%.|

||5.10.2|Parameters for Acceptance of the test: |

||The Regression of the standard curve should be > 0.99. |

||5.10.3|The residual DCA content should be ≤1% of the dry weight of |

|||purified and lyophilized sample of Pneumococcal polysaccharide.|

||5.11|Result Reporting : |

||5.11.1|Using the File menu new reports can be templates, open existing|

|||templates, save completed reports, or print reports using the |

|||current report template. |

||5.11.2|Open DCA.FRP template. |

||5.11.3|The report generated can be viewed with report review icon. |

||5.11.4|Print report: Click this option to take a printout of a |

|||Chemstation report using the current report template and data |

|||from the currently loaded data file. |

||5.11.5|The printed report is signed by the analyst who does the |

|||analysis and checked by the other analyst/supervisor. |

||5.11.6|Report the results of DCA content of the sample(s). |

		3	the wash and soak procedure 4 additional times for a
			total of 5 washes. Avoid spillage
		5.3.11.	Tap upside down on absorbent sheet till no droplets
		4	appear on the sheet, taking care not to dislodge the
			wells
		5.3.11.	Immediately discard the tissue in a beaker that
		5	contains sodium hypochlorite and close the beaker with
			aluminium foil
	5.3.1	Add 100 µL of working conjugate solution in each well including	
	2	blank well	
	5.3.1	Carefully apply cover seal to the strips and cover with	
	3	Aluminium foil	
	5.3.1	Incubate at 37°C ± 2°C for 30 min ± 2 min	
	4		
	5.3.1	Carefully aspirate the well contents and wash as describe in	
	5	5.3.11	
	5.3.1	Add 100 µL of working substrate solution in each well including	
	6	blank well	
	5.3.1	Incubate at room temperature (20 - 30°C) for 30 min in dark.	
	7		
	5.3.1	Add 100 µL of stop solution	
	8		
	5.3.1	Read absorbance at 450 nm within 30 minutes in ELISA reader.	
	9	(Use of a reference filter of 620 nm is preferred)	
	5.4	Calculations :	
	5.4.1	Take average of the ODs of Negative control and Positive	
		Control separately	
	5.4.2	[pic]	
		[pic]	
	5.4.3	[pic]	
		[pic]	
	5.4.4	Then add the average values of both positive and negative	
		control and divide by 6 which give the cut off value.	
		[pic]	
	5.5	Method Validation Criteria:	
	5.5.1	Blank acceptance criteria"	
		The OD value at 450/620 nm for blank must be <0.100 in case of	
		differential filter being used. In case differential filter is	
		not available in the reader the blank value may go higher	
	5.5.2	Negative Control (NC) acceptance criteria:	
		The OD value at 450/620 nm for NC must be < 0.150. If it is not	
		so, the run is invalid and must be repeated.	
	5.5.3	Positive Control (PC) acceptance criteria:	
		5.5.3.1	The OD value at 450/620 nm for PC must be > 0.50
		5.5.3.2	Determine the mean value for PC triplicates, if one of
		three positive control values is outside of these	
		limits; recalculate mean PC based upon the two	
		acceptable positive control values.	
		5.5.3.3	Repeat the assay if two of the three positive control
		values are outside the limits, as the assay is invalid	
		Note:	
		Care should be taken while performing the experiment in	
		order to avoid infection from plasma sample or positive	
		control.	
		Wear nose mask and hand gloves throughout the	
		experiment. Do not reuse the gloves and masks; discard	
		immediately after completion of the experiment.	
		Discard the used tips in a beaker containing sodium	
		hypochlorite and close the beaker with aluminium foil.	
		Perform the experiment under laminar airflow unit.	
		Once the assay has started, complete the procedure	
		without interruption. All the reagents should be	
		dispensed in the centre of the well and the tip of the	
		pipette should not touch the wall of the microwell

		5.3.5	Purified Cell Wall Polysaccharide (CWPS) Staten Serum Institute	
			(SSI) Cat No.: 3459.	
		5.3.6	Bovine Serum Albumin (BSA)	
		5.3.7	Tween 20	
		5.3.8	Tetra Methyl Benzidine (TMB) substrate	
		5.3.9	Concentrated Sulphuric acid	
		5.3.10	Sodium chloride; NaCl	
		5.3.11	Sodium dihydrogen phosphate hepta hydrate; NaH2PO4·7H2O	
		5.3.12	Potassium Di hydrogen phosphate; KH2PO4	
		5.3.13	Potassium chloride; KCl	
		5.3.14	Milli- Q water	

	5.4	Preparation of solutions:	
		Prepare the solutions as described below. Label the solutions and	
		assign lot numbers.	
	5.4.1	Preparation of Standard Pneumococcal antigen: For preparation	
		of standard stock solution of pneumococcal antigens, add 2 ml	
		of WFI in 2 mg vial of standard and keep it overnight at 2-8°C	
		with shaking. Make aliquots of 100 µl. Store the aliquots at	
		-70°C for further use.	
	5.4.2	Phosphate buffer saline (pH 7.2 – 7.4) (10X)	
		5.4.2.1	Weigh 80.0 g NaCl, 20.61 g NaH₂PO₄·7 H₂O, 3.14 g of
		KH₂PO₄ and 1.60 g KCl, dissolve in 800ml of Milli Q	
		water.	
		5.4.2.2	Keep the beaker on a magnetic stirrer to dissolve the
		contents.	
		5.4.2.3	Make up the volume to 1L with milli Q water and
		sterilize the solution by filtering it through 0.22 µm	
		filter and store the solution at room temperature.	
	5.4.3	Wash buffer and coating buffer (1X PBS): Add 900 ml of sterile	
		Milli Q water to 100 ml of 10X PBS. Store the solution at room	
		temperature.	
	5.4.4	Wash / diluent and Antibody buffer (PBST): Add 50 µl of Tween	
		20 to 100 ml of 1X PBS solution (PBS with 0.05 % Tween 20). Mix	
		the solution thoroughly so that Tween 20 gets uniformly	
		dissolved in PBS.	
	5.4.5	Blocking buffer: (5% BSA in PBST): Add 5 g of BSA in 100 ml	
		PBST solution to give a final concentration of 5% BSA in PBST.	
	5.4.6	Secondary antibody: Working concentration of secondary antibody	
		is 1:2000 dilutions, prepared in diluent. The solution should	
		be freshly prepared just before the use.	
	5.4.7	Stop solution (1N H₂SO₄): Add 2.8 ml of Conc. H₂SO₄ to 97.2 ml	
		of Milli Q water to make up the volume to 100ml.	
	5.5	Procedure for ELISA:	
	5.5.1	Coating of plate:	
		5.5.1.1	Coat wells of ELISA plate with 100 µl/well of ATCC
		standard capsular polysaccharide antigen (1000 ng/ml of	
		dry weight) of the serotype under test as a positive	
		control on 26 wells as A1 to A7, B1 to B7, E1 to E6 and	
		F1 to F6. The dilutions of standard are to be prepared	
		in 1X PBS buffer.	
		5.5.1.2	Coat wells of ELISA plate with 100 µl/well of purified
		pneumococcal polysaccharide test sample (1000 ng/ml dry	
		weight) of serotype under test. Coat 26 wells as C1 to	
		C7, D1 to D7, G1 to G6 and H1 to H6. The dilutions of	
		standard are to be prepared in 1X PBS buffer.	
		5.5.1.3	Keep 4 wells uncoated as negative control (Blank) i.e.
		E7 to H7. Incubate the plates overnight at 37 ± 2°C.	
		as shown plate below.	
			1
			S1 is purified pneumococcal polysaccharide of Type 1
			serotype.
			NC is negative control (Uncoated wells)
	5.5.1.4	This pattern of coating of ATCC standard and test	
		sample shall be followed for each individual serotype	
		to be analyzed.	
	5.5.2	Preparation of Primary antibody:	
		Prepare adsorption solution: For studying cross reactivity of	
		type specific antisera, (specificity parameter). Prepare	
		adsorption solution by adding 22F polysaccharide (ATCC) and	
		purified CWPS (SSI) at 5µg/ml concentration to the antibody	
		diluent.	
		On next day prepare the dilutions of antibodies in adsorption	
		buffer solution in centrifuge tubes as per the dilution fold	
		mentioned below:	
		Serotype	Antibody dilution
		Type 1	1:60000
		Type 3	1:50000
		Type 4	1:50000
		Type 5	1:40000
		Type 6A	1:50000
		Type 6B	1:50000
		Type 7F	1:60000
		Type 9V	1:25000
		Type 14	1:50000
		Type 18C	1:60000
		Type 19A	1:40000
		Type 19F	1:40000
		Type 23F	1:15000
		Incubate the diluted primary antibody solution at 37 ± 2°C for	
		2 hrs.	
	5.5.3	Blocking of wells:	
		5.5.3.1	On next day remove the plate from incubator, discard
		the coating solution by a flick and add 300 µl/well of	
		blocking solution.	
		5.5.3.2	Incubate the plate at 37 ± 2°C for 1 hr. This step
		should be initiated after one hour of antibody	
		preparation.	
	5.5.4	1st Washing:	
		5.5.4.1	Discard the blocking solution after completion of one
		hour of incubation period by flicking.	
		5.5.4.2	Add 300 µl of PBST to each well and discard the buffer

			by flicking. Tap the plate on a lint free paper towel.	
			Ensure that the buffer is removed completely.	
			5.5.4.3	Repeat the procedure for two more times and then one
			time with 300 µl of PBS.	
		5.5.5	Addition of primary antibody:	
			5.5.5.1	The primary antibody dilutions for all the 13 serotype
			are prepared one hour before addition of blocking	
			buffer as mentioned in section 5.5.2.	
			5.5.5.2	Add 100 µl/well of primary antibody of all the 13
			serotypes as per pattern mentioned below.	
			Addition of Primary Antibody against Serotype	
			1	
		5.5.6	2nd washing:	
			5.5.6.1	Discard the primary antibody solution after completion
			of 90 mins.of incubation period by flicking.	
			5.5.6.2	Add 300 µl of PBST to each well and discard the buffer
			by flicking. Tap the plate on a lint free paper towel.	
			Ensure that the buffer is removed completely.	
			5.5.6.3	Repeat the procedure for three more times and then one
			time with 300 µl of PBS.	
		5.5.7	Addition of secondary antibody:	
			5.5.7.1	Prepare the recommended dilutions of secondary
			antibody.	
			5.5.7.2	For serotype 6B prepare 1:2000 dilution of anti-mouse
			IgG-HRP conjugated antibody. Prepare the dilutions in	
			adsorption solution.	
			5.5.7.3	For all other serotypes prepare 1:2000 dilution of
			anti-rabbit IgG-HRP conjugated antibody. Prepare the	
			dilutions in adsorption solution.	
			5.5.7.4	Add 100 µl of secondary antibody solution to
			respective wells and incubate the plate for 60 minutes	
			at 37 ± 2°C.	
		5.5.8	3rd washing:	
			5.5.8.1	Discard the secondary antibody solution after
			completion of 60 mins. of incubation period by	
			flicking.	
			5.5.8.2	Add 300 µl of PBST to each well and discard the buffer
			by flicking.	
			Tap the plate on a lint free paper towel. Ensure that	
			the buffer is removed completely.	
			5.5.8.3	Repeat the procedure for three more times and then one
			time with 300 µl of PBS.	
		5.5.9	Addition of TMB substrate:	
			5.5.9.1	Add 100 µl TMB to each well by a multichannel pipette.
			Take care that the TMB solution is not exposed to	
			direct light during addition.	
			5.5.9.2	Cover the plate and incubate at room temperature in
			dark preferably in a drover for next 15 mins.	
		5.5.10	Addition of Stop Solution:	
			5.5.10.1	On completion of 15 minutes incubation period of TMB.
			Carefully remove the plate out of drover. Take care	
			that the plate is not exposed to direct light during	
			addition.	
			5.5.10.2	Add 100 µl of stop solution over the TMB solution to
			each well in the dark.	
		5.5.11	Reading of plate and Data analysis:	
			5.5.11.1	Read the absorbance of plate at 450 and 630 nm
			wavelength on a ELISA reader. Calculate delta OD of	
			the readings.	
			5.5.11.2	Take care to take the readings after 5 mins and within
			15 mins. of addition of stop solution.	
			5.5.11.3	Get the average ODs of duplicate wells and compile the
			data sheets comprising of sample and ATCC standard.	
		5.5.12	Acceptance Criteria	
			5.5.12.1	OD values of Positive control and test sample should
			not be less than 0.8	
			5.5.12.2	OD values of Negative control should not be more than
			0.3

4.2.4.6	Dimethyl barbituric acid (DMBA)	
4.2.4.7	Cyanogen Bromide (CNBr) standard	
4.3	Preparation of solutions:	
Prepare all the solutions and carry out the labelling of the prepared		
solutions and assign the lot numbers to the solutions.		
4.3.1	Phosphate Buffer Saline (PBS), pH 7.4 :	
Dissolve the following in 800mL WFI,		
80g Sodium Chloride (NaCl)		
2.91g Potassium Dihydrogen Orthophosphate (KH₂PO₄),		
12.55g Disodium Hydrogen Orthophosphate Dihydrate (Na₂HPO₄		
2H₂O),		
1.6g Potassium Chloride (KCl).		
Adjust the pH to 7.4 with 10M Sodium Hydroxide (NaOH) and make		
up to 1000mL. Filter the buffer through a 0.22 µ Millipore		
filter.		
4.3.2	Dimethyl barbituric acid (DMBA) Reagent:	
Dissolve 0.19g of DMBA in 8mL Pyridine and 2mL WFI (use glass		
tube and glass pipette) use immediately.		
4.3.3	CNBr Stock Solution (1mg/mL):	
Dissolve 50mg of CNBr in 50mL PBS (freshly prepared).		
4.3.4	CNBr Working Solution (20µg/mL):	
Mix 200 µL CNBr Stock Solution with 9.8mL of PBS (freshly		
prepared).		
4.3.5	Preparation of standard dilutions: Prepare all standards	
dilutions from CNBr working solution in duplicate as		
mentioned below:		
CNBr Conc. (µg/mL)	CNBr Working	PBS (µL)
Standard (µL)		
Blank	0	1000
0.4	20	980
0.8	40	960
1.6	80	920
2.4	120	880
4.0	200	800
4.3.6	Spiking of samples with CNBr standard:	
Sample (µL)	CNBr Working	PBS (µL)
Standard (µL)		
200	0	800
200	80	720
4.3.7	Preparation of Test sample:	
4.3.7.1	Analyze all samples (with or without spike), the blank	
and standard in duplicate. Spike all samples where		
absorbance of CNBr has to be determined.		
4.3.7.2	Pipette out 200 µL of sample into each eppendorf	
tubes.		
4.3.7.4	Add 80 µL of CNBr working standard solution for spiked	
samples.		
4.3.7.5	Add 800 µL PBS into each tubes and mix (720 µL for	
spiked samples).		
4.4	Assay Procedure	
4.4.1	Add 100 µL of DMBA reagent to all tubes and mix well.	
4.4.2	Incubate for 45 minutes at room temperature.	

	4.4.3	Read the absorbance at 595 nm within 30 minutes.
	4.4.4	Auto zero is determined using a polystyrene cuvette filled
		with Blank.
	4.4.5	Calculate the concentration of CNBr in µg/mL and enter the
		results
	4.5	Calculations:
	4.5.1	Sample conc. in µg/mL = A mean sample OD – Intercept X
		Dilution fold
		Slope
	4.5.2	% Spike Recovery = Spike µg/mL – Sample µg/mL X 100
		1.6
	4.6	Acceptance Criteria:
	4.6.1	Spike Recovery should be between 70 – 140%.
	5.0	References:

5.3.6 Test Procedure:
5.3.6.1 Add 50 μL of Assay diluted samples / Controls /
Standards and one well for Buffer working solution as
blank to the wells of the microtitre plate.
5.3.6.2 Pre-warm the Factor reagent and Substrate reagent for
3 mins 30 secs using an incubator set at 37°C.
5.3.6.3 Simultaneously incubate the microtitre plate
containing the samples at 37°C for 3 mins 30 secs
inside the ELISA reader chamber set at 37°C.
5.3.6.4 Add 50 μL of 37°C pre-warmed Factor reagent.
5.3.6.5 Incubate at 37°C for 2 min inside the ELISA reader
chamber
5.3.6.6 Add 50 μL of 37°C pre-warmed Substrate.
5.3.6.7 Incubate at 37°C for 2 min inside the ELISA reader
chamber
5.3.6.8 Add 50 μL of 20% Acetic acid to all the wells
5.3.6.9 Read absorbance at 405 nm using the ELISA reader
5.3.7 The above described key steps starting from dispensing of
reagents in microtitre plate is detailed in the table below.

		5.3.8	Calculation and analysis
		5.3.8.1	For calculations of potency using either graph pad
			prism or Combistats software.
6.	References:		
	IP General Chapter 2.8.7		

1.0	Objective:		
	Test for Description provides guidance to determine compliance with		
	requirements of individual monograph specifications.		
2.0	Scope:		
	This Standard Operating Procedure is applicable to all the In- process		
	and finished product samples.		
3.0	Responsibility		
	3.1	The QC analyst shall be responsible for executing the described	
	procedure correctly.		
	3.2	The QC supervisor shall be responsible for verifying that the	
	procedure is complied with and the results are checked.		
	3.3	The QC HOD shall be responsible for overall compliance of this SOP.	
4.0	Abbreviations and Definitions:		
	Not applicable		
5.0	Procedure:		
	5.1	Principle	
		5.1.1	Description is a general requirement given for information in
		most of the monographs. The property is not standard for	
		purity even though it may directly assist in the preliminary	
		evaluation.	
	5.2	Color:	
		5.2.1	Liquid Injectables:
			The color of the liquid biopharmaceutical product may be
		checked by taking the sample in a clean stoppered test	
		tube/vial. White color may be checked against a black	
		background and other colors may be checked against white	
		background.	
		5.2.2	Lyophilized Vials:
			Take out the contents from a vial on a white butter paper and
		observe the nature and color of the powder. Reconstitute the	
		injection in few vials by injecting a quantity of water for	
		injection as specified for the product in the pharmacopoeia	
		or in the directions for use. Observe and record the	
		solubility, color and nature of solution or suspension.

1.0 |Objective |
 |To lay down the procedure for determination of residual Ethyl dimethyl |
 |Aminopropyl carbodiimide (EDAC). |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to all the samples, in |
 |which the residual Ethyl dimethyl Aminopropyl carbodiimide (EDAC) content |
 |is to be determined, which is received in the QC. |
 3.0 |Responsibility |
3.1	The analyst shall be responsible for carrying out the described
	procedure correctly.
3.2	The Supervisor of the laboratory shall be responsible for verifying
	that the procedure is complied with and for checking the results.
3.3	The departmental head/designee shall be responsible for overall
	compliance of the SOP.
3.4	Head QA/Designee shall be responsible for final approval and
	subsequent compliance of the SOP.

	5.1.1
	5.1.2
	5.1.3
	5.1.4
5.2	Requirement:
	5.2.1
	5.2.2
5.3	Preparation of solutions:
	Prepare all the solutions as described below. Carry out the labelling
	of the prepared solutions and assign the lot numbers.
	5.3.1
	5.3.2
	5.3.3
	5.3.4

			Note: Use glass tube and glass pipettes for preparation.		
		5.3.5	Phosphate Buffer (0.2M NaCl, 10mM Phosphate Buffer pH 6.0):		
			Take 1.17 g NaCl, 0.054 g Na₂HPO₄·12H₂O and 0.133 g		
			NaH₂PO₄·2H₂O. Dissolve in 80 mL of MQW, adjust the pH with HCL		
			or NaOH and make up to 100mL. Filter through 0.22 µm filter.		
			This solution can be stored up to one month at room		
			temperature.		
		5.4	Test Procedure:		
		5.4.1	Preparation of Test Sample:		
			Dilute the test sample with phosphate buffer to 100 µg/mL of		
			polysaccharide based on its initial concentration and use 100µL		
			for the analysis.		
		5.4.2	Preparation of blank and positive control (1 µg/mL of EDC)		
			Prepare blank and positive control as described in the below		
			table.		
			EDC conc. (µg/mL)	EDC working stnd.	MES (µL)
			(µL)		
			Blank	0	100
			Positive control (1	5	95
			µg/mL)		
		5.4.3	Pipette 100 µL of the blank, the positive control and test		
			sample in duplicate into separately labeled 1.5 mL Microfuge		
			tubes.		
		5.4.4	Add 900µL DMBA reagent to all tubes using a glass pipette.		
		5.4.5	Close the tubes and vortex. Incubate them for 45 minutes at		
			room temperature.		
		5.4.6	Measure the absorbance at 595 nm (within 30 minutes after		
			incubation).		
		5.4.7	Record the results in record sheets		
		5.5	Acceptance criteria:		
			As per the specification the residual EDAC content should be less		
			than < 10 ng / µg Polysaccharides. Therefore the acceptance criterion		
			of the assay is "The absorbance value of the test sample containing		
			100 µg/mL of Polysaccharide should be less than the positive control		
			value (1 µg/mL of EDAC)".

	Not Applicable.		
4.0	Procedure:		
4.1	Preparation of solutions:		
	Prepare all the solutions as described below and fill the form No.		
	QCR/166/A. Label the solutions and assign lot numbers as per SOP		
	QC/166.		
	4.1.1	6 M Sodium hydroxide:	
		4.1.1.1	Weigh 24 g sodium hydroxide and transfer it to 100 mL
			volumetric flask.
		4.1.1.2	Dissolve and make up the volume to 100 mL with purified
			water
		4.1.1.3	Store the solution in a screw cap bottle, for a maximum
			of 6 months at room temperature.
	4.1.2	0.2 M borate buffer,pH 8.7:	
		4.1.2.1	Weigh 6.2 g of boric acid and transfer it to 500 mL
			volumetric flask.
			Dissolve in 450 mL purified water and adjust to pH 8.7
			with 6 M sodium hydroxide.
		4.1.2.2	Make up the volume to 500 mL with purified water.
		4.1.2.3	Store the solution in a screw cap amber bottle at room
			temperature, for a maximum of 6 months.
	4.1.3	0.1% w/v TNBS-10% DMF:	
		4.1.3.1	Take 1 mL of commercial TNBS solution (1% w/v in DMF)
			and transfer it to a 10 mL volumetric flask.
		4.1.3.2	Make up the volume to 10 mL with purified water.
		4.1.3.3	Prepare fresh prior to use.
	4.1.4	10% w/v Sodium dodecyl sulphate (SDS):	
		4.1.4.1	Weigh 10 g of SDS and transfer it to 100 mL volumetric
			flask.
		4.1.4.2	Dissolve in purified water and make up the volume to
			100 mL.
		4.1.4.3	Store the solution in a screw cap amber bottle at room
			temperature, for a maximum of 6 months.
	4.1.5	1M Hydrochloric acid:	
		4.1.5.1	Slowly add 42 mL concentrated hydrochloric acid to 300
			mL purified water in a 500 mL volumetric flask.
		4.1.5.2	Make up the volume to 500 mL with purified water.
		4.1.5.3	Store the solution in a screw cap amber bottle at room
			temperature, for maximum of 6 months.
	4.1.6	1 mg/mL Adipic acid dihydrazide solution:	
		4.1.6.1	Take 25 mg ADH and transfer it to 25 mL volumetric
			flask.
		4.1.6.2	Dissolve in purified water and make up the final volume
			to 25 mL with purified water.
		4.1.6.3	Prepare fresh prior to use.
	4.1.7	10 μg/mL Adipic acid dihydrazide solution:	
		4.1.7.1	Take 1 mL of 1 mg/mL Adipic acid dihydrazide solution
			and transfer it to a 100 mL volumetric flask.
		4.1.7.2	Make up the volume to 100 mL with purified water.
		4.1.7.3	Prepare fresh prior to use.
	4.2	Set the water bath to 37°C.	
4.3	Preparation of Calibration Curve:		
	4.3.1	Prepare calibration curve (1–10μg/mL) with freshly prepared	
		ADH solution (10μg /mL) in duplicate in previously labelled	
		test tubes as per following table:	
		ADH (μg/ml)	
		1	
		2	
		4	
		6	
		8	
		10	
		10 μg/ml ADH(μL)	
		100	

			200
			400

			800
			1000
			Purified water (µL)
			900
			800
			600
			400
			200
			-
		Note: The Calibration curve is accepted if it is meeting the	
		parameters of correlation coefficient i.e. ≥ 0.990 .	
		4.4	Test procedure:
		4.4.1	Take 1 ml of sample in duplicate in 10 mL thermoresistant test
		tubes after centrifugation.	
		Note: The sample dilution can vary depending upon the ADH	
		concentration. If there is any sample outside the range of the	
		calibration curve, dilute the sample appropriately.	
		4.4.2	Treat 1000 µL purified water as blank in thermoresistant test
		tube.	
		4.4.3	Add 500µL of 0.2 M borate buffer to tubes of calibration
		curve, blank and sample.	
		4.4.4	Vortex and add 500 µL of 0.1% w/v TNBS-10% DMF solution to all
		test tubes and again vortex gently.	
		4.4.5	Incubate for 30 minutes at 37°C in water bath.
		4.4.6	Allow the tubes to cool at room temperature, add 500µL 10% w/v
		SDS to each tube and vortex.	
		4.4.7	Add 1 mL of 1 M hydrochloric acid to each tube and vortex
		gently.	
		4.4.8	Allow the tubes stand at room temperature for 5 minutes and
		set the wavelength in spectrophotometer at 320 nm, as per	
		procedure described in SOP OE/058, OE/274. Zero the absorbance	
		of blank and then measure the absorbance of calibration curve	
		and test samples.	
		Note: The colour is stable for only a limited time, and absorbance	
		measurements should be made as soon as possible after colour	
		formation.	
		4.5	Calculations:
		4.5.1	Once the absorbance of the standards and the test samples have
		been taken, calculation shall be done using the excel sheet	
		carrying formulas for the required calculation.	
		4.5.2	Always copy the master excel sheet (sheet carrying formulas
		for the required calculation), never use the previously used	
		excel sheet for new calculations.	
		Master excel sheet can be assessed by following the below	
		mentioned path-	
		MY COMPUTER→ D DRIVE → MASTER EXCEL SHEETS → Master excel	
		sheet QC.01.19- Rev.04.	
		4.5.3	Copy the master excel sheet, keep it for use in respective
		folder and then fill in the required sample details, sample	
		dilution, name of analyst, date, etc.	
		4.5.4	Enter the absorbance for calculations starting from the
		Calibration curve prepared between 1 and 10 µg/mL of ADH and	
		test samples. The calculations are made according to the	
		equation of minimum squares.	
		$Y = mX + b$.	
		Where: m = slope	
		b = intercept	
		Y = absorbance	
		X = concentration	
		(Multiply by dilution factor)	
		4.5.5	Record all the calculations in the data record form and also
		attach the hard copy of the excel sheet used for calculation	
		along it.	
		4.6	Acceptance criteria:
		4.6.1	The coefficient of variation (CV) between the replicates of
		the samples should be $\leq 5\%$.	
		4.6.2	The ADH content in the sample should be within the specified
		limits.	
		Note: In case of any deviation follow the SOP QA/019 and in case some	
		parameters are not met, then proceed as per SOP QA/059.

1.0 |Objective: |
 |To lay down a procedure for determination of degree of activation for |
 |Meningococcal polysaccharide samples |
 2.0 |Scope: |
 |This SOP covers the procedure involved in testing of native and |
 |activated Meningococcal polysaccharide before conjugation |
 3.0 |Responsibility: |
 |3.1 |The analyst of the Immunochemistry laboratory shall be |
 |responsible for executing the described procedure correctly. |
 |3.2 |The supervisor of the laboratory shall be responsible for |
 |verifying that the procedure is followed correctly and for |
 |checking the results. |
 |3.3 |The Departmental Head shall be responsible for the overall |
 |compliance of the SOP and shall ensure that the SOP is reviewed |
 |every two years or if required earlier. |
 4.0 |Abbreviations and Definitions: |
4.1	QA	:Quality Assurance
4.2	QC	:Quality Control
4.3	SOP	:Standard Operating Procedure
5.0	Procedure:	
5.1	Materials, reagents & Equipments:	
5.1.1	BCA Assay reagent A: solution-containing Na₂CO₃, NaHCO₃,	
BCA detection reagent and sodium tart rate, in 0.2 M NaOH		
5.1.2	BCA Assay reagent B: 4% CuSO₄ (Sigma nr. C 2284 or Pierce	
nr. 23224)		
5.1.3	Milli Q water	
5.1.4	Glucose	
5.1.5	Glass test tubes (approximately 12 x 75 mm) with	
disposable plastic caps		
5.1.6	Pipettes and tips	
5.1.7	Analytical balance	
5.1.8	Laboratory vortex mixer	
5.1.9	Spectrophotometer	
5.1.10	Water bath with water circulation	
5.1.11	Cuvettes: 1 cm path length. Disposable polystyrene	
Cuvettes are recommended		
5.2	Preparation Of Solutions:	
5.2.1	Reagent A (commercial solution containing Na₂CO₃, NaHCO₃,	
BCA detection reagent, and sodium tartrate, in 0.2 M		
[NaOH]: total volume is 1000 mL. Store at RT (expiry 1		
year).		
5.2.2	Reagent B (commercial 4 % CuSO₄ solution): total volume is	
[25 mL. Store at RT (expiry 1 year).		
5.2.3	Reagent C: mix 1 mL of reagent B with 50 mL of reagent A.	
Prepare fresh		
5.2.4	Standard solution (0.4mM): Dissolve 0.0720 g of Glucose in	
[1000 ml MQW. Aliquot in small portion (e.g. 2.0 ml), and		
[store at ~-20°C (expiry 1 years).		
6.0	Procedure:	
6.1	Principle: Polysaccharides containing substituted or unsubstituted	
glycols in residues such as Glycerol, ribitol, arabinitol,		
furanosyl galactose, O-acetyl groups and sialic acid react with		
sodium periodate, and form an aldehyde, which further under goes		
redox reaction with oxidizing agents such as Cu⁺⁺ in presence of		
BCA and gives purple colour which is detected at 565 nm.		
6.2	Preparation for assay Standards:	
Prepare a series of standard solutions from 0.4 mM glucose		
standard solution into suitable glass tubes in duplicate according		
to the following table.		
Glucose	Volume of 0.4mM	Volume of MQW
Standard	glucose standard	(μl)
(μl)		
Blank	0	400
S1	25	375
S2	50	350
S3	100	300
S4	200	200
S5	400	0
6.2.1	Dilute the samples to desired concentration to fit in	
curve.		
6.2.2	Take appropriate aliquot of samples into the 5 ml glass	
tubes in duplicate and complete volume to 400 μl with MQW.		
6.2.3	Add 1 ml of BCA reagent to all the tubes and vortex	
gently. Cap the tubes.		
6.2.4	Incubate for 60 minutes at 60°C in a water bath.	
6.2.5	Cool the tubes to RT and read the absorbance at 550 nm	
6.3	Calculation:	
6.3.1	Data analysis can be done manually (calculator) or by	
[using computer and appropriate software (e.g. MS Excel).		
6.3.2	Construct the standard curve and calculate the aldehyde	
[concentration (mM) of the samples from their absorbance		
[and the standard curve (one mole glucose contains one mole		
aldehyde).		
[Aldehyde conc. (mM) = {(Mean absorbance –		
[Intercept)/Slope} = X		
6.3.3	Calculate the aldehyde concentration in the samples in	
[mM/ml taking into account the volume sample solution used		
[and dilution factor using formula.		
[Aldehyde conc. (mM/ml) = (X) x Diln.Factor x 1000/Volume		
[sample = Y		

	6.3.4	Calculate the MAPS concentration in the sample in mM using	
			formula.
			MAPS conc. (mM) = $m/340 \times 1000 = Z$
			Where m is MAPS concentration in mg/ml measured by
			Phosphorous assay, Z in mM assuming 340 Da for molecular
			weight of monomeric repeating unit of MAPS.
	6.3.5	Calculate the degree of activation in the sample by using	
			formula.
			Degree of activation (DA) = Y/Z
			Where Y is aldehyde concentration in mM measured by the
			BCA assay.
	6.4	Acceptance Criteria:	
		The correlation of calibration curve must be > 0.990	
	7.0	Reporting:	
	7.1	Record all the results in the data sheet.	
	7.2	Attach the print out of the spectrophotometer and the applicable	
		calculation sheet using MS Excel or any other software.	
	7.3	The report is submitted to QC in-charge for verification.	
	7.4	Report to QC in-charge in case of any problems such as out of	
		linearity and proceed as per instructions.	
	8.0	References:	
	8.1	SOP for Phosphorus contents of Meningococcal Polysaccharide

5.1.10	Pipettes and tips (e.g. Eppendorf)	
5.1.11	Phosphorus standard, 20µg/ml: KH₂PO₄ MW 137.66, ≥ 99.0%	
p.a. (e.g. Sigma P3869)		
5.1.12	Sulphuric Acid H₂SO₄ M.W.98.08 ≥ 99.0% p.a. (Fluka 84727)	
5.1.13	Perchloric acid HClO₄ M.W. 100.48 ≥ 70.0% p.a. (Aldrich	
24,425-2)		
5.1.14	Deoxycholic acid sodium salt C₂₄H₃₉O₄Na M.W. 414.2 >97%	
p.a. (Sigma D-6750) Harmful.		
5.1.15	Ascorbic acid sodium salt: C₆H₇NaO₆ MW 198.11 p.a.	
(e.g. Fluka 11140) Light and air sensitive.		
5.2	Preparation Of Solutions:	
5.2.1	Reagent A (Sulphuric acid +Perchloric acid): 2 volumes of	
Sulphuric acid and 1 volumes of Perchloric acid. Prepare		
fresh.		
5.2.2	Reagent B (1N Hydrochloric acid): Slowly add 21.5 ml	
concentrated HCl to 200 ml Milli Q water to final volume		
of 250 ml. Stored at room temperature (expiry 6 months).		
5.2.3	Reagent C (1 % DOC): Dissolve 250 mg of DOC in 25 ml of	
Milli Q water. Adjust pH to 6.8 with reagent B. prepare		
fresh.		
5.2.4	Reagent D (3 M Sulphuric acid): Take 180 ml of Milli Q	
water in volumetric flask, to this adds 40.5 ml of conc.		
Sulphuric acid slowly. Make up volume to 250 ml with Milli		
Q water. Store at room temperature. (Expiry 6 months).		
5.2.5	Reagent E (2.5% Ammonium Molybdate): Dissolve 5.0 g of	
ammonium molybdate in 200 ml of Milli Q water. Store at		
4°C. Expiry 6 month		
5.2.6	Reagent F (10 % Ascorbic acid): Dissolve 10 g of ascorbic	
acid in 80 ml of milli Q water. Make up final volume to		
100 ml with milli Q water. Store at 4°C (expiry 1 month).		
5.2.7	Reagent G: Mix 2 volume of Milli Q water, 1 volume of	
reagent D, 1 volume of reagent E, 1 volume of reagent F.		
prepare fresh.		
5.2.8	Standard solution: (2.0µg/ml): Dilute 10ml of 20µg/ml	
phosphorus standard (Sigma) with 90 ml of MQW. Aliquot in		
eppendorf tubes in small portion and store at ~-20°C		
(expiry 1 years).		
6.0	Procedure:	
6.1	Principle: The polysaccharide-protein conjugate is precipitated by	
using Deoxycholic acid (DOC) and 1N HCl. After centrifugation the		
unbound free polysaccharide remains in supernatant that is removed		
and tested by phosphorus assay.		
Phosphorus assay requires a preliminary ashing step, in order to		
release all organically bound phosphate. The conventional method		
involve drying and burning of organic sample over Bunsen burner,		
in presence of perchloric acid and Sulphuric acid. A high		
temperature furnace is now used instead. The characteristic blue		
color, which is formed from reduction of phosphomolybdo complex by		
ascorbic acid, is detected using a spectrophotometer at 825 nm.		
The method is sensitive and gives reproducible results.		
6.2	Preparation for assay Standards:	
Add standard solutions into glass test tubes in duplicate		
according to the following table.		
S.No.	Volume of	Volume of
standard (µl)	MQW (µl)	(µg /ml)
Blank	0	200
S 1	25	175
S 2	50	150
S 3	75	125
S 4	100	100

		S 5	150	50	1.5	0.01089
		S 6	200	0	2.0	0.01452
		6.3	DOC Precipitation method (sample preparation):			
		6.3.1	The total Meningococcal A polysaccharide content must be			
		determine separately (phosphorus assay.				
		6.3.2	Dilute the sample approximately 100 µg/ml with MQW into			
		conical microfuge tubes.				
		6.3.3	Add 100 µl of reagent C and vortex the sample.			
		6.3.4	Place the sample in refrigerator at 2°C- 8°C for 30 min.			
		6.3.5	Add 50 µl of reagent B and vortex. Centrifuge the sample			
		for 15 min at 6000Xg at 4°C.				
		6.3.6	Remove carefully the supernatant into another eppendorf			
		tube and mark it as supernatant.				
		6.4	Take appropriate aliquot of supernatant in duplicate in glass test			
		tubes				
		6.5	Add 75µL reagent A to each tubes and vortex			
		6.6	Ash the tubes in a furnace at 250 °C for 4hrs ± 15 minutes			
		6.7	Remove the tubes from the furnace. Cool down the tubes to room			
		temperature. Set the water bath to 37°C.				
		6.8	Add 1 ml Reagent G to each tube and vortex.			
		6.9	Cap the tubes with plastic caps and incubate in a 37°C water bath			
		for 90 ± 5 min.				
		6.10	Measure the absorbance of each tube at 825 nm with a			
		spectrophotometer.				
		6.11	Calculation:			
		6.11.1	Data analysis can be done manually (calculator) or by			
		using computer and appropriate software (e.g. MS Excel).				
		6.11.2	Construct the standard curve with the quantity of			
		phosphorous (q, in µg/ml) plotted versus the avg.				
		absorbance (A). The standard should fit a first degree				
		(i.e. linear) equation:				
		$y = mx + b$				
		6.11.3	Read the average absorbance of the samples against the			
		standard curve.				
		6.11.4	Calculate the phosphorous concentration of the samples			
		using following formula				
		Phosphorous concentration (µg/ml)=				
		$\frac{((\text{abs-intercept})/\text{slope}) \times \text{dilution factor}}{11.11}$				
		6.11.5	Calculate the polysaccharide concentration of the samples			
		using following formula				
		Polysaccharide concentration= Phosphorous concentration				
		$\times 11.11$				
		6.12	Acceptance Criteria:			
		The correlation of calibration curve must be > 0.990				
		7.0	Reporting:			
		7.1	Record all the results in the data sheet.			
		7.2	Attach the print out of the spectrophotometer and the applicable			
		calculation sheet using MS Excel or any other software.				
		7.3	The report is submitted to QC in-charge for verification.			
		7.4	Report to QC in-charge in case of any problems such as out of			
		linearity and proceed as per instructions.

	5.3.7	Start the timer corresponding to the incubation column for an
		incubation of 120 sec.
	5.3.8	After 110 sec beep sound was produced.
	5.3.9	Then transfer the cuvette from the incubation chamber to the
		test column area.
	5.3.1	Dispense 150 μL of fibrinogen solution (1 mg/mL of Clottable
	0	protein) and measure the clotting time.
	5.3.1	Record the clotting time.
	1	
	5.4	Calculation and analysis:
	5.4.1	The calculations of potency and analysis of the graphs should
		be performed using both Combistat and Graph pad prism Software.
	5.4.2	Combistat analysis- Input sample and standard ODs with proper
		dilutions folds and assigned potency value in Thrombin assay
		template and follow the settings below
	5.4.3	Settings:
		Model : Parallel lines
		Design: Completely randomized
		Transformation: $y' = \log(y)$
		Variance : Observed residuals
		In order to get the slope ratios for sample with standard need
		to include equivalence testing.
	5.4.4	Graph pad prism analysis- Analyse both standard and sample for
		linear regression and determine slope and liner regression
		values. Calculate the slope ratio for slope of test
		Sample/slope of standard.

 |7.3 |0.1M Sodium Phosphate buffer |
 | |(0.1 M Na₂HPO₄, 0.1M NaCl +0.1M NaH₂PO₄ .H₂O, pH 7.0) |
 | |For a volume of 1000 ml, take approximately 600 ml of Solution I and |
 | |400ml of Solution II. The pH of the solution should be 7.0 ± 0.2. |
 | |This solution can be stored at room temperature for 1 month. |
 |7.4 |Preservation Solution: |
 | |(Sodium azide 0.05%) |
 | |Weigh 1 g of Sodium Azide and dissolve in approximately 1800 ml of |
 | |purified Water. Make up the volume to 2.0 Litre with purified water. |
 | |This solution can be stored at room temperature for 2 months. |
 |7.5 |20% ethanol solution: |
 | |Take 200ml of absolute ethanol in a measuring cylinder and make up |
 | |the volume to 1 litre with purified water. |
 | |Note: All the solutions prepared for use are vacuum filtered using |
 | |Nylon 6, 6 membrane 0.22 µm filters to eliminate the entry of |
 | |possible particles into the system as well as the column. |
 8. |Procedure: |
 |8.1 |Run condition: | | |
 | |8.1.1 |Column: TSK gel SW3000xl column |
 | |8.1.2 |Buffer used: 0.1M sodium phosphate buffer |
 | |8.1.3 |Elution: Isocratic |
 | |8.1.4 |Flow rate: 0.75ml/min |
 | |8.1.5 |Run time: 30minutes |
 | |8.1.6 |Injection volume: 40-70µl |
 | |8.1.7 |Detector Used: UV detector at wavelength of 280nm |
 |8.2 |Run procedure: |
 | |8.2.1 |Equilibrate the column with 0.1M sodium phosphate buffer for |
 | |1 hour. |
 | |8.2.2 |Sample application: |
 | | |8.2.2.1 |Sample of purified conjugated material is injected to |
 | | |the column after a stable baseline at 280 nm is |
 | | |obtained. |
 |8.3 |Column cleaning and storage: |
 | |8.3.1 |Column storage: Pass 200 ml of preservation solution through |
 | |the column for long time storage. |
 | |8.3.2 |Cleaning the column: If peak shape observed is not proper, |
 | |then reverse the flow direction of column and pass 200 ml of |
 | |purified water and then 200 ml of 20% ethanol solution and |
 | |then pass 200ml of purified water with normal flow direction. |
 |8.4 |Chromatogram evaluation: |
 | |8.4.1 |Open the acquired chromatogram. |
 | |8.4.2 |Optimize integration with various integration parameters. |
 | |8.4.3 |The percentage of free carrier protein in sample is |
 | |calculated by taking the percentage area of the peak maxima |
 | |corresponding to the lower molecular weight compared to the |

			peak maxima of higher molecular weight.
		8.4.4	Acceptance Criteria:
		The percentage of Free Carrier Protein should be < 5%.	
8.5	Reporting Results		
	8.5.1	After optimizing integration, select Report Layout view in	
		the software.	
	8.5.2	Report the results of percentage of area of peak towards	
		higher Molecular weights (Conjugated) and percentage of area	
		of peak towards lower Molecular weights (Unconjugated).	
		Note: Percentage of free carrier protein is the percentage of	
		area of peak towards lower molecular weights (Unconjugated).	
	8.5.3	Take a printout of a report with the results.

1.0 |Objective |
 |To lay down the procedure for analysis of Pneumococcal polysaccharide |
 |samples by High Performance Size Exclusion Chromatography. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable for evaluating Kavg of |
 |polysaccharide standard; polysaccharide samples at in process stage and |
 |lyophilized purified polysaccharide of pneumococcal vaccine. |
 3.0 |Responsibility |
 |3.1 |The analyst shall be responsible for carrying out the described |
 |procedure correctly. |
 |3.2 |The Supervisor of the laboratory shall be responsible for verifying |
 |that the procedure is complied with and for checking the results. |
 |3.3 |The departmental head/designee shall be responsible for overall |
 |compliance of the SOP. |
 |3.4 |Head QA/Designee shall be responsible for final approval and |
 |subsequent compliance of the SOP. |

5.3.9	Tips for the Auto pipettes	
5.3.10	Syringe filters 0.2 µm	
5.3.11	Aluminium Foil	
5.3.12	Gloves	
5.4	Reagents:	
5.4.1	Dextran	
5.4.2	Sodium azide	
5.4.3	Deuterium Oxide	
5.4.4	Sodium Chloride	
5.4.5	Purified water	
5.4.6	Sodium dihydrogen phosphate, dihydrate	
5.4.7	Disodium hydrogen phosphate, anhydrous	
5.5	Preparation of solutions: Prepare all the solutions as described	
below. Carry out the labelling of the prepared solutions and assign		
the lot numbers.		
5.5.1	100mM Sodium dihydrogen phosphate stock Solution:	
Take 15.602g of Sodium dihydrogen phosphate in 1L of purified		
water. Mix well and store the solution at room temperature for		
not more than one month.		
5.5.2	100mM Disodium hydrogen phosphate stock Solution:	
Take 14.196g of Disodium hydrogen phosphate in 1L of purified		
water. Mix well and store the solution at room temperature for		
not more than one month.		

		5.5.3	100mM Phosphate Buffer stock Solution:
		Add 280 mL of 100mM Sodium dihydrogen phosphate and 720mL of	
		100 mM Disodium hydrogen phosphate.	
		Add 280mL of 100mM Sodium dihydrogen phosphate and 720mL of	
		100mM Disodium hydrogen phosphate. Store the solution at room	
		temperature for not more than one month.	
		5.5.4	10mM Phosphate buffer saline:
		Add 100ml of 100 mM of phosphate buffer (pH-7.2) to 800 mL of	
		purified water and then add 8.5g of Sodium Chloride and adjust	
		the pH to 7.2 by adding 100mM Disodium hydrogen phosphate	
		solution. Make the final volume to 1000mL.	
		Filter the PBS solution with 0.2µm filter under vacuum and	
		degas the solution using the ultra-sonication bath.	
		5.5.5	Dextran (1 mg/mL) and Deuterium oxide (2.5 v/v) standard to
		obtain void volume (Vo): Add 9.75mL of 10mM PBS slowly to 10mg	
		of Dextran in a clear glass bottle. Do not mix the solution.	
		Leave the glass bottle at 2-8°C for 2 hours Then add 0.25mL D2O	
		and gently shake the tube for 30 minutes on shaker.	
		Note: Prepare the standard solution fresh just prior to use	
		with the same 10mM PBS which is to be used during the run.	
		5.5.6	Sodium azide standard to obtain the total volume (Vt) : Take
		10mg of sodium azide, dissolve in 20mL of WFI/10mM Phosphate	
		Buffer Saline and then filter through 0.2µm syringe filter.	
		Note: Prepare this solution fresh just prior to use.	
		5.5.7	Pneumococcal polysaccharide standard (2mg/mL):
		Take 2mg of ATCC standard and add 2ml of 0.2µm filtered	
		purified water and keep it overnight at 2-8°C on shaker. Take	
		the 1 mg/mL of the standard and aliquot in 120µL. Store at	
		-20°C for not more than 1 month.	
		5.5.8	Purified polysaccharide sample preparation (Test sample):
		Weigh the lyophilized purified sample and dissolve in 0.2µm	
		purified water to make 1mg/mL of sample. Keep it overnight at	
		2-8°C on shaker before use. Store at -20°C for not more than	
		one month.	
		5.5.9	Preservation Solution (Sodium azide 0.05%):
		Weigh 1g of Sodium Azide and dissolve in approximately 1800 mL	
		of purified Water. Make up the volume to 2L with purified	
		water. This solution can be stored at room temperature for 2	
		months.	
		Note: All the solutions prepared for use are vacuum filtered	
		using Nylon 6,6 membrane 0.2µm filters to eliminate the entry	
		of possible particles into the system as well as the column.	
		5.6	HPLC method Run:
		5.6.1	Mount Shodex guard column, Shodex 805 column and Shodex 804
		column in series on calibrated HPLC system.	
		5.6.2	Place the inlet tubing A in the reservoir for 10 mM phosphate
		buffer saline solution.	
		5.6.3	Establish On-Line connection of HPLC System with chromatography
		software.	
		5.6.4	Switch ON the HPLC System.
		5.6.5	Click on the chromatography software.
		5.6.6	Purging the system:
		5.6.6.1	Open the purge valve of pump (by turning it counter
		clockwise) and set flow rate to 3-5ml/min.	
		5.6.6.2	Flush the vacuum degasser and all tubes with 10mM PBS
		for ten minutes.	
		5.6.6.3	Set flow to at 0.0ml/min and close the purge valve. The
		flow shall be directed to the column.	
		5.6.7	Run conditions:
		5.6.7.1	Set the flow to 1.0ml/min
		5.6.7.2	Detector used: RID
		5.6.7.3	RID optical unit temperature : 30°C
		5.6.7.4	In case of running sample manually/sequence, run time
		is 30min.	
		5.6.8	Purge reference cell of RID for 40 minutes after solvent
		change. Further purging of reference cell may be required to	
		achieve stable baseline.	
		5.6.9	Keep on running the column with 10 mM phosphate buffer saline
		solution unless a stable baseline for RID is obtained which can	
		be viewed on the chromatographic software.	
		5.7	Sample Preparation and injection to the system:
		5.7.1	Diafiltration after 3-step ethanol precipitation samples:
		5.7.1.1	Filter the samples with 0.2 µm syringe filter in HPLC
		glass vials.	
		5.7.1.2	Inject 50 µl of the sample on HPLC.
		5.7.2	HA chromatography samples:
		5.7.2.1	Filter the samples with 0.2 µm syringe filter in HPLC
		glass vials.	
		5.7.2.2	Inject 50 µl of each sample on HPLC.
		5.7.3	HA pool sample:
		5.7.3.1	Filter the samples with 0.2µm syringe filter in HPLC
		glass vials.	
		5.7.3.2	Inject 50 µl of each sample on HPLC.
		5.7.4	After final diafiltration samples:
		5.7.4.1	Filter the samples with 0.2 µm syringe filter in HPLC
		glass vials.	
		5.7.4.2	Load 50 µl of the sample on HPLC.
		Note: For the samples of step 5.5.1 to 5.5.4 if absorbance of	
		the samples in nRI Units observed is greater than 7000 nRI	
		, then the volume of sample injected may be reduced accordingly	
		and vice-versa.	
		5.7.5	Lyophilized purified polysaccharide:

		5.7.5.1	Filter the samples with 0.2 µm syringe filter in HPLC
			glass vials.
		5.7.5.2	Inject 100 µl of the sample (1mg/ml) on HPLC.
	5.7.6	Inject 100µl of the respective ATCC Standard (1mg/ml)	
		pertaining to that particular serotype for all the above	
		samples.	
	5.7.7	Inject 100µl of the Dextran standard for void volume	
		determination for final Lyophilized sample.	
	5.7.8	Inject 100µl of the sodium azide standard for total volume	
		determination for final Lyophilized sample.	
		Note: For all the samples received on same day, only one injection of	
		ATCC polysaccharide standard is required.	
	5.8	Results Evaluation:	
	5.8.1	Compare the retention time of polysaccharide standards and	
		lyophilized sample.	
	5.8.2	Proceed for calculating Kavg value of standard and sample.	
		The calculations are made as per the following equation:	
		$K_{avg} = V_r - V_o$	
		$V_t - V_o$	
		Where,	
		V_r = Retention time of pneumococcal polysaccharide sample and	
		standard polysaccharide	
		V_t = Retention time of Sodium azide	
		V_o = Retention time of Dextran(1st peak)	
		Note: In case of 7F and 5 polysaccharide retention time of	
		first peak obtained is considered for Kavg calculation.	
	5.9	Reporting Results:	
	5.9.1	Open PNEUMOCOCCAL report template showing retention time, area,	
		height of each sample.	
	5.9.2	Report the results of Kavg with the retention time values of	
		all the samples.	
	5.9.3	Print report: Click this option to take a printout of the	
		report generated for each sample, void volume marker, total	
		volume marker and polysaccharide standard.	
	5.9.4	The printed report is signed by the analyst who does the	
		analysis and also checked by the other analyst.	
		Note: In case of HA chromatography samples, the printout	
		results of samples are attached to Annexure 1.	
	5.10	Acceptance criteria: The Kavg of the sample should be ≤ 0.30 .	

1.0 |Objective |
 |To lay down the procedure for the determination of residual Cetyl Trimethyl|
 |Ammonium Bromide (CTAB) concentration in Pneumococcal Purified |
 |Polysaccharide samples by Titration Method. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to the final purified |
 |Polysaccharide samples. |
 3.0 |Responsibility |
3.1	The analyst is responsible for executing the described procedure
	correctly.
3.2	Supervisor is responsible for verifying that the procedure is carried
out correctly and check the results.	
3.3	HOD shall be responsible for overall compliance of this SOP and shall
ensure that the SOP is reviewed every two years or if required	
	earlier.

||| /ml): |

||| 5.1.8.1|Take 200 µl of 15 g/1 Acetylcholine chloride stock |

||| |solution and diluting to 10 ml with Purified water. |

||| 5.1.8.2|This solution prepared freshly. |

|| 5.2 |Testing procedure: |

|| 5.2.1 |Preparation of Calibration Curve: |

||| |From the working standard solution (600µg/ml), make the |

||| |following concentrations of the standard for the preparation of |

||| |a calibration curve. |

||| |

||| |

||| 5.2.1.1|Calibration curve for acetylcholine chloride (15-600 |

||| |µg/ml): |

||| |Acetylcholine |Working Stock- |Purified Water |

||| |chloride conc. |600 µg/ml |(µl) |

||| |(µg/ml) |(µl) |

||| |15 |25 |975 |

||| |30 |50 |950 |

||| |75 |125 |875 |

||| |120 |200 |800 |

||| |150 |250 |750 |

||| |360 |600 |400 |

||| |600 |1000 |0 |

|| 5.2.2 |Test Procedure: |

||| 5.2.2.1|Label the two sets of test tubes as "correction tubes" |

||| |and "reaction tubes". Correction tubes are used to |

||| |exclude the absorption due to non-specific binding in |

||| |sample. There is no need of the same for standards. |

||| 5.2.2.2|Introduce 1000µl of each of the concentration of the |

||| |standards, blank and sample in test tubes (in |

||| |duplicates). Sample shall be duplicated in two sets of |

||| |test tubes (correction as well as reaction) as stated |

||| |above in step 5.2.2.1 |

||| |In case of dry polysaccharide prepare a solution |

||| |containing about 1-5 mg/ml of polysaccharide in Lal |

||| |reagent water and use it as test sample. |

||| |Note: The sample dilutions can vary depending upon the |

||| |O-Acetyl concentration. If there is any sample outside |

||| |the range of the calibration curve, carry out the |

||| |calculation for more appropriate dilution. |

|| 5.2.3 |Correction tubes: |

||| 5.2.3.1|Add 0.2ml of 4M Hydrochloric acid to each of the |

||| |correction tubes, Vortex the tubes. |

||| 5.2.3.2|Add 0.4 ml of alkaline hydroxylamine solution to each |

||| |correction tubes, Vortex the tubes. |

||| 5.2.3.3|Allow the reaction to proceed exactly for 2 minutes at |

||| |room temperature, and follow the test procedure. |

|| 5.2.4 |Test procedure (Reaction tubes , Standard curve and Blank) |

||| 5.2.4.1|Add 0.4 ml of alkaline hydroxylamine to each of the |

||| |reaction tubes, standard curve and blank, Mix well. |

||| 5.2.4.2|Allow the reaction to proceed exactly for 2 minutes at |

||| |room temperature |

||| 5.2.4.3|Add 0.2 ml of 4M Hydrochloric acid to each of the |

||| |reaction tubes, standard curve and blank .Vortex the |

||| |tubes. |

||| 5.2.4.4|Add 0.2 ml of 0.74M Ferric chloride solution to all the |

||| |tubes (Blank, Reaction and correction, standard curve) |

||| |and again vortex for through mixing |

||| 5.2.4.5|Observed for the appearance for light yellow colour for |

||| |lower concentrations and yellowish brown colour for |

||| |higher concentration of acetylcholine or O-acetyl |

||| |groups. |

||| 5.2.4.6|Measure the absorbance at 540nm against the blank using |

||| |spectrophotometer. |

||| 5.2.4.7|Note that all the readings of the assay tubes should be |

||| |taken within 30 mins. of completion of the assay and |

||| |maximum 5 samples should be analysed in one single |

||| |assay. |

|| 5.3 |Calculations: |

|| 5.3.1 |Once the absorbance of the standards and the test samples have |

|| |been taken, calculation shall be done using the excel sheet |

|| |carrying formulas for the required calculation. |

|| 5.3.2 |Always copy the master excel sheet (sheet carrying formulas |

|| |for the required calculation), never use the previously used |

|| |excel sheet for new calculations. |

|| 5.3.3 |Copy the master excel sheet, keep it for use in respective |

|| |folder and then fill in the required sample details (Batch |

|| |number), sample dilution (if applicable), name of analyst, |

|| |date, etc. |

|| 5.3.4 |Proceed for calculations starting from the Calibration curve. |

|| |The calculations are done according to the equation |

|| |Y = mX + b Here: m = slope |

|| |b = intercept |

|| |Y = absorbance |

|| |X = concentration |

|| ||(Multiplication by dilution factor) |

|| 5.3.5 |Use EXCEL programme for the preparation of calibration curve |

|| |and Calculation of the results (Multiply by the dilution |

|| |factor. Divide with 1000 to change µg/ml to mg/ml). |

|| 5.3.6 |Subtract the concentration of the correction tube from the |

|| |corresponding reaction tube to estimate the accurate value of |

|| |acetylcholine chloride. |

	5.3.7	Divide the results obtained from the step above by 4.22 in
		order to get the quality of O-acetyl groups in the sample as
		the standard used is of acetylcholine chloride and 1 mole of
		acetylcholine chloride (181.7g) is equivalent to 1 mole of
		O-acetyl group (43.05g).
	5.3.8	In case of dry polysaccharide,
		O-acetyl (%) in polysaccharide on dry weight basis:
		O-acetyl Conc. in dry Polysacc. (µg/ml)
		= O-acetyl in Polysacc. sol. (µg/ml) X 1 – {Moisture (%) /
		{100}
		O-acetyl in dry polysaccharide (µg/ml)
		O-acetyl (%) = _____ X 100
		Conc. of polysaccharide solution (µg/ml)
	5.4	Acceptance criteria:
	5.4.1	The test is valid if Regression of the standard curve is ≥0.99
		and the percentage of Coefficient of Variation is ≤ 15% within
		the replicates.
	5.4.2	O-acetyl content in Purified Pneumococcal polysaccharide
		should meet the laid specifications.
	6.0	Forms and Records
		Determination of O-acetyl content - Annexure 1
	7.0	Reference
	7.1	WHO TRS No. 977 Annexure 3: Recommendations to assure the quality,
		safety and efficacy of pneumococcal conjugate vaccines.

				5.3.4	Test procedure: Conduct the experiment in 2 steps.
				Pre assay testing to check placebo interference	
				Main experiment	
				5.3.4.	Pre assay testing to check placebo interference
				1	
				5.3.4.1.1	Check placebo interference before conducting
				the main experiment.	
				5.3.4.1.2	Switch on the Coagulometer 15 minutes prior to
				analysis.	
				5.3.4.1.3	Place all the reagents in appropriate slots of
				the Start – 4 Coagulometer for warming at 37°C	
				(5 minutes prior to analysis).	
				5.3.4.1.4	Place a Cuvette strip in the incubation area
				and pre warm at 37°C at least for 3 minutes.	
				Then dispense one magnetic ball to each	
				cuvette	
				5.3.4.1.5	Add 50 μL of Placebo of test sample under
				testing, 50 μL of Factor IX deficient plasma	
				and 50 μL of C.K. Prest to each cuvette.	
				5.3.4.1.6	Immediately start the timer corresponding to
				the incubation column for an incubation of 180	
				sec.	
				5.3.4.1.7	After 170 sec beep sound was produced.
				5.3.4.1.8	Then transfer the cuvette from the incubation
				chamber to the test column area.	
				5.3.4.1.9	Then add 50 μL of 0.025 M calcium chloride
				solution pre warmed at 37°C to each cuvette	
				with the help of Micro pipette, while adding	
				calcium chloride press timer to start the	
				measurement.	
				5.3.4.1.1	A clot should be formed within the established
				0	clotting time.
				5.3.4.1.1	If the placebo is in compliance with the
				1	established spec, proceed for the main
				experiment.	
				5.3.4.	Main experiment:
				2	
				5.3.4.2.1	Once the pre assay testing is clear, follow
				the procedure mentioned below to test the	

				sample activity.	
				5.3.4.2.2	Follow section 5.3.4.1.2 to 5.3.4.1.4 of
				current STP upto addition of samples/standard.	
				5.3.4.2.3	Add 50 µL of reference standard/test sample,
				50 µL of Factor IX deficient plasma and 50 µL	
				of C.K. Prest to each cuvette.	
				5.3.4.2.4	Follow section 5.3.4.1.6 to 5.3.4.1.10 of
				current STP upto addition of 0.025 M calcium	
				chloride solution.	
				5.3.4.2.5	A clot will be formed in the reaction cuvette
				based on the activity of the sample.	
				5.3.4.2.6	Note down the clotting times which comes in
				the print out and interpret the result using	
				respective software's for data analysis.	
	5.4	Calculation and analysis:			
	5.4.1	The calculations of potency and analysis of the graphs should			
		be performed using both Combistat and Graph pad prism Software.			
	5.5	Specific activity calculation:			
	5.5.1	Specific activity =			
		Factor IX			
		Total protein mg/ml

1.0 |Objective |
 |To lay down the procedure for determination of Triethylamine (TEA) content |
 |in Pneumococcal Polysaccharide samples by Gas Chromatography. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to all the samples, in |
 |which the Triethylamine (TEA) content is to be determined, which is |
 |received in the QC. |
 3.0 |Responsibility |
 |3.1 |The analyst shall be responsible for carrying out the described |
 |procedure correctly. |
 |3.2 |The Supervisor of the laboratory shall be responsible for verifying |
 |that the procedure is complied with and for checking the results. |
 |3.3 |The departmental head/designee shall be responsible for overall |
 |compliance of the SOP. |
 |3.4 |Head QA/Designee shall be responsible for final approval and |
 |subsequent compliance of the SOP. |
 4.0 |Abbreviations and Definitions |

4.12	µl	: Micro litre
4.13	µm	: Micro meter
4.14	TEA	: Triethyl amine
5.0	Procedure	
5.1	Precautions to be taken:	
5.1.1	Always wear laboratory coat.	
5.1.2	Always use solutions and samples filtered through 0.2 µm	
membrane.		
5.1.3	Check the calibration status of all equipment and instrument.	
5.1.4	Handle acids carefully wearing gloves and always manipulate in	
fume hood.		
5.2	Requirement:	
5.2.1	Equipment and Instruments:	
5.2.1.1	Gas Chromatography system with head space	
5.2.1.2	Micropipettes	
5.2.2	Material:	
5.2.2.1	Triethyl amine (Make: Fluka, Catalogue No. 90340)	
5.2.2.2	Sodium chloride (NaCl) (Make: Qualigens, Cat No: 15915	
or equivalent grade)		
5.2.2.3	Disodium hydrogen phosphate dodecahydrate	
(Na₂HPO₄·12H₂O) (Make: Sigma Aldrich, Cat No. 71650 or		
equivalent grade)		
5.2.2.4	Laboratory Glassware	
5.2.2.5	Sodium dihydrogen phosphate dehydrate (NaH₂PO₄·2H₂O)	
(Make: Merck, Cat No. 1.06342.0250 or equivalent grade)		
5.2.2.6	Water for Injection (WFI)	
5.2.2.7	Hydrogen gas (IOLAR)	
5.2.2.8	Nitrogen gas (IOLAR)	
5.2.2.9	Helium gas (IONAR)	
5.2.2.1	Zero gas (IOLAR)	
10		
5.2.2.1	Separation Column, e.g. OPTIMA–624–LB–1.80 µm –30 m x	
1	0.32 mm (Make: Macherey-Nagel, Catalogue No. 726 786.30)	
5.2.2.1	1.5 mL vials	
2		
5.2.2.1	Volumetric flasks- 100 mL	
3		
5.2.2.1	Glass pipettes	
4		
5.2.2.1	Head space vials and septa	
5		
5.2.2.1	Buffer (0.2 M NaCl, 10mM Phosphate Buffer pH 6.0)	
6		
5.3	Preparation of solutions:	
Prepare all the solutions as described below. Carry out the labelling		
of the prepared solutions and assign the lot numbers.		
5.3.1	0.2 M NaCl, 10mM Phosphate Buffer pH 6.0:	
Take 1.17 g NaCl, 0.054 g Na₂HPO₄·12H₂O and 0.133 g		
Na₂H₂PO₄·2H₂O. Dissolve in 80 mL of MQW, adjust the pH with HCL		
or NaOH and make up to 100mL. Filter through 0.22 µm filter.		
This solution can be stored up to one month at room		
temperature.		
5.3.2	TEA stock Standard (10,000 µg/mL):	
Take 1.370 mL of neat TEA and make up to 100 mL with 0.2 M		
NaCl, 10mM Phosphate Buffer in a volumetric flask. Prepare		
fresh on the day of use.		
5.3.3	Positive control (50µg/mL of TEA standards)	
Add 15µL of TEA stock to 3mL of 0.2 M NaCl, 10mM Phosphate		
Buffer.		
5.3.4	Test sample preparation:	
5.3.5	Dilute the test sample with 0.2 M NaCl, 10mM Phosphate Buffer	
to 10mg/ml of pneumococcal polysaccharide based on its initial		

||| |concentration. |

|| |5.4 |Test Procedure: |

|| |5.4.1 |Take 3 mL of 0.2 M NaCl, 10mM Phosphate Buffer as a blank, 3 mL |

|| |of positive control and 3mL of diluted test sample into |

|| |respectively labeled head space vials, and place these vials in |

|| |the head space carousel. |

|| |5.4.2 |Create a batch file in GC solution software and wait for GC |

|| |ready command and click start button. |

|| |5.4.3 |Then create a schedule file in HT3 TEKlink software for head |

|| |spacer. |

|| |5.4.7 |Chromatography conditions: |

|| |Set the chromatography conditions as described below: |

|| |5.4.7.1 |Carrier Gas |Helium |

|| |5.4.7.2 |Makeup Gas |Nitrogen (20 mL/minute) |

|| |5.4.7.3 |Hydrogen Gas |40mL/minute |

|| |5.4.7.4 |Zero Air |300mL/minute |

|| |5.4.7.5 |Flow (Pressure) |30kPa |

|| |5.4.7.6 |Split ratio |1:10 |

|| |5.4.7.7 |Furnance Temperature |5 minute at 40OC and then |

|| || |increase to 180 OC at a rate |

|| || |of 10 OC per minute and hold |

|| || |for 5 minutes at 180OC. |

|| |5.4.7.8 |Detector Temperature |250 OC |

|| |5.4.7.9 |Injection volume |3.0 mL |

|| |5.4.7.10 |Run Time |24 minutes |

|| |5.4.8 |Conditioning of the column |

|| |Perform the column conditioning using the following settings |

|| |5.4.8.1 |Injector temperature |200 OC |

|| |5.4.8.2 |Column temperature |220OC |

|| |5.4.8.3 |Detector temperature |280 OC |

|| |5.4.8.4 |Column Flow |0.5mL/min |

|| |5.4.9 |Head space system conditioning |

|| |Set the head spacer conditions as described below |

|| |5.4.9.1 |Constant Heat Time |On |

|| |5.4.9.2 |GC Cycle Time |35 minute |

|| |5.4.9.3 |Platen Temperature |155OC |

|| |5.4.9.4 |Value oven temperature |160 OC |

|| |5.4.9.5 |Transfer line |165 OC |

|| || |Temperature | |

|| |5.4.9.6 |Sample equilibration |30 minutes |

|| |5.4.9.7 |Pressurize |15 PSIG |

|| |5.4.9.8 |Loop fill Pressure |10 PSIG |

|| |5.4.9.9 |Injection Time |3.00 minutes |

|| |5.4.9.1 |Loop fill Time |4.00 minutes |

|| || |0 | |

|| |5.4.9.1 |Pressurize equilibration |0.20 minutes |

|| || |1 |time | |

|| |5.4.9.1 |Pressurize Time |2 minutes |

|| || |2 | | |

|| |5.4.10 |Communicating Head space system with Gas chromatography |

|| |5.4.10. |Wait for ready command in GC and then click start |

|| || |1 |button which in- turn gives stand by indication on GC |

|| || |software. |

|| |5.4.10. |Now click start button in head space system schedule oh |

|| || |2 |HT3 TEKlink software. |

|| |5.4.10. |Take the printout of the chromatograms and attach to |

|| || |3 |the prescribed annexure. |

|| |5.4.10. |Record the details in record sheets. |

|| || |4 | |

|| |5.5 |Acceptance criteria: |

|| |As per the specification the residual TEA content should be "less |

|| |than 10 ng/µg of polysaccharide". Therefore the acceptance criterion |

|| |of the assay is "The TEA peak areas of the test sample containing 10 |

|| |mg/mL of Polysaccharide should be less than the positive control peak |

|| |area values (50 µg/mL of TEA)" |

|| |5.6 |Reference |

|| |British pharmacopoeia. |

|| |Head space system Manual - TEKMAR TELEDYNE HT3 |

1. |Purpose: |
 |To lay down the procedure for quantifying Total and unconjugated (free) |
 |Polysaccharide concentration. |
 2. |Scope: |
 |This Standard Operating Procedure is applicable to all the samples of |
 |Polysaccharide-CRM bulk conjugate of Pneumococcal conjugate vaccine in |
 |which total and unconjugated (free) Polysaccharide concentration is to be |
 |determined. |
 3. |Responsibility: |
 |3.1 |The analyst is responsible for executing the described procedure |
 | |correctly. |
 |3.2 |Supervisor is responsible for verifying that the procedure is carried|
 | |out correctly and check the results. |
 |3.3 |HOD shall be responsible for overall compliance of this SOP and shall|
 | |ensure that the SOP is reviewed every two years or if required |
 | |earlier. |
 4. |Safety considerations: |
 |4.1 |Wear laboratory coat while working in the laboratory. |
 |4.2 |Handle the quartz cuvettes and glassware carefully. |
 |4.3 |Work in a fume hood while handling the acids. |
 5. |Equipments: |
 |5.1 |UV-Visible Spectrophotometer |
 |5.2 |Analytical balance Sensitivity 0.01mg |
 |5.3 |Fume hood |
 |5.4 |Water bath (100 °C) |
 |5.5 |Vortex Mixer |
 |5.6 |Refrigerator |
 |5.7 |Laboratory Centrifuge |
 6. |Materials and reagents: |
 |6.1 |Materials: | |
 | |6.1.1 |20, 200, 1000 and 5000µl Autopipettes |
 | |6.1.2 |Volumetric Flasks |
 | |6.1.3 |10 and 20 ml thermoresistant test tubes. |
 | |6.1.4 |25, 50 and 100 ml Beaker |
 | |6.1.5 |Quartz cuvettes |
 | |6.1.6 |Autopipette tips |
 | |6.1.7 |Eppendorf |
 |6.2 |Reagents: |
 | |6.2.1 |Resorcinol |
 | |6.2.2 |Sulphuric acid |
 | |6.2.3 |ATCC Standard of respective Polysaccharide |
 | |6.2.4 |Sodium Deoxycholate |
 | |6.2.5 |Purified water |
 7. |Preparation of solutions: |
 |7.1 |6.0 mg/ml Resorcinol solution: | |
 | |7.1.1 |Weigh 60 mg of Resorcinol and transfer it to 10 ml volumetric |
 | | |flask. Dissolve and make up the volume to 10 ml with Purified |
 | | |water. |
 | |7.1.2 |The solution is prepared freshly. |
 |7.2 |75% Sulphuric acid: |
 | |7.2.1 |Take 250 ml of purified water in a 1000 ml volumetric flask |
 | | |and add conc. H₂SO₄ slowly and make up the volume to 1000 |
 | | |ml. |
 | |7.2.2 |The solution should be stored at room temperature for a |
 | | |maximum of 6 months. |
 |7.3 |ATCC polysaccharide (Stock solution): |
 | |7.3.1 |Prepare a 2 mg/ml solution of ATCC standard of the respective |
 | | |polysaccharide in purified water. |
 | |7.3.2 |Using the 2 mg/ml solution prepared above, prepare 100µg/ml |
 | | |solution and aliquot it into 1.5 ml vials. |
 | |7.3.3 |Store the solution at -70°C for 1 week. |
 |7.5 |5% DOC solution: |
 | |7.5.1 |Weigh and dissolve 250 mg of sodium deoxycholate in purified |
 | | |water and make up the volume to 5 ml. |
 | |7.5.2 |The solution is prepared freshly. |
 |7.6 |1 M HCl: |
 | |7.6.1 |Take 85 ml of concentrated HCl and make up the volume to 1000 |
 | | |ml with purified water. |
 | |7.6.2 |The solution should be stored at room temperature for a maximum|
 | | |of 6 months. |
 8. |Procedure: |
 |8.1. |Preparation of Calibration Curve: | | | | | | |
 | |8.1.1 |Calibration Curve (10 - 50µg/ml) is prepared in duplicates as |
 | | |follow: |
 | | |Polysaccharide content |10 |20 |30 |40 |50 |
 | | | (µg/ml) | | | | |
 | | |Stock Sol. 100 µg/ml (µl) |40 |80 |120 |160 |200 |
 | | |Purified water (µl) |360 |320 |280 |240 |200 |
 |8.2 |Total Polysaccharide: |
 | |8.2.1 |Take 400µl sample in a test tube. |
 | | |Note: If there is any sample outside the range of the |
 | | |calibration curve, prepare an appropriate dilution of the |
 | | |sample. |
 |8.3 |Unconjugated (Free) Polysaccharide: |
 | |8.3.1 |Take 1 ml of sample (dilute if required) having about 100-150 |
 | | |µg Polysaccharide in a microfuge tube, add 100 µl of 5% DOC and|
 | | |mix it. |
 | |8.3.2 |Put this tube in an ice bath for 30 minutes. |
 | |8.3.3 |Take out and add 50 µl 1M HCl and mix thoroughly. |
 | |8.3.4 |Centrifuge the mixture at 2-8°C for 15 minutes at 10000 RPM. |

		8.3.5	Take 400µl supernatant volume in a test tube for free
			Polysaccharide estimation.
		8.3.6	The test is performed in duplicate for each sample.
		8.4	Treat 400 µl purified water as blank in thermoresistant test tube.
		8.5	Add 400 µl of Resorcinol solution to tubes of calibration curve,
		Blank and samples.	
		8.6	Vortex and add 2 ml of 75% H₂SO₄ to all test tubes and vortex well.
		8.7	Close the tubes with aluminium foil and place the test tubes in water
		bath at 90°C for 30 minutes.	
		8.8	Take out the tubes and cool in iced water and place in dark for 30
		minutes.	
		8.9	Allow to come at room temperature and measure the absorbance of each
		at 430 nm against the blank.	
		8.10	Note that all the readings of the assay tubes should be taken within
		30 mins. of completion of the assay and maximum 5 samples should be	
		analysed in one single assay.	
		8.11	Calculations:
		8.11.1	The calculations are made according to the equation of minimum
		squares.	
		$Y = mX + b$.	
		Where: m = slope	
		b = intercept	
		Y = absorbance	
		X = concentration	
		(Multiply by dilution factor)	
		8.11.2	Use EXCEL programme for the preparation of calibration curve
		and Calculation of the results.	
		8.11.3	Calculation of actual dilution for free Polysaccharide:
		Sample volume taken = 1000µl	
		Total volume = 1150µl (1000µl sample + 100µl 5%DOC + 50µl 1M	
		HCl)	
		Correction Factor = 1150µl / 1000µl = 1.15	
		Actual dilution = dilution factor x 1.15	
		8.12	Acceptance criteria:
		8.12.1	The test is valid if Regression of the standard curve is ≥ 0.99
		8.12.2	The coefficient of variation (CV) between the replicates of
		the samples should be $\leq 15\%$.	
		8.12.3	In case of In process (16-24 hour stage of conjugation
		reaction) sample:	
		% Free Saccharide: < 30-35% of Total Saccharide.	
		In case of final purified and ARM:	
		% Free Saccharide: < 25% of Total Saccharide.	
9.	Abbreviations:

4.3	Preparation of solutions:	
	Prepare all the solutions as described below. Carry out the labelling	
	of the prepared solutions and assign the lot numbers.	
	4.3.1	50 mM MES (Morpholino-ethanesulfonic acid):
		Take 1.074 g of MES and dissolve it in 60 mL of WFI and adjust
		the pH to 7.0 using 1M NaOH, and make up to 100 mL with WFI.
		Store at 2° to 8°C up to 1 year.
		Note: The Calculation is based on the purity (99%) as per the
		label claim)
	4.3.2	EDC Standard stock solution (1mg/mL):
		Take 100mg EDC and dissolve it in 100 mL of 50mM MES. Prepare
		fresh on the day of use.
	4.3.3	EDC working Standard (20µg/mL):
		Take 200µL EDC stock solution and dissolve it in 9.8 mL of 50mM
		MES. Prepare fresh on the day of use.
	4.3.4	Dimethyl Barbituric Acid (DMBA) reagent:
		Take 0.5 g of DMBA. Dissolve it in solution containing 8 mL
		pyridine and 2 mL water for injection. The UV absorbance of
		this solution at 500nm should be less than 0.2, higher
		absorbance indicates poor pyridine quality. Use this solution
		immediately.
		Note: Use glass tube and glass pipettes for preparation.
	4.3.5	Phosphate Buffer (0.2M NaCl, 10mM Phosphate Buffer pH 6.0):
		Take 1.17 g NaCl, 0.054 g Na₂HPO₄.12H₂O and 0.133 g
		NaH₂PO₄.2H₂O. Dissolve in 80 mL of MQW, adjust the pH with HCL
		for NaOH and make up to 100mL. Filter through 0.22 µm filter.
		This solution can be stored up to one month at room
		temperature.
4.4	Test Procedure:	
	4.4.1	Preparation of Test Sample:
		Dilute the test sample with phosphate buffer to 100 µg/mL of
		polysaccharide based on its initial concentration and use 100µL
		for the analysis.
	4.4.2	Preparation of blank and positive control (1 µg/mL of EDC)
		Prepare blank and positive control as described in the below
		table.
		EDC conc. (µg/mL)
		(µL)
		Blank

		Positive control (1	5	95
		µg/mL)		
	4.4.3	Pipette 100 µL of the blank, the positive control and test		
		sample in duplicate into separately labeled 1.5 mL Microfuge		
		tubes.		
	4.4.4	Add 900µL DMBA reagent to all tubes using a glass pipette.		
	4.4.5	Close the tubes and vortex. Incubate them for 45 minutes at		
		room temperature.		
	4.4.6	Measure the absorbance at 595 nm (within 30 minutes after		
		incubation).		
	4.4.7	Record the results in record sheets		
	4.5	Acceptance criteria:		
		As per the specification the residual EDAC content should be less		
		than < 10 ng / µg Polysaccharides. Therefore the acceptance criterion		
		of the assay is "The absorbance value of the test sample containing		
		100 µg/mL of Polysaccharide should be less than the positive control		
		value (1 µg/mL of EDAC)".

				5.0 ml		
			5.2.3.	The test tube no. 10 and 13 are the color correction		
			2	tubes of respective samples and hence acetyl acetone is		
				not added to these tubes.		
			5.2.3.	After addition of all the components as mentioned above,		
			3	place all these test tubes in a water bath at 37±1° C for		
				50 minutes.		
			5.2.3.	On completion of incubation period, remove the test tubes		
			4	and cool them under running water for 2 minutes.		
			5.2.3.	Read the absorbance of each tube within 30 mins. at 415		
			5	nm under a UV/VIS spectrophotometer.		
			5.2.3.	The standard tube no. 1 of purified water is considered		
			6	to be as blank.		
			5.2.3.	The concentration of formaldehyde in the test sample(s)		
			7	is calculated by comparing results of its absorbance		
				obtained against the plotted calibration curve of known		
				formaldehyde concentration (10 to 100 µM/lit) Vs		
				absorbance difference at 415 nm		
			5.2.3.	Note that all the readings of the assay tubes should be		
			8	taken within 30 mins. of completion of the assay and		
				maximum 5 samples should be analysed in one single assay.		
		5.3	Calculations:			
		5.3.1	Once the absorbance of the standards and the test samples have			
				been taken, calculation shall be done using the excel sheet		
				carrying formulas for the required calculation.		
		5.3.2	Always copy the master excel sheet (sheet carrying formulas for			
				the required calculation), never use the previously used excel		
				sheet for new calculations.		
		5.3.3	Copy the master excel sheet, keep it for use in respective			
				folder and then fill in the required sample details (Batch		
				number), sample dilution (if applicable), name of analyst, date,		
				etc.		
		5.3.4	Proceed for calculations starting from the Calibration curve.			
				The calculations are done according to the equation after		
				subtractions blank OD.		
				Y = mX + b.		
				Where: m = slope		
				b = intercept		
				Y = absorbance		
				X = concentration		
		5.3.5	To determine the formaldehyde concentration in mM/lit following			
				formula is applied,		
				Formaldehyde [Sample Conc. (µM/lit) – Color correction		
				Conc. (µM/lit)]		
				Concentration =		

				(mM/lit) 1000 X		
				Dilution factor		
		5.3.6	Record all the calculations in the data record form and also			
				attach the hard copy of the excel sheet used for calculation		
				along it.		
		5.4	Acceptance criteria:			
		5.4.1	Regression of the standard curve should not be less than 0.99.			
		5.4.2	The calculated check sample concentration of 80 µmol/lit should			
				be within 10% of the true value.		
		5.4.3	The variation in OD values between the two replicates of same			
				sample should not be more the 10%.

5.0	Procedure
5.1	Preparation of solutions: Prepare all the solutions as described below
and fill the form, label the solutions and assign lot numbers.	
	Note: All the below mentioned solutions are prepared freshly prior to
use otherwise mentioned.	
5.1.1	Stock solution of Phosphorous (100µg/ml):
5.1.2	Working Standard solution (32µg/ml):
5.1.3	Ammonium heptamolybdate tetrahydrate solution (2.5% w/v):
5.1.4	6N Sulphuric acid :
5.1.5	10% w/v Ascorbic acid :
5.1.6	Ammonium Molybdate reagent:
5.1.7	Digestion Mixture :
5.2	Preparation of Calibration Curve:
5.2.1	The concentration of Phosphorus in the test sample(s) is
	calculated by comparing results of its absorbance obtained
	against the plotted calibration curve of known Phosphorus
	concentration (2-32 µg) Vs absorbance at 820 nm. The Phosphorus
	calibration curve (2-32 µg) is prepared as follows:

||| |32 |1000 |4.0 |

||5.3 |Sample preparation: |

|| |5.3.1 |In case of dry polysaccharide prepare a solution containing |

||| |about 1-5 mg/ml of polysaccharide in Lal reagent water and use |

||| |it as test sample. |

|| |5.3.2 |Take 1ml volume of the sample in duplicate in tubes. |

|| |5.3.3 |Add 500µl of Digestion mixture to each sample tube and vortex |

||| |well. |

|| |5.3.4 |Now heat the sample test tubes directly on flame with |

||| |intermittent shaking till the sample become clear and fumes |

||| |stop. |

|| |5.3.5 |Allow the tubes to cool down to room temperature. |

|| |5.3.6 |Wash the sample tubes five times vigorously with 5ml each of |

||| |purified water and transfer to 25ml volumetric flasks. |

|| |5.3.7 |Make up the volume with purified water to make any necessary |

||| |correction. |

|| |5.3.8 |Procedure for Untreated sample preparation: Take 1ml volume of |

||| |the sample and make it 25ml with purified water |

||5.4 |Test Procedure: |

|| |5.4.1 |Take 5ml of the standard dilutions from calibration curve, Test|

||| |Sample, Untreated sample and Blank (Purified water) in |

||| |duplicates in separate test tubes. |

|| |5.4.2 |Add 5ml of Ammonium molybdate reagent in all the test tubes. |

|| |5.4.3 |Vortex the test tubes and incubated at 37°C ± 2°C (dry heat) |

||| |for two hours. |

|| |5.4.4 |After incubation keep the tubes at 2-8 °C for 5 minutes. |

|| |5.4.5 |Observe for bluish color at the end of reaction in treated |

||| |sample and standards. |

|| |5.4.6 |Take absorbance of the sample at 820nm against the blank using |

||| |spectrophotometer. |

|| |5.4.7 |Note that all the readings of the assay tubes should be taken |

||| |within 30 mins. of completion of the assay and maximum 5 |

||| |samples should be analysed in one single assay. |

||5.5 |Calculations: |

|| |5.5.1 |Once the absorbance of the standards and the test samples have |

||| |been taken, calculation shall be done using the excel sheet |

||| |carrying formulas for the required calculation. |

|| |5.5.2 |Always copy the master excel sheet (sheet carrying formulas for|

||| |the required calculation), never use the previously used excel |

||| |sheet for new calculations. |

1.0 |Objective: |
 |To lay down the procedure for determine the human coagulation factor II |
 |activity in Factor IX. |
 2.0 |Scope: |
 |This Standard Operating Procedure is applicable to all the In- process and |
 |finished product samples. |
 3.0 |Responsibility |
 |3.1 |The QC analyst shall be responsible for executing the described |
 |procedure correctly. |
 |3.2 |The QC supervisor shall be responsible for verifying that the |
 |procedure is complied with and the results are checked. |
 |3.3 |The QC HOD shall be responsible for overall compliance of this SOP. |
 4.0 |Abbreviations and Definitions: |
 |Not applicable |
 5.0 |Procedure: |
5.1	Equipment, Materials and Reagents		
	5.1.1	Coagulometer	
	5.1.2	STA Deficient II	
	5.1.3	Neoplastine CI Plus	
	5.1.4	Owren koller buffer	
	5.1.5	Unicalibrator	
5.2	Preparation of solutions:		
	5.2.1	STA Deficient II:	
		5.2.1.	Freeze dried mixture of human serum and adsorbed bovine
		1	plasma, the latter providing factor V and fibrinogen to
		the test system.	
		5.2.1.	Preparation: Reconstitute each vial with 1 mL of purified
		2	water and allow to stand at room temperature (18-25 ° C)
		for 30 min. Then swirl the vial gently to obtain a	
		homogenous solution.	
		5.2.1.	Storage: The reagent in intact vial is stable until the
		3	expiration date indicated on the box label, when stored
		at 2-8° C.	
		5.2.1.	Stability after reconstitution: 8 hours at 37° C.
		4	
	5.2.2	Neoplastine CI Plus:	
		5.2.2.	Reagent 1: Lyophilized thromboplastin prepared from fresh
		1	rabbit cerebral tissues. The ISI (International sensitive
		index) value of Neoplastine CI plus is determined against	
		a secondary standard of the RBT [Rabbit brain	
		thromboplastin].	
		Note: See assay value insert provided in the box for the exact	
		ISI value of the lot being used.	
		5.2.2.	Once reconstituted, the Neoplastine CI Plus exhibits a
		2	low turbidity and does not sediment. The Neoplastine CI
		Plus reagent contains a specific heparin inhibitor. Any	
		prolongation of the prothrombin time is, therefore,	
		related to a real deficiency of factor II, V, VII, X and	
		/ or Fibrinogen.	
		5.2.2.	Reagent 2: Aqueous solvent containing calcium, 2 mL per
		3	vial.
		5.2.2.	Preparation of Neoplastin C1 plus reagent from reagent-1
		4	and reagent-2 : Transfer the entire contents of one vial
		of reagent 2 (R2) into one vial of Reagent 1 (R1) of the	
		same kit. Allow the reconstituted reagent to stand at	
		room temperature (18-25° C) for 30 min. Then swirl the	
		Neoplastin C1 plus reagent vial gently to obtain a	
		homogenous suspension.	
		5.2.2.	Storage: The reagents in intact vials are stable until
		5	the expiration date indicated on the box label, when
		stored at 2-8° C.Once reconstituted, the reagent 1	
		remains stable for 8 hours at 37° C.	
		48 hours at 20±5° C.	
		8 days at 2-8° C.	
		Do not freeze	
	5.2.3	Reference standard (Unicalibrator):	
		5.2.3.	The levels of factor II is determined against the
		1	secondary International standard.
		5.2.3.	Unicalibrator is a plasma intended for use as a
		2	calibration plasma for the assays of the following
		coagulation parameters: Prothrombin time (if to be	
		expressed as %), fibrinogen (Clauss method), factors II,	
		IV, VII, VIII, IX, X, XI, XII, anti-thrombin III (AT III),	
		protein C, protein S, plasminogen and antiplasmin.	
		5.2.3.	Preparation: Reconstitute each vial with exactly 1 mL of
		3	purified water. Allow the reconstituted material to stand
		at room temperature (18-25°C) for 30 min. Then swirl the	
		vial gently before use.	
		5.2.3.	Storage: The reagents in intact vials are stable until
		4	the expiration date indicated on the box label when
		stored at 2-8° C.	
		Once reconstituted; it remains stable for 4 hours at	
		20±5° C.	
		Do not freeze.	
5.3	Pre-Dilution of reference standard and sample:		
	5.3.1	Reference solution preparation:	
		Dilution fold	
		Unicalibrator	
		Owren koller buffer (µL)	
		Total Volume (µL)	

				1:10	
				25 µL of neat Unicalibrator	
				225	
				250	
				1:20	
				125 µL of 1:10 dilution	
				125	
				250	
				1:40	
				125 µL of 1:20 dilution	
				125	
				250	
				1:80	
				125 µL of 1:40 dilution	
				125	
				250	
				Perform serial dilutions of reference standard from 1:10	
				dilution as per the below	
				table.	
				5.3.2	Test Solution preparation:
				Dilute the test sample 1:10 folds by taking 50 µL of Neat sample	
				and 450 µL of Owren koller buffer.	
				5.4	Test method:
				5.4.1	Switch on the Coagulometer 15 minutes prior to analysis
				5.4.2	Place all the reagents in appropriate slots of the Coagulometer
				for warming at 37°C (5 minutes prior to analysis).	
				5.4.3	Place a Cuvette strip with required number of cuvettes in the
				incubation area and prewarm at 37°C at least for 3 minutes. Then	
				dispense one magnetic ball to each cuvette.	
				5.4.4	Add 50 µL of each of the dilution of reference standard, 50 µL
				of STA Deficient II into each cuvette.	
				5.4.5	Immediately start the timer corresponding to the incubation
				column for an incubation of 60 sec.	
				5.4.6	After 50 sec beep sound was produced. Then transfer the cuvette
				from the incubation chamber to the test column area.	
				5.4.7	After 60 sec of incubation time, add 100 µL of Neoplastine CI
				Plus to each cuvette by pressing timer to start the measurement.	
				5.4.8	Note down the clotting time in seconds.
				5.4.9	Then feed the Percentage of reference standard Factor II
				corresponding to its clotting time for each dilution in the	
				instrument.	
				Note: Instrument automatically plots the calibration curve.	
				5.4.10	Then perform the test for the test samples as described above
				and note down the clotting time as well as Factor II activity	
				which comes in the print out.	
				5.5	Calculations:
				5.5.1	As calibration data is fed in Coagulometer, the instrument
				itself plots test sample clotting time on standard curve and	
				calculates Factor II activity.	
				5.5.2	Calculate % activity of Factor II to that of Factor IX using
				following formula	
				[pic]

	5.4	Preparation of solutions:		
		Prepare the solutions as described below. Label the solutions and		

|| assign lot numbers. |

|| 5.4.1 |Preparation of Standard Pneumococcal antigen: For preparation |

|| |of standard stock solution of pneumococcal antigens, add 2 ml |

|| |of WFI in 2 mg vial of standard and keep it overnight at 2-8°C |

|| |with shaking. Make aliquots of 100 µl. Store the aliquots at |

|| |-70°C for further use. |

||||

|| 5.4.2 |Phosphate buffer saline (pH 7.2 – 7.4) (10X) |

|| |5.4.2.1|Weigh 80.0 g NaCl, 20.61 g NaH₂PO₄·7 H₂O, 3.14 g of |

|| |KH₂PO₄ and 1.60 g KCl, dissolve in 800ml of Milli Q |

|| |water. |

|| |5.4.2.2|Keep the beaker on a magnetic stirrer to dissolve the |

|| |contents. |

|| |5.4.2.3|Make up the volume to 1L with milli Q water and |

|| |sterilize the solution by filtering it through 0.22 µm |

|| |filter and store the solution at room temperature. |

|| 5.4.3 |Wash buffer and coating buffer (1X PBS): Add 900 ml of sterile |

|| |Milli Q water to 100 ml of 10X PBS. Store the solution at room |

|| |temperature. |

||||

|| 5.4.4 |Wash / diluent and Antibody buffer (PBST): Add 50 µl of Tween |

|| |20 to 100 ml of 1X PBS solution (PBS with 0.05 % Tween 20). Mix|

|| |the solution thoroughly so that Tween 20 gets uniformly |

|| |dissolved in PBS. |

|| 5.4.5 |Blocking buffer: (5% BSA in PBST): Add 5 g of BSA in 100 ml |

|| |PBST solution to give a final concentration of 5% BSA in PBST. |

|| 5.4.6 |Secondary antibody: Working concentration of secondary antibody|

|| |is 1:2000 dilutions, prepared in diluent. The solution should |

|| |be freshly prepared just before the use. |

|| 5.4.7 |Stop solution (1N H₂SO₄): Add 2.8 ml of Conc. H₂SO₄ to 97.2 ml |

|| |of Milli Q water to make up the volume to 100ml. |

|| 5.5 | Test Procedure |

|| 5.5.1 |Desorption treatment of test sample |

|| |5.5.1.1|Take 10 vials of 13-valent pneumococcal conjugate |

|| |vaccine and put them into 15ml centrifuge tube. Add |

|| |200µl of 0.6mo1/L sodium hydroxide solution into 4000µl|

|| |of above samples, and quickly add 200µl of 0.2mol/l |

|| |citric acid solution within 10s, mix well. The |

|| |desorption solution shall be completely clear and |

|| |transparent. |

|| |5.5.1.2|Take 4500µl of 13-valent free polysaccharide reference |

|| |substance and put it into 15ml centrifuge tube, add |

|| |200µl of 0.6mol/L sodium hydroxide solution into 4000µl|

|| |above samples, and quickly add 200µl of 0.2mol/l citric|

|| |acid solution within 10s, mix well. The desorption |

|| |solution shall be completely clear and transparent. |

|| |5.5.1.3|it is applicable to the content determination of |

|| |conjugate antigen except for type 3 in 13-valent |

|| |pneumococcal conjugate vaccine. |

|| |Free polysaccharide separation of samples: |

|| |Take 2000µl of D and Y respectively and put each into |

|| |50ml centrifuge tube, add 500µl of 5mol/L sodium |

|| |chloride solution, mix well, shake in ice water bath |

|| |at 150rpm for 30min. |

|| |5.5.1.4 |Add 10ml of absolute ethanol into each centrifuge |

|| |tube, mix well, and shake for 30min at 150rpm in ice |

|| |water bath. |

|| |5.5.1.5 |Carefully remove all the supernatant, add 2ml of |

|| |purified water into the centrifuge tube, and mix well.|

|| 5.5.3 |Determination of polysaccharide content: |

|| |5.5.3.1|Take 300µl of solution D, add 900µl of diluent 1 |

|| |(DIL1), mix well to get 4 times dilute solution, |

|| |determine the polysaccharide content on the IMMAGE |

|| |800, input 4.4 (i.e. 4×1.1) of off-line dilution |

|| |multiple. If the result is beyond the detection range,|

|| |adjust the dilute multiple to A, and input A×1.1 of |

|| |off-line dilution multiple. |

|| |5.5.3.2|Take 300µl of solution Y, add 600µl of diluent 1 |

|| |(DIL1), mix well to obtain 3 times dilute solution, |

|| |determine the polysaccharide content (except type 6B) |

|| |on the IMMAGE 800, input 3.3 (i.e. 3×1.1) of off-line |

|| |dilution multiple. Take 200µl of solution Y, add |

|| |1000µl of diluent 1 (DIL1), mix well to obtain 6 times|

|| |dilute solution, measure the polysaccharide content |

|| |(type 6B) on the IMMAGE 800, input 6.6 (i.e. 6×1.1) of|

|| |off-line dilution multiple. |

|| |Take 400µl of solution DS, add 800µl of diluent 1 |

|| |(DIL1), mix well to obtain 3 times dilute solution, |

|| |determine polysaccharide content on the IMMAGE 800, |

|| |input 3.3 (i.e. 3×1.1) for off-line dilution ratio. If|

|| |the result is beyond the detection range, adjust the |

|| |dilution ratio to A, and input A×1.1 for off-line |

|| |dilution multiple. |

|| 5.5.4 |1st Washing: |

|| |5.5.4.1|Discard the blocking solution after completion of one |

|| |hour of incubation period by flicking. |

|| |5.5.4.2|Add 300 µl of PBST to each well and discard the buffer|

|| |by flicking. Tap the plate on a lint free paper towel.|

|| |Ensure that the buffer is removed completely. |

|| |5.5.4.3|Repeat the procedure for two more times and then one |

|| |time with 300 µl of PBS. |

|| 5.5.5 |Addition of primary antibody: |

			5.5.5.1	The primary antibody dilutions for all the 13 serotype
			are prepared one hour before addition of blocking	
			buffer as mentioned in section 5.5.2.	
			5.5.5.2	Add 100 µl/well of primary antibody of all the 13
			serotypes as per pattern mentioned below.	
			Addition of Primary Antibody against Serotype	
			1	
		5.5.6	2nd washing:	
		5.5.6.1	Discard the primary antibody solution after completion	
		of 90 mins.of incubation period by flicking.		
		5.5.6.2	Add 300 µl of PBST to each well and discard the buffer	
		by flicking. Tap the plate on a lint free paper towel.		
		Ensure that the buffer is removed completely.		
		5.5.6.3	Repeat the procedure for three more times and then one	
		time with 300 µl of PBS.		
		5.5.7	Addition of secondary antibody:	
		5.5.7.1	Prepare the recommended dilutions of secondary	
		antibody.		
		5.5.7.2	For serotype 6B prepare 1:2000 dilution of anti-mouse	
		IgG-HRP conjugated antibody. Prepare the dilutions in		
		adsorption solution.		
		5.5.7.3	For all other serotypes prepare 1:2000 dilution of	
		anti-rabbit IgG-HRP conjugated antibody. Prepare the		
		dilutions in adsorption solution.		
		5.5.7.4	Add 100 µl of secondary antibody solution to	
		respective wells and incubate the plate for 60 minutes		
		at 37 ± 2°C.		
		5.5.8	3rd washing:	
		5.5.8.1	Discard the secondary antibody solution after	
		completion of 60 mins. of incubation period by		
		flicking.		
		5.5.8.2	Add 300 µl of PBST to each well and discard the buffer	
		by flicking.		
		Tap the plate on a lint free paper towel. Ensure that		
		the buffer is removed completely.		
		5.5.8.3	Repeat the procedure for three more times and then one	
		time with 300 µl of PBS.		
		5.5.9	Addition of TMB substrate:	
		5.5.9.1	Add 100 µl TMB to each well by a multichannel pipette.	
		Take care that the TMB solution is not exposed to		
		direct light during addition.		
		5.5.9.2	Cover the plate and incubate at room temperature in	
		dark preferably in a drover for next 15 mins.		
		5.5.10	Addition of Stop Solution:	
		5.5.10.1	On completion of 15 minutes incubation period of TMB.	
		Carefully remove the plate out of drover. Take care		
		that the plate is not exposed to direct light during		
		addition.		
		5.5.10.2	Add 100 µl of stop solution over the TMB solution to	
		each well in the dark.		
		5.5.11	Reading of plate and Data analysis:	
		5.5.11.1	Read the absorbance of plate at 450 and 630 nm	
		wavelength on a ELISA reader. Calculate delta OD of		
		the readings.		
		5.5.11.2	Take care to take the readings after 5 mins and within	
		15 mins. of addition of stop solution.		
		5.5.11.3	Get the average ODs of duplicate wells and compile the	
		data sheets comprising of sample and ATCC standard.		
		5.5.12	Acceptance Criteria	
		5.5.12.1	OD values of Positive control and test sample should	
		not be less than 0.8		
		5.5.12.2	OD values of Negative control should not be more than	
		0.3		
6.0	Reference			
WHO TRS No. 977 Annexure 3: Recommendations to assure the quality, safety				
and efficacy of pneumococcal conjugate vaccines.				

1.0 |Objective: |
 |To lay down the procedure for quantifying Total and unconjugated (free) |
 |PRP concentration. |
 2.0 |Scope: |
 |This Standard Operating Procedure is applicable for the analysis of all |
 |the samples of PRP and PRP-CRM bulk conjugate of Haemophilus Influenzae |
 |type b in which Total and unconjugated (free) PRP concentration is to be |
 |determined. |
 3.0 |Abbreviations and Definitions |
3.1	Abbreviations:		
	3.1.1	CV	:Coefficient of variation
	3.1.2	g	:Gram
	3.1.3	mg	:Milligram
	3.1.4	mL	:Millilitre
	3.1.5	µL	:Micro litre
	3.1.6	µg	:Microgram
	3.1.7	nm	:Nanometer
	3.1.8	PRP	:Polyribosyl Ribitol Phosphate
	3.1.9	TT	:Tetanus Toxoid
	3.1.10	TNBS	: 2, 4, 6-Trinitrobenzenesulfonic acid
	3.1.11	DMF	: Dimethylformamide
3.2	Definitions:		
	Not Applicable.		
4.0	Procedure:		
4.1	0.5 g/l Ferric chloride solution:		
	4.1.1	Weigh 50 mg of Ferric Chloride hexahydrate and transfer it to	
		100 mL volumetric flask.	
	4.1.2	Dissolve and make up the volume to 100 mL with concentrated	
		hydrochloric acid.	
	4.1.3	Store the solution in screw cap amber bottle, for a maximum 6	
		months at room temperature.	
4.2	100 g/l Orcinol solution:		
	4.2.1	Weigh 1g Orcinol monohydrate and transfer it to 10 mL	
		volumetric flask.	
	4.2.2	Dissolve and make up the volume to 10 mL with absolute	
		ethanol.	
	4.2.3	Store the solution in a screw cap amber bottle at 2 to 8 °C,	
		for maximum of 15 days.	
4.3	0.1% w/v TNBS-10% DMF:		
	4.3.1	Take 1 mL of commercial TNBS solution (1%w/v in DMF) and	
		transfer it to a 10 mL volumetric flask.	
	4.3.2	Make up the volume to 10 mL with purified water.	
	4.3.3	Prepare fresh prior to use.	
4.4	0.25 g/1 Ribose Solution:		
	4.4.1	Weigh 25 mg of D-Ribose and transfer it to a 100 mL	
		volumetric flask.	
	4.4.2	Dissolve in purified water and make up the volume to 100 mL	
		with purified water.	
	4.4.3	Prepare fresh prior to use.	
4.5	25 µg /mL Ribose Solution:		
	4.5.1	Take 1 mL of 0.25 g/1 Ribose solution and transfer it to a 10	
		mL volumetric flask.	
	4.5.2	Make up the volume to 10 mL with purified water.	
	4.5.3	Prepare fresh prior to use.	
4.6	1% w/v Sodium deoxycholate (DOC):		
	4.6.1	Dissolve 250 mg sodium deoxycholate in 25 mL purified water	
		and make up the volume to 25 mL.	
	4.6.2	Adjust the pH to 6.8 by adding about 100 µL of 1M	
		hydrochloric acid drop wise.	
	4.6.3	The solution is prepared freshly.	
4.7	1 M Hydrochloric acid:		
	4.7.1	Take 85 mL of concentrated hydrochloric acid and make up the	
		volume to 1000 mL with purified water.	
	4.7.2	The solution should be stored at room temperature for maximum	
		6 months.	
4.8	Preparation of Calibration Curve:		
	4.8.1	Prepare calibration curve (2.5-25 µg) with freshly prepared	
		ribose solution (25 µg /mL) in previously labelled test	
		tubes of 20 mL.	
	4.8.2	Calibration Curve (2.5 - 25µg) is prepared in duplicate as	
		follow:	
		Ribose content	2.5
		(µg)	
		25 µg/mL Ribose	100
		(µl)	
		Purified water	900
		(µl)	
	4.8.3	Make up the volume to 2 mL using purified water.	
	Note: The Calibration curve is accepted if it is meeting the		
	parameters of correlation coefficient i.e. ≥ 0.990 .		
4.9	Preparation of sample for total PRP content:		
	4.9.1	Take sample volume such that the sample volumes used in test	
		contain 2.5 to 25 µg of ribose i.e. lies within the	
		calibration curve.	
	4.9.2	Make up the volume to 2 mL using purified water respectively.	
	Note: The sample volume can vary depending upon the ribose		
	concentration. If there is any sample outside the range of the		
	calibration curve, prepare an appropriate dilution of the sample.		
4.10	Unconjugated (Free) PRP:		
	4.10.1	Take 1 mL of sample (dilute if required) having about	

		100-150 µg PRP in micro centrifuge tube in duplicate, add
		100 µL of 1% DOC and mix it.
	4.10.2	Put this tube in an ice bath for 30 minutes.
	4.10.3	Take out and add 50 µL 1M HCl and mix thoroughly.
	4.10.4	Centrifuge the mixture at 4°C for 15 minutes at 4000 RPM.
	4.10.5	Take 1 mL of supernatant in 20 mL labeled test tube.
	4.10.6	Make up the volume to 2 mL using purified water
		respectively.
	4.10.7	The test is performed in duplicate for each sample.
	4.11	Treat 2 mL purified water as blank in thermoresistant test tube.
	4.12	Add 2 ml of 0.5 g/l Ferric Chloride solution to tubes of calibration
		curve, Blank and samples.
	4.13	Vortex and add 0.2 mL of 100 g/l Orcinol Solution to all test tubes.
	4.14	Close the tubes with aluminium foil and place the test tubes in
		boiling water bath for 20 minutes.
	4.15	Take out the tubes and cool in iced water.
	4.16	Allow the tubes to come at room temperature and set the wavelength
		in spectrophotometer at 670 nm. Zero the absorbance of blank and
		then measure the absorbance of calibration curve and test samples.
	4.17	Calculations:
	4.17.1	Once the absorbance of the standards and the test samples
		have been taken, calculation shall be done using the excel
		sheet carrying formulas for the required calculation.
	4.17.2	Always copy the master excel sheet (sheet carrying formulas)
		for the required calculation), never use the previously
		used excel sheet for new calculations.
	4.17.3	Copy the master excel sheet, keep it for use in respective
		folder and then fill in the required sample details for
		total & free sample treatments, sample dilution, name of
		analyst, date, etc.
	4.17.4	Enter the absorbance for calculations starting from the
		Calibration curve prepared between 2.5 and 25 g of Ribose
		and test samples. The calculations are made according to
		the equation of minimum squares.
		$Y = mX + b$.
		Where: m = slope
		b = intercept
		Y = absorbance
		X = concentration
		(Multiply by dilution factor)
	4.17.5	Calculation of actual dilution for free PRP:
		Sample volume taken = 1000µL
		Total volume = 1150µL (1000µL sample + 100µL 1% DOC + 50µL
		1M HCl)
		Correction Factor = $1150\mu\text{L} / 1000\mu\text{L} = 1.15$
		Actual dilution = dilution factor x 1.15
	4.17.6	Calculate the content of ribose in the test solution for
		each volume tested and PRP content by the formula :
		PRP content = Ribose content / 0.434
	4.17.7	Record all the calculations in the data record form and
		also attach the hard copy of the excel sheet used for
		calculation along it.
	4.18	Acceptance criteria:
		The coefficient of variation (CV) between the replicates of the
		samples should be $\leq 5\%$.
		The free PRP Oligosaccharide content should not be more than 25% of
		total oligosaccharide content.
	5.0	References:
	5.1	Biologicals (1998) 26, 33-38 – A simple and rapid method for
		measuring unconjugated capsular polysaccharide (PRP) of Haemophilus
		influenzae type b in PRP-TT conjugate vaccine.

1.0 |Objective |
 |To lay down the procedure for determination of Hexosamine content in |
 |Pneumococcal Polysaccharide samples. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to all the in process and |
 |polysaccharide samples of pneumococcal serotypes 4, 5, 9V, 14, 19A and 19F |
 |in which the Hexosamine content is to be determined. |
 3.0 |Responsibility |
 |3.1 |The analyst is responsible for executing the described procedure |
 |correctly. |
 |3.2 |Supervisor is responsible for verifying that the procedure is carried |
 |out correctly and check the results. |
 |3.3 |HOD shall be responsible for overall compliance of this SOP and shall |
 |ensure that the SOP is reviewed every two years or if required |
 |earlier. |

4.1.10	DMAB	:Dimethylaminobenzaldehyde
4.2	Reagents:	
4.2.1	Hydrochloric Acid	
4.2.2	Thymolphthalein	
4.2.3	Sodium Hydroxide	
4.2.4	Sodium carbonate	
4.2.5	Acetyl acetone	
4.2.6	Dimethylaminobenzaldehyde	
4.2.7	Glucosamine hydrochloride	
4.2.8	Mannosamine hydrochloride	
4.2.9	Absolute Ethanol	
4.2.10	LAL Reagent Water	
4.3	Equipment and materials	
4.3.1	UV/VIS Spectrophotometer	
4.3.2	Water Bath	
4.3.3	Vortex	
4.3.4	Screw capped test tubes (30 ml) with stand	
4.3.5	Volumetric Flasks (5ml, 10ml, 50ml & 100ml)	
4.3.6	Glass pipettes (5ml, 10ml & 25 ml)	
4.3.7	Auto pipettes with Tips (20-200µl, 100 to 1000 µl & 1000 to	
	5000 µl)	
4.3.8	Centrifuge Tubes (15ml & 50ml)	
5.0	Procedure	
5.1	Preparation of solutions:	
Prepare all the solutions as described below and fill the form, label		
the solutions and assign lot numbers.		
5.1.1	8M Hydrochloric acid:	
5.1.1.1	Take 69.0 ml of concentrated Hydrochloric acid in 100ml	
	volumetric flask.	
5.1.1.2	Make up the volume with purified water.	
5.1.1.3	The solution can be stored at Room temperature for a	
	maximum of 6 months.	
5.1.2	0.5% Thymolphthalein solution:	
5.1.2.1	Weigh 25mg of Thymolphthalein in a 5ml volumetric flask.	
5.1.2.2	Dissolve it in absolute ethanol and make up the volume	
	with the same solvent.	
5.1.2.3	The solution is prepared freshly prior to use.	
5.1.3	5N Sodium Hydroxide solution:	
5.1.3.1	Weigh 20g of sodium hydroxide in a 100ml volumetric	
	flask.	
5.1.3.2	Dissolve in purified water and make up the volume with	
	the same solvent.	
5.1.3.3	The solution can be stored at Room temperature for a	
	maximum of 6 months.	
5.1.4	1M Hydrochloric acid:	
5.1.4.1	Take 8.6 ml of hydrochloric acid in a 100ml volumetric	
	flask.	
5.1.4.2	Mix with purified water and make up the volume with the	
	same solvent.	
5.1.4.3	The solution can be stored at Room temperature for a	
	maximum of 6 months.	
5.1.5	5.3% Sodium carbonate solution:	
5.1.5.1	Weigh 5.3gm of sodium carbonate in a 100ml volumetric	
	flask.	
5.1.5.2	Dissolve in purified water and make up the volume with	
	the same solvent.	
5.1.5.3	The solution can be stored at Room temperature for a	
	maximum of 6 months.	
5.1.6	2.0% Acetyl acetone reagent:	
5.1.6.1	Take 1ml of acetyl acetone in a 50ml volumetric flask.	
5.1.6.2	Mix with 5.3% Sodium carbonate solution and make up the	
	volume with the same solvent.	
5.1.6.3	The solution is prepared freshly prior to use.	
5.1.7	2.67% Dimethylaminobenzaldehyde solution (DMAB):	

			5.1.7.1	Weigh 800mg of dimethylaminobenzaldehyde in a 50ml			
				centrifuge tube.			
			5.1.7.2	Dissolve in 15ml of absolute ethanol and 15ml of 8M			
				hydrochloric acid.			
			5.1.7.3	The solution is prepared freshly prior to use.			
		5.1.8	1000 µg/ml Glucosamine working solution:				
			5.1.8.1	Weigh 12mg of Glucosamine hydrochloride in a 10 ml			
				Volumetric flask.			
			5.1.8.2	Dissolve in purified water and make up the volume with			
				the same solvent.			
			5.1.8.3	It should be prepared freshly before use.			
		5.1.9	1000 µg/ml Mannosamine working solution:				
			5.1.9.1	Weigh 12mg of Mannosamine hydrochloride in a 10ml			
				Volumetric flask.			
			5.1.9.2	Dissolve in purified water and make up the volume with			
				the same solvent.			
			5.1.9.3	It should be prepared freshly before use.			
		5.1.10	2000 µg/ml Mannosamine working solution:				
			5.1.10.	Weigh 12mg of Mannosamine hydrochloride in a 5ml			
				1	Volumetric flask.		
			5.1.10.	Dissolve in purified water and make up the volume with			
				2	the same solvent.		
			5.1.10.	It should be prepared freshly before use.			
				3			
			Note: In case of Pneumococcal serotypes 5 and 14, Glucosamine				
				hydrochloride is used as a standard working solution, while for			
			Pneumococcal serotypes 4, 19F, 19A and 9V Mannosamine				
				hydrochloride is used as a standard working solution.			
		5.2	Preparation of Calibration Curve:				
		5.2.1	The concentration of Hexosamine in the test sample(s) is				
				calculated by comparing results of its absorbance difference			
				obtained against the plotted calibration curve of known			
				hexosamine concentration Vs absorbance at 530 nm. The solutions			
				for making hexosamine calibration curve are prepared as follows:			
			5.2.1.1	Calibration curve for Glucosamine (50-1000 µg/ml):			
				Glucosamine Conc.	Glucosamine working	Purified Water	
				(µg/ml)	Stock (1000µg/ml)	(µl)	
				(µl)			
				50	25	475	
				100	50	450	
				200	100	400	
				400	200	300	
				800	400	100	
				1000	500	0	
			5.2.1.2	Calibration curve for Mannosamine (50-2000µg /ml):			
				Mannosamine	Mannosamine	Mannosamine	Purified Water
				Conc. (µg/ml)	working Stock	working Stock	(µl)
				(1000µg/ml)	(2000µg/ml)	(µl)	
				(µl)			
				50	25	-	475
				100	50	-	450
				200	100	-	400
				400	200	-	300
				800	400	-	100
				1000	500	-	0
				2000	-	500	0
		5.3	Test Procedure:				
		5.3.1	Take 500 µl of the standard dilutions from calibration curve,				
				Test Sample and Blank (Purified water) in duplicates in			
				separate Graduated test tubes. In case of dry polysaccharide			
				prepare a solution containing about 1-5 mg/ml of polysaccharide			
				in Lal reagent water and use it as test sample.			
				Note: The sample dilutions can vary depending upon the			
				hexosamine concentration. If there is any sample outside the			
				range of the calibration curve, carry out the calculation for			
				more appropriate dilution.			
		5.3.2	Add 500µl of 8M HCl drop wise to each tube containing standard				
				dilutions, Test Sample and Blank (Purified water).			
		5.3.3	Vortex well, cap and incubate in water bath at 90°C for 1 hour.				
		5.3.4	Allow the tubes to cool at room temperature.				
		5.3.5	Add 25µl of 0.5% Thymolphthalein solution as indicator to each				
				tube, vortex well.			
		5.3.6	Titrate each tube with 5N sodium hydroxide solution until blue				
				colour is obtained.			
		5.3.7	Add 1M HCl solution drop wise to each tube and shake properly				
				until sample turns colourless.			
		5.3.8	Make up the volume in each graduated tube to 5ml with purified				
				water, mix well.			
		5.3.9	Take 500µl of the above solutions from each tube into separate				
				fresh graduated test tubes.			
		5.3.10	Add 500µl of 2% Acetyl acetone solution to each tube and vortex				
				well.			
		5.3.11	Cap the tubes and incubate in water bath at 90°C for 45				
				minutes.			
		5.3.12	Allow the tubes to cool at room temperature.				
		5.3.13	Add 1.25ml of absolute ethanol to each tube, mix well.				
		5.3.14	Add 500µl of 2.67% Dimethylaminobenzaldehyde solution to each				
				tube and vortex well.			
		5.3.15	Make up the volume to 5ml with Absolute ethanol in graduated				
				tubes, mix well.			

	5.3.16	Cap the tubes and incubate at room temperature for 90 minutes			
		in dark place.			
	5.3.17	Vortex each tube, observe for the appearance of pink colour.			
	5.3.18	Take absorbance of the sample at 530nm against the blank using			
		spectrophotometer.			
	5.3.19	Note that all the readings of the assay tubes should be taken			
		within 30 mins. of completion of the assay and maximum 10			
		samples should be analysed in one single assay.			
	5.4	Calculations:			
	5.4.1	Once the absorbance of the standards and the test samples have			
		been taken, calculation shall be done using the excel sheet			
		carrying formulas for the required calculation.			
	5.4.2	Always copy the master excel sheet (sheet carrying formulas for			
		the required calculation), never use the previously used excel			
		sheet for new calculations.			
	5.4.3	Copy the master excel sheet, keep it for use in respective			
		folder and then fill in the required sample details (Batch			
		number), sample dilution (if applicable), name of analyst, date,			
		etc.			
	5.4.4	Proceed for calculations starting from the Calibration curve.			
		The calculations are done according to the equation,			
		$Y = mX + b$.			
		Where: m = slope			
		b = intercept			
		Y = absorbance			
		X = concentration			
		(multiply with the dilution factor)			
	5.4.5	In case of dry polysaccharide, Hexosamine (%) in polysaccharide			
		on dry weight basis:			
			Hexosamine Conc. in dry Polysacc. (µg/ml) =		
			Hexosamine in Polysacc. sol. (µg/ml) X 1 – {Moisture (%) /		
			100}		
			Hexosamine in dry polysaccharide (µg/ml)		
			Hexosamine (%) = _____		
			X 100		
			Conc. of polysaccharide solution (µg/ml)		
	5.4.6	To calculate the pure polysaccharide content (mg) present in dry			
		polysaccharide sample in of each serotype based on the			
		hexosamine content obtained, following formula is applied:			
		Pure Polysaccharide content(mg) / Dry polysaccharide content			
		(mg)			
		= (Hexosamine Conc. in dry Polysacc (mg) X Conversion factor)			
	5.4.7	The conversion factor of each serotype is mentioned below			
		Serotype	Hexosamine	Percentage as per WHO	Conversion
			TR5 977	factor	
		4	Mannosamine	71.84 %	1.39
		5	Glucosamine	44.14 %	2.26
		9V	Mannosamine	20.89 %	4.79
		14	Glucosamine	29.44 %	3.39
		19A	Mannosamine	32.98 %	3.03
		19F	Mannosamine	32.98 %	3.03
	5.5	Acceptance criteria:			
	5.5.1	The test is valid if Regression of the standard curve is ≥ 0.99			
		and the percentage of Coefficient of Variation is $\leq 15\%$ within			
		the replicates.			
	5.5.2	Hexosamine content in Purified Pneumococcal polysaccharide			
		should meet the laid specifications for each serotype.

3.11	SST	: System Suitability Test
3.12	System Suitability test: System suitability tests are an integral	
part of gas and liquid chromatographic methods. They are used to		
verify that the resolution and reproducibility of the		
chromatographic system are adequate for the analysis to be done.		
The tests are based on the concept that the equipment,		
electronics, analytical operations and samples to be analyzed		
constitute an integral system that can be evaluated as such.		
4.0	Procedure	
4.1	Precautions to be taken:	
4.1.1	Always wear laboratory coat.	
4.1.2	Always use filtered solutions. Filtration of solution should	
be done in order to eliminate the entry of possible		
particles, if any, into the system as well as the column.		
4.1.3	Degas all solutions.	
4.1.4	Avoid entry of bubbles into the system as well as column.	
4.1.5	All the solution bottle openings should be well covered with	
aluminum foil.		
4.1.6	Check the calibration status of all equipment and	
instrument.		
4.2	Requirement:	
4.2.1	Equipment:	
4.2.1.1	Calibrated HPLC System with ChemStation software.	
4.2.1.2	Ultrasonic Cleaner	
4.2.1.3	Vacuum Pump	
4.2.2	Instrument:	
4.2.2.1	pH Meter	
4.2.2.2	Magnetic stirrer	
4.2.2.3	Precision balance	
4.2.2.4	Analytical balance	
4.2.3	Materials:	
4.2.3.1	TSK gel G3000SWXL column {30cm(l), 7.8mm(i.d)}	
4.2.3.2	Laboratory Glassware	
4.2.3.3	Screw cap vials	
4.2.3.4	Solvac Filter Holder	
4.2.3.5	Nylon 6,6 membrane 0.20/0.22/0.45 µm membrane	
filter		
4.2.3.6	Auto pipettes (10-100µL), (20-200(L), (100-1000(L)	
4.2.3.7	Tips for the Auto pipettes	
4.2.4	Reagents:	
4.2.4.1	Sodium Chloride (NaCl)	
4.2.4.2	Disodium hydrogen phosphate anhydrous (Na₂HPO₄)	
4.2.4.3	Sodium dihydrogen phosphate monohydrate	
4.2.4.4	Purified water	
4.3	Preparation of solutions:	
Prepare all the solutions as described below and Carry out the		
labelling of the prepared solutions and assign the lot numbers.		
4.3.1	Isopropyl alcohol 70%	
Take 700 mL of 2-propanol in a volumetric flask and make up		
the volume to 1000 mL with Purified Water. This solution can		
be stored at room temperature for 3 months.		
4.3.2	Solution I: [Na₂HPO₄ (0.1M), NaCl (0.1M)] For a volume of	
1000 mL, weigh 14.19 g of Na₂HPO₄ and 5.84 g of NaCl and		
Dissolve in 700mL of purified water in a volumetric flask		
and make up the volume to 1000mL. Prepare fresh before use.		
4.3.3	Solution II: (NaH₂PO₄.H₂O, 0.1 M) : For a volume of 500 mL,	
weigh 6.85g of NaH₂PO₄.H₂O and dissolve in 400mL of		
purified water in a volumetric flask and make up the volume		
to 500mL. Prepare fresh before use.		
4.3.4	0.1M Sodium Phosphate buffer: (0.1 M Na₂HPO₄, 0.1M NaCl	
+0.1M NaH₂PO₄.H₂O, pH 7.0)		
For a volume of 1000mL, take approximately 600mL of		
Solution I and 400mL of Solution II. The pH of the solution		
should be 7.0 ± 0.2. Use the mobile phase within four days		
from the date of preparation if it remains clear and no		
turbidity or fibers observed in it.		
4.3.5	Column Preservation Solution: Prepare and use it.	
4.3.6	1 mg/mL of p-Aminobenzoic Acid Stock: For a Volume of 5 mL,	
weigh: 5 mg of p-Aminobenzoic acid (4-Aminobenzoic acid)		
and Dissolve in 5mL of purified water and make up the		
volume to 5mL.		
4.3.9	Working standard of p-Aminobenzoic Acid: Dilute 1 mg/mL of	
the stock solution to 1/10 with purified water.		

			Note: All the solutions prepared for use are vacuum				
			filtered using Nylon 6, 6 membrane 0.20 µm or 0.22 µm ,				
			depending upon the nature of solution to be filtered. For				
			organic solvents 0.45µm filters should be used (filtration				
			not necessary if the solution is prepared in 0.2 µ filtered				
			purified water).				
	4.4	Preparing the HPLC System for run, Agilent Series:					
	4.5	Run Conditions:					
	4.5.1	Load method					
	4.5.2	Flow Rate: 0.75 mL/min					
	4.5.3	Detection Wavelength: 280nm					
	4.5.4	Run time: 20 minutes					
	4.6	Equilibration of the system and the column:					
			Equilibrate the column with mobile 0.1 M sodium phosphate buffer				
			at 280nm until a stable baseline is observed on the online plot				
			window.				
	4.7	Sample Preparation and Application:					
	4.7.1	Test sample and standards are loaded in screw cap vials and					
			placed against the appropriate no. on the sample tray by				
			clearly marking the screw cap vial.				
	4.7.2	Load the required volume of sample as per the PRP					
			concentration equivalent to 2.5 µg in the sample vial.				
			Example: If a sample has a PRP concentration of 0.5 mg/mL,				
			to calculate volume required for 2.5 µg of protein,				
			0.5 mg (500 µg) ----1 mL				
			2.5 µg-----X mL				
			X mL = 2.5 µg x 1 mL				
			500 µg				
			X mL = 5 µL				
			Therefore, 5 µL of volume is taken for sample having PRP				
			concentration of 0.5 mg/mL.				
	4.8	Running of sequence:					
	4.8.1	Load sequence					
	4.8.2	Open the sequence parameter option by clicking Sequence					
			menu.				
	4.8.3	Enter information about the data directory and operator					
			name.				
	4.8.4	In the shutdown option, click on the post-sequence option					
			and select LAMPOFF/STANDBY.				
	4.8.5	In sequence table option, specify the sample names, methods					
			and vials to run in the sequence as per the following				
			table:				
			S No	Sample Code	Sample details	No. of	Injection
					injections	Volume(µL)	
			1	Blank	Eluent Blank	1	10
			2	p-Aminobenzoic	System	6	1
			acid	Suitability Test			
			3	Blank	Eluent Blank	1	10
			4	Test Sample(s)	Sample	1	2.5µg of
					PRP		
	5.8.6	Click on run sequence option in run control menu to start					
			the sequence.				
	5.8.7	Each sample run will be of 20 min. and after running all					
			the samples the sequence will automatically stop.				
	5.8.8	Inject the eluent blank after every 20 injections.					
			One extra vial with same SST sample can be used if 6				
			injections are not possible from single vial.				
	4.9	Calculations :					
			Area under curve for the standards/sample is analyzed by				
			Chemstation software.				
	4.9.1	Open the acquired chromatogram in the data analysis view in					
			the offline copy of the software.				
	4.9.2	Optimize integration with initial events in the signal					
			specific events table.				
	4.9.3	Enter the value of retention time of peak maxima in					
			integration with timed events option.				
	4.9.4	The percentage of free carrier protein in sample is					
			calculated by taking the percentage area of the peak maxima				
			corresponding to the lower molecular weight compared to the				
			peak maxima of higher molecular weight.				
	4.9.5	Calculations for System Suitability Test:					
			4.9.5.1	Note the values of area under the curve and			
			1	retention time for p-Aminobenzoic acid. (SST			
			standard)				
			4.9.5.2	Every time a sample is run with system suitability			
			2	test, calculate the results for system suitability			
				by creating a copy of Master EXCEL in the desired			
				folder and record the same.			
			4.9.5.3	Attach the hard print of SST calculation along with			
			3	chromatograms and the record form.			
	4.10	Acceptance Criteria :					
	4.10.1	For System Suitability Test :					
			4.10.1.1	RSD calculated for Retention time should be <5.0%.			
			1				
			4.10.1.2	RSD calculated for Area should be <5.0%.			
			2				
	4.10.2	Free protein for ARM of Haemophilus Influenzae type b					
			conjugate vaccine Samples:				
			4.10.2.1	Free protein should be less than 2%.			
			1				
	4.11	Result Reporting:					
	4.11.1	Report the results of percentage of area of peak towards					

			higher Molecular weights (Conjugated) and percentage of
			area of peak towards lower Molecular weights
			(Unconjugated).
			Note: Percentage of free carrier protein is the percentage
			of area of peak towards lower molecular weights
			(Unconjugated).

1.0 |Objective |
 |To lay down the procedure for estimation of protein content in Pneumococcal|
 |polysaccharide conjugate vaccine samples by Lowry's method. |
 2.0 |Scope |
 |This Standard Operating Procedure is applicable to all the samples of |
 |Pneumococcal polysaccharide conjugate vaccine in which protein |
 |concentration is to be determined by Lowry's method. |
 3.0 |Responsibility |
3.1	The analyst is responsible for executing the described procedure
	correctly.
3.2	Supervisor is responsible for verifying that the procedure is carried
out correctly and check the results.	
3.3	HOD shall be responsible for overall compliance of this SOP and shall
ensure that the SOP is reviewed every two years or if required	
earlier.

5.0	Procedure
5.1	Preparation of solutions: Prepare all the solutions as described below
and fill the form, label the solutions and assign lot numbers.	
	5.1.1
	5.1.2
	5.1.3
	5.1.4
	5.1.5
	5.1.6
	5.1.7
	5.1.8
5.2	Preparation of Calibration Curve:
	5.2.1

			20	50	450
			40	100	400
			80	200	300
			160	400	100
		5.3	Test Procedure:		
		5.3.1	Take 500 µl of the standard dilutions from calibration curve,		
		Test Sample and Blank (0.1M sodium hydroxide) in duplicates in			
		separate test tubes. In case of dry polysaccharide prepare a			
		solution containing about 1-5 mg/ml of polysaccharide in Lal			
		reagent water and use it as test sample.			
		Note: The sample dilutions can vary depending upon the protein			
		concentration. If there is any sample outside the range of the			
		calibration curve, carry out the calculation for more			
		appropriate dilution.			
		5.3.2	Add. 2.5 ml of Cupric-tartaric solution to each of the standard		
		blank (0.1M Sodium hydroxide) and sample.			
		5.3.3	Vortex and incubate the test tubes in dark at room temperature		
		for 10 min.			
		5.3.4	Add 250 µl of 1 N Folin & Ciocalteu's phenol reagent and mix		
		well.			
		5.3.5	Incubate the test tube at room temperature for 30 minutes in		
		dark.			
		5.3.6	Observe for blue color which can vary with the concentration.		
		5.3.7	Take absorbance of the sample at 730nm against the blank using		
		spectrophotometer.			
		5.3.8	Note that all the readings of the assay tubes should be taken		
		within 30 mins. of completion of the assay and maximum 10			
		samples should be analysed in one single assay.			
		5.4	Calculations:		
		5.4.1	Once the absorbance of the standards and the test samples have		
		been taken, calculation shall be done using the excel sheet			
		carrying formulas for the required calculation.			
		5.4.2	Always copy the master excel sheet (sheet carrying formulas for		
		the required calculation), never use the previously used excel			
		sheet for new calculations.			
		5.4.3	Proceed for calculations starting from the Calibration curve.		
		The calculations are done according to the equation,			
		Y = mX + b.			
		Where: m = slope			
		b = intercept			
		Y = absorbance			
		X = concentration			
		(Multiplication by dilution factor)			
		5.4.4	Use EXCEL programme for the preparation of calibration curve		
		and Calculation of the results (Multiply by the dilution			
		factor. Divide with 1000 to change µg/ml to mg/ml).			
		5.4.5	In case of dry polysaccharide,		
		Protein (%) in polysaccharide on dry weight basis:			
		Protein in dry polysacc. (µg/ml) =			
		Protein in Polysacc. sol. (µg/ml) X 1 – {Moisture (%) / 100}			
		Protein in dry polysaccharide (µg/ml)			
		Protein (%) = _____			
		x 100			
		Concentration of polysaccharide solution (µg/ml)			
		5.5	Acceptance criteria:		
		5.5.1	The test is valid if Regression of the standard curve is ≥0.99		
		and the percentage of Coefficient of Variation is ≤ 15% within			
		the replicates.			
		5.5.2	Protein content in Purified Pneumococcal polysaccharide and		
		conjugate should meet the laid specifications for each			
		serotype.

3.14	System	: System suitability tests are an integral part of gas and
	Suitability	liquid chromatographic methods. They are used to verify
	ty test	that the resolution and reproducibility of the
		chromatographic system are adequate for the analysis to be
		done.
		The tests are based on the concept that the equipment,
		electronics, analytical operations and samples to be
		analyzed constitute an integral system that can be
		evaluated as such.
4.0	Procedure:	
4.1	Precautions to be taken:	
4.1.1	Always use filtered solutions. Filtration of solution	
		should be done in order to eliminate the entry of possible
		particles, if any, into the system as well as the column.
4.1.2	Degas all solutions.	
4.1.3	Avoid entry of bubbles into the system as well as column.	
4.1.4	All the solution bottle openings should be well covered	
		with aluminum foil.
4.1.5	Check the calibration status of all equipment and	
		instrument.
4.2	Requirement:	
4.2.1	Equipment:	
4.2.1.1	Calibrated HPLC System with Chem Station software.	
4.2.1.2	Ultrasonic Cleaner	
4.2.1.3	Vacuum Pump	
4.2.1.4	Refrigerator	
4.2.2	Instrument:

4.2.3.8	Aluminium foil	
4.2.4	Reagents:	
4.2.4.1	Sodium Chloride (NaCl)	
4.2.4.2	Disodium hydrogen phosphate anhydrous (Na₂HPO₄)	
4.2.4.3	Sodium dihydrogen phosphate monohydrate	
4.2.4.4	Purified water	
4.2.4.5	Sodium azide	
4.2.4.6	Salmon DNA	
4.2.4.7	2-Propanol	
4.3	Preparation of solutions:	
Prepare all the solutions and Carry out the labelling of the prepared		
solutions and assign the lot numbers to the solutions.		
4.3.1	Isopropyl alcohol 70%	
Take 700 mL of 2-propanol in a volumetric flask and make up		
the volume upto 1000 mL with Purified Water. This solution can		
be stored at room temperature for 3 months.		
4.3.2	Solution I: [Na₂HPO₄ (0.1M), NaCl (0.1M)]	
For a volume of 1000 mL, weigh:		
Na₂HPO₄	14.19 g	
NaCl	5.84 g	

	Dissolve in 700mL of purified water in a volumetric flask and
	make up the volume upto 1000mL. Prepare fresh solution before
	use.
4.3.3	Solution II: NaH₂PO₄.H₂O, 0.1 M
For a volume of 500 mL, weigh:	
NaH₂PO₄.H₂O	6.85g
Dissolve in 400mL of purified water in a volumetric flask and	
	make up the volume upto 500mL. Prepare fresh solution before

```

||| |Use. | | | | | | | |
||| |4.3.4 |0.1M Sodium Phosphate buffer |
||| |(0.1 M Na2HPO4,0.1M NaCl +0.1M NaH2PO4.H2O, pH 7.0) |
||| |For a volume of 1000mL, take approximately 600mL of Solution II |
||| |and 400mL of Solution II. The pH of the solution should be 7.0|
||| |± 0.2. Use the mobile phase within four days from the date of |
||| |preparation if it remains clear and no turbidity or fibers |
||| |observed in it. |
||| |4.3.5 |Void Volume Marker (Salmon DNA): |
||| |For a volume of 5 mL, weigh: |
||| |Salmon DNA |5 mg |
||| |Dissolve in purified water and make up volume upto 5 mL with |
||| |purified water in a volumetric flask. Store at -20 °C ± 5°C |
||| |for 1 month. |
||| |4.3.6 |Total volume marker (Sodium Azide): |
||| |For a volume of 10 mL, weigh: |
||| |Sodium Azide |10 mg |
||| |Dissolve in purified water and make up volume upto 10 mL with |
||| |purified water in a volumetric flask. Store at 2-8 °C for 1 |
||| |month. |
||| |4.3.7 |Column Preservation Solution: |
||| |Note: All the solutions prepared for use are vacuum filtered |
||| |using Nylon 6, 6 membrane 0.20 µm or 0.22 µm , depending upon |
||| |the nature of solution to be filtered. For organic solvents |
||| |0.45µm filters should be used. |
||| |4.4 |Preparing the HPLC System for run, Agilent Series: |
||| |4.5 |Run Conditions: |
||| |4.5.1 |Load method |
||| |4.5.2 |Flow Rate: 0.5 mL/min |
||| |4.5.3 |Injection Quantity : 2.5µg |
||| |4.5.4 |Detection Wavelength: 214nm |
||| |4.5.5 |Run time: 30 minutes |
||| |4.6 |Equilibration of the system and the column: |
||| |Equilibrate the column with mobile 0.1 M sodium phosphate buffer at |
||| |214nm until a stable baseline is observed on the online plot window. |
||| |4.7 |Sample Preparation and Application: |
||| |4.7.1 |Test sample and standards are loaded in screw cap vials and |
||| |placed against the appropriate no. on the sample tray by |
||| |clearly marking the screw cap vial. |
||| |4.7.2 |Load the required volume of sample as per the PRP |
||| |concentration equivalent to 2.5 µg in the sample vial. |
||| |Example: If a sample has a PRP concentration of 0.5 mg/mL, to |
||| |calculate volume required for 2.5 µg of protein, |
||| |0.5 mg (500 µg) ----1 mL |
||| |2.5 µg-----X mL |
||| |X mL = 2.5 µg x 1 mL |
||| |500 µg |
||| |X mL = 5 µL |
||| |Therefore, 5 µL of volume is taken for sample having PRP |
||| |concentration of 0.5 mg/mL. |
||| |4.8 |Running of sequence: |
||| |4.8.1 |Load sequence |
||| |4.8.2 |Open the sequence parameter option by clicking Sequence menu. |
||| |4.8.3 |Enter information about the data directory and operator name. |
||| |4.8.4 |In the shutdown option, click on the post-sequence option and |
||| |select LAMPOFF/STANDBY. |
||| |4.8.5 |In sequence table option, specify the sample names, methods |
||| |and vials to run in the sequence as per the following table: |
||| |S No|Sample Code |Sample details|No. of |Injection |
||| ||| |inject|volume (µL) |
||| ||| |Ions |
||| ||| |1 |Blank |Eluent Blank |1 |10 |
||| ||| |2 |Sodium azide (Total |System |6 |1 |
||| ||| |volume marker) |Suitability | | |
||| ||| |Test | | |
||| ||| |3 |Blank |Eluent Blank |1 |10 |
||| ||| |4 |Salmon DNA |Void volume |1 |10 |
||| ||| |marker | | |
||| ||| |5 |Blank |Eluent Blank |1 |10 |
||| ||| |6 |Test Sample (s) |Sample |1 |2.5µg of PRP |
||| ||| |Click on run sequence option in run control menu to start|
||| ||| |the sequence. |
||| ||| |5.8.8|Each sample run will be of 30 min and after running all |
||| ||| |the samples the sequence will automatically stop. |
||| ||| |4.9 |Calculations : |
||| ||| |Area under curve for the standards/sample is analyzed by |
||| ||| |Chemstation software. |
||| ||| |4.9.1|The retention time of the void volume is determined with |
||| ||| |Salmon DNA. |
||| ||| |4.9.2|The Retention time of the component (total volume) which |
||| ||| |has full access to the pores of stationary phase is |
||| ||| |determined with sodium azide. |
||| ||| |4.9.3|Elution time of PRP-TT (Te) at KD = 0.50 |
||| ||| |The calculations are made as per the following equation: |
||| ||| |Te = KD (Tt - To) + To or Te = 0.50 (Tt - |
||| ||| |To) + To |
||| ||| |Where, |
||| ||| |Te = Elution time of PRP-TT Bulk Conjugate at KD = 0.50 |
||| ||| |Tt = Retention time of sodium azide |
||| ||| |To = Retention time of Salmon DNA |
||| ||| |KD = Distribution Coefficient |
||| ||| |Note: Take average RT of sodium azide as Tt from EXCEL |

```

				for calculation of SST.	
				4.9.4	Calculation of percentage of sample eluted before a given
				KD:	
				The percentage of sample eluted before a given KD is	
				calculated using ChemStation software.	
				4.9.4.1	Open the acquired chromatogram in the data
				analysis view in the offline copy of the	
				software.	
				4.9.4.2	Optimize integration with initial events in the
				signal specific events table.	
				4.9.4.3	Enter the value of Elution time (Te) calculated
				in step 5.9.3 in integration with timed events	
				option or with manual integration and select	
				split peak option.	
				4.9.4.4	The percentage of sample eluted at $KD \leq 0.3$ to
				0.6 is calculated by adding the values of	
				percentage of area (Area %) obtained for bulk	
				conjugate curve till Te.	
				4.9.5	Calculations for System Suitability Test:
				4.9.5.1	Note the values of area under the curve and
				retention time for sodium azide (SST standard) in	
				Annexure 1 and also in EXCEL format for	
				calculation of Relative standard deviation.	
				4.9.5.2	Every time a sample is run with system
				suitability test, calculate the results for	
				system suitability.	
				4.9.5.3	Attach the hard print of SST calculation along
				with chromatograms and the record form.	
		4.10	Acceptance Criteria :		
		4.10.	For System Suitability Test :		
			1		
			4.10.1.	RSD calculated for Retention time should be <	
			1	5.0%.	
			4.10.1.	RSD calculated for Area should be < 5.0%.	
			2		
			4.10.	For ARM of Haemophilus Influenzae type b conjugate	
		2	vaccine Samples: KD (Molecular Size distribution): $\geq 50\%$,		
			KD $\leq 0.3 - 0.6$		
5.0	References:				
European Pharmacopeia.					

H: the conjugate antigen content of test samples, %; P: the test validity, which shall be 70-130%.

Method two: it is applicable for the content determination of type 3 conjugate antigen in 13-valent pneumococcal conjugate vaccine.

free polysaccharide separation of samples

Take 1000μl of solution D and Y and put into 2ml centrifuge tubes respectively, add 100μl of 1% sodium deoxycholate solution, mix well, and place at 2-8℃ for 30min

Add 50μl of 1mol/L hydrochloric acid solution into each centrifuge tube, mix well, and place at 2-8℃ for 30min.

Centrifuge the tubes at 8000g, 5min for 30min.

Carefully take 800μl of supernatant using a pipette respectively, which is recorded as DS and YS.

Determination of polysaccharide content

Take 300μl of solution D, add 900μl of diluent 1 (DIL1), mix well to obtain 4 times dilute solution, determine the polysaccharide content on the IMMAGE 800, input 4.4 (i.e. 4×1.1) of off-line dilution multiple. If the result is beyond the inspection range, adjust the dilution multiple to A, and input A×1.1 of off-line dilution multiple.

Take 300μl of solution Y, add 60μl of diluent 1 (DIL1), mix well to obtain 3 times dilute solution, determine the polysaccharide content on the IMMAGE 800, input 3.3 (i.e. 3×1.1) of off-line dilution multiple.

Take 400μl of DS solution, add 800μl of diluent 1 (DIL1), mix well to obtain 3 times dilute solution, and determine polysaccharide content on the IMMAGE 800. If the result is beyond the detection range, adjust the dilution multiple. The final result is calculated manually by the tester (i.e. test result × dilute multiple).

Take solution YS and directly put it on the IMMAGE 800 to determine the polysaccharide content. The final result is calculated manually by the tester (i.e. test result × dilution multiple).

Result calculation

Calculate the conjugate antigen content and test validity as following formula:

$$H = (1 - \frac{\text{Pneumococcal polysaccharide Standard substance}}{\text{Anti-serum of pneumococcal polysaccharide}}) \times 100\%$$

In the formula,

H =

$$\frac{\text{Conjugate antigen content determination SOP} \times \text{Version} \times \text{Page}}{\text{Conjugate antigen content determination SOP} \times \text{Confidential files No copy} \times \text{Confidential files No copy}} \times 100\%$$

H: the conjugate antigen content of test samples, %; P: the test validity, which shall be 70-130%.

Flow chart

N/A

Matters need attention

In the process of free polysaccharide separating from 13-valent pneumococcal polysaccharide vaccine samples(except type 3), the supernatant in the centrifuge tube should be directly poured out after centrifuging at 6000g, 5min for 90min, and the supernatant in the centrifuge tube should be completely sucked by inverted on the absorbent paper.

When removing supernatant from the centrifuge tube, pay special attention that the pipette tip is not allowed to touch the tube wall, and it is not allowed to take precipitate or floating substance.

1.0 |Purpose: |
 |To lay down the procedure for the determination of CDAP |
 |(1-cyano-4-dimethylaminopyridinium tetrafluoroborate) by high performance |
 |liquid chromatography (HPLC). |
 2.0 |Applicable to: |
 |This Standard Operating Procedure is applicable for the analysis of the |
 |samples in which CDAP (1-cyano-4-dimethylaminopyridinium tetrafluoroborate)|
 |is to be determined. |
 3.0 |Abbreviations and Definitions |
3.1	CDAP	: 1-cyano-4-dimethylaminopyridinium tetrafluoroborate
3.2	HPLC	: High Performance Liquid Chromatography
3.3	i.d	: Internal diameter
3.4	l	: length
3.5	RSD	: Relative Standard Deviation
3.6	SST	: System Suitability Test
3.7	°C	: Degree centigrade
3.8	µg	: microgram
3.9	µL	: Micro litre
3.10	µm	: Micro meter
3.11	System	: System suitability tests are an integral part of gas
	Suitability	and liquid chromatographic methods. They are used to
	Test	verify that the resolution and reproducibility of the
		chromatographic system are adequate for the analysis
		to be done.
		The tests are based on the concept that the equipment,
		electronics, analytical operations and samples to be
		analyzed constitute an integral system that can be
		evaluated as such.
4.0	Procedure	
4.1	Precautions to be taken:	
	4.1.1	Always use filtered solutions. Filtration of solution should
		be done in order to eliminate the entry of possible particles,
		if any, into the system as well as the column.
	4.1.2	Degas all solutions.
	4.1.3	Avoid entry of bubbles into the system as well as column.
	4.1.4	All the solution bottle openings should be well covered with
		aluminum foil.
	4.1.5	Handle acids carefully and always manipulate in fume hood.
	4.1.6	Check the calibration status of all equipment and instrument.
4.2	Requirements	
	4.2.1	Equipment:
		4.2.1.1
		4.2.1.2
		4.2.1.3
		4.2.1.4
		4.2.1.5
	4.2.2	Instrument:
		4.2.2.1
		4.2.2.2
		4.2.2.3
		4.2.2.4
	4.2.3	Materials:
		4.2.3.1
		4.2.3.2
		4.2.3.3
		4.2.3.4
		4.2.3.5
		4.2.3.6
		4.2.3.7
		4.2.3.8
	4.2.4	Reagents:
		4.2.4.1
		4.2.4.2
		4.2.4.3
		4.2.4.4
		4.2.4.5
		4.2.4.6
		4.2.4.7
4.3	Preparation of solutions:	
	Prepare all the solutions and carry out the labelling of the prepared	
	solutions and assign the lot numbers to the solutions.	
	4.3.1	Solution A
	4.3.2	Mobile phase for CDAP:
	4.3.3	Isopropyl Alcohol 70% Solution

			months.			
		4.3.4	1 mg/mL of CDAP calibration standard stock:			
		Weigh 5mg of CDAP and make up the volume to 5mL with purified				
		water in a volumetric flask. This solution can be stored as				
		aliquots at -20°C for 2months.				
		4.3.5	Preparation of working calibration standard of 10µg/mL or			
		10ng/µL:				
		Take 10µL of 1 mg/mL of CDAP calibration standard stock and				
		add 990µL of purified water to make 1mL of solution in an				
		leppendorf or HPLC vial. Mix thoroughly. Prepare fresh before				
		use.				
		Note: The working calibration standard is prepared fresh				
		before use. All the solutions prepared for use are vacuum				
		filtered using Nylon 6, 6 membrane 0.20/0.22/0.45 µm filters				
		to eliminate the entry of possible particles, if any into the				
		system as well as the column. For organic solvents 0.45µm				
		filters should be used (filtration not necessary if the				
		solution is prepared in 0.2 µ filtered purified water).				
		4.4	Preparing the HPLC System for run:			
		4.5	Run Conditions:			
		4.5.1	Load method			
		4.5.2	Flow Rate: 1.0 mL/min			
		4.5.3	Detection wavelength: 280 nm			
		4.5.4	Run time: 4 minutes			
		4.5.5	Mobile Phase: mobile phase for CDAP			
		4.6	Equilibration of the system and the column:			
		Equilibrate the system and column with mobile phase for CDAP until a				
		stable baseline at 280 nm is obtained which can be viewed with the				
		online plot window.				
		4.7	Sample Preparation and Application:			
		Test sample and standards are loaded in screw cap vials and placed				
		against the appropriate no. on the sample tray by clearly marking				
		the screw cap vial.				
		4.8	Running of sequence:			
		4.8.1	Load sequence.			
		4.8.2	Open the sequence parameter option by clicking Sequence menu.			
		4.8.3	Enter information about the data directory and operator name.			
		4.8.4	In the shutdown option, click on the post-sequence option and			
		select LAMPOFF/STANDBY.				
		4.8.5	In sequence table option, specify the sample names, methods			
		and vials to run in the sequence as per the following table:				
		S. No	Sample Code	Sample details	No. of	Injection
			injections	n volume		
			per Vial			
		1	Blank	Eluent Blank	1	10 µL
		2	Standard 3	System	6	0.5 µL
		(5ng/µL)	Suitability			
		test standard				
		3	Blank	Eluent Blank	1	10 µL
		4	Standard 1	1ng/µL	1	0.1 µL
		Standard				
		5	Standard 2	3ng/µL	1	0.3 µL
		Standard				
		6	Standard 3	5ng/µL	1	0.5 µL
		Standard				
		7	Standard 4	10ng/µL	1	1.0 µL
		Standard				
		8	Standard 5	20ng/µL	1	2.0 µL
		Standard				
		9	Blank	Eluent Blank	1	10 µL
		10	Test Sample	Sample	1	1.0 µL
		(s)				
		4.8.6	Click on run sequence option in run control menu to start the			
		sequence.				
		4.8.7	Each sample run will be of 4 minutes and after running all			
		the samples the sequence will automatically stop.				
		4.8.8	Inject the eluent blank after every 20 injections.			
		Note: Here, eluent blank refers to mobile phase. One extra				
		vial with same SST sample can be used if 6 injections are not				
		possible from single vial.				
		4.9	Calculations:			
		4.9.1	Results of the sample are calculated from the calibration			
		standards using the chemstation software.				
		4.9.1.1	Open the chromatogram corresponding to 1ng/µL			
		calibration standard in the offline copy of				
		chemstation software in the Data Analysis mode.				
		4.9.1.2	From the calibration menu select calibration			
		settings and write ng/µL in the Amount unit's				
		option.				
		4.9.1.3	Select New Calibration Table from Calibration menu			
		and enter value1 in default amount option and value				
		1 in level option.				
		4.9.1.4	Now open the chromatogram for 3.0 ng/µL. Select add			
		level option from calibration menu and enter value				
		3.0 in default amount and value 2 in level option.				
		4.9.1.5	Similarly open chromatograms for 5.0ng/µL,			
		10.0ng/µL and 20.0ng/µL and keep adding default				
		amount and appropriate value of level.				
		4.9.1.6	Select calibration task icon and the calibration			
		table with required concentrations and levels can				
		be viewed in the calibration table view. A				
		calibration curve is also displayed in the				

			calibration curve field with value of correlation
			coefficient of the curve.
		4.9.1.7	Save the calibration method under appropriate name.
		4.9.1.8	Open the chromatogram of test sample and select the
			above created calibration method for integration of
			the test sample.
		4.9.1.9	In the specify report option of Report menu, select
			ESTD in the Calculate field.
		4.9.1.10	In the report layout view click on the show report
			preview with current template, method and data file
			icon and view the result of the test sample in
			terms of concentration (ng/μL).
		4.9.1.11	Calculations for Standard curve and samples:
			The calculations are made according to the equation
			of minimum squares.
			$Y = mX + b$.
			Where: m = slope
			b = intercept
			Y = absorbance
			X = concentration
		4.9.2	The calculations for determination of amount of CDAP per dose
			(10μg) of ARM of Haemophilus Influenzae type b conjugate
			vaccine is as follows:
			Example: If a sample has a PRP concentration of 1.0 mg/mL and
			the amount of CDAP present in the sample is 5ng/μL or 5μg/mL.
			The amount of CDAP present per dose(10μg) is calculated as
			follows:
			1000μg -----5μg
			10 μg(dose)----- X
			$X = 5\mu\text{g} \times 10 \mu\text{g}$
			1000 μg
			= 0.05μg or
			$X = 50 \text{ ng/dose}$
		4.9.3	Calculations for System Suitability Test:
		4.9.3.1	Note the values of area under the curve and
			retention time for standard 3(SST standard) .
		4.10	Acceptance Criteria System Suitability Test:
		4.10.1	RSD calculated for Retention time of standard 3(5ng/μL)
			should be <5.0%.
		4.10.2	RSD calculated for Area of standard 3(5ng/μL) should be
			<5.0%.
		4.11	Result Reporting:
		4.11.1	Open the template and take print out of the report.
		4.11.2	Print report: Click on print option to take a printout of a
			ChemStation report using the current report template and data
			from the currently loaded data file.
		4.11.3	Report the results of quantity of CDAP present/dose (10μg).
		4.11.4	The report generated can be viewed with report review icon.
		4.11.5	The printed report is signed by the analyst who does the
			analysis and also checked by the other analyst/supervisor.

[4.3	Preparation of solutions:		
	Prepare all the solutions as described below. Carry out the labelling		
	of the prepared solutions and assign the lot numbers.		
	4.3.1	0.2 M NaCl, 10mM Phosphate Buffer pH 6.0:	
		Take 1.17 g NaCl, 0.054 g Na₂HPO₄·12H₂O and 0.133 g	
		NaH₂PO₄·2H₂O. Dissolve in 80 mL of MQW, adjust the pH with HCL	
		or NaOH and make up to 100mL. Filter through 0.22 µm filter.	
		This solution can be stored up to one month at room	
		temperature.	
	4.3.2	TEA stock Standard (10,000 µg/mL):	
		Take 1.370 mL of neat TEA and make up to 100 mL with 0.2 M	
		NaCl, 10mM Phosphate Buffer in a volumetric flask. Prepare	
		fresh on the day of use.	
	4.3.3	Positive control (50µg/mL of TEA standards)	
		Add 15µL of TEA stock to 3mL of 0.2 M NaCl, 10mM Phosphate	
		Buffer.	
	4.3.4	Test sample preparation:	
	4.3.5	Dilute the test sample with 0.2 M NaCl, 10mM Phosphate Buffer	
		to 10mg/ml of pneumococcal polysaccharide based on its initial	
		concentration.	
[4.4	Test Procedure:		
	4.4.1	Take 3 mL of 0.2 M NaCl, 10mM Phosphate Buffer as a blank, 3 mL	
		of positive control and 3mL of diluted test sample into	
		respectively labeled head space vials, and place these vials in	
		the head space carousel.	
	4.4.2	Create a batch file in GC solution software and wait for GC	
		ready command and click start button.	
	4.4.3	Then create a schedule file in HT3 TEKlink software for head	
		spacer.	
	4.4.4	Chromatography conditions:	
		Set the chromatography conditions as described below:	
	4.4.4.1	Carrier Gas	Helium
	4.4.4.2	Makeup Gas	Nitrogen (20 mL/minute)
	4.4.4.3	Hydrogen Gas	40mL/minute

Reagent Details:

Formula & Calculations:

Formula: $M_1 \times V_1 = M_2 \times V_2$.

Calculation: To prepare 1 L of 1M HCl from 12M HCl (or 37% concentrated HCl) stock solution calculate quantity required of stock solution as below:

12M HCl stock solution required quantity= $1 \times 1 / 12 = 83.3\text{mL}$

Preparation Method:

To prepare 1M HCl, 1L solution from 12M HCl stock solution formula is $M_1(\text{Molarity of stock}) \times V_1(\text{volume of stock}) = M_2(\text{Molarity of working}) \times V_2(\text{volume of working})$.

Take 83.3mL of 12M HCl solution and make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 1M HCl

Take 83.3mL x _____ L = _____ mL of 12M HCl

Make HCl solution to _____ L solution with WFI.

1) Sewage & Effluent Treatment: Clearly mark the physical location, dimensions, and layout of the Effluent Treatment Plant (ETP) / Sewage Treatment Plant (STP). Provide structural calculations proving adequate capacity for processing waste.
 Response: Physical location already marked in site layout.
 2) Organic Waste Converter (OWC): Designate a dedicated, ventilated space for a mechanical OWC, stating its processing capacity in kg/day based on your expected workforce.
 Response: Plasma: 20.4MT/year or 68T/day, LVP: 7.9MT/year or 26T/day
 3) Process Flow & Water Balance Chart: Submit a detailed quantitative water balance diagram showing domestic and industrial consumption, recycling rates, and a commitment to Zero Liquid Discharge (ZLD).
 Response:
 Plasma:
 LVP:
 4) Hazardous Waste Management Plan: Since ethanol-based fractionation is utilized, submit storage, handling, and disposal plans for hazardous/chemical solvents
 Response:
 Plasma:
 Note: Solid Biowaste will be treated with IPA and after decontamination it will be handed over to 3rd party.
 LVP:

Output Category Output Stream Estimated Quantity per Day Estimated Quantity per Year Remarks				
Treated Water Recovery Treated Water for Reuse / Discharge ~3,500 – 6,800 L ~840,000 – 1,632,000 L				
Recovered after primary and secondary treatment				
Reject Water / Losses RO Reject / Evaporation / Handling Losses ~500 – 1,600 L ~120,000 – 384,000 L				
Depends on treatment efficiency and recovery system				
Sludge Generation ETP Sludge / Solid Waste ~20 – 50 kg ~4,800 – 12,000 kg To be disposed through authorized waste handler				
Final Discharge Treated Effluent As per discharge norms As per regulatory limits Suitable for reuse/discharge after compliance testing				
Sr. No. Process / Source Type of Hazardous Waste Approx. Quantity / Year Proposed Method				
1	Solvent recovery & viral inactivation (TnBP + detergent process)	Spent solvent mixture (Tri-n-butyl phosphate + Triton X-100 / Polysorbate 80)	1.0 – 1.5 KL / year	ETP
2	Filtration & purification units	Used filter aids / depth filter media contaminated with protein or solvent	0.8 – 1.0 MT / year	3rd party
3	Activated carbon beds (viral removal, deodorization)	Spent activated carbon with adsorbed organic residues	0.5 – 0.7 MT / year	3rd party
4	Chromatography / TFF cleaning (CIP)	Residues of buffers, cleaning agents, NaOH / HCl neutralization sludge	2.0 – 3.0 MT / year (dry solids)	ETP
5	ETP operation	Sludge containing proteinaceous organic matter & trace solvents	5.0 – 6.0 MT / year	3rd party
6	ETP / RO reject water	High-TDS / COD effluent (liquid)	≈ 900 – 1,000 m ³ / year	ETP
7	Resin & membrane replacement	Spent chromatography resin, UF/DF membranes, PVDF filters	0.5 – 1.0 MT / year	3rd party
8	Laboratory & QC activities	Contaminated lab glassware, pipette tips, chemical bottles	200 – 250 kg / year	Scrap 3rd party
9	Oil from DG sets, compressors, hydraulic systems	Used lubricating oil	50 – 100 L / year	ETP
10	DG set maintenance	Oil-soaked cotton waste, filters	50 – 100 kg / year	Scrap 3rd party
11	Production packaging & vial washing	Contaminated packaging (plastic, foil, paper)	0.3 – 0.5 MT / year	Scrap 3rd party
12	Spill & floor washings	Absorbent material, mopping waste, PPE, gloves	0.5 MT / year	3rd party
Hazardous Waste API Residue / Chemical Sludge 50 – 200 kg 12000 – 48000 kg High-temperature incineration (>1,200°C). 3rd Party as proposed method				

Reagent Details:

Formula:

Tri Sodium Citrate (M.Wt): 258.07.

Citric acid (M.Wt): 192.124

Preparation of PF-RR-03 stock buffer:

Preparation of 0.2M Sodium Citrate pH 7.0.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.2M Citric Acid (MW = 192.124 g/mol)

Weight of solute(g)=0.2×192.124×1=38.424g.

Preparation Method:

Weigh 38.424g of Citric Acid and dissolve in water to make a 1 L solution.

Preparation for differential volumes:

To prepare _____ of 0.2M Citric Acid (MW = 38.424g/mol).

Weight of solute(g)=0.2×38.424 x _____ L= _____ g.

Weigh _____ gm of Citric Acid and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.2M Tris Sodium Citrate.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.2M Tris Sodium Citrate (MW = 258.07 g/mol)

Weight of solute(g)=0.2×258.07 x1=51.614g

Preparation Method:

Weigh 51.614g of Tris Sodium Citrate and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 0.2M Tris Sodium Citrate (MW = 258.07 g/mol).

Weight of solute(g)=0.2×258.07x _____ L= _____ g.

Weigh _____ gm of Tris Sodium Citrate and dissolve in water to make a _____ L solution.

Procedure for Preparation of PF-RR-03 stock

To prepare a pH 7.0 solution, 0.2 M Tris Sodium Citrate solution is titrated with 0.2 M citric acid so that the pH attains pH 7.0 ±0.1.

For Example, to prepare a 1 L solution, take 0.2 M Tri Sodium Citrate and adjust the pH with the 0.2 M Citric acid to get the pH 7.0 ±0.1 and make up the final volume to 1L.

Check and record the details:

Reagent Details:

Formula:

Sodium Citrate (M.Wt): 258.07.

Citric acid (M.Wt): 192.124

Sodium Chloride (M.Wt): 58.44

Calcium Chloride (M.Wt): 110.98

0.1% Tween 80

Preparation of FE-RR-010 buffer with Stock FE-RR-09.

Preparation of 20mM sodium citrate pH 6.7 + 0.13M sodium chloride + 2.55mM calcium chloride + 0.01% tween 80.

Stock Buffer (FE-RR-03): 0.2M Sodium Citrate pH 7.0

Formula:

$$C1 \times V1 = C2 \times V2$$

C1 = concentration of stock

V1 = volume of stock you need to take

C2 = desired (working) concentration

V2 = final total volume of working solution

Applying the formula to prepare the working buffer:

$$C1 \times V1 = C2 \times V2$$

C1 = 0.2M Sodium Citrate pH 7.0

V1 = volume of stock you need to take _____ L.

C2 = desired (working) concentration 20mM Sodium Citrate, pH 7.0

V2 = final total volume of working solution _____ L.

$$V1 = (C2 \times V2) / C1$$

$$C2 = 0.02M ; V2 = 1.0 L ; C1 = 0.2M$$

$$V1 = (0.02 \times 1.0) / 0.2$$

$$V1 = 0.1L$$

Take 0.1 L (FE-RR-03) Stock buffer solution and dilute with water, and make up to 1L.

Calculations: To prepare the 0.13M Sodium Chloride.

Formula: Weight of solute (g) = Molarity (M) × Molecular Weight (g/mol) × Volume (L).

Calculation: To prepare 1 L of 0.13M Sodium Chloride (MW = 58.44 g/mol)

$$\text{Weight of solute (g)} = 0.13 \times 58.44 \times 1 = 7.59g.$$

Preparation Method:

Weigh 7.59g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.13M Sodium Chloride (MW = 58.44 g/mol).

$$\text{Weight of solute (g)} = 0.13 \times 58.44 \times \text{L} = \text{g}.$$

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Calculations: To prepare the 2.55mM Calcium Chloride.

Formula: Weight of solute (g) = Molarity (M) × Molecular Weight (g/mol) × Volume (L).

Calculation: To prepare 1 L of 2.55 mM Calcium Chloride (MW = 110.98g/mol)

$$\text{Weight of solute (g)} = 0.0025 \times 110.98 \times 1 = 0.277g.$$

Preparation Method:

Weigh 0.277g of Calcium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.0025mM Calcium Chloride (MW = 110.98 g/mol).

$$\text{Weight of solute (g)} = 0.0025 \times 110.98 \times \text{L} = \text{g}.$$

Weigh _____ gm of Calcium Chloride and dissolve in water to make a _____ L solution.

Procedure

Calculation: to prepare the 0.01% Tween 80:

For 1000 mL of 0.01% solution:

$$0.01\% = 0.01g \text{ per } 100ml \text{ \& } 1000 \text{ mL} = 100 \text{ mg}$$

Since Tween 80 is a liquid, you can weigh it directly or use its density (~1.06 g/mL) to measure volume:

$$\text{Approx. } 100 \mu\text{L of Tween 80} = 0.1 \text{ g}$$

Add Tween 80 to a beaker or flask containing ~800 mL of water.

Mix thoroughly:

Use a magnetic stirrer or vortex until fully dissolved. Tween 80 is viscous, so mixing may take a few minutes.

Adjust volume:

After complete dissolution, bring the final volume up to 1000 mL with water.

Procedure for Preparation of FE-RR-10 buffer with the stock FE-RR-09.

To prepare a 1 L solution, take 0.2M Tri Sodium Citrate pH 7.0. To this, add the 0.13 M sodium chloride

and dissolve it and make up the volume with water to 900ml, and then to this add 0.0025 M Calcium

chloride, to this add the 0.01% Tween 80 then mix the solution till it dissolves and check the pH; if the

pH is less than 6.7 then adjust the pH with 1 M sodium hydroxide to get the pH 6.7 ± 0.1 and make up the

final volume to 1L.

Collect the concentrated sample from Bulk Protocol step No:7.3.4. record the details.

PRA-NF-005 FILTRATION

Filter the concentrated sample through a sterile PRA-SF-001 filter (pre-filter for PRA-NF-005 filtration) at 0.5 bar pressure under LAFU.

Check and record the following details:

Filtrate Volume: _____ L,

O.D. at 280 nm: _____, O.D. at 600 nm: _____.

Pass the pre-filtered sample through the PRA-NF-005 filter at 1.0 bar pressure.

Check and record the following details:

Filtrate Volume: _____ L,

O.D. at 280 nm: _____, O.D. at 600 nm: _____.

PRA-SF-001 FILTRATION

Filter the PRA-NF-005 filtered sample through a sterile PRA-SF-001 filter at 0.5 bar pressure under LAFU, and collect the filtrate into sterilised 50 ml polypropylene bottles.

Check and record the following details:

O. D. at 280 nm: _____, O.D. at 600 nm: _____.

Collect and send 10 ml of the PRA-SF-001 filtered sample to QC for in-process QC analysis. Record the QC Analysis report.

Store the bottles containing PRA-SF-001 filtrate at -20 °C until further use.

Reagent Details:

Formula:

Sodium Citrate (M.Wt): 258.07.

Citric acid (M.Wt): 192.124

Preparation of FN-RR-08 stock buffer:

Preparation of 0.2M Sodium Citrate pH 7.4

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.2M Citric Acid (MW = 192.124 g/mol)

Weight of solute(g)=0.2×192.124×1=38.42g.

Preparation Method:

Weigh 38.42 g of Citric Acid and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.2M Citric Acid (MW = 192.124g/mol).

Weight of solute(g)=0.2×192.124x _____L= _____g.

Weigh _____gm of Citric Acid and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.2M Tris Sodium Citrate.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.2M Tris Sodium Citrate (MW = 258.07 g/mol)

Weight of solute(g)=0.2×258.07 x1=51.61g

Preparation Method:

Weigh 51.61g of Tris Sodium Citrate and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 0.2M Tris Sodium Citrate (MW = 258.07 g/mol).

Weight of solute(g)=0.2×258.07x _____L= _____g.

Weigh _____gm of Tris Sodium Citrate and dissolve in water to make a _____ L solution.

Procedure for Preparation of FN-RR-08 stock

To prepare a pH 7.4 solution, 0.2 M Tris Sodium Citrate solution is titrated with 0.2 M citric acid so that the pH attains pH 7.4.

For Example, to prepare a 1 L solution, take 0.2 M Tri Sodium Citrate and adjust the pH with the 0.2 M Citric acid to get the pH 7.4 and make up the final volume to 1 L.

Check and record the details:

Query: In Utility RDS; transformer load looks high?

Response:

Query: In Utility RDS summary sheet; Dual fuel boiler (3000Kg/Hr) and normal boiler (1000 Kg/H) is mentioned but capacity for both is mentioned different, so what capacity is exactly required?

Response:

Query: Black steam is considered for PSG calculation?

Response:

Query: Common load like electric bulb load not considered in RDS as it is mentioned as 0KW

Response: We have considered all equipment load and Lux value is mentioned for each area, please considered electric bulb etc load on standard basis.

Query: For CNC area temperature not given?

Response: We have given temperate range where it is mandatory to control; however for CNC area RT can be considered.

Query: Differential Pressure difference between adjacent areas are always 5 Pascal ,may be it should be min.10 Pascal ,PI check

Response: We have considered DP basis on standard requirements.

Query: Where you use common AHU and where you use individual AHU

Response: AHU zoning layout is pending and in process.

Query: AHU type - CHW OR Dx system

Response:

Query: ACPH of Area is not mentioned in RDS.

Response: To be calculated

Query: AHU Zoning with AHU No.

Response: AHU zoning layout is pending and in process.

CONCENTRATION OF CHROMATOGRAPHY-14E ELUATE 12

FORMULATION 14

CHROMATOGRAPHY-12E

Take the following Fraction-1 from Chromatography-1F run of Plasma fractionation step 4.6.3.

Fraction 1: Take the Fraction 1 and load it on the Chromatography-FE-I column as Run-1. Collect the eluate and store at 2-8°C for processing of F-VIII.

Check and record the following details of Fraction 1:

Under stirring conditions, add Tween 80 to a final concentration of 0.1% to the above collected fraction volumes.

LOAD PREPARATION

Assemble PA-PO-007 filter and record the following details:

No. of filter(s) used: _____.

Equilibrate the filter by passing 0.5 L FE-RR-18 at 0.5 bar pressure.

Volume of FE-RR-18 used: _____ L.

Start filtration of the peak-1 fraction 1 at a pressure below 1.0 bar.

Total filtration time: _____.

After completion of the filtration, pass 0.5 L FE-RR-18 to flush out the protein solution.

Volume of FE-RR-18 used: _____ L.

Record the Chromatography-I load details:

Collect 10 mL of the Fraction 1 sample and send the sample to QC for in-process QC analysis. Record the obtained results as per the QC report:

pH: _____, Conductivity: _____ mS/cm.

Switch on the chromatography system. When the chromatography system is ready, open the UNICORN software.

Connect the column to the chromatography system and check the column connections to the system. Check for instrument air connection at 6 bar to the system.

Column Cleaning and Wash

Pass 2 CVs of WFI through the column at 32.7ml/min till the conductivity has dropped below 1.0 mS/cm.

Pass 2 CVs of FE-RR-15 through the column at 32.7ml/min .

Pass 2 CVs of FE-RR-16 through the column at 32.7ml/min .

Pass 2 CVs of WFI through the column at 32.7ml/min .

pH drop

Pass the column with upto 2 CVs of FE-RR-17 (50% gradient of FE-RR-02 against WFI) at a flow rate of 32.7ml/min till the pH has dropped down to 3.50 ± 0.50 . Record the following details:

Column Equilibration

Equilibrate the column with 3 CVs of FE-RR-18 (10% gradient of FE-RR-04 against WFI) at a flow rate of 32.7ml/min .

Loading and Elution

Before loading, Auto Zero the absorbance (A280nm) on the chromatography system and switch on the record button and enter the run details and date.

i) Load the fraction -1 sample as Run-1 at a flow rate of 32.7ml/min .

Pass 3 CVs of Wash-I buffer FE-RR-18 (10% gradient of FE-RR-04 against WFI) at a flow rate of 32.7ml/min .

Pass 3 CVs of Wash-II buffer FE-RR-19 (10% gradient of FE-RR-05 against WFI) at a flow rate of 32.7ml/min .

Pass 3 CVs of elution buffer (FE-RR-06) through the column at 32.7ml/min .

Start collecting the eluate when the absorbance rises from 100 mAU and collect until absorbance drops down to 100 mAU. Record the following details:

Eluate from Run. Check and record the following details.

O.D280/600 : _____. Final Volume: _____L.

Protein concentration: _____. Total protein: _____.

Regeneration

Pass 2 CVs of FE-RR-21(25% gradient of FE-RR-13 against WFI) through the column in reverse flow at 32.7ml/min and hold the column for 30 min.

Storage

Pass 2 CVs of FE-RR-14 through the column at a flow rate of 32.7ml/min and store the column in FE-RR-14.

Volume of FE-RR-14 used: _____ L.

SOLVENT / DETERGENT (S/D) TREATMENT FOR VIRAL INACTIVATION

Take the 1000 ml of plasma equivalent of the Elution sample from step 1.11.7 as Run-1 and add 50 mL/L of FE-RR-07 slowly to the sample under gentle stirring conditions.

Add 15 mL/L of FE-RR-23 slowly to the sample and incubate the sample at RT under gentle stirring conditions for 4 Hours.

CONDUCTIVITY ADJUSTMENT

3.1 After completion of incubation, adjust the conductivity of the Run-1 S/D treated sample to 14 – 17 mS/cm with FE-RR-08.

Collect 10 mL of the conductivity-adjusted sample and send the sample to QC for in-process QC analysis.

Record the obtained results as per the QC report.

pH: _____, Conductivity: _____ mS/cm.

CHROMATOGRAPHY-13E

Switch on the chromatography system. When the chromatography system is ready, open the UNICORN software.

Connect the column to the chromatography system and check the column connections to the system. Check for instrument air connection at 6 bar to the system.

Column Cleaning and Wash

Pass 2 CVs of WFI through the column at 16.40ml/min.

Pass 2 CVs of FE-RR-15 through the column at 16.40ml/min.

Pass 2 CVs of FE-RR-16 through the column at 16.40ml/min.

Pass 5CVs of WFI through the column at 16.40ml/min

Column Equilibration

Equilibrate the column with 3 CVs of FE-RR-20 (10% gradient of FE-RR-03 against WFI) at a flow rate of 16.40ml/min.

Loading and Elution

Before loading, Auto Zero the absorbance (A280) on the chromatography system and switch on the record button and enter the run details and date.

Load the S/D treated eluate obtained from step 3.1 at a flow rate of 16.40ml/min.

Note: NMT 176 mL of plasma per mL of resin.

After loading is completed, pass 15 CVs of FE-RR-20 (10% gradient of FE-RR-03) at a flow rate of 16.40ml/min

Pass 3 CVs of elution buffer (FE-RR-09) through the column at 16.40ml/min

Start collecting the eluate when the absorbance rises from 10 mAU and collect until absorbance drops down to 10 mAU.

Record the volume of eluate: _____ L

Regeneration

Pass 2 CVs of FE-RR-21 (25% gradient of FE-RR-13 against WFI) through the column in reverse flow at 16.40ml/min and hold the column for 30 minutes.

Storage

Pass 2 CVs of FE-RR-14 through the column at a flow rate of 16.40ml/min and store the column in FE-RR-14.

Volume of FE-RR-14 used: _____ L.

CONCENTRATION OF CHROMATOGRAPHY-13E ELUATE

Take the chromatography-13E pooled eluate sample from step 4.5.6 and record the following details:

pH: _____, Conductivity: _____ mS/cm.

O.D280/600 : _____, Volume: _____.

NWP calculation before concentration

Record the following details of the TFF cassettes connected in series horizontally to the TFF system:

No. of cassettes used: _____, Cassette ID Nos.: _____.

Wash the cassettes with WFI till conductivity reaches to < 0.1mS/cm and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Volume of WFI used: _____ L.

Check and record the details as below:

Concentration of Eluate sample

After NWP calculation, flush the cassettes with FE-RR-09 till conductivity reaches to 52 to 53 mS/cm.

Volume of FE-RR-09 used: _____ L.

Concentrate the eluate sample to 10 folds at a set TMP of ≤ 1.0 bar.

Check and record the details as below:

Unload the concentrated sample and record the following details:

pH: _____, Conductivity: _____ mS/cm.

O.D280/600 : _____, Volume: _____.

Regeneration

Flush the cassettes with WFI and then with FE-RR-25 and carry out recirculation for 30 to 45 min.

Volume of FE-RR-25 used: _____ L.

Post NWP calculation

Repeat the step as 5.2.2 and record the details as below. Check if NWP is ≥ 120 LMH/Bar. If not, carry out the regeneration procedure again.

Storage

Flush the cassettes with FE-RR-14 and finally store the cassettes in FE-RR-14 at RT

Volume of FE-RR-14 used: _____ L.

CHROMATOGRAPHY-14E

Switch on the chromatography system. When the chromatography system is ready, open the UNICORN software.

Connect the column to the chromatography system and check the column connections to the system. Check for instrument air connection at 6 bar to the system.

Record the following details:

Column Height: _____ cm, Column Volume: _____ L,

HETP value: _____, Asymmetry: _____.

Column Cleaning and Wash

Pass 2 CVs of FE-RR-22(10% gradient of FE-RR-13 against WFI) through the column at a flow rate of 15 LPH and hold the column for 30 minutes.

Volume of FE-RR-22 used: _____ L.

Pass upto 5 CVs of WFI through the column at 15 LPH till the conductivity has dropped below 1.0 mS/cm.

Volume of WFI used: _____ L, Conductivity: _____ mS/cm

Pass 2 CVs of FE-RR-16 through the column at a flow rate of 15 LPH.

Volume of FE-RR-16 used: _____ L.

Pass upto 5 CVs of WFI through the column at 15 LPH till the conductivity has dropped below 0.1 mS/cm.

Volume of WFI used: _____ L, Conductivity: _____ mS/cm.

Column Equilibration

Equilibrate the column with 3 CVs of FE-RR-11 at a flow rate of 15 LPH.

Check and record the details

pH: _____, Conductivity: _____ mS/cm,

Volume of FE-RR-11 used: _____ L.

Loading and Elution

Before loading, Auto Zero the absorbance (A280) on the chromatography system and switch on the record button and enter the run details and date.

Note: Loading should not exceed 12.5% of column volume

(NMT 0.75 L per injection).

Load the concentrated chromatography-13E eluate obtained from step 5.3.4 at a flow rate of 15 LPH.

Check and record the details below.

After loading is completed, pass 2 CVs of FE-RR-11 at a flow rate of 15 LPH.

Start collecting the eluate when the absorbance rises from 5 mAU and collect until absorbance drops down to 5 mAU.

After conductivity peak comes down repeat steps 6.6.2 to 6.6.5 for Inj 2 and record the results in the above table.

After conductivity peak comes down repeat steps 6.6.2 to 6.6.5 for Inj 3 and record the results in the above table.

After conductivity peak comes down repeat steps 6.6.2 to 6.6.5 for Inj 4 and record the results in the above table.

Pool the eluates from injection1 to 4 from step 6.6.5.

Final Volume of Pooled eluate : _____ L.

Collect 12 mL of the sample and send the sample to QC for in-process QC analysis and record the obtained results as per the QC report.

pH: _____, Conductivity: _____ mS/cm.

Activity (IU/mL) _____ :

Regeneration

Pass 2 CVs of FE-RR-22(10% gradient of FE-RR-13 against WFI) through the column in reverse flow at 15 LPH.

Volume of FE-RR-22 used: _____ L.

Storage

Pass 2 CVs of FE-RR-14 through the column at a flow rate of 15 LPH and store in FE-RR-14.

Volume of FE-RR-14 used: _____ L.

STABILIZER ADDITION

Take the pooled chromatography-14E eluate volume from step 6.6.6 and add 80 mL/L of FE-RR-10.

Volume of FE-RR-10 added: _____ L.

Final Volume of the Eluate: _____ L.

Add 10 mL of Human Serum Albumin (HSA-20%) to the above sample and record the following details:

Volume of 20% HSA added: _____.

OD280/600: _____, Final Volume: _____ L,

pH: _____, Conductivity: _____ mS/cm.

If the pH of the pooled eluate is above 6.90, adjust to 6.70 - 6.80 with FE-RR-24.

pH: _____, Volume of FE-RR-24 used: _____ L.

CONCENTRATION OF CHROMATOGRAPHY-14E ELUATE

Take the pooled eluate sample from step 7.2 and carry out the concentration of the sample.

NWP calculation before concentration

Record the following details of the TFF cassettes connected in series horizontally to the TFF system:

No. of cassettes used: _____, Cassette ID Nos.: _____.

Wash the cassettes with WFI till conductivity reaches below 0.1mS/cm and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Volume of WFI used: _____ L.

Check and record the details as below:

Concentration of Eluate sample

After NWP calculation, flush the cassettes with FE-RR-11 till the conditions of the buffer are attained.

Volume of FE-RR-11 used: _____ L.

Concentrate the eluate sample to the activity of > 40 IU/mL, at a set TMP of ≤ 1.0 bar.

Check and record the details as below:

Unload the concentrated sample and record the following details:

pH: _____, Conductivity: _____ mS/cm.

O.D.280/600: _____. Final Volume: _____.

Regeneration

Flush the cassettes with WFI and then with FE-RR-25 at 40 - 45°C and carry out recirculation for 30 to 45 min.

Volume of FE-RR-25 used: _____ L.

Post NWP calculation

Repeat the step as 8.2.2 and record the details as below. Check if NWP is ≥ 120 LMH/Bar. If not, carry out the regeneration procedure again.

Storage

Flush the cassettes with FE-RR-14 and finally store the cassettes in FE-RR-14.

Volume of FE-RR-14 used: _____ L.

FORMULATION

After concentration, add L-Arginine Hydrochloride and Sucrose to a final concentration of 100mM and 1% respectively.

Quantity of L-Arginine Hydrochloride added: _____

Quantity of Sucrose added: _____

Add and adjust the concentration of HSA-20% to a final concentration of 10 mg/mL of the concentrated sample volume

Volume of HSA-20% added before concentration in step 7.2 : _____.

Volume of HSA-20% added after concentration: _____.

Check and record the following details.

pH: _____, Conductivity: _____ mS/cm.

O.D280/600: _____. Final Volume: _____.

Reagent Details:
Preparation of FE-RR-08 buffer with Stock FE-RR-03.
Formula & Calculations:
Formula: $M_1 \times V_1 = M_2 \times V_2$.
Calculation: To prepare 1 L of 2mM sodium citrate from 0.2M sodium citrate stock solution calculate quantity required of stock solution as below:
 $0.2\text{M sodium citrate stock solution required quantity} = 0.002 \times 1 / 0.2 = 0.01\text{L}$
Preparation Method:
To prepare 2mM sodium citrate 1L solution from 0.2M sodium citrate stock solution formula is M_1 (Molarity of stock) $\times V_1$ (volume of stock) = M_2 (Molarity of working) $\times V_2$ (volume of working).
Take 0.01L of 0.2M sodium citrate solution and make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 2mM sodium citrate
Take 0.01L $\times$ _____ L = _____ L of 0.2M sodium citrate
Make sodium hydroxide solution to _____ L solution.
Adjust the pH with citric acid or sodium citrate to pH 7.0
Check and record the details:
Preparation Details:

| |

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.4M Sodium Acetate (MW = 80.03 g/mol)
Weight of solute(g)=0.4×80.03 = 32.01g.
Preparation Method:
Weigh 32.01g of Sodium Acetate and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.4M Sodium Acetate (MW = 80.03 g/mol).
Weight of solute(g)=0.4×80.03 x _____L= _____gm
Weigh _____gm of Sodium Acetate and dissolve in water to make a _____ L solution.
Check and record the details:
Preparation Details:
Name of Reagent | Grade / Purity | Manufacturer / Supplier | Lot / Batch No | Storage Condition | Expiry
Date
0.4M Sodium Acetate | | | |
Final volume prepared | Weighed Quantity | pH(8.7 ±0.2) | Conductivity (4.7 ±0.2ms/cm) | Storage
Condition:

Reagent Details:

Formula & Calculations:

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.5M sodium chlorolride (MW = 58.44g/mol)

Weight of solute(g)=1×29.22=29.22g.

Preparation Method:

Weigh 29.22g of sodium chloride

To prepare 20mM Tris 1L solution from 1M Tris stock solution formula is $M_1(\text{Molarity of stock}) \times V_1$

(volume of stock)= $M_2(\text{Molarity of working}) \times V_2(\text{volume of working})$.

Take 20mL of 1M tris solution and add weighed amount of sodium chloride as required and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 0.5M NaCl(MW = 58.44g/mol).

Weight of solute(g)=29.22 _____ L= _____ gm

Weigh _____ gm of NaCl.

To prepare _____ of 20mM Tris

Take 20mL x _____ L= _____ mL of 1M Tris

Dissolve pre weighed NaCl in 20mM Tris solution to make a _____ L solution.

Adjust the pH to 8 using concentrated HCl/NaOH solution

Check and record the details:

Reagent Details:

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 0.4 M.

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 0.4 M acetic acid.

V₂ = final total volume of working solution for one liter.

V₁ = (C₂ x V₂)/C₁.

C₂=0.4 M; V₂= 1.0 L; C₁=17.5 M

V₁ = (0.4 x 1.0)/17.5

V₁ = 0.0228 L

Take 0.0228 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 0.4M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ _____ x V₂ _____) /17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Check and record the details:

Preparation Details:

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.6M Sodium Acetate (MW = 80.03 g/mol)
Weight of solute(g)=0.6×80.03 = 48.018g.
Preparation Method:
Weigh 48.01g of Sodium Acetate and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.6M Sodium Acetate (MW = 80.03 g/mol).
Weight of solute(g)=0.6×80.03 x _____L= _____gm
Weigh _____gm of Sodium Acetate and dissolve in water to make a _____ L solution.
Check and record the details:

Reagent Details:

Formula:

Glycine (M.Wt): 75.07 g/mol
 Calcium Chloride (M.Wt): 110.98 g/mol
 PEG 200 : (M.Wt): 200 g/mol
 0.01% Tween 80

Preparation of FE-RR-012 buffer.

Preparation of reagent :25 mM Glycine +0.52 mM PEG + 5 mM Calcium Chloride + 0.0025%Tween 80 pH 7.0

Calculations: To prepare the 5mM Calcium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 5 mM Calcium Chloride (MW = 110.98g/mol)

Weight of solute(g)=0.005×110.98 x1=0.554g.

Preparation Method:

Weigh 0.554g of Calcium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.005mM Calcium Chloride (MW =110.98 g/mol).

Weight of solute(g)=0.005 ×110.98x _____ L= _____ g.

Weigh _____ gm of Calcium Chloride and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.52mM PEG 200.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.52 mM PEG (MW = 200g/mol)

Weight of solute(g)=0.00052×200 x1=0.104g.

Preparation Method:

Weigh 0.104g of PEG and dissolve it in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.00052mM PEG (MW =200g/mol).

Weight of solute(g)=0.00052 ×200x _____ L= _____ g. Weigh _____ gm of PEG and

dissolve in water to make a _____ L solution.

Procedure

Calculation: to prepare the 0.0025% Tween 80:

For 1000 mL of 0.0025% solution:

0.0025% =0.0025g per 100ml & 1000 mL=25 mg

Since Tween 80 is a liquid, you can weigh it directly or use its density

(~1.06

g/mL) to measure volume:

Approx. 25 µL of Tween 80 = 0.025 g

Add Tween 80 to a beaker or flask containing ~800 mL of water.

Mix thoroughly:

Use a magnetic stirrer or vortex until fully dissolved. Tween 80 is viscous,

so mixing may take a few minutes.

Calculations: To prepare the 25mM Glycine.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol)

×Volume (L).

Calculation: To prepare 1 L of 0.025M Glycine (MW = 75.07g/mol)

Weight of solute(g)=0.025×75.07 x1=1.876g.

Preparation Method:

Weigh 1.876g of Glycine and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.025M Glycine (MW =75.07g/mol).

Weight of solute(g)=0.025 ×75.07x _____ L= _____ g.

Weigh _____ gm of Glycine and dissolve in water to make a _____ L solution.

Adjust volume:

After complete dissolution, bring the final volume up to 1000 mL with water.

Procedure for Preparation of FE-RR-12 buffer.

To prepare a 1 L solution, take this add 5mM Calcium chloride, and then to this add 25mM Glycine and to

this add 0.52mM PEG and to this add the 0.0025% Tween 80 then mix the solution till it dissolves and

check the pH; if the pH is less than 7.0 then adjust the pH with 1 M sodium hydroxide to get the pH 7.0

±0.1 and make up the final volume to 1L.

Check and record the details:

Preparation Details:

Contact Details:

1. Dr. Ganesh Kumraj: ganesh@biobridge.in

Technical Information # BB-LN/IND/003

Reagent Details:

Formula:

Sodium Citrate (M.Wt): 258.07.

Citric acid (M.Wt): 192.124

Sodium Chloride (M.Wt): 58.44

Calcium Chloride (M.Wt): 110.98

0.1% Tween 80

Preparation of FE-RR-05 buffer with Stock FE-RR-03.

Preparation of 20mM sodium citrate pH 7.0 + 0.18M sodium chloride +2.6mM calcium chloride + 0.1% tween 80.

Stock Buffer (FE-RR-03):0.2M Sodium Citrate pH 7.0

Formula:

$$C1 \times V1 = C2 \times V2$$

C1 = concentration of stock

V1 = volume of stock you need to take

C2 = desired (working) concentration

V2 = final total volume of working solution

Applying the formula to prepare the working buffer:

$$C1 \times V1 = C2 \times V2$$

C1 = 0.2M Sodium Citrate pH 7.0

V1 = volume of stock you need to take _____ L.

C2 = desired (working) concentration 20mM Sodium Citrate, pH 7.0

V2 = final total volume of working solution _____ L.

$$V1 = (C2 \times V2) / C1$$

$$C2 = 0.02M ; V2 = 1.0 L ; C1 = 0.2M$$

$$V1 = (0.02 \times 1.0) / 0.2$$

$$V1 = 0.1L$$

Take 0.1 L (FE-RR-03) Stock buffer solution and dilute with water, and make up to 1L.

Calculations: To prepare the 0.18M Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.18M Sodium Chloride (MW = 58.44 g/mol)

$$\text{Weight of solute(g)} = 0.18 \times 58.44 \times 1 = 10.52g.$$

Preparation Method:

Weigh 10.52 g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.18M Sodium Chloride (MW = 58.44 g/mol).

$$\text{Weight of solute(g)} = 0.18 \times 58.44 \times \text{L} = \text{g}.$$

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Calculations: To prepare the 2.6mM Calcium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 2.6 mM Calcium Chloride (MW = 110.98g/mol)

$$\text{Weight of solute(g)} = 0.0026 \times 110.98 \times 1 = 0.288g.$$

Preparation Method:

Weigh 0.288g of Calcium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.0026mM Calcium Chloride (MW =110.98 g/mol).

$$\text{Weight of solute(g)} = 0.0026 \times 110.98 \times \text{L} = \text{g}.$$

Weigh _____ gm of Calcium Chloride and dissolve in water to make a _____ L solution.

Procedure

Calculation: to prepare the 0.1% Tween 80:

For 1000 mL of 0.1% solution:

$$0.1\% = 0.1g \text{ per } 1000 \text{ mL} = 1000 \text{ mg}$$

Since Tween 80 is a liquid, you can weigh it directly or use its density (~1.06 g/mL) to measure volume:

$$\text{Approx. } 100 \mu\text{L of Tween 80} = 1.0 \text{ g}$$

Add Tween 80 to a beaker or flask containing ~800 mL of water.

Mix thoroughly:

Use a magnetic stirrer or vortex until fully dissolved. Tween 80 is viscous, so mixing may take a few minutes.

Adjust volume:

After complete dissolution, bring the final volume up to 1000 mL with water.

Procedure for Preparation of FE-RR-05 buffer with the stock FE-RR-03.

To prepare a 1 L solution, take 0.2M Tri Sodium Citrate pH 7.0. To this, add the 0.18M sodium chloride

and dissolve it and make up the volume with water to 900ml, and then to this add 0.026 M Calcium

chloride, to this add the 0.1% Tween 80 then mix the solution till it dissolves and check the pH; if the

pH is less than 7.0 then adjust the pH with 1 M sodium hydroxide to get the pH 7.0 ±0.1 and make up the

final volume to 1L.

Check and record the details:

Preparation Details:

Application for Consent/ Authorisation

Sir,

I/We hereby apply for*

1. Consent to Establish/Operate/Renewal of consent under section 25 and 26 of the Water (Prevention & Control of Pollution) Act, 1974 as amended.
2. Consent to Establish/Operate/Renewal of consent under Section 21 of the Air (Prevention and Control of Pollution) Act, 1981, as amended.
3. Authorization/renewal of authorization under Hazardous and Other Wastes (Management and Transboundary Movement) Rules, 2016 in connection with my/our/existing/proposed/alterd/ additional manufacturing/processing activity from the premises as per the details given below.

Consent Information

UAN No: Application submitted on:
MPCB-CONSENT-0000274336 15-01-2026

Industry Information

Consent To: IIN No.: Submit to:
Establish (New) SRO - Chhatrapati
Sambhajanagar I

PRECIPITATION OF FRACTION-2 FROM CHROMATOGRAPHY -1F 3

CONCENTRATION AND DIAFILTRATION 4

SOLVENT / DETERGENT (S/D) TREATMENT FOR VIRAL INACTIVATION 6

CHROMATOGRAPHY-11FB 6

CONCENTRATION AND DIAFILTRATION OF CHROMATOGRAPHY-11FB ELUATE 8

DS SAMPLE DETAILS.....10

PRECIPITATION OF FRACTION-2 FROM CHROMATOGRAPHY-1F.

Collect 8 injections, Fraction-2 from Chromatography-1F.

Check and record the following details:

Total Volume of Fraction-2 _____ L.

Visual Appearance: _____, O.D280/600: _____.

To the above collected Fraction-2 and add FG-RR-03 to raise the conductivity to 100 ± 10 mS/cm.

Volume of FG-RR-03 used: _____ L.

Adjust the pH to 4.00 ± 0.2 with FG-RR-01 and record the details.

pH: _____, Conductivity: _____ mS/cm.

O.D280/600: _____, Volume of FG-RR-01 used: _____ L.

Under stirring conditions, incubate the above sample for 3 hours at RT.

Incubation time: _____; O.D280/600: _____.

Collection of Slurry from Precipitated Sample

Reinsert the Falcon with buffer FG-RR-06 and pour the sample into the Falcon, and place the Falcon in the high-speed Centrifuge and operate it at a speed of 9100 rpm.

Speed: _____ rpm,

Collect the slurry into a Falcon and record the volume of slurry collected.

Volume of Slurry collected: _____ L.

Add 12.5% of the volume of FG-RR-04 to a final volume of the slurry collected from step 1.6.2.

Volume of FG-RR-04 used: _____ L.

Adjust pH of the suspended slurry with FG-RR-15 to 7.5 ± 0.1

Final pH: _____, Cond.: _____ mS/cm.

Volume of FG-RR-15 used: _____ L

Resuspend the pH-adjusted slurry with FG-RR-06 in the ratio of 1:2 volumes.

Volume of FG-RR-06 used: _____ L.

Under stirring conditions, incubate the sample for 1 hour at RT.

Incubation time: _____

Filtration

Pass the resuspended slurry through PA-PO-008 filter and record the results below

Note: Divide the obtained value of O.D280 by the extinction coefficient of 1.51 to obtain protein concentration in mg/mL.

CONCENTRATION AND DIAFILTRATION

Take the filtered sample from step 1.7.1 for concentration.

2.2 NWP calculation before concentration

Record the following details of the TFF cassettes connected in series horizontally to the TFF system:

No. of cassettes used: _____, Cassette ID Nos.: _____.

Wash the cassettes with WFI and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Volume of WFI used: _____ L.

Check and record the details as below:

Concentration of filtrate sample

After NWP calculation, flush the cassettes with FG-RR-10.

Volume of FG-RR-10 used: _____ L.

Concentrate the filtrate sample to 1.5-fold to 2-fold at a set TMP of ≤ 1.0 bar.

Final Volume: _____ L.

Check and record the details as below

Diafiltration

Collect the concentrated sample from step 2.3.2. and diafilter the

sample with 5 DF volumes using FG-RR-10.

Volume of FG-RR-10 used (L): _____

Unload the diafiltered sample. Check and record the following details

Regeneration

After unloading the concentrated sample, flush the cassettes with ambient WFI and then with FG-RR-15 at 40 to 45°C . Recirculate the cassettes with FG-RR-15 at 40°C to 45°C for 30 - 45 min.

Volume of FG-RR-15 used (L): _____.

Post-NWP calculation

Repeat the step as in 2.2.2 and record the details as below. Check if NWP is ≥ 120 LMH/Bar. If not, carry out the regeneration procedure again.

Storage

Flush the cassettes with FG-RR-14 and finally store the cassettes in FG-RR-14.

Remove the cassettes from the system, immerse in FG-RR-14 and store at $2-8^\circ\text{C}$.

Volume of FG-RR-14 used: _____ L.

SOLVENT / DETERGENT (S/D) TREATMENT FOR VIRAL INACTIVATION

Note: The amount of FG-RR-07 (20% stock solution) to be added to a final concentration of 1% (v/v) and FG-RR-08 (20% stock solution) to be added to a final concentration of 0.3% (v/v) is based on the sample volume.

Take the diafiltered sample from step 2.4.2 equivalent to 1 gram of protein/L/L of resin for Run and keep on the magnetic stirrer for thorough mixing, and store the remaining eluate at 2 to 8°C .

FG-RR-07 is added slowly to the diafiltered sample under gentle stirring conditions.

Then add FG-RR-08 slowly to the sample under gentle stirring conditions.

Incubate the sample at RT for 4 hours under stirring conditions and record the details below.

Repeat the steps from 3.1 to 3.3 for Run 2 and record the details in the above table.

CHROMATOGRAPHY-11FB

Switch on the chromatography system. When the chromatography system is ready, open the UNICORN software.

Connect the column to the chromatography system and check the column connections to the system. Check for instrument air connection at 6 bar to the system.

Record the following column details

Column Height: 20 cm, Column Volume: 393 ml,

HETP value: _____, Asymmetry: _____.

Column Wash

Pass 2 CVs of WFI through the column at 39.30 ml/min till the conductivity has dropped. Volume of WFI used

; _____ L.

pH Drop
 Pass 1.5 CVs of FG-RR-09 through the column at 39.30 ml/min.
 Volume of FG-RR-09 used: _____ L.
 Column Equilibration
 Equilibrate the column with 3 to 4 CVs of FG-RR-10 at a flow rate of 39.30 ml/min.
 Volume of FG-RR-10 used: _____ L.
 Loading and Elution
 Before loading, Auto Zero the absorbance (A280) on the chromatography system and switch on the record button, and enter the run details and date.
 Load the S/D treated sample obtained from step 3.4 at a flow rate of 39.30 ml/min. Volume of Load: _____.
 Note: Loading should be NMT 1 mg of protein / mL of resin.
 After loading is completed, pass 9 CVs of FG-RR-10 at a flow rate of 39.30 ml/min. Volume of FG-RR-10 used: _____.
 Pass 2 to 3 CVs of FG-RR-11 through the column at 39.30 ml/min.
 Volume of FG-RR-11 used: _____.
 Start collecting the eluate when the absorbance rises from 0.05 AU and collect until absorbance drops to 0.05 AU.
 Check and record the following details:
 Note: Divide the obtained value of O.D280 by the extinction coefficient of 1.51 to obtain protein concentration in mg/mL.
 Regeneration
 Pass 2 CVs of FG-RR-15 (25% gradient of FG-RR-13 against WFI) through The column in reverse flow at 39.30 ml/min.
 Volume of FG-RR-15 (L) used: _____
 Repeat steps 4.4 to 4.8 for Run2 and record the results in the above table.
 Storage
 Pass 2 CVs of FG-RR-14 through the column at a flow rate of 39.30 ml/min and store the column in FG-RR-14. Volume of FG-RR-14 used: _____ L
 Disconnect the column and store at 2-8 °C.
 CONCENTRATION AND DIAFILTRATION OF CHROMATOGRAPHY-11FB ELUATE
 The chromatography-11FB eluates from step 4.7.6 and record the following details.
 Note: Divide the obtained value of O.D280 by the extinction coefficient of 1.51 to obtain protein concentration in mg/mL.
 NWP calculation before concentration
 Record the following details of the TFF cassettes connected in series horizontally to the TFF system:
 No. of cassettes used: _____, Cassette ID Nos.: _____.
 Wash the cassettes with WFI and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.
 Volume of WFI used: _____ L.
 Check and record the details as below:
 Concentration of Eluate sample
 After NWP calculation, flush the cassettes with FG-RR-11.
 Volume of FG-RR-11 used: _____ L.
 Concentrate the eluate sample to 12 to 16 mg/mL, at a set TMP of ≤ 1.0 bar.
 Collect and send 2 mL of the sample for in-process QC analysis.
 Record the obtained results as per the QC report:
 Protein Conc. (mg/mL): _____ .BET: _____.
 Concentrate the above sample from step 5.3.2 further to 35 to 50 mg/mL, at a set TMP of ≤ 1.0 bar.
 Check and record the details as below:
 Unload the concentrated sample and record the following details.
 Note: Divide the obtained value of O.D280 by the extinction coefficient of 1.51 to obtain protein concentration in mg/mL.
 Regeneration
 Flush the cassettes with ambient WFI and then with FG-RR-15, and carry out recirculation for 30 to 45 min.
 Volume of FG-RR-15 used: _____ L.
 Finally, wash the cassettes with ambient WFI.
 Volume of WFI used : _____ L
 Post-NWP calculation
 Repeat step 5.2.2 and record the details as below. Check if NWP is ≥ 120 LMH/bar if not, carry out the regeneration procedure again.
 Storage
 Flush the cassettes with FG-RR-14 and finally store the cassettes in FG-RR-14.
 Remove the cassettes from the system, immerse in FG-RR-14 and store at 2-8°C.
 Volume of FG-RR-14 used: _____ L.
 DS SAMPLE DETAILS:
 Record the QC Analysis report.
 Storage of the DS sample:
 Label the sample and store the DS sample in the -20°C freezer.

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.1N Sodium Chloride (MW = 58.44 g/mol)
Weight of solute(g)=0.1×58.44 = 5.844g.
Preparation Method:
Weigh 5.844 g of Sodium Chloride and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.1N Sodium Chloride (MW = 58.44 g/mol).
Weight of solute(g)=0.1×58.44 x _____L= _____gm
Weigh _____gm of Sodium Chloride and dissolve in water to make a _____ L solution.

9 PRA-SF-001 FILTRATION 15

1 CONCENTRATION OF ELUATE FROM CHROMATOGRAPHY-2F OF PLASMA FRACTIONATION

Take the eluate sample from Chromatography-2F of Plasma fractionation step 5.10 of Plasma Fractionation Stages.

Check and record the details:

Dilute the eluate with FN-RR-02 to obtain conductivity of 10 – 11 mS/cm.

NWP calculation before concentration

Record the following details of the TFF cassettes connected in series horizontally to the TFF system:

No. of cassettes used: _____,

Cassette ID Nos.: _____.

Wash the cassettes with 10 L of ambient WFI and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Volume of ambient WFI used for Run: _____ L,

Check and record the details as below:

Concentration of Eluate sample

After NWP calculation, flush the cassettes with FN-RR-02.

Volume of FN-RR-02 used for Run: _____ L.

Concentrate the eluate sample to 7 to 9 folds based on plasma equivalent volume loaded on Chr.-PF-2F column; at a set TMP of ≤ 1.0 bar and Pump Speed of Run : _____ %.

Check and record the details as below:

Check and record the retentate details as below:

OD280/600: Run: _____,

pH: Run: _____,

Conductivity: Run : _____ mS/cm.

Regeneration

After unloading the concentrated sample, flush the cassettes with 10 L of ambient

WFI. Volume of WFI used for flush: Run : _____ L,

Then flush the cassettes with 80 L of FN-RR-01 at 40 to 45°C.

Volume of FN-RR-01 used: Run : _____ L, Temp. of FN-RR-01: Run: _____ °C.

Recirculate the cassettes with 10 L of FN-RR-01 at 40°C to 45°C for 30 - 45 min.

Volume of FN-RR-01 used: Run : _____ L,

Temp. of FN-RR-01: Run : _____ °C.

Finally wash the cassettes with 10 L of ambient WFI.

Volume of ambient WFI used: Run 1: _____ L.

Post NWP calculation

Repeat the step as in 1.4.2 and record the details as below. Check if NWP is ≥ 120 LMH/Bar. If not, carry out the regeneration procedure again.

Storage

Wash the cassettes with 5 L of FN-RR-17 and finally remove the cassettes and store in FN-RR-17. Volume of FN-RR-17 used: _____ L.

FILTRATION

2.1 Filter the Run concentrated sample through PRA-PO-003 filter. Collect the filtrate into a sterile vessel.

Check and record the following details:

Filtrate volume: Run : _____ L.

pH: Run : _____,

Conductivity: Run : _____ mS/cm,

OD280/600: Run : _____.

VIRUS INACTIVATION BY S/D TREATMENT

Note: The volume of FN-RR-19 (20% stock solution) and FN-RR-20 (20% stock solution) to be added to a final concentration of 1.05% (v/v) and 0.35% (v/v) respectively is based on the volume of FIX solution.

FN-RR-19 is added slowly to the run wise filtered sample under gentle stirring condition and continue stirring till the solution is homogenous.

Volume of FN-RR-19 used: Run : _____ L,

FN-RR-20 is added slowly to the sample under gentle stirring condition and continue stirring till the solution is homogenous.

Volume of FN-RR-20 used: Run: _____ L.

Incubate the sample under stirring condition at $25 \pm 1^\circ\text{C}$ for 4 hours.

Incubation temperature: Run : _____ °C.

Incubation time: Run : _____.

CHROMATOGRAPHY – 8N

Connect the column to the chromatography system and check the column connections to the system. Open the software.

Record the following details:

Column height: 15 cm, Column Volume: 79.60 L,

HETP value: _____, Asymmetry: _____.

Column Wash

Wash the column with up to 2 CVs of ambient WFI at a flow rate of 8.84ml/min till the conductivity drops below 1.0 ± 0.1 mS/cm. Volume of WFI used:

Run : _____ L,

pH drop

Wash the column with upto 2 CVs of FN-RR-05 at a flow rate of 8.84ml/min till pH has dropped down to 6.50 ± 0.20 . Volume of FN-RR-05 used: Run: _____ Final pH of the column: _____,

Column Equilibration

Equilibrate the column with upto 3 CVs of FN-RR-09 at a flow rate of 8.84ml/min .

Check and record the final pH: Run: _____,

Conductivity: Run : _____ mS/cm.

Volume of FN-RR-09 used: Run: _____ L

Sample preparation for loading

Check and record the conditions of virus inactivated sample from step 3.3:

pH: Run: _____.

Conductivity: Run : _____ mS/cm.

O.D. at 600 nm: Run: _____.

Volume: Run: _____ L.

Adjust the pH to 7.40 ± 0.10 with FN-RR-18.

Check and record the conditions below:

Volume of FN-RR-18 used: Run : _____ L.

O.D. at 600 nm: Run: _____.

Total Volume: Run : _____ L

pH: Run : _____.

Conductivity: Run : _____ mS/cm

ml of plasma load / ml of resin: _____. (Limit: ≤ 90 ml/ml).

Loading

Before loading, switch on the 'Record On' button and enter the run details and date. Auto Zero the absorbance at 280 nm on the chromatography system.

Load the sample at a flow rate of 8.84ml/min .

Wash-I

After loading is completed, wash the column with upto 2 CVs of FN-RR-09 at a flow rate of 8.84ml/min .

Record the following details:

Volume of FN-RR-09 used: Run : _____ L.

Wash II

After the A280 has reached the base line, pass upto 2 CVs of FN-RR-10 at a flow rate of 8.84ml/min .

Volume of FN-RR-10 used: Run : _____ L.

Elution

After the A280 has reached the base line, pass upto 2 CVs of FN-RR-11 at a flow rate of 8.84ml/min .

Collect eluate when the A280 reaches 10 mAU and collect the total peak till A280 drops down to 10 mAU.

Check and record the following eluate conditions:

OD280/600: Run : _____.

pH: Run : _____.

Cond.: Run : _____ mS/cm.

Volume of FN-RR-11 used: Run: _____ L.

Eluate vol.: Run : _____ L.

Protein conc.: Run : _____ mg/ml,

Total protein: Run : _____ g.

Cleaning

Clean the column by passing upto 2.0 CVs of FN-RR-12 at a flow rate of 8.84ml/min . Volume of FN-RR-12 used: Run : _____ L.

Regeneration

Wash the column by passing upto 2.0 CVs of ambient WFI at a flow rate of 8.84ml/min till the conductivity drops below 1.0 ± 0.1 mS/cm. Volume of WFI used: Run : _____ L.

Regenerate the column by passing upto 2.0 CVs of FN-RR-13 at a flow rate of 8.84ml/min and hold for 30 – 45 minutes.

Volume of FN-RR-13 used: Run : _____ L.

4.13.3 Wash the column by passing upto 2.0 CVs of ambient WFI at a flow rate of 8.84ml/min till the conductivity drops below 1.0 ± 0.1 mS/cm.

Volume of WFI used: Run : _____ L.

Storage

Store the column (at room temp.) by passing 2.0 CVs of FN-RR-14 at a flow rate of 8.84ml/min . Volume of FN-RR-14 used: _____ L.

Enter the process details as below:

CONCENTRATION OF ELUATE FROM CHROMATOGRAPHY-8N

Check and record the following details:

Eluate vol.: Run : _____ L.

pH: Run : _____.

Cond.: Run : _____ mS/cm.

OD280/600: Run: _____.

NWP calculation before concentration

Record the following details of the TFF cassettes connected in series horizontally to the TFF system:

No. of cassettes used: _____.

Cassette ID Nos.: _____.

Wash the cassettes with WFI and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Volume of WFI used: Run : _____ L.

Check and record the details as below:

Concentration of Eluate sample

After NWP calculation, flush the cassettes with 10 L of FN-RR-11 of Chromatography-FN-I. Volume of FN-RR-11 used: Run : _____ L.

Concentrate the eluate sample to ≤ 10 mg/ml protein concentration at a set TMP of ≤ 1.0 bar. Flush the cassettes with FN-RR-11.

Check and record the details as below:

Unload the concentrated sample after obtaining the required protein concentration. Check and record the following details:

Volume of Retentate: Run: _____ L.

O.D.280/600: Run : _____.

Note: The time for concentration of Chromatography-FN-I Eluate and loading on Chromatography-FN-II should not exceed 6 hrs.

Regeneration

Flush the cassettes with 10 L of WFI and then with 10 L FN-RR-01 at $40 - 45^\circ\text{C}$ and carry out recirculation for 30 to 45 min.

Volume of FN-RR-01 used: Run : _____ L.

Post NWP calculation

Repeat the step as 5.1.1 and record the details as below. Check if NWP is ≥ 120 LMH/Bar. If not, carry out the regeneration procedure again.

Storage

Flush the cassettes with 5 L of FN-RR-17 and finally remove the cassettes and store in FN-RR-17 at $2 - 8^\circ\text{C}$. Volume of FN-RR-17 used: _____ L.

CHROMATOGRAPHY – 9N

Connect the column to the AKTA process chromatography system and check the column connections to the system. Check for instrument air connection at 6 bar to the system. Open the UNICORN software.

Record the following column details:

Column height: _____ cm, Column Volume: _____ L,

HETP value: _____, Asymmetry: _____.

Column Wash

Wash the column with upto 2.0 CVs of ambient WFI at a flow rate of 0.8 ml/min till the conductivity has dropped below 1.0 ± 0.1 mS/cm.

Volume of WFI used: _____ L, Conductivity: _____ mS/cm

Column Equilibration (With Formulation buffer)

Equilibrate the column with 2 - 3 column volumes of FN-RR-15 at a flow rate of 0.8 ml/min .

Check and record the final pH: _____,

Conductivity: _____ mS/cm,

Volume of FN-RR-15 used: _____ L.

Load Details

Take the pooled concentrated Chromatography-FN-I eluate as a load for Chromatography-FN-II.

Check and record the conditions as below:

pH: _____, Conductivity: _____ mS/cm,

O.D. at 280 nm for 10x diluted (with FN-RR-15) sample: _____,

O.D. at 600 nm: _____, Total Volume: _____ L,

Each injection Load Volume: _____ ml,

Load %: _____, (Limit: ≤ 2.0 %)

Number of injections = Total Volume / Each injection Load Volume = _____.

Loading and Elution

Before loading, switch on the 'Record On' button and enter the run details and date. Auto Zero the absorbance at 280 nm on the chromatography system.

Load 200 – 376 ml of the load volume for each injection at a flow rate of 0.8 ml/min .

After each injection, pass FN-RR-15 and collect Peak 3 observed at 50 - 60 % CV. Start peak collection when the A280 rises from 10 mAU, and stop collection when the A280 reaches to 10 mAU.

Check and record the details of the pooled peak 3 as below:

O.D.280: _____, O.D.600: _____,

pH: _____, Conductivity: _____ mS/cm,

Total volume of the Peak 3: _____ L,

Protein conc.: _____ mg/ml.

Note: pH and Conductivity of the pooled peak 3 should be in the range of 7.4 ± 0.2 and 17.0 ± 1.0 mS/cm respectively.

Collect and send 7.5 ml of the pooled peak 3 sample to QC for in-process QC analysis. Record the obtained result: Activity: _____ IU/ml.

Regeneration

Regenerate the column by passing up to 2.0 CVs of FN-RR-16 (10% gradient of FN-RR-18 against ambient WFI) at a flow rate of 0.8 ml/min and hold the column for 20 - 30 mins. Volume of FN-RR-16 used: _____ L.

Storage

Store the column (at room temp.) by passing upto 2.0 CVs of FN-RR-17 at a flow rate of 0.8 ml/min .

Volume of FN-RR-17 used: _____ L.

Enter the process details as below:

CONCENTRATION OF CHROMATOGRAPHY-9N ELUATE

Take the Chromatography eluate sample from step 6.6 and check and record the following details:

Eluate Volume: _____ L, pH: _____,

Conductivity: _____ mS/cm, OD280/600: _____.

NWP calculation before concentration

Record the following details of the TFF cassettes connected in series horizontally to the TFF system:

No. of cassettes used: _____,

Cassette ID Nos.: _____.

Wash the cassettes with 10 L of WFI and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Volume of WFI used: _____ L.

Check and record the details as below:

Concentration of Eluate sample

After NWP calculation, flush the cassettes with 10 L of FN-RR-15.

Volume of FN-RR-15 used: _____ L.

Concentrate the eluate sample to the required activity based on the QC result of pooled peak 3 sample, at a set TMP of ≤ 1.0 bar; to achieve a final activity of ≥ 125 IU/ml. Flush the cassettes with FN-RR-15.

Check and record the details as below:

Unload the concentrated sample and record the following details:

Volume of Retentate: _____ L, O.D.280/600: _____.

Regeneration

Flush the cassettes with 10 L of WFI and then with 10 L of FN-RR-01 at 40 - 45°C and carry out recirculation for 30 to 45 min.

Volume of FN-RR-01 used: _____ L.

Post NWP calculation

Repeat the step as 7.2.2 and record the details as below. Check if NWP is ≥ 120 LMH/Bar. If not, carry out the regeneration procedure again.

Storage

Flush the cassettes with 5 L of FN-RR-17 and finally store the cassettes in FN-RR-17 at room temp. Volume of FN-RR-17 used: _____ L.

PRA-NF-005 FILTRATION

Filter the concentrated sample through sterile PRA-SF-001 filter (pre-filter for PRA-NF-005 filtration) at 0.5 bar pressure under LAFU.

Check and record the following details:

Filtrate Volume: _____ L,

O.D. at 280 nm: _____, O.D. at 600 nm: _____.

Pass the pre filtered sample through PRA-NF-005 filter at 1.0 bar pressure.

Check and record the following details:

Filtrate Volume: _____ L,

O.D. at 280 nm: _____, O.D. at 600 nm: _____.

PRA-SF-001 FILTRATION

Filter the PRA-NF-005 filtered sample through a sterile PRA-SF-001 filter at 0.5 bar pressure under LAFU; and collect the filtrate into sterilised 50 ml polypropylene bottles.

Check and record the following details:

Filtrate Volume: _____ L,

O.D. at 280 nm: _____, O.D. at 600 nm: _____.

Collect and send 10 ml of the PRA-SF-001 filtered sample to QC for in-process QC analysis. Store the bottles containing PRA-SF-001 filtrate at -25°C till further usage.

WATER BALANCE DIAGRAM

1. System Boundaries

Water-using blocks:

Plasma fractionation & purification

CIP/SIP systems

Utilities (boilers, cooling towers, HVAC)

Formulation & filling

QC laboratory

Domestic usage (staff)

Effluent treatment + ZLD system

2. Estimate Water Consumption

For biologics/plasma plants, water intensity is typically:

10–20 L water per L plasma processed (efficient facility)

Total annual water demand:

150,000 L plasma × 12 = 1,800,000 L/year (1,800 m³/year)

≈ 6,000 L/day

3. Break Down Water Usage

A. Process & CIP (Major Consumer ~50%)

Chromatography buffers

Equipment cleaning

Viral inactivation cleaning

~3,000 L/day

B. Utilities (~30%)

Cooling tower makeup

Boiler feed (WFI generation losses)

HVAC humidification

~1,800 L/day

C. Domestic (~5%)

Staff (say 40–50 people) ~600 L/day

D. QC + Misc (~5%)

Lab washing, testing ~250 L/day

4. Wastewater Generation

Not all input becomes effluent (some losses like evaporation, product incorporation)

Typical:

80–85% becomes wastewater

Effluent: ~5,000 L/day

5. ZLD Strategy

Typical ZLD system:

Segregation

High TDS (CIP, buffers)

Low TDS (cooling tower blowdown, domestic)

Treatment Train

ETP → UF → RO → MEE → ATFD

6. Recycling Assumptions (Practical & Achievable)

Recycled water: ~4,500 L/day recovered

~500 L/day losses (solid waste)

7. Final Water Balance (Daily)

INPUT

Fresh water: 6,000 L/day

OUTPUT (After ZLD)

Recycled: 4,500 L/day (75%)

Losses: 1,500 L/day

Evaporation: ~1,000 L

Sludge/salts: ~500 L

Liquid discharge: ZERO

Stream | Recovery

RO permeate | 70%

MEE condensate | 20%

Losses (salts, sludge) | 10%

Reagent Details:

Formula:

Sodium Citrate (M.Wt): 258.07.

Citric Acid (M.Wt): 192.124.

Calcium Chloride (M.Wt): 110.98

Preparation of FN-RR-09 working buffer from Stock buffer (FN-RR-08):

Calculations: For the Preparation of 20mM Sodium Citrate pH 7.4 + 2.5mM Calcium Chloride.

Stock Buffer (FN-RR-08):0.2M Sodium Citrate pH 7.4.

Formula:.

$C1 \times V1 = C2 \times V2$

C1 = concentration of stock

V1 = volume of stock you need to take

C2 = desired (working) concentration

V2 = final total volume of working solution

Applying the formula to prepare the working buffer:

$C1 \times V1 = C2 \times V2$

C1 = 0.2M Sodium Citrate pH 7.4.

V1 = volume of stock you need to take _____ L.

C2 = desired (working) concentration 20mM Sodium Citrate, pH 7.4

V2 = final total volume of working solution _____ L.

$V1 = (C2 \times V2) / C1$.

$C2 = 0.02M$; $V2 = 1.0 L$; $C1 = 0.2M$

$V1 = (0.02 \times 1.0) / 0.2$

$V1 = 0.1L$

Take 0.1 L (FN-RR-08) Stock buffer solution and dilute it with water to make up 1 L.

Calculations: 2.5mM Calcium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 2.5mM Calcium Chloride (MW = 110.98 g/mol)

Weight of solute(g)=0.0025×110.98×1=0.277g.

Preparation Method:

Weigh 0.277g of Calcium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.0025 M Calcium Chloride (MW = 110.98 g/mol).

Weight of solute(g)=0.0025 ×110.98× _____ L= _____ g.

Weigh _____ gm of Calcium Chloride and dissolve in water to make a _____ L solution.

Preparation of working buffer (FN-RR-09):

Take 0.1 L (FN-RR-08) Stock buffer solution and add 0.0025 M Calcium Chloride (0.277 gm). Dissolve it,

and then make up the final volume to 1 L with water.

Check and record the details:

Reagent Details:

Formula:

Sodium Acetate(M.Wt): 82.03g/mol.

Acetic Acid (M.Wt): 60.05g/ mol

Preparation of 0.6 M Sodium Acetate pH 5.35 buffer

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.6 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.6×82.03=49.21

Preparation Method:

Weigh 49.21 g of Sodium Acetate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.6 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.6 ×82.03x _____L= _____g.

Weigh _____gm of Sodium Acetate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.6 M Acetic Acid.

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 1.0 M.

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 0.6 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ x V₂)/C₁.

C₂=0.6 M ; V₂= 1.0 L; C₁=17.5 M

V₁ = (0.6 x 1.0)/17.5

V₁ = 0.034 L

Take 0.034 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____L.

C₂ = desired (working) concentration 0.6 M acetic acid.

V₂ = final total volume of working solution _____L.

V₁ = (C₂ x V₂) /17.5.

V₁= _____L.

Take V₁ _____L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____L.

Procedure for Preparation of 0.6 M Sodium Acetate pH 5.35.

To prepare a pH 5.35 solution, 0.6 M Sodium Acetate solution is titrated with 0.6 M Acetic acid so that the pH attains pH 5.35.

Reagent Details:
Formula & Calculations:
Formula: $M_1 \times V_1 = M_2 \times V_2$.
Calculation: To prepare 1 L of 0.1M Tris from 1M tris stock solution calculate quantity required of stock solution as below:
 $1M \text{ tris stock solution required quantity} = 0.1 \times 1 / 1 = 0.1L$
Preparation Method:
To prepare 0.1M Tris 1L solution from 1M Tris stock solution formula is $M_1(\text{Molarity of stock}) \times V_1(\text{volume of stock}) = M_2(\text{Molarity of working}) \times V_2(\text{volume of working})$.
Take 0.1L of 1M tris solution and make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.1M Tris
Take 0.1L x _____ L = _____ L of 1M Tris
Make Tris solution to _____ L solution.
Check and record the details:

To,
M/s. Aurangabad Industrial Township Ltd., (CETP),
(M/s. Delhi Mumbai Industrial Corridor Development
Corporation Ltd.,) .
Plot No. 1, Sector 9, AURIC, Shendra,
Your Service is Our Duty
Aurangabad.

Sub: Grant renewal of consent to operate under the provisions of Water
(P & CP) Act, 1974, Air (P & CP) Act, 1981 and Bio-Medical Waste
Management Rules, 2016 as amended and Hazardous Waste (M &
TM) Rules, 2016.

Ref: 1. Renewal of Consent to Operate granted vide No- Format1.0/CC/UAN
No.MPCB-CONSENT-0000126745/CR/2211000292 Date: 04/11/2022 valid
up to 31/12/2022
2. Minutes of 14th Consent Committee Meeting (Agenda C) of 2024-2025
held on 17/01/2025

Your application No.MPCB-CONSENT-0000157866 Dated 31.12.2022
For: grant of Consent to Operate under Section 26 of the Water (Prevention & Control of
Pollution) Act, 1974 & under Section 21 of the Air (Prevention & Control of Pollution) Act,
1981 and Authorization under Rule 6 and Rule 18(7) of the Hazardous & Other Wastes
(Management & Transboundary Movement) Rules 2016 is considered and the consent is
hereby granted subject to the following terms and conditions and as detailed in the
schedule I, II, III & IV annexed to this order:

1. The Renewal of consent to Operate is granted for period upto 31.12.2026
2. The capital investment of the project is Rs.60.3823 Crs. (As per C.A
Certificate submitted by industry Rs. 75.07 Crs (Previous Rs. 60.38 Crs))
3. Consent is valid for:
Sr Maximum
Treatment Facility UOM
No Quantity
Common Effluent Treatment Plant – The daily quantity of
13 MLD
industrial effluent to be treated shall not exceed

Common Effluent Treatment Plant for Mega Industrial Park in Shendra, District Aurangabad named as

5. Conditions under Air (P & CP) Act, 1981 for air emissions:

Sr Stack Description of stack / Number of Standards to be
No. No. source Stack achieved

- 1 S-1 DG Set-125 KVA 01 As per Schedule -II
- 2 S-2 DG Set-320 KVA 01 As per Schedule -II
- 3 S-3 DG Set-500 KVA 01 As per Schedule -II
- 4 S-4 DG Set-720 KVA 01 As per Schedule -II

6. Non-Hazardous Wastes:

Sr No Type of Waste Quantity UoM Treatment Disposal
1 NA 0 --NA-- 0 NA

7. Conditions under Hazardous & Other Wastes (M & T M) Rules 2016 for
Collection, Segregation, Storage, Transportation, Treatment and Disposal of
hazardous waste:

Sr No Category No./ Type Quantity UoM Treatment Disposal
35.3 Chemical sludge from waste

12 MT/Day Landfill CHWTSDF
water treatment

8. The Board reserves the right to review, amend, suspend, revoke this consent and the
same shall be binding on the industry.

9. This consent should not be construed as exemption from obtaining necessary NOC/
permission from any other Government authorities.

10. PP shall comply with the conditions stipulated in EC vide dated 18.06.2015 & its
amendment dated 26.02.2016.

11. PP shall ensure 100% recycle of treated effluent in the member industrial units & shall
not discharge outside the premise in any case.

12. PP shall study feasibility of connection of effluent generating industries located at Shendra MIDC to CETP by pipe conveying systems.

SCHEDULE-I

Terms & conditions for compliance of Water Pollution Control:

1. A] As per your application, you have provided Common Effluent Treatment Plant of capacity 3 MLD to treat the effluent of 3.0 MLD out of proposed CETP capacity 12 MLD consisting of receiving chamber, coarse screen, wet well, inlet chamber, fine screen, vortex grit chamber, equalization tank, flash mixing tank, flocculation tank, primary clarifier, ultra-fine screen, pre-anoxic tank, aeration tank, post-anoxic tank, membrane tank, chlorine contact tank, treated effluent outfall chamber, etc.

B] The Consent is valid for collection, storage and treatment of Industrial and Domestic Effluent conforming to the inlet standards specified here under:-

Limiting concentration not to exceed in

Sr.No Parameters

mg/l, except for pH

(1) pH 5.5 to 9.0

(2) Total Dissolved Solids 2100

(3) Suspended solids 600

(4) COD 1000

(5) BOD (3 days 27 °C) 700

(6) Total Nitrogen 80

(7) Total phosphorus 10

(8) Chlorides 600

(9) Sulphate 1000

(10) Total oil (free + emulsified) 350

(11) (a) Free Oil 100

(12) (b) Emulsified oil 250

(13) Arsenic (as As) 0.2

(14) Mercury (as Hg) 0.01

(15) Cadmium 1.0

(16) Selenium (as Se) 0.1

(17) Iron 5.0

(18) Lead 1.0

(19) Copper 3.0

(20) Zinc 15.0

(21) Nickel 3.0

(22) Chromium 1.0

(23) Hexavalent Chromium 0.1

(24) Cyanide 0.1

(25) Colour 150 Platinum Cobalt Unit

Common Effluent Treatment Plant for Mega Industrial Park in Shendra, District Aurangabad named as Aurangabad Industrial City (Auric), Shendra, under the Delhi Mumbai Industrial Corridor (DMIC) Page 4 of 12

Project./CR/UAN No.MPCB-CONSENT-0000157866/Indus-Id.4709 (05-03-2025 10:16:58 pm) /QMS.PO6_F02/00

When the CETP is complying with discharge standards then, In case of SSI Unit, BOD of Maximum of 700 mg/l and COD of maximum 1000 mg/l will be allowed to inlet of CETP.

All other specific parameters including colour shall be complied before disposal to CETP. In case of other, primary and secondary treatment is required to meet consented standards before disposal to CETP.

i) All Large & Medium Scale Units irrespective of the quantity of effluent will have to achieve the standards as prescribed in the letter of Consent issued to them individually under the Water (P & CP) Act 1974, Air (P & CP) Act 1981, Hazardous Waste (M&H) Amendment thereto before discharging the effluent into CETP

C] The applicant shall operate the Common Effluent Treatment Plant (CETP) to treat the trade effluent so as to achieve the following standards prescribed by the

Board of under EP Act, 1986 & rules made there under from time to time, whichever is stringent. PP shall achieve the following standards from Sr. No. 01 to 06 for recycling back to member industry & from Sr. No. 07 to 31 for discharge on land for gardening.

Common Effluent Treatment Plant for Mega Industrial Park in Shendra, District Aurangabad named as Aurangabad Industrial City (Auric), Shendra, under the Delhi Mumbai Industrial Corridor (DMIC) Page 5 of 12

Project./CR/UAN No.MPCB-CONSENT-0000157866/Indus-Id.4709 (05-03-2025 10:16:58 pm) /QMS.PO6_F02/00

Sr.No Parameters Standards (mg/l)

- 1 pH 6.0 to 9.0
- 2 BOD 3 Days 27 OC 5.0
- 3 COD 30
- 4 Total suspended Solids (TSS) 100
- 5 Fixed Dissolved Solids (FDS) 750
- 6 Oil & Grease 0.01
- 7 pH 6.0 to 9.0
- 8 BOD 3 Days 27 OC 30
- 9 COD 250
- 10 Ammoniacal Nitrogen 50
- 11 Nitrate-Nitrogen 10
- 12 Total Kjeldahl Nitrogen 50
- 13 Chlorides 1000
- 14 Sulphate (as SO₄) 1000
- 15 Fluoride 2
- 16 Sulphides (as S) 2
- 17 Phenolic Compound (as C₆H₅OH) 1
- 18 Total Residual Chlorine 1
- 19 Zinc 5
- 20 Iron 3
- 21 Copper 3
- 22 Trivalent Chromium 1.1
- 23 Manganese 2
- 24 Nickel 3
- 25 Arsenic 0.2
- 26 Cyanide (as CN) 0.2
- 27 Vanadium 0.2
- 28 Lead 0.1
- 29 Hexavalent Chromium 0.1
- 30 Selenium 0.05
- 31 Cadmium 0.05
- 32 Mercury 0.01
- 33 Phosphate as P 5.0
- 34 Colour 150 Platinum Cobalt Unit

Common Effluent Treatment Plant for Mega Industrial Park in Shendra, District Aurangabad named as Aurangabad Industrial City (Auric), Shendra, under the Delhi Mumbai Industrial Corridor (DMIC) Page 6 of 12

Note:-

- i. All efforts should be made to remove colour and unpleasant odour as per as possible.
- ii. If the CETP is not able to achieve the outlet parameters, then all the members and the said Society would be individually and jointly responsible and liable for legal actions under the provisions of sections 47 of the Water (Prevention & Control of Pollution) Act, 1974.

D] The heavy metals if any shall be treated by providing separate treatment facility & the standard prescribed for metals shall meet at the outlet of metal treatment facility.

E] i] The treated trade effluent shall be 100% utilized for industrial purpose, flushing, HVAC make up, gardening etc. to the tune of 3.0 MLD generated in 1st phase as per your proposal. ii] In no case effluent shall find its way outside the designated area at any time. PP shall provide flow meter to ensure recycling of treated effluent & shall maintain the record with data logging system. iii] You shall demark the recycling effluent pipeline by colour coding for identification purpose & also shall demark the storage tanks used for the same purpose. iv] Online monitoring system shall be provided at the outlet of CETP for critical parameters such as BOD, COD, Chromium, O & G, Phenolic compound, TSS, flow & pH.

2. A] Generation - Nil

B] Treatment - NA

C] Disposal - NA

3. The Board reserves its rights to review plans, specifications or other data relating to plant setup for the treatment of waterworks for the purification thereof & the system for the disposal of sewage or trade effluent or in connection with the grant of any consent conditions. The Applicant shall obtain prior consent of the Board to take steps to establish the unit or establish any treatment and disposal system or an extension or addition thereto.

4. The industry shall ensure replacement of pollution control system or its parts after expiry of its expected life as defined by manufacturer so as to ensure the compliance of standards and safety of the operation thereof.

5. The Applicant shall comply with the provisions of the Water (Prevention & Control of Pollution) Act, 1974 and as amended, by installing water meters and other provisions as contained in the said act:

Water consumption quantity

Sr. No. Purpose for water consumed

(CMD)

PP shall provide backup arrangement for proper supply towards smooth & continuous operation of CETP.

2. The Applicant shall provide Specific Air Pollution control equipments as per the conditions of EP Act, 1986 and rule made there under from time to time/ Environmental Clearance / CREP guidelines.

3. The Applicant shall obtain necessary prior permission for providing additional control equipment with necessary specifications and operation thereof or alteration or replacement/alteration well before its life come to an end or erection of new pollution control equipment.

4. The Board reserves its rights to vary all or any of the condition in the consent, if due to any technological improvement or otherwise such variation (including the change of any control equipment, other in whole or in part is necessary).

Project./CR/UAN No.MPCB-CONSENT-0000157866/Indus-Id.4709 (05-03-2025 10:16:58 pm) /QMS.PO6_F02/00 SCHEDULE-IV

General Conditions:

1. The Energy source for lighting purpose shall preferably be LED based
2. The PP shall harvest rainwater from roof tops of the buildings and storm water drains to recharge the ground water and utilize the same for different industrial applications within the plant
3. Conditions for D.G. Set
 - a) Noise from the D.G. Set should be controlled by providing an acoustic enclosure or by treating the room acoustically.
 - b) Industry should provide acoustic enclosure for control of noise. The acoustic enclosure/ acoustic treatment of the room should be designed for minimum 25 dB (A) insertion loss or for meeting the ambient noise standards, whichever is on higher side. A suitable exhaust muffler with insertion loss of 25 dB (A) shall also be provided. The measurement of insertion loss will be done at different points at 0.5 meters from acoustic enclosure/room and then average.
 - c) Industry should make efforts to bring down noise level due to DG set, outside industrial premises, within ambient noise requirements by proper siting and control measures.
 - d) Installation of DG Set must be strictly in compliance with recommendations of DG Set manufacturer.
 - e) A proper routine and preventive maintenance procedure for DG set should be set and followed in consultation with the DG manufacturer which would help to prevent noise levels of DG set from deteriorating with use.
 - f) D.G. Set shall be operated only in case of power failure.
 - g) The applicant should not cause any nuisance in the surrounding area due to operation of D.G. Set.
 - h) The applicant shall comply with the notification of MoEFCC, India on Environment (Protection) second Amendment Rules vide GSR 371(E) dated 17.05.2002 and its amendments regarding noise limit for generator sets run with diesel.
4. The applicant shall maintain good housekeeping.
5. The non-hazardous solid waste arising in the factory premises, sweepings, etc. be disposed of scientifically so as not to cause any nuisance / pollution. The applicant shall take necessary permissions from civic authorities for disposal of solid waste.
6. The applicant shall not change or alter the quantity, quality, the rate of discharge, temperature or the mode of the effluent/emissions or hazardous wastes or control equipments provided for without previous written permission of the Board. The industry will not carry out any activity, for which this consent has not been granted/without prior consent of the Board.
7. The industry shall ensure that fugitive emissions from the activity are controlled so as to maintain clean and safe environment in and around the factory premises.
8. The industry shall submit quarterly statement in respect of industries obligation towards consent and pollution control compliance's duly supported with documentary evidences (format can be downloaded from MPCB official site).
9. The industry shall submit official e-mail address and any change will be duly informed to the MPCB.
10. The industry shall achieve the National Ambient Air Quality standards prescribed vide Government of India, Notification No. B-29016/20/90/PCI-L dated. 18.11.2009 as amended.

Common Effluent Treatment Plant for Mega Industrial Park in Shendra, District Aurangabad named as Aurangabad Industrial City (Auric), Shendra, under the Delhi Mumbai Industrial Corridor (DMIC) Page 10 of 12

Project./CR/UAN No.MPCB-CONSENT-0000157866/Indus-Id.4709 (05-03-2025 10:16:58 pm) /QMS.PO6_F02/00

11. The Board reserves its rights to review plans, specifications or other data relating to plant setup for the treatment of waterworks for the purification thereof & the system for the disposal of sewage or trade effluent or in connection with the grant of any consent conditions. The Applicant shall obtain prior consent of the Board to take steps to establish the unit or establish any treatment and disposal system or an extension or addition thereto.
12. The industry shall ensure replacement of pollution control system or its parts after expiry of its expected life as defined by manufacturer so as to ensure the compliance of standards and safety of the operation thereof.
13. The PP shall provide personal protection equipment as per norms of Factory Act
14. Industry should monitor effluent quality, stack emissions and ambient air quality monthly/quarterly.
15. Whenever due to any accident or other unforeseen act or even, such emissions occur or is apprehended to occur in excess of standards laid down, such information shall be forthwith Reported to Board, concerned Police Station, Office of Directorate of Health Services, Department of Explosives, Inspectorate of Factories and Local Body. In case of failure of pollution control equipments, the production process connected to it shall be stopped.
16. The applicant shall provide an alternate electric power source sufficient to operate all pollution control facilities installed to maintain compliance with the terms and conditions of the consent. In the absence, the applicant shall stop, reduce or otherwise, control production to abide by terms and conditions of this consent.
17. The industry shall recycle/reprocess/reuse/recover Hazardous Waste as per the provision contain in the Hazardous and Other Wastes (M & TM) Rules 2016, which can be recycled /processed /reused /recovered and only waste which has to be incinerated shall go to incineration and waste which can be used for land filling and cannot be recycled/reprocessed etc. should go for that purpose, in order to reduce load on incineration and landfill site/environment.
18. An inspection book shall be opened and made available to the Board's officers during their visit to the applicant.
19. Industry shall strictly comply with the Water (P&CP) Act, 1974, Air (P&CP) Act, 1981 and Environmental Protection Act, 1986 and industry specific standard under EP Rules 1986 which are available on MPCB website (www.mpcb.gov.in).
20. Separate drainage system shall be provided for collection of trade and sewage

e■uents. Terminal manholes shall be provided at the end of the collection system with arrangement for measuring the ■ow. No e■uent shall be admitted in the pipes/sewers downstream of the terminal manholes. No e■uent shall ■nd its way other than in designed and provided collection system.

21. Neither storm water nor discharge from other premises shall be allowed to mix with the e■uents from the factory.

22. The industry should not cause any nuisance in surrounding area.

23. The industry shall take adequate measures for control of noise levels from its own sources within the premises so as to maintain ambient air quality standard in respect of noise to less than 75 dB (A) during day time and 70 dB (A) during night time. Day time is reckoned in between 6 a.m. and 10 p.m. and night time is reckoned between 10 p.m. and 6 a.m.

Project./CR/UAN No.MPCB-CONSENT-0000157866/Indus-Id.4709 (05-03-2025 10:16:58 pm) /QMS.PO6_F02/00

24. The industry shall create the Environmental Cell by appointing an Environmental Engineer, Chemist and Agriculture expert for looking after day to day activities related to Environment and irrigation ■eld where treated e■uent is used for irrigation.

25. The applicant shall provide ports in the chimney(s) and facilities such as ladder, platform etc. for monitoring the air emissions and the same shall be open for inspection to/and for use of the Board's Sta■. The chimney(s) vents attached to various sources of emission shall be designated by numbers such as S-1, S-2, etc. and these shall be painted/ displayed to facilitate identi■cation.

26. The industry should comply with the Hazardous and Other Wastes (M & TM) Rules, 2016 and submit the Annual Returns as per Rule 6(5) & 20(2) of Hazardous and Other Wastes (M & TM) Rules, 2016 for the preceding year April to March in Form-IV by 30th June of every year.

27. The applicant shall install a separate meter showing the consumption of energy for operation of domestic and industrial e■uent treatment plants and air pollution control system. A register showing consumption of chemicals used for treatment shall be maintained.

28. The applicant shall bring minimum 33% of the available open land under green coverage/ plantation. The applicant shall submit a yearly statement by 30th September every year on available open plot area, number of trees surviving as on 31st March of the year and number of trees planted by September end.

29. The Board reserves its rights to review plans, speci■ications or other data relating to plant setup for the treatment of waterworks for the puri■ication thereof & the system for the disposal of sewage or trade e■uent or in connection with the grant of any consent conditions.

30. The ■rm shall submit to this o■ce, the 30th day of September every year, the Environment Statement Report for the ■nancial year ending 31st March in the prescribed FORM-V as per the provisions of Rule 14 of the Environment (Protection) (second Amendment) Rules, 1992.

31. The Applicant shall obtain necessary prior permission for providing additional control equipment with necessary speci■ications and operation thereof or alteration or replacement/alteration well before its life come to an end or erection of new pollution control equipment.

32. The Board reserves its rights to vary all or any of the condition in the consent, if due to any technological improvement or otherwise such variation (including the change of any control equipment, other in whole or in part is necessary).

33. The applicant shall provide facility for collection of environmental samples and samples of trade and sewage e■uents, air emissions and hazardous waste to the Board sta■ at the terminal or designated points and shall pay to the Board for the services rendered in this behalf.

This certi■icate is digitally & electronically signed.

Project./CR/UAN No.MPCB-CONSENT-0000157866/Indus-Id.4709 (05-03-2025 10:16:58 pm) /QMS.PO6_F02/00

Reagent Details:
Formula & Calculations:
Formula: Use the formula to calculate the molarity:
 $Molarity (M) = (Per\ cent\ by\ Weight / 100) * (Density\ in\ g/mL) * 1000 / Molar\ Mass.$
Example: Molarity of Glacial Acetic Acid
Molar Mass of CH₃COOH: ~60.05 g/mol
Density: ~1.05 g/mL
Purity: 100%
Acetic Acid (MW = 60.05 g/mol).
Calculation:
 $Molarity = (100 / 100) * 1.05\ g/mL * 1000\ mL/L / 60.05\ g/mol \approx 17.5\ M.$
Calculation: To prepare 1 L of 0.1M.
Applying the formula to prepare the working buffer:
 $C1 \cdot V1 = C2 \cdot V2$
 $C1 = 17.5\ M$ acetic acid.
 $V1$ = volume of stock needed to take.
 $C2$ = desired (working) concentration 0.1M acetic acid.
 $V2$ = final total volume of working solution for one liter.
 $V1 = (C2 \times V2) / C1.$
 $C2=0.1\ M; V2= 1.0\ L; C1=17.5\ M$
 $V1 = (0.1 \times 1.0) / 17.5$
 $V1 =$ Take 0.0057 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.
To prepare various volumes:
 $V1$ = volume of stock needed to take _____ L.
 $C2$ = desired (working) concentration 0.1M acetic acid.
 $V2$ = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / 17.5.$
 $V1=$ _____ L.
Take $V1$ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Query: In Utility RDS; transformer load looks high?

Response: jameel to ask Rao

Query: In Utility RDS summary sheet; Dual fuel boiler (3000Kg/Hr) and normal boiler (1000 Kg/H) is mentioned but capacity for both is mentioned different, so what capacity is exactly required?

Response: jameel to ask Rao

Query: Black steam is considered for PSG calculation?

Response: Yes

Query: Common load like electric bulb load not considered in RDS as it is mentioned as 0KW

Response: We have considered all equipment load and Lux value is mentioned for each area, please considered electric bulb etc load on standard basis. Per sq feet yogesh

Query: For CNC area temperature not given?

Response: RDS revised

Query: Differential Pressure difference between adjacent areas are always 5 Pascal ,may be it should be min.10 Pascal ,PI check

Response: RDS revised

Query: Where you use common AHU and where you use individual AHU

Response: AHU zoning layout is pending and in process.

Query: AHU type - CHW OR Dx system

Response: CHW

Query: ACPH of Area is not mentioned in RDS.

Response: RDS revised

Query: AHU Zoning with AHU No.

Response: AHU zoning layout is pending and in process.

Reagent Details:

Formula:

Sodium Chloride (M.Wt):58.44

Glycine(M.Wt): 75.07.

Glycerol (M.Wt):92.094 g/mol

Calcium Chloride (M.Wt): 110.98

0.1% Tween 80

Preparation of FE-RR-06 buffer.

Preparation of 0.94M Sodium chloride +0.1M Glycine +12% Glycerol + 2.6mM Calcium Chloride +0.1% Tween-80,

pH- 6.0

Calculations: To prepare the 0.94M Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.94M Sodium Chloride (MW = 58.44 g/mol)

Weight of solute(g)=0.94×58.44×1=54.93g.

Preparation Method:

Weigh 54.93 g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.94M Sodium Chloride (MW = 58.44 g/mol).

Weight of solute(g)=0.94×58.44 x _____ L= _____ g.

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Calculations: To prepare the 2.6mM Calcium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 2.6 mM Calcium Chloride (MW = 110.98g/mol)

Weight of solute(g)=0.0026×110.98 x1=0.288g.

Preparation Method:

Weigh 0.288g of Calcium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.0026mM Calcium Chloride (MW =110.98 g/mol).

Weight of solute(g)=0.0026 ×110.98x _____ L= _____ g.

Weigh _____ gm of Calcium Chloride and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.1mM Glycine.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.1M Glycine (MW = 75.07g/mol)

Weight of solute(g)=0.1×75.07 x1=7.507g.

Preparation Method:

Weigh 7.507g of Glycine and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.1M Glycine (MW =75.07 g/mol).

Weight of solute(g)=0.1 ×75.07x _____ L= _____ g.

Weigh _____ gm of Glycine and dissolve in water to make a _____ L solution.

Procedure

Calculation: to prepare the 12% Glycerol:

For 1000 mL of 12% solution:

12% =120g per 1000 mL=1200 mg

Since glycerol is a liquid, you can weigh it directly or use its density (~

1.261 g/mL) to measure volume:

Approx. 100 µL of Glycerol = 1.0 g

Add Glycerol to a beaker or flask containing ~800 mL of water.

Mix thoroughly:

Use a magnetic stirrer or vortex until fully dissolved. Glycerol is viscous, so mixing may take a few minutes.

Adjust volume:

After complete dissolution, bring the final volume up to 1000 mL with water.

Procedure

Calculation: to prepare the 0.1% Tween 80:

For 1000 mL of 0.1% solution:

0.1% =0.1g per 1000 mL=1000 mg

Since Tween 80 is a liquid, you can weigh it directly or use its density

(~1.06 g/mL) to measure volume:

Approx. 100 µL of Tween 80 = 1.0 g

Add Tween 80 to a beaker or flask containing ~800 mL of water.

Mix thoroughly:

Use a magnetic stirrer or vortex until fully dissolved. Tween 80 is viscous, so mixing may take a few minutes.

Adjust volume:

After complete dissolution, bring the final volume up to 1000 mL with water.

Procedure for Preparation of FE-RR-06 buffer.

To prepare a 1 L solution, To this, add the 0.94M sodium chloride and dissolve it and make up the volume

with water to 800ml, and then to this add 0.1M Glycine, then to this add 0.0026 M Calcium chloride, add

the 12% Glycerol then mix the solution till it dissolves, to this add the 0.1% Tween 80 then mix the

solution till it dissolves and check the pH; if the pH is less than 6.0 and need to adjust pH using HCl

or NaOH after dissolving all components and make up the final volume to 1L.

Check and record the details:

PROPOSED METHOD FOR EFFLUENT TREATMENT FOR LIFENITY HEALTH LIMITED,
AURIC, AURANGABAD

This project of Wastewater Treatment is based on most conventional method of treatment "Activated Sludge Process". The Activated Sludge Process is first developed by Ardern and Lockett (1914) in England. In this proposed process of treatment, the wastewater undergoes Collection Tank, Bar Screen, Oil & Grease separation, Equalization, De-ammonification, Settlement, Aerobic Digestion, Clarification, Settlement, Disinfection followed by Filtration.

The treated water can be used for Green Belt.

DESIGN BASIS

275 KLD ETP PROCESS FLOW SHEET

M/s. LIFENITY HEALTH Ltd., Aurangabad, India.

BAR SCREEN

PROCESS DESCRIPTION

This project of Wastewater Treatment is based on the most conventional method of treatment, "Activated Sludge Process". The Activated Sludge Process is first developed by Ardern and Lockett (1914) in England. Wastewater is continuously exposed and subjected to biological degradation carried out by the microbial floc suspended in the aeration tank, into which oxygen is introduced by mechanical means. The wastewater from the aeration tank is allowed to settle, and a portion of the sludge is recycled to the tank itself for an effective microbial population.

In this proposed process of treatment, the wastewater undergoes Collection Tank, Bar Screen, Oil & Grease separation, De-ammonification, Equalization, Settlement, Aerobic Digestion, Clarification, Settlement, Disinfection, followed by Filtration. Sludge will pass onto the Sludge Beds. The treated water can be used for the Green Belt.

The process steps in brief are given below.

Primary Treatment,

Secondary Treatment,

Tertiary Treatment.

PRIMARY TREATMENT,

BAR SCREEN:

The effluents from various points from the Production and Utilities will flow by gravity into the Collection tank or sump through Bar Screen Chamber, where 1 No. SS Bar Screen is provided. The screen provided will arrest suspended trashy matter such as paper, cotton waste etc.

OIL & GREASE SEPARATION:

The effluents having Oil & Grease type material will be removed by mechanical equipment manually for further treatment.

EQUALIZATION TANK:

The pH of the wastewater is neutralized in this process. pH Correction chemical will be added in this process at justified dosage and uniform mixing. So that the wastewater is neutralized and pass onto further treatment process.

DEAMONIFICATION TANK:

The de-ammonification will be done in this by providing aeration and chemical dosing will be added in this process at justified dosage and uniform mixing. So that the wastewater is pass onto clarifier further treatment process.

PRIMARY SETTLING TANK:

In this process, the suspended Solids in the wastewater will be removed with help of coagulant agents. The Coagulants will be added at justified dosage and uniform mixing for settlement of Suspended Solids and enhancement treatment process.

SECONDARY TREATMENT:

AEROBIC DIGESTION TANKS:

The wastewater is passed into Aeration Tanks where an active mass of microorganisms is maintained with sufficient aeration. The biomass converts the organic matter present in the wastewater into cellular material. The Organic as well as Digestible Inorganic load of Wastewater will be decreased in this aerobic stabilization process.

TERTIARY TREATMENT.

CLARIFICATION TANK:

In this process, the suspended Solids in the wastewater will be removed with help of coagulant agents. The Coagulants will be added at justified dosage and uniform mixing for settlement of Suspended Solids and enhancement treatment process.

SECONDARY SETTLING CUM FILTER FEED TANK:

Suspended solids are settled at the bottom of the tank and in this disinfectant, will be used to avoid health hazard. The wastewater will be pumped to Filtration units for further treatment.

FILTRATION:

Final traces of solids are removed by filtration through Multi Grade Filter & Adsorption on Activated Carbon Filter. The treated water can be used for Green Belt.

SLUDGE DRYING BEDS:

The partial sludge settled in Settling Tanks, Clarifier and from the MGF & ACF will dry in the Sludge Drying Beds. In order to maintain sufficient cell concentration a part of the sludge settled in the Clarifiers is recycled as biomass. The dried solids from sludge systems will be send to PCB authorized Solid Disposal Facility as per PCB guidelines. The water from sludge beds is send collection for further treatment process.

Reagent Details:
Preparation of AL-RR-20 working buffer from Stock buffer (AL-RR-18):
Calculations: For the Preparation of 0.01M Sodium Hydroxide.
Stock Buffer (AL-RR-18):2.0M Sodium Hydroxide,
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 2.0 M Sodium Hydroxide.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 0.01M Sodium Hydroxide.
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
C2=0.01M; V2= 1.0 L; C1=2.0M
 $V1 = (0.01 \times 1.0) / 2.0$
V1 = 0.005L
Take 0.005 L (AL-RR-18) Stock buffer solution and dilute it with water, making up to 1 L.
Check and record the details:

Reagent Details:

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 0.6 M.

Applying the formula to prepare the working buffer:

$C_1 V_1 = C_2 V_2$

C_1 = 17.5 M acetic acid.

V_1 = volume of stock needed to take.

C_2 = desired (working) concentration 0.6 M acetic acid.

V_2 = final total volume of working solution for one liter.

$V_1 = (C_2 \times V_2) / C_1$.

$C_2 = 0.6$ M; $V_2 = 1.0$ L; $C_1 = 17.5$ M

$V_1 = (0.6 \times 1.0) / 17.5$

$V_1 = 0.034$ L

Take 0.034 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V_1 = volume of stock needed to take _____ L.

C_2 = desired (working) concentration 0.6M acetic acid.

V_2 = final total volume of working solution _____ L.

$V_1 = (C_2 \times V_2) / 17.5$.

$V_1 =$ _____ L.

Take V_1 _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Check and record the details:

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.1N Sodium Hydroxide (MW = 40.0 g/mol)
Weight of solute(g)=0.1×40 = 4g.
Preparation Method:
Weigh 4 g of Sodium Hydroxide and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.1N Sodium Hydroxide (MW = 40.0 g/mol).
Weight of solute(g)=0.1×40.0 x _____L= _____gm
Weigh _____gm of Sodium Hydroxide and dissolve in water to make a _____ L solution.
Check and record the details:

Reagent Details:
Calculations: To prepare 1 L of 0.35% TNBP.
Decide on the total final volume to prepare (e.g., 1000 mL).
Calculate 0.35% of the total final volume to determine the amount of TNBP needed:
"TNBP required"="Total Volume"×0.35/100.
For 1000 mL final volume: mL TNBP.
Preparation Method:
Measure the required volume for one litre and take it in a beaker, and dilute it with water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.35% TNBP.
TNBP required"="Total Volume"×0.35/100.
For _____ mL final volume: mL TNBP.
Measure the required volume of one liter and dissolve it in water to make a 1 L solution.
Check and record the details:
Preparation Details:

Engineering-grade ZLD system for PDMP plant
(150,000 L/year plasma processing).

1. Design Basis

Plant Throughput

Plasma processed: 150,000 L/year

Operating days: 300 days/year

1000 L/batch plasma

Water & Effluent

Total water consumption: 1,13,551 L/day (113.551 m³/day)

Effluent generation: 51,988 L/day (51.988 m³/day)

2. Effluent Segregation (Critical for Proper Sizing)

Low TDS → direct RO

High TDS → RO + MEE

3. Overall ZLD Philosophy

Effluent → Equalization → ETP → UF → RO → (Permeate reuse)

↓

RO Reject → MEE → ATFD → Solids

4. RO System Sizing

Design Assumptions

Feed: 5 m³/day

Recovery: 70%

Operating hours: 20 hr/day

Flow Calculations

Feed flow rate:

51.988 m³/day ÷ 20 hr = 2.5994 m³/hr

Permeate: 70% of 51.988 = 36.3916 m³/day

Reject:

15.5964 m³/day

RO Capacity Selection

Add design margin (25–30%):

■ Installed RO capacity: 0.35 m³/hr (~350 L/hr)

RO System Components

Multi-grade filter (MGF)

Activated carbon filter (ACF)

UF membrane

High-pressure RO skid

5. MEE (Multiple Effect Evaporator) Sizing

Feed to MEE

RO reject: 15.5964 m³/day

Assume concentration to 20–25% solids

Evaporation Load

Water to be evaporated: ~1.2 m³/day (80% evaporation)

Hourly evaporation: 1.2 ÷ 20 hr = 0.06 m³/hr (60 L/hr)

MEE Design Capacity

MEE capacity: 75–100 L/hr evaporation

Number of Effects

Typically: 2 or 3 effects

Steam Requirement

Typical:

1 kg steam evaporates ~0.8–1 kg water (2-effect)

Steam required:

~75 kg/hr steam

6. ATFD (Agitated Thin Film Dryer) Sizing

Feed to ATFD

Concentrated slurry from MEE:

■ ~0.3 m³/day (~300 L/day)

Solid Load

Assume:

20% solids

Solids:

~60 kg/day

ATFD Capacity

Operating hours: 10–12 hr/day

Required: 60 kg ÷ 12 hr = 5 kg/hr

With margin: ATFD capacity: 8–10 kg/hr solids handling

7. Final Water Recovery Summary

8. Utilities Requirement

Power

Total: ~25–35 kW

Steam

MEE: ~75 kg/hr

ATFD: ~20 kg/hr

Total: ~100 kg/hr steam

9. Equipment Sizing Summary (DPR Ready Table)

Stream Type | Source | Flow (m³/day) | TDS

Low TDS | Cooling tower blowdown, domestic | 2.0 | <2,000 ppm

High TDS | CIP, buffers, process streams | 3.0 | 5,000–15,000 ppm

Stage | Output

RO permeate | 3.5 m³/day

MEE condensate | 1.0 m³/day

Total recovery | 4.5 m³/day

Losses (salts/sludge) | 0.5 m³/day

Liquid discharge | ZERO

Equipment | Load

RO system | 5–7 kW

MEE | 10–15 kW

ATFD | 8–12 kW

Pumps & auxiliaries | 5 kW

Unit | Capacity

Equalization Tank | 10 m³

ETP | 5 m³/day
UF System | 0.3 m³/hr
RO System | 0.35 m³/hr
MEE | 100 L/hr evaporation
ATFD | 10 kg/hr solids

[SHEET: DG Set]

Sr.No. | Parameter | Description / Specification |

- 1 | Make / Model | Cummins / Kirloskar / Mahindra (example – confirm at procurement) | Back to Index
- 2 | Type | Silent Type, Auto-start, Water-cooled, Turbocharged Diesel Generator |
- 3 | Rating / Capacity | 2 × 1300 kVA each (standby operation, load sharing optional) |
- 4 | Fuel Used | High-Speed Diesel (HSD) – BS-VI grade, low sulphur (<0.05%) |
- 5 | Rated Power Output | ~400 kW per DG set (0.8 PF) |
- 6 | Total Installed Capacity | 2,600 kVA (2 sets × 1300 kVA) |
- 7 | Operating Hours / Year | ~800–1,000 hours per year (emergency + load testing only) |
- 8 | Fuel Consumption | ~55–60 L/hour @ full load |
- 9 | Estimated Annual HSD Consumption | ≈ 27,000 L / year (≈ 27 KL / year) |
- 10 | Storage Capacity (HSD Tank) | 10 KL aboveground double-walled MS tank with vent, dyke, and spill tray as per PESO norms |
- 11 | Cooling System | Water-cooled, with radiator and jacket water heater |
- 12 | Lube Oil System | Forced lubrication; oil drain point connected to collection tray |
- 13 | Starting System | 24V battery start with automatic mains failure (AMF) panel |
- 14 | Exhaust System | Silencer with flexible coupling; insulated exhaust manifold |
- 15 | Emission Parameters (at rated load) | • PM ≤ 0.3 g/kWh • NO_x + HC ≤ 7.5 g/kWh • CO ≤ 3.5 g/kWh (As per CPCB II norms) |
- 16 | Stack Details | Mild steel stack with flanged joints; height as per CPCB formula: $H = h + 0.2\sqrt{KVA} = 3 + 0.2\sqrt{1300} \approx 10.2$ m above roof level per set | 36.05551275463989
- 17 | Stack Quantity | 2 Nos (individual stack for each DG set) | 7.211102550927979
- 18 | Noise Level at 1 m distance | ≤ 75 dB(A) – within CPCB norm | 10.21110255092798
- 19 | Noise Control Measures | • Acoustic Enclosure (≤ 75 dB(A)) • Vibration isolators under skid base • Greenbelt & acoustic barriers along DG yard boundary |
- 20 | Location | Utility block (away from production & office area) |
- 21 | Ventilation System | Forced air intake & exhaust with acoustic louvers |
- 22 | Emission Control | • Stack emission monitoring (PM, NO_x, SO_x) – quarterly • Use of low-sulphur HSD |
- 23 | Lube Oil Handling | Drained to closed HDPE drum; sent to authorized recycler (HW 5.1) |
- 24 | Spill Control | Impervious floor, containment dyke, absorbent pads available |
- 25 | Safety & Fire Protection | Fire extinguishers (CO₂ + dry chemical) at DG yard; earthing pit per IS 3043 |
- 26 | Authority Approval | DG sets to comply with CPCB-II emission & noise certification; HSD tank under PESO license |

Sr.No. | Parameter | Standard / Limit | Plant DG Result / Provision

- 1 | Emissions (CPCB-II) | PM ≤ 0.3 g/kWh NO_x+HC ≤ 7.5 g/kWh CO ≤ 3.5 g/kWh | Cummins CPCB-II compliant engines
- 2 | Stack Height | $H = h + 0.2\sqrt{KVA}$ | 6.5 m above roof per set
- 3 | Noise | ≤ 75 dB(A) at 1 m | Acoustic enclosure fitted
- 4 | Fuel Type | Low-sulphur HSD | BS-VI HSD used
- 5 | Used Oil Disposal | To authorized recycler | As per HW Rule 5.1
- 6 | DG Area Containment | Impervious floor + bund | Provided

| Back to Index |

[SHEET: Pol control meas]

Sr.No. | Type | Source | Pollutants Likely | Control Measures / Equipment | Remarks |

- 1 | AIR POLLUTION | a. DG Set (2 × 500 kVA, standby) | PM, SO_x, NO_x, CO (from diesel combustion) | • Acoustic enclosure to control noise • Adequate stack height as per CPCB formula ($H = h + 0.2\sqrt{KVA}$) ~6.5 m above roof • Low-sulphur HSD (<0.05%) fuel • Regular maintenance & emission monitoring | Operates only during power outage | | Back to Index
- 2 | AIR POLLUTION | b. PNG / CNG-fired Boiler (500 kg steam/hr) | NO_x, trace CO | • Use of low-NO_x burner • Stack height 12 m above roof • Online temperature & pressure monitoring • Periodic stack emission testing | PNG is clean fuel, minimal SO_x |
- 3 | AIR POLLUTION | c. HVAC systems / AHUs | Dust, microbial aerosols | • HEPA filters (0.3 µm) at terminal outlets • Pre-filters (10 µm) at return air • Periodic filter replacement as per SOP | Ensures cleanroom Class 10,000–100,000 compliance |
- 4 | AIR POLLUTION | d. Solvent & detergent handling (TnBP, Triton X-100) | VOC vapours | • Closed mixing vessels, nitrogen blanketing • Solvent vapor condenser + activated-carbon adsorption unit • Explosion-proof zone classification (ATEX) | Emission < 50 mg/Nm³ VOC ensured |
- 5 | AIR POLLUTION | e. Laboratory fume hoods / exhausts | Trace acidic or organic vapours | • Fume hoods with local scrubbers or HEPA filters • Ducted exhaust at safe height | Minimal emissions, intermittent source |

Sr.No. | Type | Source | Type of Wastewater | Pollutants Likely | Treatment / Control Equipment |

- 1 | WATER POLLUTION | a. Process & WFI drains | Process effluent containing protein residues, buffers, mild solvents, detergents | pH 6–8, COD 1,000–2,000 mg/L, BOD 400–800 mg/L, low TDS | Effluent Treatment

Plant (ETP): • Collection & equalization tank (15 m³) • pH correction & neutralization tank • Primary clarifier • Biological MBR / MBBR reactor • Tertiary filtration (UF + RO) • RO permeate reused for gardening / utilities • RO reject → MEE + ATFD | |

2 | WATER POLLUTION | b. Solvent-detergent streams (TnBP phase) | High COD, solvent traces | Trace VOCs, COD > 10,000 mg/L | Dedicated solvent holding tank → evaporation or incineration via TSDF | |

3 | WATER POLLUTION | c. Domestic sewage (staff 506) | Black / grey water | BOD ~250 mg/L | STP (40 m³/day): MBBR + UF + chlorination | |

4 | WATER POLLUTION | d. Cooling tower blow-down, softener reject | High TDS, hardness | TDS 2,000–3,000 mg/L | Collected in neutralization tank → mixed with RO reject → MEE | |

Sr.No. | Type | Source | Type of Waste | Category | Control / Disposal Method | |

1 | SOLID / HAZARDOUS WASTE POLLUTION | Process residues, filter aids, spent carbon, ETP sludge | Solid / semi-solid | HW 28.2 / 35.3 | Sent to Authorized TSDF (CHWTSDF) for landfill/incineration | |

2 | SOLID / HAZARDOUS WASTE POLLUTION | Spent solvent mix (TnBP + detergent) | Liquid | HW 28.1 | Sent to Solvent recovery or TSDF | |

3 | SOLID / HAZARDOUS WASTE POLLUTION | Used oil from DG set | Liquid | HW 5.1 | Sold to MPCB-authorized recycler | |

4 | SOLID / HAZARDOUS WASTE POLLUTION | Biomedical waste (lab disposables, plasma bags) | Bio-infectious | BMW Cat. 4 / 5 | Sent to Authorized CBWTF | |

5 | SOLID / HAZARDOUS WASTE POLLUTION | Non-hazardous recyclable waste | Paper, plastic, metal, glass | Non-hazardous | Segregation → authorized recyclers | |

6 | SOLID / HAZARDOUS WASTE POLLUTION | Organic waste (canteen, sludge) | Biodegradable | Non-hazardous | Composting / manure | |

Sr.No. | Type | Source | Noise Level (dB-A) | Control Measures | | |

1 | NOISE POLLUTION | DG sets | 75–80 | Acoustic enclosure, antivibration mounts, green belt | | |

2 | NOISE POLLUTION | Compressors, pumps, blowers | 70–75 | Foundation damping pads, acoustic barrier | | |

3 | NOISE POLLUTION | HVAC & AHU | 60–65 | Acoustic lining, flexible connectors | | |

4 | NOISE POLLUTION | General utilities | < 55 | Periodic maintenance, ear protection for workers | | |

Sr.No. | Type | Equipment / Facility | Capacity / Function | Purpose | | |

1 | SOLID WASTE MANAGEMENT | ETP | 70 m³/day (MBBR + UF + RO + MEE) | Treat & recycle process effluent | | |

2 | SOLID WASTE MANAGEMENT | STP | 40 m³/day (MBBR + UF) | Treat domestic sewage | | |

3 | SOLID WASTE MANAGEMENT | Air pollution stacks | Boiler – 12 m; DG – 6.5 m above roof | Emission dispersion | | |

4 | SOLID WASTE MANAGEMENT | Activated carbon filter | 1 × 500 kg | VOC adsorption from S-D exhaust | | |

5 | SOLID WASTE MANAGEMENT | Scrubber (if acid used) | 1 × 3,000 m³/hr | Fume removal from buffer prep / lab exhaust | | |

6 | SOLID WASTE MANAGEMENT | Noise enclosure | DG & compressors | Noise reduction | | |

7 | SOLID WASTE MANAGEMENT | Greenbelt | ≥ 33 % of plot | Dust, noise & micro-climate control | | |

[SHEET: Heat treat_Reaction_Tank]
Sr.No. | Vessel | Working vol (L) | No. of units recommended
1 | Plasma pooling tank (refrigerated) | 2000 | 1 primary + 1 standby (or reserve)
2 | Caprylic acid reaction tank (jacketed) | 2000 | 1 (or 2 for staggered batches)
3 | S-D mixing tank (jacketed, sealed) | 2000 | 1 (with dedicated solvent bund)
4 | Clarification / settling tank or DAF feed | 2500 | 1
5 | Pasteurizer (container) | capacity to hold per-batch vials (900) | 1 tunnel / basket line sized to throughput
6 | Buffer / formulation tanks (jacketed) | 500–1,500 | 2–3 (for different buffers)
7 | Waste / solvent hold tank (bunded) | 1,000–2,000 | 1
| Back to Index | |
[SHEET: Fuel Consmpr]
Sr. No. | Fuel Type | Purpose / Area of Use | Approx. Annual Consumption | Unit
1 | Electricity | Cleanroom HVAC, process equipment (centrifuges, lyophilizers, pumps, lighting, DG auxiliaries, WFI generation, chillers, lab & office) | 3.5 – 4.0 million kWh / year | kWh
2 | HSD (High-Speed Diesel) | Stand-by DG sets (2 × 500 kVA) for emergency power | ≈ 25 – 30 KL / year | KL (≈ 25,000 – 30,000 L)**
3 | CNG / PNG | Boiler / hot-water generation for WFI plant, sterilization steam, HVAC re-heat coils | ≈ 150,000 – 180,000 Sm³ / year | Standard m³ (Sm³)
4 | LPG (optional small cylinders) | Laboratory instruments / flame sterilizers | ≤ 500 kg / year | kg
| Back to Index | | |
[SHEET: Water]
Sr.No. | Item | Litres (L / year) | Cubic metres (m³ / year) | Notes
| A. Water Inputs | | |
1 | Domestic water (506 ppl × 100 L/p/d) | 18469000 | 18469 | Toilets, canteen, housekeeping
| WFI (process) | 6205470 | 6205.47 | WFI for formulation, CIP, rinses
| Other process water (25% of WFI) | 1551368 | 1551.37 | CIP makeup, utility washes
| Extra process water (10% of plasma vol) | 41400 | 41.4 | Misc. process losses, small uses
2 | Process Water | 7798238 | 7798.24 |
| Total Water Input | 26267238 | 26267.24 | A = sum of above
| B. Water Outputs / Wastewater | | |
1 | Domestic sewage → STP (80% of domestic) | 14775200 | 14775.2 | Black/gray water to STP
2 | Process wastewater → ETP (99% of process) | 7720256 | 7720.26 | Process drains, WFI rejects, CIP effluent
| Total Wastewater Generated | 22495456 | 22495.46 | B = sum of above
| C. Balance / Losses / Product incorporation | | |
1 | Unaccounted losses / product incorporation / evaporation (A – B) | 3771782 | 3771.78 | ~14.36% of input — includes water in products, steam losses, sampling, evaporation, bleed, equipment hold-up
| Back to Index | | |
[SHEET: Non Haz Waste]
Sr. No. | Source / Process Area | Type of Non-Hazardous Waste | Approx. Quantity / Year
1 | ETP / STP treatment | Biological sludge (after dewatering) | 8 – 10 MT/year (wet)
2 | Process area & lab washing | Treated water (ETP + RO permeate) | ~12,000 m³/year
3 | Packaging line | Empty glass vials (non-contaminated rejects) | 0.5 – 1.0 MT/year (~50,000 pcs)
4 | Packaging & labeling | Paperboard cartons, labels, paper scrap | 1.5 – 2.0 MT/year
5 | Procurement / stores area | Corrugated boxes, stretch film, plastic wrapping | 1.0 – 1.5 MT/year
6 | Maintenance workshop | Metal scrap (iron, steel, aluminum parts) | 0.8 – 1.2 MT/year
7 | Utility & HVAC area | Spent filters (air filters, bag filters, prefilters) | 0.3 – 0.5 MT/year
8 | Admin & office areas | Office paper waste, packaging waste | 1.0 – 1.5 MT/year
9 | Canteen / pantry | Organic kitchen waste | 1.5 – 2.0 MT/year
10 | General housekeeping | Sweepings, mopping dust, non-contaminated PPE | 0.5 – 0.8 MT/year
11 | Cooling tower & utilities | Blowdown & scale sludge (non-toxic) | 1.0 – 1.5 MT/year
12 | Electrical systems | Cable cuttings, wire ends, plastic conduits | 0.2 – 0.3 MT/year
13 | Gardening & green area | Dry leaves, grass clippings | 0.3 – 0.5 MT/year
14 | Water purification & softener | Spent ion-exchange resins (non-toxic) | 0.2 MT/year
15 | Misc. activities | Empty HDPE / PET bottles (non-contaminated) | 0.1 – 0.2 MT/year
| Back to Index | | |
[SHEET: Raw Material]
Sr.No. | Item | Annual requirement (rounded) | Unit | Notes |
1 | Source human plasma | 414000 | L | Primary raw material (cold chain required) | Back to Index
2 | Water for Injection (WFI) | 6205000 | L | Assumed 15,000 L WFI / 1,000 L plasma |

[SHEET: Hazardous Waste]

Sr. No. | Process / Source | Type of Hazardous Waste | Approx. Quantity / Year

1 | Solvent recovery & viral inactivation (TnBP + detergent process) | Spent solvent mixture (Tri-n-butyl phosphate + Triton X-100 / Polysorbate 80) | 1.0 – 1.5 KL / year

2 | Filtration & purification units | Used filter aids / depth filter media contaminated with protein or solvent | 0.8 – 1.0 MT / year

3 | Activated carbon beds (viral removal, deodorization) | Spent activated carbon with adsorbed organic residues | 0.5 – 0.7 MT / year

4 | Chromatography / TFF cleaning (CIP) | Residues of buffers, cleaning agents, NaOH / HCl neutralization sludge | 2.0 – 3.0 MT / year (dry solids)

5 | ETP operation | Sludge containing proteinaceous organic matter & trace solvents | 5.0 – 6.0 MT / year

6 | ETP / RO reject water | High-TDS / COD effluent (liquid) | ≈ 900 – 1,000 m³ / year

7 | Resin & membrane replacement | Spent chromatography resin, UF/DF membranes, PVDF filters | 0.5 – 1.0 MT / year

8 | Laboratory & QC activities | Contaminated lab glassware, pipette tips, chemical bottles | 200 – 250 kg / year

9 | Oil from DG sets, compressors, hydraulic systems | Used lubricating oil | 50 – 100 L / year

10 | DG set maintenance | Oil-soaked cotton waste, filters | 50 – 100 kg / year

11 | Production packaging & vial washing | Contaminated packaging (plastic, foil, paper) | 0.3 – 0.5 MT / year

12 | Spill & floor washings | Absorbent material, mopping waste, PPE, gloves | 0.5 MT / year

| Back to Index | |

Reagent Details:

Formula:

Sodium Citrate (M.Wt): 258.07.

Citric Acid (M.Wt): 192.124

Sodium Chloride(M.Wt):58.44

Preparation of FN-RR-12 working buffer from Stock buffer (FN-RR-08):

Calculations: For the Preparation of 20mM Sodium Citrate pH 7.4 + 2 M Sodium Chloride.

Stock Buffer (FN-RR-08):0.2M Sodium Citrate pH 7.4.

Formula:.

$C1 \times V1 = C2 \times V2$

C1 = concentration of stock

V1 = volume of stock you need to take

C2 = desired (working) concentration

V2 = final total volume of working solution

Applying the formula to prepare the working buffer:

$C1 \times V1 = C2 \times V2$

C1 = 0.2M Sodium Citrate pH 7.4.

V1 = volume of stock you need to take _____ L.

C2 = desired (working) concentration 20mM Sodium Citrate, pH 7.4

V2 = final total volume of working solution _____ L.

$V1 = (C2 \times V2) / C1$.

$C2 = 0.02M$; $V2 = 1.0 L$; $C1 = 0.2M$

$V1 = (0.02 \times 1.0) / 0.2$

$V1 = 0.1L$

Take 0.1 L (FN-RR-08) Stock buffer solution and dilute it with water to make up 1 L.

Calculations: 2M Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 2 M Sodium Chloride (MW = 58.44 g/mol)

Weight of solute(g)=2×58.44 x1=116.88 g.

Preparation Method:

Weigh 116.88 g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 2 M Sodium Chloride (MW = 58.44 g/mol).

Weight of solute(g)=2×58.44× _____ L= _____ g.

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Preparation of working buffer (FN-RR-12):

Take 0.1 L (FN-RR-08) Stock buffer solution and add 2 M Sodium Chloride (116.88 gm). Dissolve it, and

then make up the final volume to 1 L with water.

Check and record the details:

Reagent Details:

Formula & Calculations:

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.2M sodium chlorolride (MW = 58.44g/mol)

Weight of solute(g)=1×11.688=11.688g.

Preparation Method:

Weigh 11.688 g of sodium chloride

To prepare 20mM Tris 1L solution from 1M Tris stock solution formula is $M_1(\text{Molarity of stock}) \times V_1$

(volume of stock)= $M_2(\text{Molarity of working}) \times V_2(\text{volume of working})$.

Take 20mL of 1M tris solution and add weighed amount of sodium chloride as required and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 0.2M NaCl(MW = 58.44g/mol).

Weight of solute(g)=11.688x _____ L= _____ gm

Weigh _____ gm of NaCl.

To prepare _____ of 20mM Tris

Take 20mL x _____ L= _____ mL of 1M Tris

Dissolve pre weighed NaCl in 20mM Tris solution to make a _____ L solution.

Adjust the pH to 8 using concentrated HCl/NaOH solution

1) Sewage & Effluent Treatment: Clearly mark the physical location, dimensions, and layout of the Effluent Treatment Plant (ETP) / Sewage Treatment Plant (STP). Provide structural calculations proving adequate capacity for processing waste.
Response: Physical location already marked in site layout.

2) Organic Waste Converter (OWC): Designate a dedicated, ventilated space for a mechanical OWC, stating its processing capacity in kg/day based on your expected workforce.
Response: Plasma: 20.4MT/year or 68T/day, LVP: 7.9MT/year or 26T/day

3) Process Flow & Water Balance Chart: Submit a detailed quantitative water balance diagram showing domestic and industrial consumption, recycling rates, and a commitment to Zero Liquid Discharge (ZLD).
Response:
Plasma:
LVP:
4)Hazardous Waste Management Plan: Since ethanol-based fractionation is utilized, submit storage, handling, and disposal plans for hazardous/chemical solvents
Response:
Plasma:
LVP:

Sr.No.	Item	Litres (L / year)	Cubic metres (m ³ / year)	Notes
A. Water Inputs				
1	Domestic water (506 ppl × 100 L/p/d)	1,84,69,000	18,469.00	Toilets, canteen, housekeeping
	WFI (process)	62,05,470	6,205.47	WFI for formulation, CIP, rinses
	Other process water (25% of WFI)	15,51,368	1,551.37	CIP makeup, utility washes
	Extra process water (10% of plasma vol)	41,400	41.4	Misc. process losses, small uses
2	Process Water	77,98,238	7,798	
	Total Water Input	2,62,67,238	26,267.24	A = sum of above
B. Water Outputs / Wastewater				
1	Domestic sewage → STP (80% of domestic)	1,47,75,200	14,775.20	Black/gray water to STP
2	Process wastewater → ETP (99% of process)	77,20,256	7,720.26	Process drains, WFI rejects, CIP effluent
	Total Wastewater Generated	2,24,95,456	22,495.46	B = sum of above
C. Balance / Losses / Product incorporation				
1	Unaccounted losses / product incorporation / evaporation (A – B)	37,71,782	3,771.78	~14.36% of input — includes water in products, steam losses, sampling, evaporation, bleed, equipment hold-up
	Category Type of Water/Steam	Estimated Quantity per day	Estimated Quantity per year	Purpose
	Product Vehicle Water for Injection (WFI)	~62,200 – 62,500 L	~14928000 – 15000000 L	Main solvent; added q.s. to reach final batch volume.
	Equipment Cleaning Purified Water (PW)	5,000 – 8,000 L	1200000 – 1920000 L	Initial rinses for mixing tanks, piping, and filling lines (CIP).
	Final Rinse Water for Injection (WFI)	2,000 – 3,000 L	480000 – 720000 L	Final rinse of product-contact surfaces to ensure a pyrogenicity.
	Sterilization Pure Steam (Clean Steam)	~1,500 – 2,500 kg	~360000 – 600000 kg	Used in autoclaves for terminal sterilization and SIP of lines.
	Utility Heating Industrial Steam	~5,000 – 7,000 kg	~1200000 – 1680000 Kg	Indirect heating for jacketed vessels and WFI generation.
	Cooling Process Water	10,000 L	2400000+ L	Non-contact cooling for jacketed vessels after sterilization.
	Wastewater Cleaning-in-Place (CIP) Effluent	5,000 – 8,000 L	1200000 – 1920000 L	Treatment in an Effluent Treatment Plant (ETP)
	Output Category Output Stream	Estimated Quantity per Day	Estimated Quantity per Year	Remarks
	Treated Water Recovery Treated Water for Reuse / Discharge	~3,500 – 6,800 L	~840,000 – 1,632,000 L	
	Recovered after primary and secondary treatment			
	Reject Water / Losses RO Reject / Evaporation / Handling Losses	~500 – 1,600 L	~120,000 – 384,000 L	
	Depends on treatment efficiency and recovery system			
	Sludge Generation ETP Sludge / Solid Waste	~20 – 50 kg	~4,800 – 12,000 kg	To be disposed through authorized waste handler
	Final Discharge Treated Effluent	As per discharge norms As per regulatory limits	Suitable for reuse/discharge after compliance testing	
	Sr. No. Process / Source	Type of Hazardous Waste	Approx. Quantity / Year	
1	Solvent recovery & viral inactivation (TnBP + detergent process)	Spent solvent mixture (Tri-n-butyl phosphate + Triton X-100 / Polysorbate 80)	1.0 – 1.5 KL / year	
2	Filtration & purification units	Used filter aids / depth filter media contaminated with protein or solvent	0.8 – 1.0 MT / year	
3	Activated carbon beds (viral removal, deodorization)	Spent activated carbon with adsorbed organic residues	0.5 – 0.7 MT / year	
4	Chromatography / TFF cleaning (CIP)	Residues of buffers, cleaning agents, NaOH / HCl neutralization sludge	2.0 – 3.0 MT / year (dry solids)	
5	ETP operation	Sludge containing proteinaceous organic matter & trace solvents	5.0 – 6.0 MT / year	
6	ETP / RO reject water	High-TDS / COD effluent (liquid)	≈ 900 – 1,000 m ³ / year	
7	Resin & membrane replacement	Spent chromatography resin, UF/DF membranes, PVDF filters	0.5 – 1.0 MT / year	
8	Laboratory & QC activities	Contaminated lab glassware, pipette tips, chemical bottles	200 – 250 kg / year	
9	Oil from DG sets, compressors, hydraulic systems	Used lubricating oil	50 – 100 L / year	
10	DG set maintenance	Oil-soaked cotton waste, filters	50 – 100 kg / year	
11	Production packaging & vial washing	Contaminated packaging (plastic, foil, paper)	0.3 – 0.5 MT / year	
12	Spill & floor washings	Absorbent material, mopping waste, PPE, gloves	0.5 MT / year	
	Hazardous Waste API Residue / Chemical Sludge	50 – 200 kg	12000 – 48000 kg	High-temperature incineration (>1,200°C).

Reagent Details:

Formula:

Sodium Citrate (M.Wt): 258.07.

Citric acid (M.Wt): 192.124

Preparation of FN-RR-05 stock buffer:

Preparation of 0.1M Sodium Citrate pH 6.5

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.1M Citric Acid (MW = 192.124 g/mol)

Weight of solute(g)=0.1×192.124×1=19.21g.

Preparation Method:

Weigh 19.21g of Citric Acid and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.1M Citric Acid (MW = 192.124g/mol).

Weight of solute(g)=0.1×192.124× _____ L= _____ g.

Weigh _____ gm of Citric Acid and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.1M Tris Sodium Citrate.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.1M Tris Sodium Citrate (MW = 258.07 g/mol)

Weight of solute(g)=0.1×258.07 ×1=25.80g

Preparation Method:

Weigh 25.80g of Tris Sodium Citrate and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 0.1M Tris Sodium Citrate (MW = 258.07 g/mol).

Weight of solute(g)=0.1×258.07× _____ L= _____ g.

Weigh _____ gm of Tris Sodium Citrate and dissolve in water to make a _____ L solution.

Procedure for Preparation of FN-RR-05 stock

To prepare a pH 6.5 solution, 0.1 M Tris Sodium Citrate solution is titrated with 0.1 M citric acid so that the pH attains pH 6.5.

For Example, to prepare a 1 L solution, take 0.1 M Tri Sodium Citrate and adjust the pH with the 0.1 M Citric acid to get the pH 6.5 and make up the final volume to 1 L.

PROCESS INSTRUCTIONS AND DATA CAPTURE POINTS –THROMBIN

TABLE OF CONTENTS

1 CHROMATOGRAPHY-10T 3

2 CONCENTRATION OF CHROMATOGRAPHY-10T ELUATE 6

3 PA-SF-001FILTRATION 8

CHROMATOGRAPHY-10T

Note: Activation/Load preparation to be carried out every time for 300ml equivalent plasma.

Take the Wash-II peak from Chromatography-8N Run of Human coagulation factor IX and store at 2-8°C until it is used for processing of Thrombin.

Check and record the following details in the table below.

Note: Estimate the protein content (mg/mL) by using the extinction coefficient 1.83 by using the formula $O.D280/1.83$, and multiply the obtained value by the total volume to calculate total protein.

ACTIVATION STEP

Note: Take a 500 mL plasma equivalent sample each time for activation.

To the collected wash-II sample, add 125 mL/ml of TH-RR-07 and incubate it for 5Hours $\pm$ 10 Mins at RT (20-25°C).

LOAD PREPARATION

After incubation, filter the sample through a mesh to remove clots formed during incubation and followed by a PA-PO-007 filter.

No. of filters used: _____.

Lower the conductivity of the above sample to 1.9 – 2.4 mS/cm by adding TH-RR-06 buffer to the sample under constant stirring.

Check and record the Chromatography - 10T load details:

Note: Estimate the protein content (mg/mL) by using the extinction coefficient 1.83 by using the formula $O.D. 280 / 1.83$.

Switch on the chromatography system. When the chromatography system is ready, open the UNICORN software.

Connect the column to the chromatography system and check the Column connections to the system. Check for instrument air connection at 6 bar to the system.

Record the following details:

Column height: 20 cm, Column volume:393ml,

HETP value: _____, Asymmetry: _____.

Column Wash

Pass 2 CVs of WFI through the column at 39.3 ml/min till the conductivity has dropped below 1.0 mS/cm.

Volume of WFI used: _____.

pH drop

Pass up to 2 CVs of TH-RR-05 through the column at a flow rate of 39.3 ml/min till the pH has dropped to 7.5 ± 0.5 . Record the following details:

Column Equilibration

Equilibrate the column with 3 CVs of TH-RR-02 at a flow rate of 39.3 ml/min.

Loading and Elution

Before loading, Auto Zero the absorbance (O.D280) on the chromatography system and switch on the record button and enter the run details and date.

Load the sample from step 1.4.3 at a flow rate of 39.3 ml/min.

Loading should be done in equivalent of 300L plasma on chromatography-TH-1column (NMT 65mL of plasma/mL of resin).

Pass 3 CVs of TH-RR-02at a flow rate of 39.3 ml/min to wash the column.

Pass up to 7 CVs of TH-RR-03through the column at a flow rate of 39.3 ml/min to elute the bound protein.

Start collecting the eluate when the absorbance rises to 100mAU and collect until the absorbance drops down to 100mAU. Record the following details of the eluate.

Note: Protein concentration is estimated by dividing the O.D. 280 value by the extinction coefficient 1.83.

Stabiliser Addition

Add 10 mL of Human Serum Albumin (HSA-20%) to each eluate and record the following details.

Cleaning

Pass 2 CVs of cleaning buffer TH-RR-04 at a flow rate of 39.3 ml/min.

Regeneration

Pass 2 CVs of TH-RR-09 through the column in reverse flow at 39.3 ml/min and hold the column for 30min in TH-RR-09 buffer.

Repeat steps 1.7 to 1.13 for Run 2 and record the results in the above tables.

Storage

Pass 2 CVs of TH-RR-10 through the column at a flow rate of 39.3 ml/min to store the column in TH-RR-10.

Volume of TH-RR-10 used: _____ L.

CONCENTRATION OF CHROMATOGRAPHY-10T ELUATE

Take the Chromatography - 10T Run 1 eluate sample from step 1.11 and carry out the concentration of the sample.

NWP calculation before concentration

Record the following details of the TFF cassettes connected in series horizontally to the TFF system.

No. of cassettes used: _____,

Cassette ID Nos.: _____.

Wash the cassettes with WFI till conductivity reaches below 0.1mS/cm and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Volume of WFI used: _____ L.

Check and record the details as below:

Concentration of Eluate sample

After NWP calculation, flush the cassettes with TH-RR-03 till the conditions of the buffer are reached.

Volume of TH-RR-03 used: _____ L.

Irrespective of the eluate volume, concentrate the sample to 400mL $\pm$ 50 mL, at a set TMP of ≤ 1.0 bar.

Check and record the details as below

Repeat the steps from 2.3 to 2.6.3 for Run 2 and record the details in the above tables.

Pool the concentrated eluates from step 2.6.3.

Volume of sample: _____ (mL).

Note: Store concentrated eluate from Run 1 at 2-8°C until it is pooled with Run 2 concentrated eluate.

Diafilter the pooled concentrated sample with 5 dia volumes of TH-RR-08 at a set TMP of ≤ 1.0 bar and concentrate the sample to 500 $\pm$ 100 mL.

Volume of TH-RR-08 used: _____.

pH: _____, Conductivity: _____ mS/cm.

O.D280/600: _____, Final volume (mL): _____.

Collect 2 mL of sample and send to QC for in-process QC analysis.

Record the obtained results as per the QC report :

Activity: _____, BET: _____.

Add and adjust Human Serum Albumin (HSA-20%) to a final concentration of 25 mg/mL to the diafiltered sample from step 2.6.6

Volume of diafiltered sample: _____ mL.

Volume of HSA-20% added before concentration in step 1.11.1: _____.

Volume of HSA-20% added after diafiltration: _____.

Regeneration

Flush the cassette with WFI till conductivity reaches below 0.1mS/cm and then with TH-RR-09at 40 - 45°C and recirculate TH-RR-09 for 30 to 45 min at a set TMP of ≤ 1.0 bar.

Volume of TH-RR-09 used: _____ L.

Post-NWP calculation

Repeat the step as in 2.2 and record the details of NWP in the table below. If NWP is <120 LMH/Bar, repeat the cleaning procedure.

Storage

Flush the cassettes with 2L of TH-RR-10 and finally store the cassettes inTH-RR-10. Remove the cassettes from the system, immerse in TH-RR-10 and store at 2-8°C.

Volume of TH-RR-10 used: _____ L.

PA-SF-001FILTRATION

Assemble the PA-SF-001 filter with sterilised inlet and outlet silicone tubing.

Check and record the following filter details:

No. of filter(s) used: _____.

Equilibrate the filter by passing 0.5L TH-RR-08.

Volume of TH-RR-08 passed: _____ L.

Filter the sample through a filter using a peristaltic pump under LAFU.

Collect 10 mL sample and send to QC for Drug Substance testing.

Check and record the following details:

Store the above sample at - 20°C from step 3.6 in a 500 mL Nalgene bottle till it is released for filling.

Sample Label ID: _____.

Reagent Details:

Formula:

Sodium Citrate (M.Wt): 258.07.

Citric Acid (M.Wt): 192.124

Sodium Chloride(M.Wt):58.44

Preparation of FN-RR-15 working buffer from Stock buffer (FN-RR-08):

Calculations: For the Preparation of 11.4mM Sodium Citrate pH 7.4 + 145m M Sodium Chloride.

Stock Buffer (FN-RR-08):0.2M Sodium Citrate pH 7.4.

Formula:.

$C1 \times V1 = C2 \times V2$

C1 = concentration of stock

V1 = volume of stock you need to take

C2 = desired (working) concentration

V2 = final total volume of working solution

Applying the formula to prepare the working buffer:

$C1 \times V1 = C2 \times V2$

C1 = 0.2M Sodium Citrate pH 7.4.

V1 = volume of stock you need to take _____ L.

C2 = desired (working) concentration 0.114mM Sodium Citrate, pH 7.4

V2 = final total volume of working solution _____ L.

$V1 = (C2 \times V2) / C1$.

$C2 = 0.0114M$; $V2 = 1.0 L$; $C1 = 0.2M$

$V1 = (0.0114 \times 1.0) / 0.2$

$V1 = 0.057L$

Take 0.057 L (FN-RR-08) Stock buffer solution and dilute it with water to make up 1 L.

Calculations: 0.145M Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.145 M Sodium Chloride (MW = 58.44 g/mol)

Weight of solute(g)=0.145×58.44 ×1=8.473 g.

Preparation Method:

Weigh 8.473 g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.145 M Sodium Chloride (MW = 58.44 g/mol).

Weight of solute(g)=0.145×58.44× _____ L= _____ g.

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Preparation of working buffer (FN-RR-15):

Take 0.057 L (FN-RR-08) Stock buffer solution and add 0.145M Sodium Chloride (8.473 gm). Dissolve it, and

then make up the final volume to 1 L with water.

Check and record the details:

Reagent Details:

Formula & Calculations:

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.1M Tri-Sodium Citrate (MW = 258.06g/mol)

Weight of solute(g)=0.1×258.06 x 1=25.806g.

Preparation Method:

Weigh 25.806 g of Tri-sodium citrate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.1M Tri -Sodium Citrate (MW = 258.06g/mol).

Weight of solute(g)=0.1 x 258.06 x _____L= _____gm

Weigh _____gm of Tri-sodium citrate and dissolve in water to make a _____ L

solution.

[SHEET: Reponse]		
S. No.	Query	Response
1	Pls share the following Layout Plan , Manpower resources required, Height of the Plasma Ground Floor , 1st Floor and LVP 1st Floor height required considering machine height, HVAC and access requirements.	
2	Confirmation of machine list with make, model, size, and weight. Attached excel for make, size and weight, model can be confirmed after confirmation of vendor	
3	Final machine layout and required working clearances. Layout attached, working clearance should be 2 meters	
4	Floor-to-floor height confirmation as per machinery and HVAC requirements. As per machinery 3.5 meters, HVAC requirement 6 meters	
5	Verification of internal room sizes as per operational needs. As per layout	
6	Confirmation of surrounding space for vehicular movement and loading/unloading access.	
7	Utility requirements (water inlet/outlet, drainage, power load, and waste disposal). Water inlet = 87557 L/day, Water outlet = 74984 L/day, Working load 4143.37 KVA and stand by load 1068.24 KVA, waste = 74984 L/day, ETP/STP: 900-1000 m3/year	
8	Manpower resources required 508 as per DPR submitted earlier	

Reagent Details:
Formula & Calculations:
Formula: Use the formula to calculate the molarity:
 $Molarity (M) = (Per\ cent\ by\ Weight / 100) * (Density\ in\ g/mL) * 1000 / Molar\ Mass.$
Example: Molarity of Glacial Acetic Acid
Molar Mass of CH_3COOH : ~60.05 g/mol
Density: ~1.05 g/mL
Purity: 100%
Acetic Acid (MW = 60.05 g/mol).
Calculation:
 $Molarity = (100 / 100) * 1.05\ g/mL * 1000\ mL/L / 60.05\ g/mol \approx 17.5\ M.$
Calculation: To prepare 1 L of 1.0 M.
Applying the formula to prepare the working buffer:
 $C1 \cdot V1 = C2 \cdot V2$
 $C1 = 17.5\ M$ acetic acid.
 $V1$ = volume of stock needed to take.
 $C2$ = desired (working) concentration 1.0 M acetic acid.
 $V2$ = final total volume of working solution for one litre.
 $V1 = (C2 \times V2) / C1.$
 $C2=1.0\ M ; V2= 1.0\ L; C1=17.5\ M$
 $V1 = (1.0 \times 1.0) / 17.5$
 $V1 = 0.057\ L$
Take 0.057 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.
To prepare various volumes:
 $V1$ = volume of stock needed to take _____ L.
 $C2$ = desired (working) concentration 1.0 M acetic acid.
 $V2$ = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / 17.5.$
 $V1=$ _____ L.
Take $V1$ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

PLASMA THAWING, CUTTING, POOLING AND FILTRATION
TABLE OF CONTENTS

- 1. ISSUANCE OF PLASMA BAGS AND THAWING OF PLASMA BAGS 3
- 2. CUTTING AND POOLING OF PLASMA BAGS 3
- 3. PLASMA FILTRATION THROUGH PP FILTERS (5µm + 1.2 µm) 4

ISSUANCE OF QC TESTED PLASMA BAGS:

THAWING OF PLASMA BAGS

Collect purified water (PW) up to 80% of the volume of the thawing tank and ensure that the temperature is < 30 0C.

Collect the QC test released plasma bags from -25 0C freezer, disinfect with 70% IPA and place them in the thawing tank, lot-wise.

Drain the purified water from the tank when the water temperature drops below 20■C. Refill the tank with fresh, purified water.

Repeat until the plasma bags are completely thawed, take out the plasma bags from the tank and place them in plastic crates.

Transfer these plastic crates with plasma bags from the plasma thawing room to the plasma cutting and pooling room.

CUTTING AND POOLING OF PLASMA BAGS

The plasma bags are cut manually using SS scissors under the LAF unit, and collected in a sterilized glass bottle.

After completion, check and record the following details:

PLASMA FILTRATION THROUGH PP FILTERS 5µm + 1.2 µm FILTERS.

Filter the pooled plasma through sterilised PP filters connected serially.

Note: Collect a 65 ml sample for in-process QC analysis.

Check and record the following details:

Plasma Bags Details | Plasma Bags Details

Total number of plasma bags received |

Total volume of plasma bags (kg) |

Total plasma volume considering the density of 1.05. Volume(L) = plasma volume in kg/density. |

Plasma Bags Details | Plasma Bags Details

Total number of plasma bags received |

Total number of Rejects due to clots & RBCs |

Total number of Rejects due to leaks |

Total number of plasma bags pooled |

Final pooled plasma volume (L) |

Plasma volume after filtration (L) |

OD at 600 nm |

pH |

Conductivity (mS/cm) |

[SHEET: Sheet1]

Sr.No. | Action Point | Owner | Target Date | BB Response 12.05.26

1 | Sewage & Effluent Treatment: Clearly mark the physical location, dimensions, and layout of the Effluent Treatment Plant (ETP) / Sewage Treatment Plant (STP). Provide structural calculations proving adequate capacity for plasma processing waste. | LVP , Plasma : Mr. Budhish
Dialyzer : Mr. Vinod , Mr. Laxminarayan, Mr. Abhijit | 2026-05-13 00:00:00 | Physical location already marked in site layout.

2 | Organic Waste Converter (OWC): Designate a dedicated, ventilated space for a mechanical OWC, stating its processing capacity in kg/day based on your expected workforce. | LVP , Plasma : Mr. Budhish
Dialyzer : Mr. Vinod , Mr. Laxminarayan, Mr. Abhijit | 2026-05-13 00:00:00 | See attached word file

3 | Green Belt Compliance: Highlight the mandatory 33% Green Belt area (27,033.6 Sqm of your 81,920 Sqm plot) on the master layout plan with a clear index. | Mr. Dashrath Dhupal | 2026-05-13 00:00:00 | NA

4 | Peripheral Driveway: Ensure the peripheral driveway around the 44,190 Sqm industrial shed shows a minimum clear width of 6.00 meters to comply with MIDC Fire Protection Norms. | Mr. Dashrath Dhupal | 2026-05-13 00:00:00 | NA

5 | Process Flow & Water Balance Chart: Submit a detailed quantitative water balance diagram showing domestic and industrial consumption, recycling rates, and a commitment to Zero Liquid Discharge (ZLD). | LVP , Plasma : Mr. Budhish

Dialyzer : Mr. Vinod , Mr. Laxminarayan, Mr. Abhijit | 2026-05-13 00:00:00 | See attached word file for procecss flow water calculations.

6 | Hazardous Waste Management Plan: Since ethanol-based fractionation is utilized, submit storage, handling, and disposal plans for hazardous/chemical solvents. | LVP , Plasma : Mr. Budhish
Dialyzer : Mr. Vinod , Mr. Laxminarayan, Mr. Abhijit | 2026-05-13 00:00:00 | See attached word file

7 | MPCB Status: Submit a copy of the submitted application or acknowledgment for Consent to Establish (CTE) from the Maharashtra Pollution Control Board (MPCB). | Mr.Kiran ECOSIA | 2026-05-13 00:00:00 | NA

8 | Legal Undertaking: Submit a draft copy of the notarized ■500 Stamp Paper Affidavit confirming that no physical construction or site preparation will commence post-IOD until the final EC from SEIAA is obtained and uploaded to MITL. | Ashok | 2026-05-13 00:00:00 | NA

SIZE A0 DWG.NO 01

Reagent Details:
Preparation of AL-RR-23 working buffer from Stock buffer (AL-RR-09):
Calculations: For the Preparation of 150 mM Sodium Acetate pH 5.2.
Stock Buffer (AL-RR-09):0.6M Sodium acetate, pH 5.35.
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.2M Sodium Acetate pH 5.35.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 150mM Sodium Acetate pH 5.2
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
C2=0.15M ; V2= 1.0 L; C1=0.6M
 $V1 = (0.15 \times 1.0) / 0.6$
V1 = 0.25L
Take 0.25 L (AL-RR-09) Stock buffer solution, dilute with water, and make up to 1 L.
Check and record the details:

1. Size of dispatch and receiving bay:
FG Dispatch room: 9.42 x 6.25 meter, 4.70 x 3.85 meter, 4.55 x 2.32 meter,
Plasma receiving bay: 10 x 6.84 meter
RM receiving bay: 10 x 6.84 meter
SPM receiving bay: 10 x 6.84 meter
FG dispatch corridor: 10 x 6.84 meter
2. Loading/unloading dock height: 3 meter
3. Clear floor height requirement: 3 meter
4. Slab load capacity (kg/sq.m):
5. Point load of heavy machinery:
6. Crane requirement (capacity & hook height):
Heavy load items for first floor are: Vial washing machine gross weight is 4000 Kg, Autoclave gross weight is 2500 Kg
Filling machine 2200 Kg
Lyophilizer machine 7500 Kg
7. Machine foundation requirement: No machine will be placed on foundation it will be rested on flaps
8. Total electrical load (kW): Working load 4143.37 KVA and stand by load 1068.24 KVA
9. Power backup requirement (DG/UPS): 1000 KVA (2 sets x 500 KVA)
10. Water inlet size and pressure:
11. Daily water consumption (liters/day): Water consumption (including process water): 87557 L/day
12. Process water requirement (RO/DM): purified water, WFI
13. Waste water generation per day: 74984 L/day
14. ETP/STP requirement: 900-1000 m3/year
15. Drainage line size:
16. Harmful chemicals used (if any): 1.0-4.5 KL/ year (spent solvent, triton x100 and polysorbate)
17. Chemical storage room requirement:
Approved RM area is 9.72x7.22 meter and 4.63 x 4.00 meter
RM quarantine area is 6.21 x 5.77 meter
18. Biomedical waste disposal system: Biomedical waste disposal shall be done by 3rd party
19. Thermal insulation requirement: Modular panels as per GMP design will be used
Roof/wall insulation requirement: Modular panels as per GMP design will be used
20. Epoxy or anti-static flooring requirement: Epoxy shall be done
21. Male/Female toilet requirement (as per staff):
Gents toilet size is 5.90 x 5.20 and Female toilet size is 5.90 x 5.20
22. Future expansion provision upper floors

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 2N Sodium Hydroxide (MW = 40.0 g/mol)
Weight of solute(g)=2×40 = 80.00g.
Preparation Method:
Weigh 80.00 g of Sodium Hydroxide and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 2N Sodium Hydroxide (MW = 40.0 g/mol).
Weight of solute(g)=2×40.0 x _____L= _____gm
Weigh _____gm of Sodium Hydroxide and dissolve in water to make a _____ L solution.
Check and record the details:
Preparation Details:

TABLE OF CONTENTS

CONCENTRATED SAMPLE.....2

FORMULATION.....2

QC ANALYSIS REPORT.....3

CONCENTRATED SAMPLE:

1.1 Concentrate the sample and record the following details:

pH: _____, Conductivity: _____ mS/cm.

O.D.280/600: _____.Final Volume: _____.

FORMULATION

After concentration, add 100mM L-Arginine Hydrochloride and 1% Sucrose to a final concentration respectively.

Quantity of L-Arginine Hydrochloride added: _____

Quantity of Sucrose added: _____

Add and adjust the concentration of HSA-20% to a final concentration of 10 mg/mL of the concentrated sample volume

Volume of HSA-20% added before concentration from BMR step 7.2 : _____.

Volume of HSA-20% added after concentration: _____.

Check and record the following details.

pH: _____, Conductivity: _____ mS/cm.

O.D280/600: _____. Final Volume: _____.

Record the QC Analysis report.

Store the bottles containing PRA-SF-001 filtrate at -20 °C until further use.

Reagent Details:

Formula:

Sodium Acetate (M.Wt): 82.03g/mol.

Acetic acid (M.Wt): 60.05 g/mol

Glycine (M.Wt): 75.07 g/mol

Sodium Chloride (M.Wt):58.44 g/mol

Calcium Chloride (M.Wt): 110.98 g/mol

0.01% Tween 80

Preparation of FE-RR-010 buffer with Stock FE-RR-09.

Preparation of reagent :30mM sodium acetate ph 6.7 +50mM glycine +0.2Msodium chloride +5 mM calcium chloride+0.01% tween 80, pH-7.0.

Stock Buffer (FE-RR-09):0.2M Sodium Citrate pH 6.9.

Formula:.

$$C1 \times V1 = C2 \times V2$$

C1 = concentration of stock

V1 = volume of stock you need to take

C2 = desired (working) concentration

V2 = final total volume of working solution

Applying the formula to prepare the working buffer:

$$C1 \times V1 = C2 \times V2$$

C1 = 0.2M Sodium Citrate pH 6.9

V1 = volume of stock you need to take _____ L.

C2 = desired (working) concentration 0.03M Sodium Citrate, pH 7.0

V2 = final total volume of working solution _____ L.

$$V1 = (C2 \times V2) / C1$$

C2=0.03M ; V2= 1.0 L; C1=0.2M

$$V1 = (0.03 \times 1.0) / 0.2$$

$$V1 = 0.15L$$

Take 0.15 L (FE-RR-09) Stock buffer solution and dilute with water, and make up to 1L.

Calculations: To prepare the 0.2M Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.2M Sodium Chloride (MW = 58.44 g/mol)

$$\text{Weight of solute(g)} = 0.2 \times 58.44 \times 1 = 11.688g$$

Preparation Method:

Weigh 11.688g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.2M Sodium Chloride (MW = 58.44 g/mol).

$$\text{Weight of solute(g)} = 0.2 \times 58.44 \times \text{L} = \text{g}$$

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Calculations: To prepare the 5mM Calcium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 5 mM Calcium Chloride (MW = 110.98g/mol)

$$\text{Weight of solute(g)} = 0.005 \times 110.98 \times 1 = 0.554g$$

Preparation Method:

Weigh 0.554g of Calcium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.005mM Calcium Chloride (MW =110.98 g/mol).

$$\text{Weight of solute(g)} = 0.005 \times 110.98 \times \text{L} = \text{g}$$

Weigh _____ gm of Calcium Chloride and dissolve in water to make a _____ L solution.

Procedure

Calculation: to prepare the 0.01% Tween 80:

For 1000 mL of 0.01% solution:

$$0.01\% = 0.01g \text{ per } 100ml \text{ \& } 1000 \text{ mL} = 100 \text{ mg}$$

Since Tween 80 is a liquid, you can weigh it directly or use its density (~1.06 g/mL) to measure volume:

$$\text{Approx. } 100 \mu\text{L of Tween 80} = 0.1 \text{ g}$$

Add Tween 80 to a beaker or flask containing ~800 mL of water.

Mix thoroughly:

Use a magnetic stirrer or vortex until fully dissolved. Tween 80 is viscous, so mixing may take a few minutes.

Calculations: To prepare the 50mM Glycine.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.05M Glycine (MW = 75.07g/mol)

$$\text{Weight of solute(g)} = 0.05 \times 75.07 \times 1 = 3.753g$$

Preparation Method:

Weigh 3.753g of Glycine and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.05M Glycine (MW =75.07g/mol).

$$\text{Weight of solute(g)} = 0.05 \times 75.07 \times \text{L} = \text{g}$$

Weigh _____ gm of Glycine and dissolve in water to make a _____ L solution.

Adjust volume:

After complete dissolution, bring the final volume up to 1000 mL with water.

Procedure for Preparation of FE-RR-11 buffer with the stock FE-RR-09.

To prepare a 1 L solution, take 0.2M Tri Sodium Citrate pH 6.9. To this, add the 0.2 M sodium chloride and dissolve it and make up the volume with water to 900ml, and then to this add 5mM Calcium chloride, and then to this add 50mM Glycine and to this add the 0.01% Tween 80 then mix the solution till it dissolves and check the pH; if the pH is less than 7.0 then adjust the pH with 1 M sodium hydroxide to get the pH 7.0 ±0.1 and make up the final volume to 1L.

Check and record the details:

Reagent Details:

Formula & Calculations:

Formula: $M_1 \times V_1 = M_2 \times V_2$.

Calculation: To prepare 1 L of 2mM Tris from 1M tris stock solution calculate quantity required of stock solution as below:

1M tris stock solution required quantity= $2 \times 1 / 1000 = 2 \text{ mL}$

Preparation Method:

To prepare 0.1M Tris 1L solution from 1M Tris stock solution formula is $M_1 (\text{Molarity of stock}) \times V_1 (\text{volume of stock}) = M_2 (\text{Molarity of working}) \times V_2 (\text{volume of working})$.

Take 2mL of 1M tris solution and make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 2mM Tris

Take 2mL x _____ L = _____ mL of 1M Tris

Make Tris solution to _____ L solution.

Check and record the details:

Reagent Details:

Formula:

Sodium Citrate (M.Wt): 258.07.

Citric Acid (M.Wt): 192.124

Calcium Chloride(M.Wt): 110.98

Sodium Chloride(M.Wt):58.44

Preparation of FN-RR-10 working buffer from Stock buffer (FN-RR-08):

Calculations: For the Preparation of 20mM Sodium Citrate pH 7.4 + 2.5mM Calcium Chloride.

Stock Buffer (FN-RR-08):0.2M Sodium Citrate pH 7.4.

Formula:

$$C1V1=C2V2$$

C1 = concentration of stock

V1 = volume of stock you need to take

C2 = desired (working) concentration

V2 = final total volume of working solution

Applying the formula to prepare the working buffer:

$$C1V1=C2V2$$

C1 = 0.2M Sodium Citrate pH 7.4.

V1 = volume of stock you need to take _____ L.

C2 = desired (working) concentration 20mM Sodium Citrate, pH 7.4

V2 = final total volume of working solution _____ L.

$$V1 = (C2 \times V2)/C1.$$

C2=0.02M ; V2= 1.0 L; C1=0.2M

$$V1 = (0.02 \times 1.0)/0.2$$

$$V1 = 0.1L$$

Take 0.1 L (FN-RR-08) Stock buffer solution and dilute it with water to make up 1 L.

Calculations: 2.5mM Calcium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 2.5mM Calcium Chloride (MW = 110.98 g/mol)

$$\text{Weight of solute(g)}=0.0025 \times 110.98 \times 1=0.277g.$$

Preparation Method:

Weigh 0.277g of Calcium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.0025 M Calcium Chloride (MW = 110.98 g/mol).

$$\text{Weight of solute(g)}=0.0025 \times 110.98 \times \text{_____} L= \text{_____} g.$$

Weigh _____ gm of Calcium Chloride and dissolve in water to make a _____ L solution.

Calculations: 200mM Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 200mM Sodium Chloride (MW = 58.44 g/mol)

$$\text{Weight of solute(g)}=0.2 \times 58.44 \times 1=11.688g.$$

Preparation Method:

Weigh 11.688 g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.2 M Sodium Chloride (MW = 58.44 g/mol).

$$\text{Weight of solute(g)}=0.2 \times 58.44 \times \text{_____} L= \text{_____} g.$$

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Preparation of working buffer (FN-RR-10):

Take 0.1 L (FN-RR-08) Stock buffer solution, add 0.0025 M Sodium Chloride (0.277 gm) and add 200mM Sodium

Chloride (11.688gm). Dissolve it, and then make up the final volume to 1 L with water.

TABLE OF CONTENTS

FORMULATION.....	2
FORMULATED BULK & DS.....	4

Formulation

Check the QC result for Bulk from step 11.3.3:

Protein Concentration _____, pH: _____,

Conductivity: _____ uS/cm, Total Volume: _____ L,

Total Protein: _____ g.

Formulation with 10% (W/V) Maltose:

Finally, the sample concentration should be 5%.

Folds to be diluted to the total volume of the Bulk sample.

A= Protein Concentration of Bulk sample _____/50 mg.

A= _____.

Final Total volume to be made up after formulation =A x Bulk total volume.

B=A _____ x _____.

B= _____ L.

Difference between = final volume - bulk volume.

C= B _____ - _____.

C= _____ L.

Calculation of the 10 % maltose.

D=Final volume (B) x 10% (w/v) Maltose.

D=B _____ x 10% _____.

D= _____ kg.

Dissolving the maltose:

Add the calculated amount of the maltose slowly to the Bulk Sample under stirring (150 rpm) for 15 to 20 min.

Note: Check with 10% of maltose dissolved in the 5 ml of water, and the rise of the water level and check the difference between the final rise volume and mine's initial volume. The difference in the volume is considered a standard rise value for the formulated bulk.

Standard rise in the formulated bulk volume:

= rise in volume – dissolved in 5 ml.

E= _____.

Rise in volume after the addition of Maltose to the Bulk Sample.

F= D (kg) _____ + Bulk volume _____ x E _____.

F= _____ L.

Calculating the Dilution of the formulated bulk sample with the dilution buffer to achieve the final 5% concentration.

G = (B) final total volume -(F) Rise volume after maltose addition.

G = _____.

Formulate Bulk Details:

Check and record the following details:

OD at 280 nm: _____, OD at 600 nm: _____,

pH: _____, Conductivity: _____ uS/cm,

Protein Concentration _____.

Total Volume: _____ L, Total Protein: _____ g.

Collect 25 ml of sample and send to QC for Formulated Bulk-API analysis. Record the obtained results as per the QC report:

Protein Concentration _____, pH: _____.

Conductivity: _____ uS/cm,

Calculate and record the following details according to the QC result:

pH: _____, Conductivity: _____ uS/cm,

Protein Concentration _____.

Total Volume: _____ L, Total Protein: _____ g.

Adjusting the Protein concentration. If it is more than 5.5% then dilute the sample with the dilution buffer.

Final protein concentration should be 5.0. % accepted criteria is $\pm 0.5\%$.

Do the sterile filtration with a 0.2 μ m filter.

Submit the final sample for the QC testing as a drug substance.

Record the Drug substance QC result.

pH: _____, Conductivity: _____ uS/cm,

Protein Concentration _____.

Total Volume: _____ L, Total Protein: _____ g.

Storage of DS sample.

The DS sample is stored in the 2 to 8 °C.

Reagent Details:

Formula:

Sodium Citrate (M.Wt): 258.07.

Citric Acid (M.Wt): 192.124

Calcium Chloride(M.Wt): 110.98

Sodium Chloride(M.Wt):58.44

Preparation of FN-RR-11 working buffer from Stock buffer (FN-RR-08):

Calculations: For the Preparation of 20mM Sodium Citrate pH 7.4 + 2.5mM Calcium Chloride + 370 mM Sodium Chloride.

Stock Buffer (FN-RR-08):0.2M Sodium Citrate pH 7.4.

Formula:.

$C1 \times V1 = C2 \times V2$

C1 = concentration of stock

V1 = volume of stock you need to take

C2 = desired (working) concentration

V2 = final total volume of working solution

Applying the formula to prepare the working buffer:

$C1 \times V1 = C2 \times V2$

C1 = 0.2M Sodium Citrate pH 7.4.

V1 = volume of stock you need to take _____ L.

C2 = desired (working) concentration 20mM Sodium Citrate, pH 7.4

V2 = final total volume of working solution _____ L.

$V1 = (C2 \times V2) / C1$.

C2=0.02M ; V2= 1.0 L; C1=0.2M

$V1 = (0.02 \times 1.0) / 0.2$

V1 = 0.1L

Take 0.1 L (FN-RR-08) Stock buffer solution and dilute it with water to make up 1 L.

Calculations: 2.5mM Calcium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol)×Volume (L).

Calculation: To prepare 1 L of 2.5mM Calcium Chloride (MW = 110.98 g/mol)

Weight of solute(g)=0.0025×110.98×1=0.277g.

Preparation Method:

Weigh 0.277g of Calcium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.0025 M Calcium Chloride (MW = 110.98 g/mol).

Weight of solute(g)=0.0025 ×110.98× _____ L= _____ g.

Weigh _____ gm of Calcium Chloride and dissolve in water to make a _____ L solution.

Calculations: 370 mM Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 370 mM Sodium Chloride (MW = 58.44 g/mol)

Weight of solute(g)=0.37×58.44 ×1=21.622g.

Preparation Method:

Weigh 21.622 g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.37 M Sodium Chloride (MW = 58.44 g/mol).

Weight of solute(g)=0.37 ×58.44× _____ L= _____ g.

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Preparation of working buffer (FN-RR-11):

Take 0.1 L (FN-RR-08) Stock buffer solution, add 0.0025 M Calcium Chloride (0.277 gm) and add 370mM

Sodium Chloride (21.622gm). Dissolve it, and then make up the final volume to 1 L with water.

Reagent Details:

Formula & Calculations:

Formula: $M_1 \times V_1 = M_2 \times V_2$.

Calculation: To prepare 1 L of 0.01M sodium hydroxide from 0.5M sodium hydroxide stock solution calculate quantity required of stock solution as below:

0.5M sodium hydroxide stock solution required quantity= $0.01 \times 1 / 0.5 = 0.02$ L

Preparation Method:

To prepare 0.01M sodium hydroxide 1L solution from 0.5M sodium hydroxide stock solution formula is

$M_1 (\text{Molarity of stock}) \times V_1 (\text{volume of stock}) = M_2 (\text{Molarity of working}) \times V_2 (\text{volume of working})$.

Take 0.02L of 0.5M sodium hydroxide solution and make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 0.01M sodium hydroxide

Take 0.02L x _____ L = _____ L of 0.5M sodium hydroxide

Make sodium hydroxide solution to _____ L solution.

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.1M citric acid (MW = 192.124g/mol)
Weight of solute(g)=1×19.212=19.212g.
Preparation Method:
Weigh 19.212 g of citric acid and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.1M citric acid (MW = 192.124g/mol).
Weight of solute(g)=1×19.212x _____L= _____gm
Weigh _____gm of citric acid base and dissolve in water to make a _____ L solution.
Check and record the details:
Preparation Details:

Reagent Details:

Formula & Calculations:

Formula: $M_1 \times V_1 = M_2 \times V_2$.

Calculation: To prepare 1 L of 0.01M sodium hydroxide from 1M sodium hydroxide stock solution calculate quantity required of stock solution as below:

0.5M sodium hydroxide stock solution required quantity= $0.01 \times 1 / 1 = 0.1L$

Preparation Method:

To prepare 0.01M sodium hydroxide 1L solution from 1M sodium hydroxide stock solution formula is

$M_1 (\text{Molarity of stock}) \times V_1 (\text{volume of stock}) = M_2 (\text{Molarity of working}) \times V_2 (\text{volume of working})$.

Take 0.1L of 1M sodium hydroxide solution and make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 0.01M sodium hydroxide

Take 0.1L x _____ L = _____ L of 1M sodium hydroxide

Make sodium hydroxide solution to _____ L solution.

WATER BALANCE DIAGRAM – LVP plant

1. Design Basis (BFS Technology)

Production

36 million units/year

500 mL each

18 million L/year

Daily Production

300 days/year

30,000 L/day product

2. Water Consumption Benchmark

BFS plants are more efficient:

Typical range: 5–8 L water / L product

Total Water Requirement

30,000 L/day × 6

180,000 L/day (180 m³/day)

3. Revised Water Consumption Breakdown

A. Industrial (~80%)

1. WFI Generation

Includes distillation losses

90 m³/day

2. BFS Machine Cooling + Process

Mould cooling, machine cleaning

30 m³/day

3. CIP/SIP Systems

Tanks, pipelines, filters

20 m³/day

4. Utilities

Boiler + cooling tower

25 m³/day

B. Domestic (~20%)

15 m³/day

4. Wastewater Generation

~80% becomes effluent

~145 m³/day

5. ZLD-Based Segregation

6. Recycling & Losses

Final Recovery

Recycled water: ~125 m³/day (~69%)

Losses:

Evaporation: ~12 m³/day

Sludge/salts: ~8 m³/day

Liquid discharge = ZERO

7. Key KPIs

Stream | Flow | Type

Low TDS | 70 m³/day | Cooling + domestic

High TDS | 75 m³/day | WFI reject + CIP

Parameter | Value

RO recovery | 70%

MEE condensate | 20%

Losses | 10%

Parameter | Value

Water intensity | 6 L per L product

Reduction vs glass system | ~40% lower

Recycling rate | ~69–70%

ZLD compliance | 100%

CONCENTRATION OF FLOW THROUGH FROM CHROMATOGRAPHY–4I RUN OF PLASMA FRACTIONATION

Take the flow through sample from the two runs of Chromatography-4I run of Plasma fractionation step

10.8. (Refer to PROCESS INSTRUCTIONS of Plasma Fractionation)

Check and record the following details of the runs of Chromatography-4I run of Plasma fractionation step

10.8. (Refer to PROCESS INSTRUCTIONS of Plasma Fractionation):

NWP calculation before concentration

Record the following details of the TFF cassettes connected to the TFF system:

No. of cassettes used: _____,

Cassette ID Nos.: _____.

Wash the cassettes with 5 L of PW and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Volume of PW used: _____ L.

Check and record the details as below:

Concentration of Flow through Sample

After NWP calculation, flush the cassettes with 5 L of equilibration buffer PF-RR-22 of Chromatography-4I of Plasma fractionation step 10.5. (Refer to PROCESS INSTRUCTIONS of Plasma Fractionation)

Volume of PF-RR-22 used: _____ L.

Based on the initial volume of the flow through the sample, concentrate the sample to the initial batch volume at a set TMP of ≤ 1.0 bar.

Check and record the details as below:

Unload the concentrated sample based on initial batch volume; by flushing 5 L of PF-RR-22. Check and record the following details:

Regeneration

After unloading the concentrated sample, flush the cassettes with 5 L of PW and then with 5 L of IG-RR-23. Recirculate the cassettes with IG-RR-23 at 40°C to 45°C for 30 - 45 min.

Finally, wash the cassettes with 5 L of PW.

Repeat steps 1.4 to 1.5 for Run 2 and record the results in the above tables.

Post-NWP calculation

Repeat the step as in 1.3.2 and record the details as below. Check if NWP is ≥ 120 LMH/Bar. If not, carry out the regeneration procedure again.

Storage

Wash the cassettes with 5 L of IG-RR-24 and finally store the cassettes in IG-RR-24 at room temp. Volume of IG-RR-24 used: _____ L.

CHROMATOGRAPHY 5I

Check the column connections to the AKTA process chromatography system. Check for instrument air connection at 6 bar to the system. Open the UNICORN software.

Record the following column details:

Column height: _____ cm, Column Volume: _____ L,

HETP value: _____, Asymmetry: _____.

Column Wash

Wash the column with 1-2 CVs of PW at a flow rate of 36 ml/min till the conductivity drops below 1.0 mS/cm.

pH drop

Pass up to 2 CVs of IG-RR-02 (10% gradient of IG-RR-09 against PW) at a flow rate of 36 ml/min till the pH has dropped to 3.50 ± 0.50 . Record the following details:

Column Equilibration

Equilibrate the column with 2 CVs of IG-RR-06 (10% gradient of IG-RR-05 against PW) at a flow rate of 36 ml/min .

Sample preparation for loading

Take the Concentrated Flow Through sample from step 1.4 as load.

Check and record the conditions as below:

If the pH is below 5.15, adjust it to 5.20 ± 0.05 with IG-RR-01.

Bring down the conductivity to 1200 – 1400 μ S/cm with IG-RR-25.

Check and record the following conditions:

Filtration of the load sample

Filter the Load sample using a sterilised PRA-SF-003 filter based on sample clarity.

Record the following details of the final load sample:

Loading

Before loading, switch on the 'Record On' button and enter the run details and date. Auto Zero the absorbance at 280 nm on the chromatography system.

Load the sample at a flow rate of 36 ml/min (Limit: ≤ 35 mg of protein/ml of resin)

Collect the Flow through sample when the A280 rises from 50 mAU.

Wash

After loading is completed, wash the column with 1 - 2 CVs of IG-RR-06 at a flow rate of 36 ml/min, and stop collecting the flow when the A280 reaches baseline. (50 - 100 mAU).

Check and record the flow through the sample details as below:

pH adjustment for flow-through sample

Check and adjust the pH of the flow-through sample to 4.00 ± 0.10 with IG-RR-09.

Record the following conditions:

Cleaning

Clean the column by passing 2 column volumes of IG-RR-08 (25% gradient of IG-RR-07 against PW) at a flow rate of 36 ml/min and hold the column for 20 - 30 min.

Regeneration

Regenerate the column by passing 2 column volumes of IG-RR-23 (25% gradient of IG-RR-22 against PW) at a flow rate of 36 ml/min and hold the column for 30 min.

Repeat steps 2.2 to 2.12 for Run 2 and record the results in the above tables.

Storage

Store the column by passing 2 CVs of IG-RR-24 at a flow rate of 36 ml/min. Volume of IG-RR-24 used: _____ L.

Record the volume of flow through after pH adjustment: Run 1: _____ L; Run 2: _____ L

CONCENTRATION OF FT FROM CHROMATOGRAPHY 5I

Take the Run-1 flow through sample after pH adjustment from step 2.10 of Chromatography-IG-5I to do concentration.

NWP calculation before concentration

Record the following details of the TFF cassettes connected to the TFF system:

No. of cassettes used: _____,

Cassette ID Nos.: _____.

Wash the cassettes with 5 L of PW and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Volume of PW used: _____ L.

Check and record the details as below:

Concentration of Flow through Sample

After NWP calculation, flush the cassettes with 5 L of IG-RR-06 of Chromatography-IG-5I.

Volume of IG-RR-06 used: Run 1: _____ L, Run 2: _____ L.

Concentrate the FT sample to 59 - 63 mg/ml of protein concentration at a set TMP of ≤ 1.0 bar.

Check and record the details as below:

Unload the concentrated sample when the desired protein concentration is reached; by flushing 10 L of IG-RR-06. Check and record the following details:

Regeneration

Flush the cassettes with 5 L of PW and then with 5 L of IG-RR-23 at 40 - 45°C and carry out recirculation for 30 to 45 min. Flush the cassettes with 30 L of PW again.

Repeat the steps 3.0 to 3.4 for Run 2 and record the results as above.

Post NWP calculation

Repeat the step as 3.2.2 and record the details as below. Check if NWP is ≥ 120 LMH/Bar. If not, carry out the regeneration procedure again.

Storage

Flush the cassettes with 5 L of IG-RR-24 and finally store the cassettes in IG-RR-24 at room temp. Volume of IG-RR-24 used: _____ L.

CONDUCTIVITY ADJUSTMENT

Take the concentrated FT sample run wise from step 3.2.4 and adjust the conductivity to 2.0 mS/cm (Limit: 2.0 ± 0.2 mS/cm) with IG-RR-10.

Record the following conditions:

Repeat the steps 4.1 to 4.2 for Run 2 and record the results as above.

Pool 25 ml of the sample and send it to QC for in-process QC analysis. Record the obtained results as per the QC report: pH: _____,

Cond.: _____ mS/cm and Protein Conc. (mg/ml): _____.

VIRUS INACTIVATION BY LOW pH TREATMENT

Take the conductivity adjusted sample run-wise from step 4.0 and incubate the sample at $\text{pH } 4.00 \pm 0.10$ at $37.0 \pm 0.5^\circ\text{C}$ for 12 hrs. in a process vessel with water circulation in jacket.

Record the incubation details:

Check and record the sample details after incubation:

OD at 280 nm for 100x diluted sample: Run 1: _____,

Run 2: _____. (Dilution buffer is IG-RR-06)

OD at 600 nm: Run 1: _____, Run 2: _____.

Repeat the steps 5.1 to 5.3 for Run 2 and record the results as above.

VIRUS INACTIVATION BY S/D TREATMENT

Note: The amount of IG-RR-12 (20% stock solution) and IG-RR-13 (20% stock solution) to be added to a final concentration of 1% (w/w) is based on the weight of IgG solution.

IG-RR-12 is added slowly to the run wise low pH treated sample for 15 - 20 mins. under gentle stirring condition and continue stirring till the solution is homogenous.

Then add IG-RR-13 slowly to the sample for 15 - 20 mins. under gentle stirring condition and continue stirring till the solution is homogenous.

Check and record the following details:

Incubate the sample at $30 \pm 3^\circ\text{C}$ for 6 hrs. under stirring conditions in a process vessel with water circulation in the jacket.

Check and record OD600 after 10 min. of incubation:

OD600: Run 1: _____, Run 2: _____.

Check and record the sample details after incubation:

Total incubation time: Run 1: _____, Run 2: _____.

OD600 after incubation: Run 1: _____, Run 2: _____.

Repeat the steps 6.1 to 6.6 for Run 2 and record the results as above.

FILTRATION

Filter the S/D treated virus inactivated sample run wise using sterilized PRA-PO-008 and PRA-PO-005 filters connected serially.

Check and record the following details:

Volume after filtration: Run 1: _____ L, Run 2: _____ L.

OD at 280 nm for 10x diluted sample: Run 1: _____, Run 2: _____. (Dilution buffer is IG-RR-25)

OD at 600 nm: Run 1: _____, Run 2: _____.

Repeat the steps 7.1 to 7.2 for Run 2 and record the results as above.

CHROMATOGRAPHY 6I

Check the column connections to the AKTA process chromatography system. Check for instrument air connection at 6 bar to the system. Open the UNICORN software.

Record the following column details:

Column height: _____ cm, Column Volume: _____ L,

HETP value: _____, Asymmetry: _____.

Column Wash

Wash the column with upto 2 CVs of PW at a flow rate of 27.8 ml/min till the conductivity has dropped below 0.50 mS/cm.

pH Drop

Wash the column with up to 2 CVs of IG-RR-02 (10% gradient of IG-RR-09 against PW) at a flow rate of 27.8 ml/min till the pH drops to 4.50 ± 0.10 .

Column Equilibration

Equilibrate the column with 6 CVs of IG-RR-15 (10% gradient of IG-RR-14 against PW) at a flow rate of 27.8 ml/min.

Check and record the following results:

Sample details

Take the filtered sample from step 7.0 (run wise) and record the following conditions:

Loading

Before loading, switch on the 'Record On' button and enter the run details and date. Auto Zero the absorbance at 280 nm on the chromatography system.

Load the sample at a flow rate of 27.8 ml/min and start collecting the flow through sample.

Wash-I

After loading is completed, wash the column with 4 CVs of IG-RR-15 (10% gradient of IG-RR-14 against PW) at a flow rate of 27.8 ml/min and collect the wash in the same flow-through vessel until A280 reaches baseline (50 – 100 mAU).

Wash II

After the UV absorbance has reached the baseline, pass 6 CVs of IG-RR-17 (25% gradient of IG-RR-16 against PW) at a flow rate of 27.8 ml/min in order to remove the virus inactivation chemicals.

Elution

After the A280 reaches the base line, pass 4 – 5 CVs of IG-RR-19 (25% gradient of IG-RR-18 against PW). Collect the peak when the A280 rises and collect the total peak till the A280 reaches base line (50 – 100 mAU).

Check and record the following conditions:

pH adjustment for eluate

Adjust the pH of the eluate to 4.00 ± 0.10 with IG-RR-20.

Check and record the following conditions:

Regeneration

Regenerate the column by passing 2 CVs of IG-RR-23 (25% gradient of IG-RR-22 against PW) at a flow rate of 27.8 ml/min and hold the column for 30 - 60 mins.

Repeat steps 8.2 to 8.11 for Run 2 and record the results as above.

Storage

Store the column (at room temp.) by passing 2 CVs of IG-RR-24 at a flow rate of 27.8 ml/min.

Volume of IG-RR-24 used: _____ L.

Enter the process details as below:

ADJUSTMENT OF PROTEIN CONCENTRATION

Take the CHROMATOGRAPHY 5I pooled eluate sample and check the protein concentration. Record the following details:

O.D. at 280 nm for 10x diluted sample: _____ (Dilution buffer is IG-RR-26),

Protein conc.: _____ mg/ml, Pooled Eluate volume: _____ L.

Note: Divide OD280 by the extinction coefficient of 1.40 to obtain protein concentration. in mg/ml.

If protein concentration is more than 11 mg/ml, dilute the pooled eluate sample with IG-RR-26 to a final protein concentration of 8 - 11 mg/ml. Record the following details:

Volume of IG-RR-26 used: _____ L,

O.D. at 280 nm: _____, Protein conc.: _____ mg/ml, Final Eluate volume: _____ L.

PRA-DE-005 & PRA-NF-003 FILTRATION

Flush 5 L of PW through PRA-DE-005 and equilibrate with 5 L of IG-RR-26 buffer. Volume of PW used: _____ L,

Volume of IG-RR-26 used: _____ L.

Take the concentration-adjusted sample from step 9.2 and filter the sample through the PRA-DE-005 filter.

Check and record the following details:

OD at 280 nm: _____, OD at 600 nm: _____,

Protein conc.: _____ mg/ml, Final Volume after filtration: _____ L.

Flush 5 L of PW through PRA-NF-003 and equilibrate with 5 L of IG-RR-26 buffer. Volume of PW used: _____ L.

Volume of IG-RR-26 used: _____ L.

Take the PRA-DE-005 filtrate from step 10.2 and filter the sample through the PRA-NF-003 filter.

Check and record the following details:

Final Volume after filtration: _____ L,

pH: _____, Conductivity: _____ mS/cm,

OD at 280 nm: _____, OD at 600 nm: _____,

Protein conc.: _____ mg/ml, Total Protein: _____ g.

CONCENTRATION AND DIAFILTRATION

NWP calculation before concentration

Record the following details of the TFF cassettes connected to the TFF system:

No. of cassettes used: _____,

Cassette ID Nos.: _____.

Wash the cassettes with 5 L of ambient WFI and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Volume of ambient WFI used: _____ L.

Check and record the details as below:

Concentration of filtrate sample

After NWP calculation, flush the cassettes with 5 L of IG-RR-26.

Volume of IG-RR-26 used: _____ L.

Based on the initial protein concentration of the filtrate sample, concentrate the sample to 5.0 - 5.5% at a set TMP of ≤ 1.0 bar.

Check and record the following details:

Note: Divide the obtained value of OD280 with extinction coefficient of 1.40 to obtain protein concentration in mg/ml.

Diafiltration

Diafilter the sample from step 11.2 with IG-RR-28 to reach a final conductivity of permeate of 900 – 1300 uS/cm.

Unload the concentrated sample when the required protein concentration of 5.5 - 6.5% is reached; by flushing 5 L of IG-RR-26. Check and record the following details:

Volume of Retentate: _____ L, OD280/600: _____.

Collect 25 ml of sample and send to QC for Bulk-API analysis. Record the obtained results as per the QC report: pH: _____.

Check and record the following details:

OD at 280 nm: _____, OD at 600 nm: _____,

pH: _____, Conductivity: _____ uS/cm,

Total Volume: _____ L, Total Protein: _____ g.

Regeneration

Flush the cassettes with 5 L of ambient WFI and then with IG-RR-23 at 40 - 45°C and carry out recirculation for 30 to 60 min.

Volume of IG-RR-23 used: _____ L.

Post NWP calculation

Repeat the step as 11.1.2 and record the details as below. Check if NWP is ≥ 120 LMH/Bar. If not, carry out the regeneration procedure again.

Storage

Flush the cassettes with 5 L of IG-RR-24 and finally store the cassettes in IG-RR-24 at room temp.

Volume of IG-RR-24 used: _____ L.

Enter the process details as below:

Formulation

Check the QC result for Bulk from step 11.3.3:

Protein Concentration _____, pH: _____,

Conductivity: _____ uS/cm, Total Volume: _____ L,

Total Protein: _____ g.

Formulation with 10% (W/V) Maltose:

Finally, the sample concentration should be 5%.

Folds to be diluted to the total volume of the Bulk sample.

A= Protein Concentration of Bulk sample _____/50 mg.

A= _____.

Final Total volume to be made up after formulation =A x Bulk total volume.

B=A _____ x _____.

B= _____ L.

Difference between = final volume - bulk volume.

C= B _____ - _____.

C= _____ L.

Calculation of the 10 % maltose.

D=Final volume (B) x 10% (w/v) Maltose.

D=B _____ x 10% _____.

D= _____ kg.

Dissolving the maltose:

Add the calculated amount of the maltose slowly to the Bulk Sample under stirring (150 rpm) for 15 to 20 min.

Note: Check with 10% of maltose dissolved in the 5 ml of water, and the rise of the water level and check the difference between the final rise volume and mine's initial volume. The difference in the volume is considered a standard rise value for the formulated bulk.

Standard rise in the formulated bulk volume:

= rise in volume – dissolved in 5 ml.

E= _____.

Rise in volume after the addition of Maltose to the Bulk Sample.

F= D (kg) _____ + Bulk volume _____ x E _____.

F= _____ L.

Calculating the Dilution of the formulated bulk sample with the dilution buffer to achieve the final 5% concentration.

G = (B) final total volume -(F) Rise volume after maltose addition.

G = _____.

Formulate Bulk Details:

Check and record the following details:

OD at 280 nm: _____, OD at 600 nm: _____,

pH: _____, Conductivity: _____ uS/cm,

Protein Concentration _____.

Total Volume: _____ L, Total Protein: _____ g.

Collect 25 ml of sample and send to QC for Formulated Bulk-API analysis. Record the obtained results as per the QC report:

Protein Concentration _____, pH: _____.

Conductivity: _____ uS/cm,

Calculate and record the following details according to the QC result:

pH: _____, Conductivity: _____ uS/cm,

Protein Concentration _____.

Total Volume: _____ L, Total Protein: _____ g.

Adjusting the Protein concentration. If it is more than 5.5% then dilute the sample with the dilution buffer.

Final protein concentration should be 5.0. % accepted criteria is $\pm 0.5\%$.

Do the sterile filtration with a 0.2 μ m filter.

Submit the final sample for the QC testing as a drug substance.

Record the Drug substance QC result.

pH: _____, Conductivity: _____ uS/cm,

Protein Concentration _____.

Total Volume: _____ L, Total Protein: _____ g.

Storage of DS sample.

DS sample is stored in the 2 to 8 °C.

Reagent Details:
Preparation of PF-RR-26 working buffer from Stock buffer (PF-RR-25):
Calculations: For the Preparation of 25mM Sodium acetate pH 5.2.
Stock Buffer (PF-RR-25):0.1M Sodium acetate, pH 5.35 + 4.0 M Sodium Chloride.
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.1M Sodium Acetate pH 5.35.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 25mM Sodium Acetate pH 5.2
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
C2=0.025M; V2= 1.0 L; C1=0.1M
 $V1 = (0.025 \times 1.0) / 0.1$
V1 = 0.25L
Take 0.25 L (PF-RR-25) Stock buffer solution and dilute it with water to make up a final volume of 1 L.
Check and record the details:

Reagent Details:

Formula & Calculations:

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 1M sodium hydroxide (MW = 40g/mol)

Weight of solute(g)=1×40=40g.

Preparation Method:

Weigh 40 g of Sodium hydroxide and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 1M sodium hydroxide (MW = 40g/mol).

Weight of solute(g)=1×40× _____ L= _____ gm

Weigh _____ gm of sodium hydroxide and dissolve in water to make a _____ L solution.

Check and record the details:

Formula & Calculations:

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.2M sodium hydroxide (MW = 40g/mol)

Weight of solute(g)=1×8=8g.

Preparation Method:

Weigh 8 g of Sodium hydroxide and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 0.2M sodium hydroxide (MW = 40g/mol).

Weight of solute(g)=1×8× _____ L= _____ gm

Weigh _____ gm of sodium hydroxide and dissolve in water to make a _____ L solution.

TABLE OF CONTENTS

Concentration sample details..... 2

Formulation2

pH Adjustment.....3

QC result.....4

Record The Concentrated Sample Details:

Formulation:

Preparation Of Stabiliser (FG-RR-12):

60mM Histidine + 3.5mg/ml Nicotinamide + 0.05% Tween 80 + 8mg/ml Human Serum Albumin pH7.2

Preparation 60mM L-Histidine Molecular weight: (155.15 g/mol).

To prepare _____ of 60mM L-Histidine (MW = 155.15g/mol).

Weight of solute(g)=9.31x _____ L= _____ gm

Weigh _____ gm of L-Histidine.

Prepared according to the final protein concentration requirements, as defined in the dilution scope.

Preparation of 3.5mg/ml Nicotinamide.

After adjusting the protein concentration, the final protein concentration volume _____ ml, and calculating the 3.5mg/ml Nicotinamide to the sample.

Final sample volume: _____ ml X 3.5mg/ml of Nicotinamide.

Added Nicotinamide _____ mg/ml.

Addition of 0.05% Tween 80 .

After adjusting the protein concentration, the final protein concentration volume _____ ml and measure the volume to be add 0.05% Tween 80.

Final sample volume: _____ ml X 0.05% Tween 80.

Added Tween 80 volume _____ ml.

Addition of 8mg/ml Human Serum Albumin.

After adjusting the protein concentration, the final volume _____ ml is calculated for the 8mg/ml Human Serum Albumin required, and it is taken from the 20% Albumin sample.

Final sample volume: _____ ml X 8mg/ml Human Serum Albumin.

Added 20% Human Serum Albumin volume _____ ml.

pH Adjustment:

After the addition of the stabilisers check the pH _____.

Adjust the pH to pH 7.2 with the 0.5M NaOH/ HCL Added volume _____.

Send 2 mL of the sample for in-process QC analysis.

Record the QC Analysis report.

Storage of the DS sample:

Label the sample and store the DS sample in the -20°C freezer.

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 50 mM Sodium Acetate (MW = 80.03 g/mol)
Weight of solute(g)=0.05×80.03 = 4g.
Preparation Method:
Weigh 4 g of Sodium Acetate and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.05mM Sodium Acetate (MW = 80.03 g/mol).
Weight of solute(g)=0.05×80.03 x _____ L= _____ gm
Weigh _____ gm of Sodium Acetate and dissolve in water to make a _____ L solution.
Preparation of 20%Ethanol:
For per cent v/v:
Calculation:
Volume of ethanol needed = (% desired / 100) × final solution volume.
Examples (digit-by-digit arithmetic)
To make 1000 mL of 20% (v/v) ethanol
Ethanol: (20 / 100) × 1000 mL = 0.20 × 1000 mL = 200.0 mL
Water: 1000 mL – 200.0 mL = 800.0 mL
Procedure for Preparation of 50mM Sodium Acetate + 20% Ethanol.
To prepare a 50 mM Sodium Acetate solution, 4gm added to the water and completely dissolved and to this the 200 mL of 20% Ethanol was added and made up to 1 L.

CHROMATOGRAPHY 7A

Check the XK column connections to the chromatography system. Check for instrument air connection at 6 bar to the system. Open the software.

Record the following column details :

Column height: 20 cm, Column Volume: 393ml,

HETP value: _____, Asymmetry: _____.

Column Wash

Wash the column with upto 2 CVs of PW at a maximum flow rate of 40ml/min till the conductivity drops below 1.0 mS/cm.

pH Drop

Pass up to 2 CVs of AL-RR-22 (10% gradient of AL-RR-02 against PW) at a maximum flow rate of 40ml/min till the pH drops to 4.50 ± 0.10 .

Column Equilibration

Equilibrate the column with up to 6 CVs of AL-RR-06 (12.5% gradient of AL-RR-05 against PW) at a flow rate of 40ml/min.

Check and record the details:

Sample preparation for loading

Take Eluate from step 10.9 of Plasma fractionation step as load for CHROMATOGRAPHY 7A. (Refer PROCESS

INSTRUCTIONS of Plasma Fractionation)

Check and record the conditions as below:

Adjust the pH to 4.50 (Limit: 4.50 ± 0.10) with AL-RR-02.

Record the following conditions:

Loading and Washing

Before loading, switch on the 'Record On' button and enter the run details and date. Auto Zero the absorbance at 280 nm on the chromatography system.

Load the sample based on ≤ 60 mg of protein per ml of resin at a flow rate of 40ml/min

After loading is completed, wash the column with up to 2 CVs of AL-RR-06 (12.5% gradient of AL-RR-05 against PW).

Elution

After the column wash, pass 2 - 3 CVs of AL-RR-23 (25% gradient of AL-RR-09 against PW) through the column.

Start collecting Eluate when the A280 rises to 100 mAU and collect till A280 drops to 400 mAU.

Cleaning

Clean the column by passing upto 2 CVs of AL-RR-11 (25% gradient of AL-RR-10 against PW) in up flow direction at a flow rate of 40ml/min .

Regeneration

Regenerate the column by passing up to 2 CVs of AL-RR-19 (25% gradient of AL-RR-18 against PW) in the up-flow direction at a flow rate of 40ml/min and hold the column for 30 min.

Repeat the steps 1.3 to 1.10 for Run 2 and record the results as above.

Check and record the following conditions of the pooled eluate sample:

Storage

Store the column (at room temp.) by passing upto 2 CVs of AL-RR-20 at a flow rate of 40ml/min .

Volume of AL-RR-20 used: _____ L.

CONCENTRATIONS OF ELUATE FROM CHROMATOGRAPHY 7A

Take the eluate from the above 2 runs from step 1.8 of Chromatography-I.

pH adjustment

Adjust the pH to 5.20 (Limit: 5.20 ± 0.10) with AL-RR-12 under stirring condition, run-wise.

NWP calculation before concentration

Record the following details of the TFF cassettes connected in series horizontally to the TFF system:

No. of cassettes used: _____,

Cassette ID Nos.: _____.

Wash the cassettes with 20L of PW and calculate NWP at a set TMP of ≤ 1.0 bar. Volume of PW used: _____ L.

Check and record the details as below:

Concentration

After NWP calculation, flush the cassettes with 30 L of AL-RR-23 of CHROMATOGRAPHY 7A.

Volume of AL-RR-23 used: Run 1: _____ L, Run 2: _____ L.

Based on the initial protein concentration of eluate from step no. 1.8.2, concentrate the pooled eluate sample to 60 – 70 mg/ml at a set TMP of ≤ 1.0 bar and Pump Speed: Run 1: _____, Run 2: _____.

Check and record the details as below:

Unload the concentrated sample when the desired protein concentration is reached by flushing 30 L of AL-RR-23. Check and record the following details as below:

Note: Divide the obtained value of OD280 by the extinction coefficient of 0.56 to obtain protein concentration in mg/ml.

Regeneration

Flush the cassettes with 10 L of PW and then with 10 L of AL-RR-19 at 40 - 45°C and carry out recirculation for 30 to 45 min.

Volume of AL-RR-19 used: Run 1: _____ L, Run 2: _____ L.

Flush the cassettes with 25 L of PW.

Volume of PW used: Run 1: _____ L, Run 2: _____ L.

Repeat steps 2.4 to 2.5 for Run 2 and record the results as above.

Post NWP calculation

Repeat the step as 2.3.2 and record the details as below. Check if NWP is ≥ 120 LMH/Bar. If not, carry out the regeneration procedure again.

Storage

Flush the cassettes with 50 L of AL-RR-21 and store the cassettes in AL-RR-21 at room temp.

Volume of AL-RR-21 used: _____ L.

HEAT TREATMENT

Take the concentrated eluate from step 2.4. Check and record pH: _____.

If the pH is not 5.20 ± 0.10 , then adjust to 5.20 ± 0.10 with AL-RR-12.

Volume of AL-RR-12 used: _____ L.

Check and record the following details:

Final pH: _____, Cond.: _____ mS/cm,

OD280/600: _____, Final volume of sample: _____ L,

Protein Conc. (mg/ml): _____, Total protein (g): _____.

Incubation

Incubate the pH-adjusted sample at 57°C (Limit: $57 \pm 0.5^\circ\text{C}$) for up to 6 hrs. in a process vessel with hot water circulation in the jacket.

Temp. achieved: _____. Temp. achieved at: _____.

Record the temperature and stirrer speed at regular intervals:

Record the details after heat treatment. OD600: _____.

After incubation at 57°C, shift the incubation temperature to $< 13^\circ\text{C}$ by circulating chilled water through the jacket of process vessel.

Temp. achieved: _____. Temp. achieved at: _____.

Separation of Supernatant from Heat-treated sample

Take the Heat treatment sample in a batch mode centrifuge bottle and spin at a speed of 10000 rpm.

Collect the supernatant into a sterilized bottle, and discard the pellet in a centrifuge bottle.

Check and record the following details:

Collect the supernatant into a sterilized glass bottle.

Check and record the following details of supernatant:

OD280/600: _____, Protein conc.: _____ mg/ml,

pH: _____, Cond.: _____ mS/cm,

Final Volume: _____ L, Total protein (g): _____.

Concentration of Heat-treated sample

Pre-NWP calculation

Record the following details of the TFF cassettes connected in series horizontally to the TFF system: No. of cassettes used: _____,

Cassette ID Nos.: _____.

Wash the cassettes with 15 L of PW and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Volume of PW used: _____ L.

Check and record the details as below:

Concentration

After NWP calculation, flush the cassettes with 30 L of AL-RR-23 of CHROMATOGRAPHY 7A.

Volume of AL-RR-23 used: _____ L.

Based on the initial protein conc., concentrate the sample to 120 to 130 mg/ml at a set TMP of ≤ 1.0 bar and Pump speed: _____ %.

Check and record the details as below:

Unload the concentrated sample when the desired protein concentration is reached; by flushing 30 L of AL-RR-23. Check and record the following details: Volume of AL-RR-23 used: _____ L.

Note: Divide the obtained value of OD280 with extinction coefficient of 0.56 to obtain protein concentration in mg/ml.

Regeneration

Flush the cassettes with 10 L of PW and then with 10 L of AL-RR-19 at $40 - 45^\circ\text{C}$ and carry out recirculation for 30 to 45 min.

Volume of AL-RR-19 used: _____ L.

Flush the cassettes with 15 L of PW.

Volume of PW used: _____ L.

Post NWP calculation

Repeat the step as 4.2.2 and record the details as below. Check if NWP is ≥ 120 LMH/Bar. If not, carry out the regeneration procedure again.

Storage

Flush the cassettes with AL-RR-21 and finally store the cassettes at room temp. in

AL-RR-21 Volume of AL-RR-21 used: _____ L.

5.0 PRA-SF-003 Filtration

Filter the above concentrated sample using PRA-SF-003 filter.

Check and record the following details after filtration:

OD600: _____, Final Volume: _____ L.

6.0 Virus inactivation by AL-RR-14 and low pH treatment

6.1 AL-RR-14 addition

Add AL-RR-14 to a final concentration of 32 mM.

Volume of AL-RR-14 used: _____ L.

pH and protein concentration adjustment

After AL-RR-14 addition, adjust the pH of the sample to 4.50 (Limit: 4.50 ± 0.10) with AL-RR-02; and at a final albumin concentration of 100 ± 05 mg/ml.

Record the details as below:

Volume of AL-RR-02 used: _____ L, Final Volume: _____ L,

pH: _____, Cond.: _____ mS/cm,

OD280/600: _____, Protein Conc. (mg/ml): _____.

Collect and send 15 ml of the pH and concentration adjusted sample for in-process QC analysis. Record the obtained results as per the QC report: pH: _____, Protein Conc. (mg/ml): _____.

Viral inactivation by low pH incubation

Incubate the pH adjusted sample at 30°C (Limit: $30 \pm 2.0^\circ\text{C}$) for upto 10 hrs. in a process vessel with water circulation in jacket

Shift the temperature to 5°C (Limit: $5 \pm 3^\circ\text{C}$) by giving chilled water circulation to the jacket of the process vessel.

Record the temperature and stirrer speed at regular intervals as below:

Record the details after incubation:

OD600: _____.

Filtration of viral inactivated sample through PRA-DE-002 filter

Check and record the following details after filtration:

OD600: _____, pH: _____, Cond.: _____ mS/cm,

Filtrate Volume: _____ L.

Filtration of PRA-DE-002 filtrate through PRA-SF-003 filter

Check and record the following details after filtration:

OD600: _____, pH: _____, Cond.: _____ mS/cm,

Filtrate Volume: _____ L.

DIAFILTRATION AND CONCENTRATION

USING TFF SYSTEM

pH adjustment before diafiltration

After PRA-SF-003 filtration, adjust the pH of the sample to 7.00 (Limit: 7.00 ± 0.30) with AL-RR-12.

Record the details as below after pH adjustment:

Volume of AL-RR-12 used: _____ L.

OD280/600: _____, Protein Conc. (mg/ml): _____,

pH: _____, Cond.: _____ mS/cm,

Volume: _____ L and Total Protein (g): _____.

Pre NWP calculation

Record the following details of the TFF cassettes connected in series horizontally to the TFF system:

No. of cassettes used: _____, Cassette ID Nos.: _____.

Wash the cassettes with 15 L of PW and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Volume of PW used: _____ L.

Check and record the details as below:

Diafiltration

Take the pH adjusted sample for diafiltration.

Diafilter the sample with 3 dia volumes of AL-RR-15 at a set TMP of ≤ 1.15 bar.

Check and record the following details after diafiltration.

Concentration

Concentrate the diafiltered sample to 190 – 210 mg/ml at a set TMP of ≤ 1.15 bar. Pump Speed: _____ %.

Check and record the following details:

Unload the concentrated sample when the desired protein concentration is reached; by flushing 10 L of AL-RR-15. Check and record the following details:

pH: _____, Cond.: _____ mS/cm,

OD280/600: _____, Volume of AL-RR-15 used: _____ L.

Regeneration

Flush the cassettes with 10 L of PW and then with 10 L of AL-RR-19 and carry out recirculation for 30 to 45 min. Volume of AL-RR-19 used: _____ L.

Post NWP calculation

Repeat the step as 7.2.2 and record the details as below. Check if NWP is ≥ 120 LMH/Bar. If not, carry out the regeneration procedure again.

Storage

Flush the cassettes with 5 L of AL-RR-21 and finally store the cassettes at room temp. in AL-RR-21.

Volume of AL-RR-21 used: _____ L.

PRA-SF-003 FILTRATION

Filter the above c concentrated sample using sterilized PRA-SF-003 filter.

Check and record the following details after filtration:

OD280/600: _____, Protein Conc. (mg/ml): _____,

pH: _____, Cond.: _____ mS/cm,

Final Volume: _____ L, Total Protein (g): _____.

PASTEURIZATION

Incubate the PRA-SF-003 filtered sample at 60°C (Limit: 60 ± 1.0 °C) for 5 $\pm$ 1 hrs. in a process vessel with hot water circulation in the jacket.

Record the temperature and stirrer speed at regular intervals as below:

After 4 to 6 hours of incubation, adjust the pH of the sample to 5.20 (Limit: 5.20 ± 0.10) with AL-RR-02.

Record the following details:

Volume of AL-RR-02 used: _____ L. Final pH: _____.

Incubate the pH adjusted sample at 60°C (Limit: 60 ± 1.0 °C) for another 5 $\pm$ 1 hrs. in the same process vessel with hot water circulation in jacket.

Record the temperature and stirrer speed at every 3 hrs. interval as below:

Record the details after completion of pasteurization:

OD600: _____.

Cool the pasteurized sample to 37.0°C by giving chilled water circulation to the jacket of the process vessel.

PRA-DE-004 FILTRATION

Filter the pasteurized sample using PRA-DE-004 filter.

Check and record the following details after filtration:

OD280/600: _____, pH: _____, Cond.: _____ mS/cm,

Final Volume: _____ L, and Total protein (g): _____.

pH ADJUSTMENT

Adjust the pH of the sample to 6.80 (Limit: 6.80 ± 0.10) with AL-RR-12. Volume of

AL-RR-12 used: _____ L.

Record the details as below:

OD280/600: _____, Protein Conc. (mg/ml): _____,

pH: _____, Cond.: _____ mS/cm,

Final Volume: _____ L, and Total protein (g): _____.

DIAFILTRATION AND CONCENTRATION OF pH ADJUSTED

SAMPLE.

Pre NWP calculation

Record the following details of the TFF cassettes connected in series horizontally to the TFF system: No. of cassettes used: _____,

Cassette ID Nos.: _____.

Wash the cassettes with 10 L of WFI and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Volume of WFI used: _____ L.

Check and record the details as below:

Diafiltration

Take the pH adjusted sample for diafiltration.

Diafilter the sample with 2 dia volumes of AL-RR-24 at a TMP of ≤ 1.0 bar.

Check and record the following details after diafiltration.

Volume of AL-RR-24 used: _____ L.

Concentration

Based on the initial protein conc., concentrate the sample to 220 to 230 mg/ml at a set TMP of ≤ 1.0 bar and Pump speed: _____ %; to obtain Bulk-API.

Check and record the details as below:

Unload the concentrated sample when the desired protein concentration is reached; by flushing 10 L of AL-RR-24. Check and record the following details:

Note: Divide the obtained value of OD280 with extinction coefficient of 0.56 to obtain protein concentration in mg/ml.

Regeneration

Flush the cassettes with 10 L of WFI and then with 100 L of AL-RR-19 at 40 - 45°C and carry out recirculation for 30 to 45 min.

Flush the cassettes with 10 L of ambient WFI.

Volume of ambient WFI used: _____ L.

Post NWP calculation

Repeat the step as 12.1.2 and record the details as below. Check if NWP is ≥ 120 LMH/Bar. If not, repeat the regeneration procedure.

Storage

Flush the cassettes with 5 L of AL-RR-21 and finally store the cassettes at room temp. in AL-RR-21.

Volume of AL-RR-21 used: _____ L.

PRA-SF-003 FILTRATION

Filter the above concentrated sample using sterile PRA-SF-003 filter under LAFU.

Check and record the following details after filtration:

OD280/600: _____, Protein Conc. (mg/ml): _____,

pH: _____, Cond.: _____ mS/cm,

Filtrate Volume: _____ L, Total Protein (g): _____.

Collect and send 25 ml of the sample after PRA-SF-003 filtration to QC for Bulk- API analysis. Record the obtained results as per the QC report: pH: _____.

Formulation

Check and record the QC results:

Protein Conc. (mg/ml): _____,

pH: _____, Cond.: _____ mS/cm,

Filtrate Volume: _____ L, Total Protein (g): _____.

Calculation of the protein concentration for 20%.

Required Dilution fold calculation for bulk sample(A) = QC estimated protein concentration $\div$ Required protein concentration(200mg).

A= _____.

Depending on the No. of fold to be diluted to the bulk sample to get the 20% final sample concentration.

Final Dilution of bulk sample volume (B) = Initial bulk volume _____ x A _____.

Final dilution volume(B)= _____.

PREPARATION OF THE FORMULATION BUFFERS:

Formulation with AL-RR-16 & AL-RR-17 buffers should be prepared based on the total protein & concentration of both buffers should be 16 mM per gram of protein AL-RR-16 required is (0.0133).

Preparation of 0.15 M AL-RR-16(C):

Molecular weight =166.2.

C = 0.0133x Total protein _____ gm.

C= _____ gm.

Required 0.15M=1/0.15.

= 6.666-fold dilution.

0.15 M=Volume (1M) x 6.666 folds.

From a 1M solution, dissolve 6.666-fold to get a 0.15M solution.

AL-RR-16 Required volume of 0.15 M = _____ L.

Dissolution of AL-RR-16 buffer.

Dissolution of the Sodium Caprylate with hot WFI, and after dissolving the salt and make up the volume with ambient WFI to attain the 0.15M.

Preparation of 0.4 M AL-RR-17(D):

Molecular weight = 246.26.

D = 0.0197x Total protein _____ gm.

D= _____ gm.

Required 0.4M=1/0.4.= 2.5-fold dilution.

0.4 M=Volume (1M) x 2.5 folds.

From a 1M solution, dissolve 2.5-fold to get a 0.4M solution.

AL-RR-17 Required volume of 0.4 M = _____ L.

Dissolution of AL-RR-17 buffer.

Dissolution of the Sodium N-Acetyl Tryptophan with 1M NaOH solution (25mg salt will be dissolved in 1ml 1M NaOH solution after dissolving the salt, then make up with ambient WFI.

Addition of the formulation buffer:

Add the C & D formulation buffer to the bulk sample while stirring at 150 rpm.

Note: Formulated sample protein concentration should be checked against the formulated buffer.

Check the sample details:

OD280/600: _____, Protein Conc. (mg/ml): _____,

pH: _____, Cond.: _____ mS/cm,

Filtrate Volume: _____ L, Total Protein (g): _____.

Protein concentration criteria are 200mg/ml $\pm$ 10 mg. If the concentration is higher side to be adjusted with dilution buffer AL-RR-24.

AL-RR-24 added volume _____ L.

Check the sample details:

OD280/600: _____, Protein Conc. (mg/ml): _____,

pH: _____, Cond.: _____ mS/cm,

Filtrate Volume: _____ L, Total Protein (g): _____.

Sterile filtration:

Filter the sample with PRA-SF-003 filter.

Collect and send 25 ml of the sample after PRA-SF-003 filtration to QC for Drug substance-API analysis.

Record the obtained results as per the QC report:

Protein Conc. (mg/ml): _____, pH: _____, Cond.: _____ mS/c Filtrate Volume:

_____, L, Total Protein (g): _____.

Reagent Details:

Formula & Calculations:

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.5M sodium hydroxide (MW = 40g/mol)

Weight of solute(g)=1×20=20g.

Preparation Method:

Weigh 20 g of Sodium hydroxide and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 0.5M sodium hydroxide (MW = 40g/mol).

Weight of solute(g)=1×20x _____L= _____gm

Weigh _____gm of sodium hydroxide and dissolve in water to make a _____ L solution.

Check and record the details:

Reagent Details:

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 1.0 M.

Applying the formula to prepare the working buffer:

$C_1 V_1 = C_2 V_2$

C_1 = 17.5 M acetic acid.

V_1 = volume of stock needed to take.

C_2 = desired (working) concentration 1.0 M acetic acid.

V_2 = final total volume of working solution for one litre.

$V_1 = (C_2 \times V_2) / C_1$.

$C_2 = 1.0$ M ; $V_2 = 1.0$ L; $C_1 = 17.5$ M

$V_1 = (1.0 \times 1.0) / 17.5$

$V_1 = 0.057$ L

Take 0.057 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V_1 = volume of stock needed to take _____ L.

C_2 = desired (working) concentration 1.0 M acetic acid.

V_2 = final total volume of working solution _____ L.

$V_1 = (C_2 \times V_2) / 17.5$.

$V_1 =$ _____ L.

Take V_1 _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 7mM sodium chroloride (MW = 58.44g/mol)
Weight of solute(g)=1×0.409=0.409■g.
Preparation Method:
Weigh 0.409 g of sodium chloride
To prepare 20mM Tris 1L solution from 1M Tris stock solution formula is M1(Molarity of stock) x V1
(volume of stock)= M2 (Molarity of working) xV2 (volume of working).
Take 20mL of 1M tris solution and add weighed amount of sodium chloride as required and dissolve in water
to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 7mM NaCl(MW = 58.44g/mol).
Weight of solute(g)=0.409x _____ L= _____ gm
Weigh _____ gm of NaCl.
To prepare _____ of 20mM Tris
Take 20mL x _____ L= _____ mL of 1M Tris
Dissolve pre weighed NaCl in 20mM Tris solution to make a _____ L solution.
Adjust the pH to 8 using concentrated HCl/NaOH solution

Reagent Details:
Preparation of AL-RR-19 working buffer from Stock buffer (AL-RR-18):
Calculations: For the Preparation of 0.5M Sodium Hydroxide.
Stock Buffer (AL-RR-18):2.0M Sodium Hydroxide,
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 2.0 M Sodium Hydroxide.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 0.5M Sodium Hydroxide.
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
C2=0.5M; V2= 1.0 L; C1=2.0M
 $V1 = (0.5 \times 1.0) / 2.0$
V1 = 0.25L
Take 0.25 L (AL-RR-18) Stock buffer solution and dilute with water, and make up to 1L.
Check and record the details:

Formulation

Check and record the QC results:

Protein Conc. (mg/ml): _____,

pH: _____, Cond.: _____ mS/cm,

Filtrate Volume: _____ L, Total Protein (g): _____.

Calculation of the protein concentration for 20%.

Required Dilution fold calculation for bulk sample(A) = QC estimated protein concentration ÷ Required protein concentration(200mg).

A=_____.

Depending on the No. of fold to be diluted to the bulk sample to get the 20% final sample concentration.

Final Dilution of bulk sample volume (B) = Initial bulk volume _____ x A _____.

Final dilution volume(B)=_____.

Preparation Of the Formulation Buffers

Formulation with AL-RR-16 & AL-RR-17 buffers should be prepared based on the total protein & concentration of both buffers should be 16 mM per gram of protein. The amount of AL-RR-16 required is (0.0133).

Preparation of 0.15 M AL-RR-16(C):

Molecular weight =166.2.

C = 0.0133x Total protein _____ gm.

C=_____ gm.

Required 0.15M=1/0.15 = 6.666-fold dilution.

0.15 M=Volume (1M) x 6.666 folds.

From a 1M solution, dissolve 6.666-fold to get a 0.15M solution.

AL-RR-16 Required volume of 0.15 M = _____ L.

Dissolution of AL-RR-16 buffer.

Dissolution of the Sodium Caprylate with hot WFI, and after dissolving the salt, make up the volume with ambient WFI to attain the 0.15M.

Preparation of 0.4 M AL-RR-17(D):

Molecular weight = 246.26.

D = 0.0197x Total protein _____ gm.

D=_____ gm.

Required 0.4M=1/0.4.= 2.5-fold dilution.

0.4 M=Volume (1M) x 2.5 folds.

From a 1M solution, dissolve 2.5-fold to get a 0.4M solution.

AL-RR-17 Required volume of 0.4 M = _____ L.

Dissolution of AL-RR-17 buffer.

Dissolution of the Sodium N-Acetyl Tryptophan with 1M NaOH solution (25mg salt will be dissolved in 1ml 1M NaOH solution after dissolving the salt, then make up with ambient WFI.

Addition of the formulation buffer:

Add the C & D formulation buffer to the bulk sample while stirring at 150 rpm.

Note: Formulated sample protein concentration should be checked against the formulated buffer.

Check the sample details:

OD280/600: _____, Protein Conc. (mg/ml): _____,

pH: _____, Cond.: _____ mS/cm,

Filtrate Volume: _____ L, Total Protein (g): _____.

Protein concentration criteria are 200mg/ml ± 10 mg. If the concentration is higher side to be adjusted with dilution buffer AL-RR-24.

AL-RR-24 added volume _____ L.

Check the sample details:

OD280/600: _____, Protein Conc. (mg/ml): _____,

pH: _____, Cond.: _____ mS/cm,

Filtrate Volume: _____ L, Total Protein (g): _____.

Sterile filtration:

Filter the sample with the PRA-SF-003 filter.

Collect and send 25 ml of the sample after PRA-SF-003 filtration to QC for Drug substance-API analysis.

Record the obtained results as per the QC report:

Protein Conc. (mg/ml): _____, pH: _____, Cond: _____ mS/c Filtrate Volume:

_____ L, Total Protein (g): _____.

DS sample stored in 2 to 8 °Cold room.

Reagent Details:
Preparation of AL-RR-21 working buffer from Stock buffer (AL-RR-18):
Calculations: For the Preparation of 0.1M Sodium Hydroxide.
Stock Buffer (AL-RR-18):2.0M Sodium Hydroxide,
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 2.0 M Sodium Hydroxide.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 0.1M Sodium Hydroxide.
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
C2=0.1M; V2= 1.0 L; C1=2.0M
 $V1 = (0.1 \times 1.0) / 2.0$
V1 = 0.05L
Take 0.05 L (AL-RR-18) Stock buffer solution and dilute it with water, making up to 1 L.
Check and record the details:

-----6M WIDE ROAD-----

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.2M Citric Acid (MW = 192.12g/mol)
Weight of solute(g)=1×38.424=38.424g.
Preparation Method:
Weigh 38.424 g of Citric acid and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.2M Citric acid (MW = 192.12g/mol).
Weight of solute(g)=1×38.424 _____ L= _____ gm
Weigh _____ gm of Citric acid and dissolve in water to make a _____ L solution.
Check and record the details:
Preparation Details:

Reagent Details:
Preparation of PF-RR-30 working buffer from Stock buffer (PF-RR-27):
Calculations: For the Preparation of 0.01M Sodium Hydroxide.
Stock Buffer (PF-RR-27):2.0M Sodium Hydroxide,
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 2.0 M Sodium Hydroxide.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 0.01M Sodium Hydroxide.
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
C2=0.01M; V2= 1.0 L; C1=2.0M
 $V1 = (0.01 \times 1.0) / 2.0$
V1 = 0.005L
Take 0.005 L (PF-RR-30) Stock buffer solution and dilute it with water, making up to 1 L.
Check and record the details:

Reagent Details:
Calculations: To prepare 1 L of 1.05% Tween 80.
Decide on the total final volume to prepare (e.g., 1000 mL).
Calculate 1.05% of the total final volume to determine the amount of Tween-80 needed:
"Tween-80 required"="Total Volume"×1.05/100.
For 1000 mL final volume: mL Tween-80.
Preparation Method:
Measure the required volume of one litre and dissolve it in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 1.05% Tween 80.
Tween-80 required"="Total Volume"×1.05/100.
For _____ mL final volume: mL Tween-80.
Measure the required volume of one liter and dissolve it in water to make a 1 L solution.
Check and record the details:

Reagent Details:

Formula:

Sodium Acetate(M.Wt): 82.03g/mol.

Acetic Acid (M.Wt): 60.05g/ mol

Sodium Chloride:58.44g/mol

Preparation of 0.1 M Sodium Acetate pH 5.35 buffer

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.1 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.1×82.03× 1.0=8.203g.

Preparation Method:

Weigh 8.203 g of Sodium Acetate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.1M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.1×82.03× _____ L= _____ g.

Weigh _____ gm of Sodium Acetate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.1 M Acetic Acid.

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 0.1 M acetic acid

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 0.1 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ × V₂)/C₁.

C₂=0.1 M ; V₂= 1.0 L; C₁=17.5 M

V₁ = (0.1 × 1.0)/17.5

V₁ = 0.0057 L

Take 0.0057 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 0.1 M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ _____ × V₂ _____) /17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Preparation of 4.0 M Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 4 M Sodium Chloride (MW = 58.44g/mol).

Weight of solute(g)=4×58.44 × 1.0= 233.76g.

Preparation Method:

Weigh 233.76g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 4 M Sodium Chloride (MW = 58.44g/mol).

Weight of solute(g)=0.1×58.44× _____ L= _____ g.

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Procedure for Preparation of 0.1 M Sodium Acetate + 4 M Sodium Chloride pH 5.35

To prepare a pH 5.35 solution, 0.1 M Sodium Acetate solution was added to this 4M Sodium Chloride was added and completely dissolved and then titrated with 0.1 M Acetic acid so that the pH attains pH 5.35 and made up to 1 L.

Check and record the details:

Reagent Details:
Formula & Calculations:
Formula: Use the formula to calculate the molarity:
 $Molarity (M) = (Per\ cent\ by\ Weight / 100) * (Density\ in\ g/mL) * 1000 / Molar\ Mass.$
Example: Molarity of Glacial Acetic Acid
Molar Mass of CH_3COOH : ~60.05 g/mol
Density: ~1.05 g/mL
Purity: 100%
Acetic Acid (MW = 60.05 g/mol).
Calculation:
 $Molarity = (100 / 100) * 1.05\ g/mL * 1000\ mL/L / 60.05\ g/mol \approx 17.5\ M.$
Calculation: To prepare 1 L of 1.0 M.
Applying the formula to prepare the working buffer:
 $C_1 V_1 = C_2 V_2$
 $C_1 = 17.5\ M$ acetic acid.
 V_1 = volume of stock needed to take.
 C_2 = desired (working) concentration 1.0 M acetic acid.
 V_2 = final total volume of working solution for one litre.
 $V_1 = (C_2 \times V_2) / C_1.$
 $C_2 = 1.0\ M ; V_2 = 1.0\ L ; C_1 = 17.5\ M$
 $V_1 = (1.0 \times 1.0) / 17.5$
 $V_1 = 0.057\ L$
Take 0.057 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.
To prepare various volumes:
 V_1 = volume of stock needed to take _____ L.
 C_2 = desired (working) concentration 1.0 M acetic acid.
 V_2 = final total volume of working solution _____ L.
 $V_1 = (C_2 \times V_2) / 17.5.$
 $V_1 =$ _____ L.
Take V_1 _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 2mM Tri-sodium citrate (MW = 258.06g/mol)
Weight of solute(g)=0.002×258.06=0.516g.
Preparation Method:
Weigh 0.516 g of Tri-sodium citrate and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 2mM Tri-sodium citrate (MW = 258.06g/mol).
Weight of solute(g)=0.002×258.06x _____L= _____gm
Weigh _____gm of Tri-sodium citrate and dissolve in water to make a _____ L solution.
Check and record the details
Preparation Details:
Name of Reagent | Grade / Purity | Manufacturer / Supplier | Lot / Batch No | Storage Condition | Expiry Date
Tri-sodium citrate | | | |
Final volume prepared | Weighed Quantity | pH(7.0±0.1) | Conductivity(0.650 ± 0.1 µs/cm) | Storage Condition:

Reagent Details:

Formula:

Sodium Acetate(M.Wt): 82.03g/mol.

Acetic Acid (M.Wt): 60.05g/ mol

Sodium Chloride:58.44g/mol

Preparation of 0.2 M Sodium Acetate pH 5.35 buffer

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.2 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.2×82.03x 1.0=16.406 g.

Preparation Method:

Weigh 16.406 g of Sodium Acetate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.2M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.2×82.03x _____ L= _____ g.

Weigh _____ gm of Sodium Acetate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.2 M Acetic Acid.

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 0.2 M acetic acid

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 0.2 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ × V₂)/C₁.

C₂=0.2 M ; V₂= 1.0 L; C₁=17.5 M

V₁ = (0.2 × 1.0)/17.5

V₁ = 0.011 L

Take 0.011 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 0.2 M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ _____ x V₂ _____) /17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Preparation of 4.0 M Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 4 M Sodium Chloride (MW = 58.44g/mol).

Weight of solute(g)=4×58.44 x 1.0= 233.76g.

Preparation Method:

Weigh 233.76g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 4 M Sodium Chloride (MW = 58.44g/mol).

Weight of solute(g)=0.2×58.44x _____ L= _____ g.

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Procedure for Preparation of 0.2 M Sodium Acetate + 4 M Sodium Chloride pH 5.35

To prepare a pH 5.35 solution, 0.2 M Sodium Acetate solution was added, to then 4M Sodium Chloride was added and completely dissolved and then titrated with 0.2 M Acetic acid so that the pH attains pH 5.35 and made up to 1 L.

Check and record the details:

Reagent Details:

Formula:

Sodium Citrate (M.Wt): 258.07.

Citric acid (M.Wt): 192.124

Sodium Chloride (M.Wt): 58.44

Calcium Chloride (M.Wt): 110.98

0.1% Tween 80

Preparation of FE-RR-04 buffer with Stock FE-RR-03.

Preparation of 20mM sodium citrate pH 7.0 + 1.3M sodium chloride + 2.6mM calcium chloride + 0.1% tween 80.

Stock Buffer (FE-RR-03): 0.2M Sodium Citrate pH 7.0

Formula:

$$C1 \times V1 = C2 \times V2$$

C1 = concentration of stock

V1 = volume of stock you need to take

C2 = desired (working) concentration

V2 = final total volume of working solution

Applying the formula to prepare the working buffer:

$$C1 \times V1 = C2 \times V2$$

C1 = 0.2M Sodium Citrate pH 7.0

V1 = volume of stock you need to take _____ L.

C2 = desired (working) concentration 20mM Sodium Citrate, pH 7.0

V2 = final total volume of working solution _____ L.

$$V1 = (C2 \times V2) / C1$$

C2 = 0.02M ; V2 = 1.0 L ; C1 = 0.2M

$$V1 = (0.02 \times 1.0) / 0.2$$

V1 = 0.1L

Take 0.1 L (FE-RR-03) Stock buffer solution and dilute with water, and make up to 1L.

Calculations: To prepare the 1.3M Sodium Chloride.

Formula: Weight of solute (g) = Molarity (M) × Molecular Weight (g/mol) × Volume (L).

Calculation: To prepare 1 L of 1.3M Sodium Chloride (MW = 58.44 g/mol)

$$\text{Weight of solute (g)} = 1.3 \times 58.44 \times 1 = 75.972\text{g}$$

Preparation Method:

Weigh 75.972g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 1.3M Sodium Chloride (MW = 58.44 g/mol).

$$\text{Weight of solute (g)} = 1.3 \times 58.44 \times \text{L} = \text{g}$$

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Calculations: To prepare the 2.6mM Calcium Chloride.

Formula: Weight of solute (g) = Molarity (M) × Molecular Weight (g/mol) × Volume (L).

Calculation: To prepare 1 L of 2.6 mM Calcium Chloride (MW = 110.98g/mol)

$$\text{Weight of solute (g)} = 0.0026 \times 110.98 \times 1 = 0.288\text{g}$$

Preparation Method:

Weigh 0.288g of Calcium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.0026mM Calcium Chloride (MW = 110.98 g/mol).

$$\text{Weight of solute (g)} = 0.0026 \times 110.98 \times \text{L} = \text{g}$$

Weigh _____ gm of Calcium Chloride and dissolve in water to make a _____ L solution.

Procedure

Calculation: to prepare the 0.1% Tween 80:

For 1000 mL of 0.1% solution:

$$0.1\% = 0.1\text{g per } 1000\text{ mL} = 1000\text{ mg}$$

Since Tween 80 is a liquid, you can weigh it directly or use its density (~1.06 g/mL) to measure volume:

$$\text{Approx. } 100\text{ }\mu\text{L of Tween 80} = 1.0\text{ g}$$

Add Tween 80 to a beaker or flask containing ~800 mL of water.

Mix thoroughly:

Use a magnetic stirrer or vortex until fully dissolved. Tween 80 is viscous, so mixing may take a few minutes.

Adjust volume:

After complete dissolution, bring the final volume up to 1000 mL with water.

Procedure for Preparation of FE-RR-04 buffer with the stock FE-RR-03.

To prepare a 1 L solution, take 0.2M Tri Sodium Citrate pH 7.0. To this, add the 1.3 M sodium chloride

and dissolve it and make up the volume with water to 900ml, and then to this add 0.026 M Calcium

chloride, to this add the 0.1% Tween 80 then mix the solution till it dissolves and check the pH; if the

pH is less than 7.0 then adjust the pH with 1 M sodium hydroxide to get the pH 7.0 ± 0.1 and make up the

final volume to 1L.

Check and record the details:

ZLD system for LVP plant
(180 m³/day water demand, 145 m³/day effluent)

1. Design Basis (Confirmed)
Effluent Load
Total effluent: 145 m³/day
Operating hours: 20 hr/day
Hourly flow = 145 / 20 = 7.25 m³/hr

2. Effluent Segregation (Critical for Cost Optimization)

3. Overall ZLD Scheme
Equalization → ETP → UF → RO → Permeate reuse
↓
RO Reject → MEE → ATFD → solids

4. RO SYSTEM SIZING

4.1 Feed to RO
Total after ETP/UF: 145 m³/day
Hourly: 7.25 m³/hr

4.2 Design Assumptions
Recovery: 70%
Flux: 18–22 LMH (industrial pharma)
Operating: 20 hr/day
Safety margin: 25%

4.3 Flow Calculations
Permeate:
70% of 145 = 101.5 m³/day
Reject:
43.5 m³/day

4.4 Design Capacity
Required:
7.25 m³/hr
With margin:
~9 m³/hr RO system

4.5 Membrane Area
Assume flux = 20 LMH
Area:
9,000 L/hr ÷ 20 = 450 m² membrane area

4.6 RO Configuration
2-stage RO (70% recovery)
Skid size: ~9 m³/hr
Pumps: ~12–15 kW

5. MEE (MULTIPLE EFFECT EVAPORATOR) SIZING

5.1 Feed to MEE
RO reject: 43.5 m³/day
Hourly: 2.2 m³/hr

5.2 Concentration Target
From ~5–8% solids → 25–30% slurry

5.3 Evaporation Load
Water to evaporate (~80%):
~35 m³/day
Hourly evaporation:
35 ÷ 20 = 1.75 m³/hr

5.4 MEE Capacity
Add margin:
Design MEE capacity: 2.0 m³/hr evaporation

5.5 Number of Effects
Recommended: 3-effect MEE
Reason:
Better steam economy
Lower OPEX

5.6 Steam Requirement
Typical:
1 kg steam evaporates ~1.8–2.2 kg water (3-effect)
Steam needed:
1,750 kg/hr ÷ 2 ≈ 875 kg/hr steam
Design:
~900–1,000 kg/hr steam

5.7 Power Requirement
Pumps + vacuum system: 25–35 kW

6. ATFD (AGITATED THIN FILM DRYER) SIZING

6.1 Feed to ATFD
Concentrated slurry: ~8.5 m³/day

6.2 Solids Load
Assume:
25% solids
Solids:
~2,100 kg/day

6.3 Hourly Load
Operating: 16 hr/day
Solids/hr:
2100 ÷ 16 ≈ 130 kg/hr

6.4 ATFD Capacity
With margin:
Design capacity: 150–180 kg/hr solids

6.5 Steam Requirement
~1.2–1.5 kg steam/kg evaporation
~200–250 kg/hr steam

6.6 Power
Motor + scraper: 15–20 kW

7. FINAL WATER BALANCE (ZLD PERFORMANCE)

8. EQUIPMENT SIZING SUMMARY (DPR TABLE)

9. UTILITIES REQUIREMENT

Power
Total: ~80–100 kW
Steam
Total: ~1.2 TPH boiler capacity
Stream | Flow (m³/day) | TDS | Treatment Path
Low TDS | 70 | <2,000 ppm | ETP → RO
High TDS | 75 | 5,000–15,000 ppm | ETP → RO → MEE → ATFD
Stage | Flow (m³/day)
RO permeate | 101.5
MEE condensate | 32–35
Total recovery | ~135 m³/day
Losses (sludge + evaporation) | ~10 m³/day
Liquid discharge | ZERO
Unit | Capacity
Equalization Tank | 200 m³
ETP | 150 m³/day
UF System | 10 m³/hr
RO System | 9 m³/hr
MEE | 2.0 m³/hr evaporation
ATFD | 150–180 kg/hr solids
System | Load
RO | 15 kW
MEE | 30 kW
ATFD | 20 kW
Pumps/ETP | 20 kW
System | Steam
MEE | 900–1,000 kg/hr
ATFD | 200–250 kg/hr

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.01N Sodium Hydroxide (MW = 40.0 g/mol)
Weight of solute(g)=0.01×40 = 0.4g.
Preparation Method:
Weigh 0.4 g of Sodium Hydroxide and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.01N Sodium Hydroxide (MW = 40.0 g/mol).
Weight of solute(g)=0.01×40.0 x _____L= _____gm
Weigh _____gm of Sodium Hydroxide and dissolve in water to make a _____ L solution.

Reagent Details:

Formula:

Sodium Acetate(M.Wt): 82.03g/mol.

Acetic Acid (M.Wt): 60.05g/ mol

Preparation of 0.4 M Sodium Acetate pH 4.6 buffer

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.4 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.4×82.03× 1.0=32.81g.

Preparation Method:

Weigh 32.81 g of Sodium Acetate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.4 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.4×82.03× _____ L= _____ g.

Weigh _____ gm of Sodium Acetate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.4 M Acetic Acid.

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 0.4 M.

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 0.4 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ x V₂)/C₁.

C₂=0.4 M ; V₂= 1.0 L; C₁=17.5 M

V₁ = (0.4 x 1.0)/17.5

V₁ = 0.022 L

Take 0.022 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 0.4 M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ x V₂) / 17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Procedure for Preparation of 0.4 M Sodium Acetate pH 4.6.

To prepare a pH 4.6 solution, 0.4 M Sodium Acetate solution is titrated with 0.4 M Acetic acid so that the pH attains pH 4.6.

Reagent Details:
Preparation of PF-RR-28 working buffer from Stock buffer (PF-RR-27):
Calculations: For the Preparation of 0.5M Sodium Hydroxide.
Stock Buffer (PF-RR-27):2.0M Sodium Hydroxide,
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 2.0 M Sodium Hydroxide.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 0.5M Sodium Hydroxide.
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$.
C2=0.5M; V2= 1.0 L; C1=2.0M
 $V1 = (0.5 \times 1.0) / 2.0$
V1 = 0.25L
Take 0.25 L (PF-RR-27) Stock buffer solution and dilute with water, and make up to 1L.
Check and record the details:

Reagent Details:
Preparation of AL-RR-11 working buffer from Stock buffer (AL-RR-10):
Calculations: For the Preparation of 50mM Sodium acetate pH 5.2.
Stock Buffer (AL-RR-10):0.2M Sodium acetate, pH 5.35 + 4.0 M Sodium Chloride.
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.2M Sodium Acetate pH 5.35.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 50mM Sodium Acetate pH 5.2
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
C2=0.05M; V2= 1.0 L; C1=0.2M
 $V1 = (0.05 \times 1.0) / 0.1$
V1 = 0.5L
Take 0.5 L (AL-RR-10) Stock buffer solution and dilute it with water to make up a final volume of 1 L.
Check and record the details:

FIRST FLOOR PLAN BUILDING -A CLIENT :- LIFENITY- HEALTH LIMITED (DIALYZER, LVP & PLASMA)
ADDRESS :-Auric city, chhatrapati sambhaji nagar

SCALE 1:100

DESIGN &
PROJECT BY :-BIOBRIDGE HEALTHCARE SOLUTION PVT.LTD.
PREPARED A.K
ADDRESS :-13, Rachna Blossom, Jagdishnagar,
Aundh, Pune -411007, Maharastra, India. CHECKED G.K.

DATE 18-06-2026
TITLE- CONCEPTUAL LAYOUT-FF-A REVISION R0
SCALE 1:1

SIZE A0 DWG.NO 02

TABLE OF CONTENTS

POOLED CONCENTRATED SAMPLE 2

QC FOR IN-PROCESS2

PA-SF-001 FILTRATION.....2

QC ANALYSIS REPORT.....3

Pooled Concentrated Sample:

Diafilter the pooled concentrated sample with 5 dia volumes of TH-RR-08 at a set TMP of ≤ 1.0 bar and concentrate the sample to 500 ± 100 mL.

Volume of TH-RR-08 used: _____.

pH: _____, Conductivity: _____ mS/cm.

O.D280/600: _____, Final volume (mL): _____.

Collect 2 mL of sample and send to QC for in-process QC analysis.

Record the obtained results as per the QC report :

Activity: _____, BET: _____.

Add and adjust Human Serum Albumin (HSA-20%) to a final concentration of 25 mg/mL to the diafiltered sample from BMR step 2.6.6

Volume of diafiltered sample: _____ mL.

Volume of HSA-20% added before concentration from BMR step 1.11.1: _____.

Volume of HSA-20% added after diafiltration: _____.

PA-SF-001FILTRATION

Assemble the PA-SF-001 filter with sterilised inlet and outlet silicone tubing.

Check and record the following filter details:

No. of filter(s) used: _____.

Equilibrate the filter by passing 0.5L TH-RR-08.

Volume of TH-RR-08 passed: _____ L.

Filter the sample through a filter using a peristaltic pump under LAFU.

Collect 10 mL sample and send to QC for Drug Substance testing.

Check and record the following details:

Store the above sample at -20°C from step 3.6 in a 500 mL Nalgene bottle till it is released for filling.

Sample Label ID: _____.

Activity (IU/mL) as per QC report. | |

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.2M Sodium Acetate (MW = 80.03 g/mol)
Weight of solute(g)=0.2×80.03 = 16.00g.
Preparation Method:
Weigh 16.00 g of Sodium Acetate and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.2M Sodium Acetate (MW = 80.03 g/mol).
Weight of solute(g)=0.2×80.03 x _____L= _____gm
Weigh _____gm of Sodium Acetate and dissolve in water to make a _____ L solution.
Check and record the details:

| Check- sheet for Application for Consent To Establish (CTE) / Authorisation |||||

|

| Industry Unit & Plant Details | Plant Address along with Pin code |||||

| Industry Information |||||

| Consent to | Date of Commissioning | UAN No.: | Submit to : |||||

| Renewal Type | Validity of existing content |||||

| Industrial Type | Category | Scale |||||

| Location of industry/activity/etc. | Name of MIDC |||||

| Whether the project requires clearance under the Environment (Protection) Act 1986 (Environmental Clearance) |||||

| Whether construction-built-up area is more than 20,000 sq.mtr.(Existing Expansion Unit) |||||

|||||

| Part A: General |||||

1 | 1. Name, designation, office address with : Telephone/Fax numbers, e-mail of the Applicant

Occupier/Industry/Institution / Local Body. || Address |||||

| Designation || Taluka |||||

| Area || District |||||

| Telephone || Fax |||||

| Email || PAN number |||||

2 | Name and location of the industrial unit/premises for which the application is made (Give revenue Survey Number/Plot number name of Taluka and District, also telephone and fax number) |||||

|||||

| Industry name || Survey number/Plot Number |||||

| Telephone | Fax |||||

b | Details of the planning permission obtained from the local body /town and Country planning authority

/ metropolitan development authority designated authority Planning Permission |||||

| Planning Authority |||||

| Name of the local body under whose jurisdiction the units is located and name of the lincses issuing authority |||||

| Name of Local Body |||||

| Name of the lincses issuing authority |||||

3 | Names, addresses with Telephone and Fax Number of Managing Director / Managing Partner and officer

responsible for matters connected with pollution control and/or Hazardous waste disposal |||||

|||||

| Name of Managing Director | Telephone number | Fax number |||||

| Officer responsible for day to day business |||||

4 | 4. (a.) Are you registered Industrial/HCE unit ? | (b.) If yes, give the number and date of

registration | Registration number | Date of registration |||||

5 | Gross capital investment of the unit without depreciation till the date of application (Cost of building, land, plant and machinery). (To be supported by an affidavit/undertaking on Rs.20/- stamp paper, annual report or certificate from a Chartered Accountant for proposed unit(s), give estimated figure) |||||

| Gross capital (in Lakh) | Verified | Terms | Consent fee |||||

6a | If the site is located near sea-shore/river bank/other water bodies/Highway, Indicate the crow fly

distance and the name of the water body, if any |||||

| SH/NH |||| 0 |||||

| River |||||

| Human Habitation |||||

| Religious Place |||||

| Historical Place |||||

| Creek/Sea |||||

6b | Enter Latitude and Longitude details of site (In degrees) |||||

| Latitude | Longitude |||||

7 | Does the location satisfy the requirement under relevant central/state govt. notification such as coastal regulation zone . Notification on ecologically fragile area industrial location policy , etc. if so, give details |||||

| Location | Approved Industrial Area | Sensitive Area | If YES, Name of Area | Industrial Location with Reference to CRZ |||||

8 | If the site is situated in notification industrial estate |||||

(a) | (a.) Whether effluent collection , treatment and disposal system has been provided by the authority

|||||

(b) | (b) Will the application utilize the system if provided |||||

© | (c) if not provided details of proposed arrangement |||||

9 (a) | Total plot area (in square meter) |||||

(b) | * (b) Built up area and (in square meter) |||||

© | (c) Area available for the use of treated sewage/ trade effluent for gardening/irrigation. (in square meter) |||||

10 | Month and year of commissioning of the Unit. |||||

11 | Number of Worker and office staff |||||

| Workers | Staff | Hrs. of Shift | Weekly off |||||

12 (a) | Do you have a residential colony within the premises in respect of which the present application is made? |||||

13 | List of products and by-products Manufactured in tonnes/month, KI/month or numbers/month with their types i.e. Dyes, drugs etc.

(Give figures corresponding to maximum installed production capacity |||||

| Products Name and Quantity |||||

| Products Name and Quantity |||||

| Product Name | * UOM | * Product Name | * Existing | * Consented | * Proposed Revision | * Total |

Remarks |||||

| BY Products Name and Quantity |||||

| By product Name | * UOM | Quantity | Remark |||||

14 | List of raw materials and process chemicals with annual consumption corresponding to above stated production figures, in tonnes/month or kl/month or numbers/month |||||

| Raw Material With Quantity |||||

| Name of Raw Material | * UOM | Quantity | Hazardous Waste(Y/N) | * Hazardous Chemicals(Y/N) |||||

|||||

15 | Decryption of process of manufacture for each of the products input, output, quality and quantity of solid, liquid and gaseous waste , if from each units |||||

BioBridge Master Knowledge — Page 2949

43 | Hazardous chemical - give details of chemicals and quantities handle and stored. |||||
(i) is the units a major accident hazard units as per mfg. storage import hazardous chemical rule?				
(ii) is the unit an isolated storage as defined under the MSIHC rules ?				
(iii) indicate status of compliance of Rule 5,7,10,11,12,13,& 18 of MSIHC rules?				
(iv) Has approval if site been obtained from the concerned authority ?				
(vi) has information on imports of chemicals been provided to the concerned authority?				
(vii) does the unit process a policy under the PLI act?				
44	Brief details of tree plantation / green belt development within applicants premises			
Tree-plantation				
Open Space Availability	Square meter	Plantation Done on	Square meter	
Number of Tree Planted				
 45 | Information of schemes for waste minimization , resource recycling - implemented and to be implemented severalty |||||
 46. (a) | The applicant shall indicate whether industry comes under public hearing if so the relevant document such as EIA, EMP, risk analysis etc. shall be submitted , if so the relevant documents enclosed shall be indicated accordingly |||||
 (b) | any other additional information that the application desires to give |||||
 © | whether environmental statement submitted ? If submitted , give date of submission |||||
 ||||| |
 | Bank Guarantee |||||
 | Bank Guarantee applicable |||||
 47 | I/we undertake to furnish any other information within one month of its being called by the board |

G16 Dal Mills ||||| Carpet Weaving ||||| 5.1 Used or spent oil || A20 Benzene |

G17 Decoration of ceramic cups and plates by electric furnace ||||| Casting ||||| 5.2 Wastes or residues containing oil || A21 Benzo (a) Pyrene |

G18 Digital printing on PVC Clothes ||||| Cement ||||| 5.3 Waste cutting oils || A22 Bromodichloromethane |

G19 Facility of handling, storage and transportation of food grains in bulk ||||| Ceramics ||||| 6.1 Sludge and filter press cake arising out of production of Zinc Sulphate and other Zinc Compound || A23 Bromoform |

G20 Flour mills(dry process) ||||| Chemical, petrochemical& Electrochemical ||||| 6.2 Zinc fines or dust or ash or skimmings in dispersible form || A24 Carbon tetrachloride |

G21 Glass, ceramic, earthen potteries, tile and tile manufacturing using electrical kiln or not involving fossil fuel kiln ||||| Chilling plants and cold storages ||||| 6.3 Other residues from processing of zinc ash or skimmings || A25 Chlorobenzene |

G22 Glue from starch (physical; mixing) with gas / electrically operated oven / boiler ||||| Chlorates, perchlorates & peroxides ||||| 6.4 Flue gas dust and other particulates |

A26 Chloroform |

G23 Gold and silver smithy (purification with acid smelting operation and sulphuric acid polishing operation)(using less or equal to 1 litre of sulphuric acid/ nitric acid per month) ||||| Chlorine,fluorine& their compounds ||||| 7.1 Flue gas dust from roasting || A27 Cresol (ortho+ meta+ para) |

G25 Insulation and other coated papers (excluding paper or pipe manufacturing) ||||| Copper Smelter ||||| 7.2 Process residues || A28 Dibromochloromethane |

G26 Leather foot wear and leather products (excluding tanning and hide processing except cottage scale | ||||| Cosmetic & Herbal ||||| 7.3 Arsenic-bearing sludge || A29 Hexachlorobenzene |

G27 Lubricating oil, graeses or petroleum based products (only blending at normal temperature) ||||| Cotton and woolen hosiery ||||| 7.4 Non-ferrous metal bearing sludge and residue || A30 Hexachlorobutadiene |

G28 Manufacturing of pasted venners using gas fired boiler or thermic fluid heater and by sun drying || ||||| Cotton spinning and weaving ||||| 7.5 Sludge from scrubbers || A31 Hexachloroethane |

G29 Oil mill Ghani and extraction (no hydrogenation / refining) ||||| Dal Mills ||||| ||||| 8.1 Spent electrolytic solutions || A32 Methyl ethyl ketone |

G30 Packing materials manufacturing from non asbestos fibre, vegetable fibre yarn ||||| Distillery including Fermentation Industry ||||| 8.2 Sludge and filter cakes || A33 Napthalene |

G31 Phenyl/toilet cleaner formulation and bottling ||||| Dry Coal Processing/mines Processing ||||| 8.3 Flue gas dust and other particulates || A34 Nitrobenzene |

G32 Polythene and plastic processed products manufacturing (virgin plastic) ||||| Dyes and Dye intermediaries ||||| 9.1 Lead bearing residues || A35 Pentachlorophenol |

G33 Polutry, Hatchery and Piggery ||||| Electronic and Electrical goods ||||| || 9.2 Lead ash or particulate from the flue gas || A36 Pyridine |

G34 Power looms (without dye and bleaching) ||||| Electronics equipment(Assembly) ||||| ||||| 9.3 Acid from used batteries || A37 tetrachloroethylene |

G35 Puffed rice (muri) (using gas or electrical heating system) ||||| Electroplating ||||| ||||| 10.1 Residues containing cadmium and arsenic || A38 Trichloroethylene |

G36 Pulverization of bamboo and scrap wood ||||| Explosive Including detonators etc. ||||| ||||| 11.1 Sludges from off-gas treatment || A39 Vinyl Chloride |

G37 Ready mix cement concrete ||||| Fermentation Industry Including manufacture of yeast, beer etc. ||||| 11.2 Cathode residues including pot lining wastes || A40 2,4,5-TP (Silvex) |

G38 Reprocessing of waste cotton ||||| Fertiliser(Basic) (excluding formulation) ||||| ||||| 11.3 Tar containing wastes || A41 2,4-Dichlorophenoxyacetic acid |

G39 Rice mill (Rice hullers only) ||||| Fire Crackers ||||| 11.4 Flue gas dust and other particulates || A42 Alachlor |

G 41 Rubber goods industry (with gas opertaed baby boiler) ||||| Fish Processing ||||| ||||| 11.5 Drosses and waste from treatment of salt sludge || A43 Alpha HCH |

G42 Saw mills ||||| Flour Mills (excluding Domestic AattaChakki) ||||| 11.6 Used anode butts || A44 Atrazine |

G43 Soap manufacturing (hand made without staem boiling/ boiler) ||||| Food additives, nutrients and flavours ||||| 11.7 Vanadium sludge from alumina refineries || A45 Beta HCH |

G44 Spice grinding (upto 20 HP motor) ||||| Food Including fruits & vegetable Processing |

||||| 12.1 Acidic and alkaline residue || A46 Butachlor |
G45 spice grinding (>20 hp motor) ||| | | | | | | | | Footware(rubber) ||| | | | | | | | | 12.2 Spent acid and alkali || A47 Chlordane |
G46 Steel furniture without spray painting ||| | | | | | | | | Forging ||| | | | | | | | | 12.3 Spent bath and sludge containing sulphide, cyanide and toxic metals || A48 Chlorpyrifos |
G47 Stepping and processing of grains ||| | | | | | | | | Fountain Pens ||| | | | | | | | | 12.4 Sludge from bath containing organic solvents || A49 Delta HCH |
G48 Tyres and tube retreating (without boiler) ||| | | | | | | | | Fragrances and industrial perfumes ||| | | | | | | | | 12.5 Phosphate sludge || A50 Endosulfan(alpha+beta+ sulphate) |
G49 Chilling plant and ice making without using ammonia ||| | | | | | | | | Furniture (Wooden & Steel) |
||||| 12.6 Sludge from staining bath || A51 Endrin |
G50 CO2 recovery ||| | | | | | | | | Garments stitching 7 Tailoring ||| | | | | | | | | 12.7 Copper etching residues || A52 Ethion |
G51 Distilled water (without boiler) with electricity as source of heat ||| | | | | | | | | Glass and Fibreglass Production & Processing ||| | | | | | | | | 12.8 Plating metal sludge || A53 Heptachlor (& its Epoxide) |
G52 Hotels(up to 20 rooms and without boilers) ||| | | | | | | | | Glue & gelatin ||| | | | | | | | |
13.1 Spent pickling liquor || A54 Isoproturon |
G53 Manufacturing of optical lenses (using electrical furnace) ||| | | | | | | | | Gold & Silver thread zari work ||| | | | | | | | | 13.2 Sludge from acid recovery unit || A55 Lindane |
G54 Mineralized water ||| | | | | | | | | Gold and Silver smithy ||| | | | | | | | | 13.3 Benzol acid sludge || A56 Malathion |
G55 Tamarind powder manufacturing ||| | | | | | | | | Groundnut decorticating(dry) ||| | | | | | | | |
| 13.4 Decanter tank tar sludge || A57 Methoxychlor |
G56 Cutting, sizing and polishing of marble stone ||| | | | | | | | | Handloom Weaving ||| | | | | | | | |
|| 13.5 Tar storage tank residue || A58 Methyl Parathion |
G57 Emery powder (fine dust of sand) manufacturing ||| | | | | | | | | Hotels & restaurants ||| | | | | | | | |
|||| 13.6 Residues from coke oven by product plant || A59 Monocrotophos |
G58 Flyash export, transport & disposal facilities ||| | | | | | | | | Hydrocarbons ||| | | | | | | | |
| 14.1 Cyanide, nitrate, or nitrite- containing sludge || A60 Phorate |
G59 Mineral stack yard / Railway siding ||| | | | | | | | | Hydrocyanic acid & its derivatives ||| | | | | | | | |
|||| 14.2 Spent hardening salt || A61 Toxaphene |
G60 Oil and gas transportation pipeline ||| | | | | | | | | Ice cream or ice making ||| | | | | | | | |
| 15.1 Asbestos -containing residues || A62 Antimony |
G61 Seasoning of wood in steam heated chamber ||| | | | | | | | | Incineration Plant ||| | | | | | | | |
|| 15.2 Discarded asbestos || A63 Beryllium |
G62 Synthetic detergent formulation ||| | | | | | | | | Industrial Carbon including electrodes and graphic blocks ||| | | | | | | | | 15.3 Dust or particulates from exhaust gas treatment || A64 Chromium (VI) |
|
G63 Tea processing (with boiler) ||| | | | | | | | | Industrial or Inorganic Gases ||| | | | | | | | |
| 16.1 Mercury bearing sludge generated from mercury cell process || A65 Cobalt |
01 Dismantling of rolling stocks (wagons/ coaches) ||| | | | | | | | | Industry or Process involving electroplating operations ||| | | | | | | | | 16.2 Residue or sludge and filter cakes || A66 Copper |
|
02 Bakery and confectionery units with production capacity > 1 TPD.(with ovens/ furnaces) ||| | | | | | | | |
|| Industry or process involving foundry operations ||| | | | | | | | | 16.3 Brine sludge || A67 Molybdenum |
03 Chanachur and laddoo from puffed and beaten rice (muri and shira) using husk fired oven ||| | | | | | | | |
|| Ink ||| | | | | | | | | 17.1 Process acidic residue, filter cake , dust || A68 Nickel |
04 Coated electrode manufacturing ||| | | | | | | | | Instant tea/coffee,coffee processing ||| | | | | | | | |
|||| 17.2 Spent catalyst || A69 Thallium |
05 Compact disc computer floppy and cassette manufacturing / Reel manufacturing ||| | | | | | | | |
Insulation and other coated papers ||| | | | | | | | | 18.1 Spent catalyst || A70 Vanadium |
06 Flakes from rejected PET bottle ||| | | | | | | | | Iron & Steel ||| | | | | | | | | 18.2 Carbon residue || A71 Zinc |
07 Food and food processing including fruits and vegetable processing ||| | | | | | | | | ITES & ITES Activity ||| | | | | | | | | 18.3 Sludge or residue containing arsenic || A72 Fluoride |
08 Jute processing without dyeing ||| | | | | | | | | Jobbing & Machining ||| | | | | | | | | 18.4 Chromium sludge from water cooling tower || A73 Aldrin |
09 Manufacturing of silica gel ||| | | | | | | | | Khandsari Sugar ||| | | | | | | | | 19.1 Residue or sludge containing phenol || A74 Dichlorodiphenyltrichloroethane(DDT), Dichlorophenyldichloroethylene(DDE), Dichlorodiphenyldichloroethane(DDD) |
010 Manufacturing of tooth powder, toothpaste, talcum powder and other cosmetic items ||| | | | | | | | |
Laboratory-wares ||| | | | | | | | | 19.2 Spent catalyst || A75 Dieldrin |
011 Printing or etching of glass sheet using hydrofluoric acid ||| | | | | | | | | Laboratory chemicals (distillation & Purification Process) ||| | | | | | | | | 20.1 Contaminated aromatic, aliphatic or naphthenic solvent may or may not be fit for reuse || A76 Kepone |
012 Silk screen printing, sari printing by wooden blocks ||| | | | | | | | | Lead processing & battery reconditioning & Manufacturing ||| | | | | | | | | 20.2 Spent solvents || A77 Mirex |
013 Synthetic detergents and soaps(excluding formulation) ||| | | | | | | | | Leather footwear and leather excluding tanning ||| | | | | | | | | 20.3 Distillation residue || A78 Polychlorinated biphenyls |
015 Cotton spinning and weaving (medium and large scale) ||| | | | | | | | | Lime Manufacturing ||| | | | | | | | |
|||| 20.4 Process Sludge || A79 Dioxin(2,3,7,8-TCDD) |
016 Almirah, Grill Manufacturing (Dry Mechanical Process) ||| | | | | | | | | Lubricating Oils Greases or petroleum bases products ||| | | | | | | | | 21.1 Process Wastes, residues and sludges || B1 Asbestos |
017 Aluminium & copper extraction from scrap oil fired furnace (dry process only) ||| | | | | | | | |
Malated food ||| | | | | | | | | 21.2 Spent Solvent || B2 Total Petroleum Hydrocarbons(TPH)(C5-C36) |
018 Automobile servicing, repairing and painting (excluding only oil dispensing) ||| | | | | | | | |
Manufacture of Mirror from sheet glass and photoframing ||| | | | | | | | | 22.1 Spent Catalyst ||
C1 Flammable |
019 Ayurvedic and homeopathic medicine ||| | | | | | | | | Manufacture of steel trunks and suitcases ||| | | | | | | | |
|||| 22.2 Process residues || C2 Corrosive |
020 Brickfields (excluding fly ash brick manufacturing using lime process)||| | | | | | | | | Medical & Surgical Instruments ||| | | | | | | | | 23.1 Waste or residues(not made with vegetable or animal materials) || C3 Reactive or explosive |
021 Building and construction project more than 20,000 sq. m built up are ||| | | | | | | | | Metal ||| | | | | | | | |
|||| 23.2 Spent solvents || C4 Toxic |
022 Ceramics and Refractories ||| | | | | | | | | Milk processing and dairy products(integrated project) ||| | | | | | | | |
|||| 24.1 Chemical residues || C5 Substances or wastes liable to spontaneous combustion |

023 Coal Washeries ||||| Mineralised Water ||||| 25.1 Chemical residues |
| C6 Substances or Wastes which in contact with water emit flammable gases |
024 Dairy and dairy products (small scale) ||||| Minerals ||||| 25.2
Residues from wood alkali bath || C5 Oxidizing |
025 DG Set of capacity > 1 MVA but < 5 MVA ||||| Mining ||||| 26.1
Process waste sludge /residues containing acid, toxic metals , organic compounds || C8 Organic Peroxides
|
026 dry coal processing, mineral processing, industries involving ore sintering, pelletisating, grinding
& pulverization ||||| Musical Instruments manufacturing ||||| 26.2 Dust
from air filtration system || C9 Poisons(acute) |
027 Fementation industry including manufacture of yeast, beer, distillation of alcohol (Extra Neutral
Alcohol) ||||| Non-alcoholic beverages (soft drinks) ||||| 26.3 Spent
acid || C10 Infectious substances |
028 Ferrous and Non- ferrous metal extraction involving different furnances through melting , refining,
re-processing, casting and alloy-making ||||| NPK Fertilisers/Granulation |||||
|| 26.4 Spent solvent || C11 Liberation of toxic gases in contact with air or water |

|||||||

040 Industries engaged in recycling/ reprocessing/ recovery/ reuse of Hazardous waste under schedule iv of HW (M.H & TBM) rules, 2008- items namely-B148 Paint and ink sludges /residues |||||||||

Thermal Power Plants |||||||||

041 Industries engaged in recycling/ reprocessing/ recovery/ reuse of Hazardous waste under schedule iv of HW (M>H& TBM) rules, 2008- Items namely- Brass Dross, Copper Dross, Copper Oxide Mill Scale, Copper reverts, Cake & residues, Waste Waste Copper and copper alloys in dispersible form, Slags from copper processing for further processing or refining, Insulated Copper Wire, Scrap/Copper with PVC Sheathing including ISRI- code Material namely "Druid", jelly filled copper cables, Zinc Dross- Hot dip Galvanizers SLAB, Zinc Dross-Bottom Dross, Zinc ash/Skimming arising from galvanizing and die casting operations, Zinc ash/Skimming/other zinc bearing wastes arising from smelting and refining , Zinc ash and residues including zinc alloy residues in dispersible form ||||||||| Tobacco Products(Cigarettes & tobacco processing) |||||||||

061 Rolling mill (oil or coal fired) and cold rolling mill ||||||||| Tyres & Tubes (excluding vulcanisation/ Retreating/moulding) |||||||||

067 Thermocol manufacturing(with boiler) ||||||||| Tyres and Tubes vulcanisation, vulcanisation, retreading |||||||||

081 Industries enagagged in recycling / reprocessing / recovery/ reuse of Hazardous Waste under schedule iv of HW (M.H & TBM) rules, 2008- Items namely- Used Oil- As per specifications prescribed from time to time ||||||||| Vegetable oils including solvent extracted oils, hydrog. Oils |||||||||

|||||||

082 Industries engaged in recycling / reprocessing / recovery/ reuse of Hazardous Waste under schedule iv of HW(M.H& TBM) rules, 2008- Items namely- Waste Oil----As per specifications prescribed from time to time ||||||||| Wire Drawing (Cold Process) and bailing straps |||||||||

Resturant activity having over all waste water generated upto 10 KLD ||||||||| Yarn & Textile processing (Scouring, bleaching, dyeing, etc.) |||||||||

084 railway Stations (waste water Generation >= 10 KLD, but <100 KLD) ||||||||| Zinc Smelter ||

|||||||

085 Scrapping Centers (for End of Life if Vehicles and other scraps such as plant and machineries, structural materail, railway coaches and wagons etc.) a. Collection, De-Pollution, Dismantling Centers and Shredding Centres. B. Collection, De-Pollution , Dismantling Centers and Shredding Centre. C. Shredding Centres (Can include white goods*/other scrap Also) |||||||||

|||

086 Compressed /Refined Bio-Gas Production from Bio-degradables Wates |||||||||

|||||||

087 Dairy farms |||||||||

Assaying & hallmarking centers |||||||||

R61 Dead Animal incineration plant (Carcass disposal plant) |||||||||

||

R89 (i.e. Sterilization process by using Gamma Rays using CoBALT-60). |||||||||

|||||||

R61 Railway Stations (Water Water Generation >= 100 KLD) |||||||||

Pyrolysis oil from plastic waste |||||||||

Municipal corpotaion stp |||||||||

Restaurant activity having over all waste water generated more than 10KLD |||||||||

|||||||

R3 Industries engaged in recycling / reprocessing/ recovery/ reuse of Hazardous Waste under schedule iv of HW (m.H& TBM) rules, 2008- Items namely - Spent cleared metal catalyst containing copper, Spent cleared metal catalyst containing Zinc |||||||||

R10 Industries engaged in recycling / reprocessing / recovery / reuse of Hazardous Waste under schedule iv of HW (M, H & TBM) rules, 2008- Items namely -Spent catalyst containing nickel, cadmium, Zinc, Copper, arsenic, vanadium and cobalt, |||||||||

R15 Industries engaged in recycling / reprocessing / recovery / reuse of Hazardous Waste under schedule iv of HW (M, H & TBM) rules, 2008- Items namely - Dismantlers Recycling Plants-- Components of waste electrical and electronic assemblies comprising accumulators and other batteries included on list A, mercury-switches, actived glass cullets from cathode-ray tubes and other activated glass and PCB-Capacitors or any other component contaminated with Schedule 2 constituents (e.g. cadmium, mercury, lead, polychlorinated biphenyl) to an extent that they exhibit hazard characteristics indicated in part C of this Schedule |||||||||

R18 Pulp & Paper (waste paper based without bleaching process to manufacture Kraft paper) ||||||||

|||||||

R32 Industries engaged in recycling /reprocessing/recovery/reuse of Hazardous Waste under Schedule iv of HW (M, H & TBM) |||||||||

R33 Industries engaged in recycling / reprocessing/ recovery / reuse of Hazardous Waste under Schedule iv of HW (M, H & TBM) rules, 2008 -Items Namely -Integrated Recycling Plants--Components of waste electrical and electronic assemblies comprising accumulators and other batteries included on list A, mercury- switches, activated glass cullets from cathode-ray tubes and other activated glass and PCB-Capacitors, or any other component contaminated with Schedule 2 constituents(e.g, cadmium, mercury, lead, polychlorinated biphenyl) to an extent that they exhibit hazard characteristics indicated in part C of this Schedule. |||

R54 Pulp & Paper (waste paper based units with bleaching process to manufacture writing & printing paper) |||

R59 Pulp 7 Paper (Large-Agro + wood), Small Pulp & Paper (agro based-wheat straw/ rice husk) |||

R1 Isolated storage of hazardous chemicals (as per schedule of manufacturing , storage of hazardous chemicals rules, 1989 as amended) |||

R2 Automobile Manufacturing (Integrated facilities) |||

R4 Manufacturing of lubricating oils, grease and petroleum based Products |||

R5 DG Set of capacity> 5 MVA |||

R6 Industrial carbon including electrodes and graphite blocks, activated carbon, carbon black |||

R7 Lead acid battery manufacturing (excluding assembling and charging of lead- acid battery in micro scale) |||

R8 Phosphate rock processing plant |||

R9 Power generation plant [except Wind and solar renewable power plants of all capacities and Mini Hydel power plant of capacity <25MW] |||

R11 processes involving chlorinated hydrocarbons |||

R12 Sugar(excluding Khandsari) |||

R13 Fibre glass production and processing (excluding moulding) |||

R14 Fire Crackers manufacturing and bulk storage facilities |||

R16 Milk processes and dairy products(integrated project) |||

R17 Phosphorus and its compounds |||

R19 Coke making, liquefaction, coal tar distillation or fuel gas making |||

R20 Manufacturing of explosives, detonators, fuses including management and handling activities |||

R21 Manufacturing of paints varnishes, pigments and intermediate (excluding blending /mixing) |||

R22 Organic Chemicals manufacturing |||

R23 Airports and Commercial Air Strips |||

R24 Asbestos and asbestos based industries |||

R25 Basic chemicals and electro chemicals and its derivatives including manufacturing of acids |||

R26 Cement |||

R27 Chlorates, per-chlorates & peroxides |||

R28 Chlorine, fluorine, bromine, iodine and their compounds |||

R29 Dyes and Dye- Intermediates |||

R31 Hotels having overall waste-water generation @ 100 KLD and more |||

R34 Manufacturing of glue and gelatin |||

R35 Mining and ore beneficiation |||

R36 Nuclear power plant |||

R37 Pesticides (technical) (excluding formulation) |||

R38 Photographic film and its chemicals |||

R39 Railway locomotive workshop/ Integrated road transport workshop/ Authorized service centre |||

R40 Yarn/ Textile processing involving any effluent/ emission generating processes including bleaching, dyeing, printing and colouring |||

R41 Chlor Alkali |||

R42 Ship Breaking Industries |||

R43 Oil and gas extraction including CBM(offshore & on-shore extraction through drilling wells) |||

R44 Industry or process involving metal surface treatment or process such as pickling/ electroplating/paint stripping/heat treatment using cyanide bath/phosphating or finishing and anodizing / enamellings/ galvanizing |||

R45 Tanneries |||

R46 Ports and harbour, jetties and dredging operations |||

R47 Synthetic fibres including rayon, tyre cord, polyester filament yarn |||

R48 Thermal Power Plants |||

R49 Slaughter house (as per notification S.O.270 E dated (26.03.2001) and meat processing industries , bone mill , processing of animal horn, hoofs and other body parts |||

R50 Aluminium Smelter |||

R51 Copper Smelter |||

R52 Fertilizer(basic) (excluding formulation) |||

R53 Iron & Steel 9involving processing from ore/ integrated steel plants) and or Sponge Iron units |||

R55 Zinc Smelter |||

R56 Oil refinery (mineral Oil or Petro refineries) |||

R57 Petrochemicals Manufacturing (including Processing or Emulsions of oil and water) |||

R58 Pharmaceuticals |||

R60 Distillery(molasses/ grain / yeast based) |||

Other |||

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.2M Tri Sodium Citrate (MW = 258.06g/mol)
Weight of solute(g)=0.2×258.06=51.66g.
Preparation Method:
Weigh 51.66 g of Tri-sodium citrate and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.2M Tri Sodium Citrate (MW = 258.06g/mol).
Weight of solute(g)=0.2×258.06x _____L= _____gm
Weigh _____gm of Tri-sodium citrate and dissolve in water to make a _____ L solution.
Check and record the details:
Preparation Details:
Name of Reagent | Grade / Purity | Manufacturer / Supplier | Lot / Batch No | Storage Condition | Expiry Date
Tri Sodium Citrate | | | |
Final volume prepared | Weighed Quantity | pH (8.4±0.2) | Conductivity (35±0.5 ms/cm) | Storage Condition:

-----6M WIDE ROAD-----

Reagent Details:

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 2M.

Applying the formula to prepare the working buffer:

$C_1 V_1 = C_2 V_2$

C_1 = 17.5 M acetic acid.

V_1 = volume of stock needed to take.

C_2 = desired (working) concentration 2 M acetic acid.

V_2 = final total volume of working solution for one litre.

$V_1 = (C_2 \times V_2) / C_1$.

$C_2 = 2$ M; $V_2 = 1.0$ L; $C_1 = 17.5$ M

$V_1 = (2 \times 1.0) / 17.5$

$V_1 = 0.11$ L

Take 0.11 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V_1 = volume of stock needed to take _____ L.

C_2 = desired (working) concentration 2 M acetic acid.

V_2 = final total volume of working solution _____ L.

$V_1 = (C_2 \times V_2) / 17.5$.

$V_1 =$ _____ L.

Take V_1 _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Check and record the details:

Reagent Details:
Preparation of PF-RR-14 buffer :
Calculations: For the Preparation of 20mM Sodium Citrate pH 7.0 + 0.3 M Sodium Chloride.
Stock Buffer (PF-RR-12):40mM Sodium Citrate + 0.6M Sodium Chloride.
Formula:.
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.4M Sodium Citrate, pH 7.0.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 20mM Sodium Citrate, pH 7.0.
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$.
C2=0.02M ; V2= 1.0 L; C1=0.4M
 $V1 = (0.02 \times 1.0) / 0.4$
V1 = 0.05L
Take 0.05 L (PF-RR-12) Stock buffer solution .
Preparation of Stock buffer (PF-RR-12):
Take 0.05 L (PF-RR-12) Stock buffer solution and then make up the volume to 1 L with water.
Check and record the details:
Preparation Details:

Reagent Details:

Preparation of PF-RR-11 Stock buffer :

Calculations: For the Preparation of 40mM Sodium Citrate pH 7.0 + 0.32M Sodium Chloride.

Stock Buffer (PF-RR-09):0.4M Sodium Citrate pH 7.0.

Formula:

$$C1 \times V1 = C2 \times V2$$

C1 = concentration of stock

V1 = volume of stock you need to take

C2 = desired (working) concentration

V2 = final total volume of working solution

Applying the formula to prepare the working buffer:

$$C1 \times V1 = C2 \times V2$$

C1 = 0.4M Sodium Citrate pH 7.0 .

V1 = volume of stock you need to take _____ L.

C2 = desired (working) concentration 40mM Sodium Citrate, pH 7.0.

V2 = final total volume of working solution _____ L.

$$V1 = (C2 \times V2) / C1$$

$$C2 = 0.04M ; V2 = 1.0 L ; C1 = 0.4M$$

$$V1 = (0.04 \times 1.0) / 0.4$$

$$V1 = 0.1L$$

Take 0.1 L (PF-RR-09) Stock buffer solution and add 0.32M sodium Chloride.

Calculations: To prepare the 0.32M Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.32M Sodium Chloride (MW = 58.44 g/mol)

$$\text{Weight of solute(g)} = 0.32 \times 58.44 \times 1 = 18.7g.$$

Preparation Method:

Weigh 18.7 g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.32 M Sodium Chloride (MW = 58.44 g/mol).

$$\text{Weight of solute(g)} = 0.32 \times 58.44 \times \text{_____} L = \text{_____} g.$$

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Preparation of Stock buffer (PF-RR-11):

Take 0.1 L (PF-RR-09) Stock buffer solution and add 0.32 M sodium chloride. Dissolve it, and then make up the volume to 1 L with water.

Check and record the details:

CHROMATOGRAPHY -1F ,2F & 4F

TABLE OF CONTENTS

CHROMATOGRAPHY-1F 3

CHROMATOGRAPHY-2F 5

CONCENTRATION AND DIAFILTRATION OF CHROMATOGRAPHY-2F FT USING TFF SYSTEM.....8

DILUTION & pH ADJUSTMENT 11

EUGLOBULIN PRECIPITATION 11

SEPARATION OF PRECIPITATE 12

CHROMATOGRAPHY-4F.....12

CHROMATOGRAPHY-1F

Check the column connections to the chromatography system. Check for instrument air connection at 6 bars to the system. Open the software.

Record the following details for column:

Column height: 60 cm, Column Volume: 1.178 L

HETP value: _____, Asymmetry: _____.

Column wash

Wash the columns with 1 - 2 CVs of PW at a flow rate of 23.3ml/min till the conductivity has dropped below 1.0 mS/cm.

Record the volume of PW used: _____ L.

Column Equilibration

Equilibrate the columns with 2 CVs of PF-RR-04 (10% gradient of PF-RR-03 against PW) at a flow rate of 23.3ml/min.

Check and record the final pH: _____.

Conductivity: _____ mS/cm,

Volume of PF-RR-04 consumed: _____ L.

Loading & Elution

Before loading, switch on the 'Record On' button and enter the run details and date. Auto Zero the absorbance at 280 nm on the chromatography system.

Load the filtered plasma (250 ml) for first injection, and after loading is completed, pass PF-RR-04 (10% gradient of PF-RR-03 against PW) at a flow rate of 16.7 ml/min.

Collect fractions 1 & 2 at a flow rate of 16.7 ml/min, and for fraction 3 collection, increase the flow rate to 23.3ml/min (Column pressure should be ≤ 2.5 bar). Collect the three fractions separately.

Note: Fraction 1 should be further sent for FE processing and Fraction 2 for FG processing.

Repeat steps 1.5.2 and 1.5.3 for Inj. 2.

Repeat steps 1.5.2 and 1.5.3 for Inj. 3.

Repeat steps 1.5.2 and 1.5.3 for Inj. 4.

Record the details of four injections: Frac-1,2&3.

Regeneration

Regenerate the column with 2 CV of PF-RR-28 (25% gradient of PF-RR-27 against PW) in up flow direction at a flow rate of 23.3ml/min and hold the column for 30 – 60 minutes. Volume of PF-RR-28 used: _____ L.

Storage

Pass 2 CVs of PF-RR-30 through the column at a flow rate of 23.3ml/min and finally store the column in PF-RR-30 at room temp.

Volume of PF-RR-30 used: _____ L.

CHROMATOGRAPHY-2F

Check the column connections to the chromatography system. Check for instrument air connection at 6 bar to the system. Open the UNICORN software.

Record the following column details:

Column height: 20 cm, Column Volume: 0.393 L,

HETP value: _____, Asymmetry: _____.

Column Wash

Wash the column with upto 2 CVs of PW at a flow rate of 40 ml/min till the conductivity has dropped below 1.0 mS/cm.

pH Drop

Wash the column with upto 3 CVs of PF-RR-06 (25% gradient of PF-RR-35 against PW) to drop the pH to 4.50 (4.50 ± 0.50) at a flow rate of 40 ml/min.

Column Equilibration

Equilibrate the column with up to 8 CVs of PF-RR-10 (10% gradient of PF-RR-31 against PW) at a flow rate of 40 ml/min to reach a final pH of 7.00 (7.00 ± 0.20).

Sample preparation for loading

Take fraction 3 (pooled 4 injections) from Chromatography-1F (step 1.5.7) as a load for Chromatography-1 and record the following conditions:

If pH is not 7.00 ± 0.20 , then adjust the pH to 7.00 ± 0.20 with PF-RR-05 under stirring condition.

Record the following conditions:

ml of plasma loaded / ml of resin: _____. (Limit: ≤ 9.0 ml/ml)

Loading

Before loading, switch on the 'Record On' button and enter the run details and date. Auto Zero the absorbance at 280 nm on the chromatography system.

Load the sample at a flow rate of 33.3 ml/min.

Collect the flow through sample when the A280 rises from 100 mAU.

Wash I

After loading is completed, wash the column with up to 2 CVs of PF-RR-10 (10% gradient of PF-RR-31 against PW) at a flow rate of 33.3 ml/min and stop collecting the flow through when the A280 drops down to 100 mAU. Volume of PF-RR-10 used:

Wash II

After Wash I, pass 3.5 CVs of PF-RR-29 (50% gradient of PF-RR-11 against PW) at a flow rate of 33.3 ml/min and do not collect the peak as it contains most of the impurities.

Elution

After the A280 has reached the baseline, elute the sample by passing up to 3 CVs of PF-RR-14 (50% gradient of PF-RR-12 against PW) at a flow rate of 33.3 ml/min.

Note: Elution buffer (PF-RR-14) conductivity should be in the range of 33 ± 1.5 mS/cm.

Collect the eluate when the A280 rises from 100 mAU and collect the total peak until the A280 drops down to 100 mAU.

Check and record the following conditions of eluate sample:

Note: Send the eluate fraction for further purification of FN.

Cleaning

Clean the column by passing up to 2 CVs of PF-RR-13 (25% gradient of PF-RR-32 against PW) in upflow direction at a flow rate of 33.3 ml/min.

Regeneration

Regenerate the column by passing 2 CVs of PF-RR-28 (25% gradient of PF-RR-27 against PW) in up flow

direction at a flow rate of 33.3 ml/min and hold the column for 30 – 60 minutes.

Storage

Store the column (at room temp.) by passing 2 CVs of PF-RR-30 at a flow rate of 33.3 ml/min. Volume of PF-RR-30 used: _____ L.

Enter the process details as below:

CONCENTRATION AND DIAFILTRATION OF CHROMATOGRAPHY-2F FT USING TFF SYSTEM

Take the FT from Chromatography-2F step (Step 2.8.1).

Pre-NWP calculation

Record the following details of the TFF cassettes connected in series horizontally to the TFF system:

No. of cassettes used: _____, Cassette ID Nos.: _____,

Wash the cassettes with 10 L of PW to remove storage solution and calculate NWP before concentration at a set TMP of ≤ 1.0 bar.

Check and record the details as below:

Concentration of FT

After NWP calculation, wash the cassettes with 5 L of PF-RR-10 at ambient temperature to equilibrate the cassettes. Based on the initial volume, concentrate the sample to the batch volume at a set TMP of ≤ 1.0 bar and Pump Speed of 25 to 32%. Volume of PF-RR-10 used: Run : _____ L.

After collecting the retentate, flush the cassettes and system with 1.0 L of PF-RR-15 to collect the holdup volume and pool into the collected retentate. Volume of PF-RR-15 passed: Run : _____ L.

Check and record the following details:

Record the retentate details:

Diafiltration

Dia filter the concentrated sample from step 3.3 with PF-RR-15 to reach a final conductivity of permeate of 2000 – 2500 $\mu\text{S}/\text{cm}$.

Check and record the following details of the Dia filtered sample:

Cassette Regeneration

After the diafiltration step, wash the cassettes with 5 L of PF-RR-15 and then with 15 L of PW.

Volume of PF-RR-15 used: Run : _____ L, Flush the cassettes with 10 L of PF-RR-28 at 40 - 45°C and carry out recirculation for 30 min – 45 min.

After recirculation, wash the cassettes with 20 L of PW.

Post NWP calculation

Repeat the step from 3.2.2 and record the details below. Check if NWP is ≥ 120 LMH/Bar. If not, perform the regeneration procedure again.

Storage

Flush the cassettes with 10 L of PF-RR-30. After flushing, store the cassettes in PF-RR-30 at room temp.

Volume of PF-RR-30 used: _____ L.

DILUTION & pH ADJUSTMENT

Take the Dia filtered sample from step 3.4 and split it into two runs.

Make up the volume to _____ ml (run-wise) with PF-RR-15 under stirring conditions. Ensure that conductivity is NMT 1100 $\mu\text{S}/\text{cm}$.

Adjust the pH of the sample to 5.20 (run-wise) (Limit: 5.20 ± 0.10) with PF-RR-16 under stirring conditions.

Collect 20 ml of sample from Run and send to QC for in-process QC analysis. Record the obtained results:

pH: _____, Cond. (mS/cm): _____.

Record the details below:

EUGLOBULIN PRECIPITATION

Incubate the sample after pH adjustment in the sterilized 10 L glass bottle for 6 – 16 hrs. at 2 to 8°C under stirring conditions.

Check and record the following details after incubation:

SEPARATION OF PRECIPITATE

Take Euglobulin precipitate sample in a batch mode centrifuge bottle and spin at a speed of 10000 rpm.

Collect the supernatant into a sterilized bottle and pellet in a centrifuge bottle is discarded.

Check and record the following details:

CHROMATOGRAPHY-4I

Check the column connections to the chromatography system. Check for instrument air connection at 6 bar to the system. Open the UNICORN software.

Record the following column details:

Column height: 25 cm, Column Volume: 491 ml ,

HETP value: _____, Asymmetry: _____.

Column Wash

Wash the column with upto 2 CVs of PW at a flow rate of 36.7ml/min till the conductivity has dropped below 1.0 mS/cm. Record the following details:

pH drop

Wash the column with upto 2 CVs of PF-RR-36 (10% gradient of PF-RR-18 against PW) to drop the pH to 4.25 ± 0.25 at a flow rate of 36.7ml/min. Record the following details:

Column Equilibration

Equilibrate the column with upto 4 CVs of PF-RR-22(10% gradient of PF-RR-21 against PW) at a flow rate of 36.7ml/min, to reach a final pH of 5.20 (5.20 ± 0.10).

After equilibration, check and record the details below:

Sample preparation for loading

Take the supernatant sample from step 6.2 (run-wise) after Euglobulin precipitate separation step and divide it into two runs.

Adjust the conductivity of the sample (run-wise) to 1.4 ± 0.1 mS/cm with PF-RR-17.

Check and record the following conditions:

ml of plasma loaded/ml of resin: _____. (Limit: ≤ 1.12 ml/ml).

Loading

Before loading, switch on the 'Record On' button and enter the run details and date. Auto Zero the absorbance at 280 nm on the chromatography system.

Load the sample at a flow rate of 36.7ml/min.

Start collecting the flow through sample when the A280 rises from 100 mAU.

Wash-I

After loading is completed, wash the column with up to 2 CVs of PF-RR-22 (10% gradient of PF-RR-21 against PW) at a flow rate of 36.7ml/min; and collect the flow through till the A280 drops down to 100 mAU.

Check and record the details as below:

Elution

After the A280 has reached the baseline, pass up to 3 CVs of PF-RR-24 (12.5% gradient of PF-RR-23 against PW) at a flow rate of 36.7ml/min. Record the details:

Collect the eluate when the A280 rises from 200 mAU and collect the total peak until the A280 drops down to 200 mAU.

Check and record the following conditions:

Cleaning
Clean the column by passing 2 CVs of PF-RR-26 (25% gradient of PF-RR-25 against PW) in up-flow direction at a flow rate of 36.7ml/min.

Regeneration
Regenerate the column by passing 2 CVs of PF-RR-28 (25% gradient of PF-RR-27 against PW) in up flow direction at a flow rate of 36.7ml/min.

Repeat the steps 7.3 to 7.11 for Run 2. Record the results as above.

Storage
Store the column by passing 2 CVs of PF-RR-30 at a flow rate of 36.7ml/min. Volume of PF-RR-30 used: _____ L.

Pool Flow Through sample after completion of 2 runs for further processing of IG.

Final Volume of Flow Through: _____ L.

Start sending the Eluate sample after completion of 1runs for further processing of AL. Final Volume of Eluate: _____ L.

Reagent Details:

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 0.2M.

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 0.2 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ x V₂)/C₁.

C₂=0.2 M; V₂= 1.0 L; C₁=17.5 M

V₁ = (0.2 x 1.0)/17,5

V₁ = 0.011 L

Take 0.011 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 0.2 M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ _____ x V₂ _____) /17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Check and record the details:

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.1M Citric Acid (MW = 192.12g/mol)
Weight of solute(g)=1×19.212=19.212g.
Preparation Method:
Weigh 19.212 g of Citric acid and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.1M Citric acid (MW = 192.12g/mol).
Weight of solute(g)=1×19.212 _____ L= _____ gm
Weigh _____ gm of Citric acid and dissolve in water to make a _____ L solution.
Check and record the details:

TITLE- CONCEPTUAL LAYOUT-GF REVISION R0
SCALE 1:1

SIZE A0 DWG.NO 01

Reagent Details:
Preparation of AL-RR-06 working buffer from Stock buffer (AL-RR-05):
Calculations: For the Preparation of 50mM Sodium acetate pH 4.5.
Stock Buffer (AL-RR-05):0.4M Sodium acetate, pH 4.6.
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.4M Sodium Acetate pH 4.6.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 50mM Sodium Acetate pH 4.5
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$.
C2=0.05M ; V2= 1.0 L; C1=0.4M
 $V1 = (0.05 \times 1.0) / 0.4$
V1 = 0.125L
Take 0.125 L (AL-RR-05) Stock buffer solution, dilute with water, and make up to 1 L.
Check and record the details:
Preparation Details:
Name of Reagent | Grade / Purity | Manufacturer / Supplier | Lot / Batch No | Storage Condition | Expiry
Date
Sodium Acetate | | | |
Acetic Acid | | | |
Stock buffer (AL-RR-05) taken volume(L) | pH
(4.5±0.1) | Conductivity (2.0±0.2ms/cm) | Storage Condition | Final volume prepared

Reagent Details:
Preparation of PF-RR-06 working buffer from Stock buffer (PF-RR-05):
Calculations: For the Preparation of 50mM Citric Acid.
Stock Buffer taken from (PF-RR-05):1.0 M Citric Acid.
Dilution Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = Concentration of Stock Citric Acid.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 50mM Citric Acid.
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
C2=0.05M ; V2= 1.0 L; C1=1.0M
 $V1 = (0.05 \times 1.0) / 1.0$
V1 = 0.05L
Take 0.05 L (PF-RR-05) Stock buffer solution and dilute with water, and make up to 1L.
Check and record the details:
Preparation Details:
Name of Reagent | Grade / Purity | Manufacturer / Supplier | Lot / Batch No | Storage Condition | Expiry

[D726] Budhish-20260806T040948Z-1-001(1)/Budhish/Lifenity/Buffer Annexure/PF Annexure/Annexure-003 PF-RR-03 preparation of buffer solution.

Reagent Details:

Formula:

Sodium Citrate (M.Wt): 258.07.

Citric acid (M.Wt): 192.124

Sodium Chloride (M.Wt): 58.44

Calcium Chloride (M.Wt): 110.98

Preparation of PF-RR-03 stock buffer:

Preparation of 0.2M Sodium Citrate pH 7.0 + 1.2M Sodium Chloride + 26mM Calcium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.2M Citric Acid (MW = 192.124 g/mol)

Weight of solute(g)=0.2×192.124×1=38.424g.

Preparation Method:

Weigh 38.424g of Citric Acid and dissolve in water to make a 1 L solution.

Preparation for differential volumes:

To prepare _____ of 0.2M Citric Acid (MW = 38.424g/mol).

Weight of solute(g)=0.2×38.424 x _____ L= _____g.

Weigh _____ gm of Citric Acid and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.2M Tris Sodium Citrate.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.2M Tris Sodium Citrate (MW = 258.07 g/mol)

Weight of solute(g)=0.2×258.07 x1=51.614g

Preparation Method:

Weigh 51.614g of Tris Sodium Citrate and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 0.2M Tris Sodium Citrate (MW = 258.07 g/mol).

Weight of solute(g)=0.2×258.07x _____ L= _____g.

Weigh _____ gm of Tris Sodium Citrate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 1.2M Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 1.2M Sodium Chloride (MW = 58.44 g/mol)

Weight of solute(g)=1.2×58.44x1=70.128g.

Preparation Method:

Weigh 70.128g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 1.2M Sodium Chloride (MW = 58.44 g/mol).

Weight of solute(g)=1.2×58.44 x _____ L= _____g.

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Calculations: To prepare the 26mM Calcium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 26 mM Calcium Chloride (MW = 110.98g/mol)

Weight of solute(g)=0.026×110.98 x1=2.88g.

Preparation Method:

Weigh 2.88g of Calcium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.026mM Calcium Chloride (MW =110.98 g/mol).

Weight of solute(g)=0.026 x110.98x _____ L= _____g.

Weigh _____ gm of Calcium Chloride and dissolve in water to make a _____ L solution.

Procedure for Preparation of PF-RR-03 stock

To prepare a pH 7.0 solution, 0.2 M Tris Sodium Citrate solution is titrated with 0.2 M citric acid so that the pH attains pH 7.0 ±0.1.

For Example, to prepare a 1 L solution, take 0.2 M Tri Sodium Citrate and adjust the pH with the 0.2 M Citric acid to pH 7.0. To this, add the 1.2 M sodium chloride and dissolve it and make up the volume with water to 900ml, and then to this add 0.026 M Calcium chloride, then mix the solution till the salt dissolves and check the pH; if the pH is less than 7.0 then adjust the pH with 1 M sodium hydroxide to get the pH 7.0 ±0.1 and make up the final volume to 1L.

Check and record the details:

Preparation Details:

Name of Reagent | Grade / Purity | Manufacturer / Supplier | Lot / Batch No | Storage Condition | Expiry Date

Sodium Citrate | | | |

Sodium Chloride | | | |

Calcium Chloride | | | |

Final volume prepared | pH (7.0 ± 0.1) | Conductivity (130 to 150 ms/cm) | Storage Condition | Reagent

||||| Back to Index

[SHEET: DG Set]

Sr.No. | Parameter | Description / Specification |

- 1 | Make / Model | Cummins / Kirloskar / Mahindra (example – confirm at procurement) | Back to Index
- 2 | Type | Silent Type, Auto-start, Water-cooled, Turbocharged Diesel Generator |
- 3 | Rating / Capacity | 2 × 1300 kVA each (standby operation, load sharing optional) |
- 4 | Fuel Used | High-Speed Diesel (HSD) – BS-VI grade, low sulphur (<0.05%) |
- 5 | Rated Power Output | ~400 kW per DG set (0.8 PF) |
- 6 | Total Installed Capacity | 2,600 kVA (2 sets × 1300 kVA) |
- 7 | Operating Hours / Year | ~800–1,000 hours per year (emergency + load testing only) |
- 8 | Fuel Consumption | ~55–60 L/hour @ full load |
- 9 | Estimated Annual HSD Consumption | ≈ 27,000 L / year (≈ 27 KL / year) |
- 10 | Storage Capacity (HSD Tank) | 10 KL aboveground double-walled MS tank with vent, dyke, and spill tray as per PESO norms |
- 11 | Cooling System | Water-cooled, with radiator and jacket water heater |
- 12 | Lube Oil System | Forced lubrication; oil drain point connected to collection tray |
- 13 | Starting System | 24V battery start with automatic mains failure (AMF) panel |
- 14 | Exhaust System | Silencer with flexible coupling; insulated exhaust manifold |
- 15 | Emission Parameters (at rated load) | • PM ≤ 0.3 g/kWh • NO_x + HC ≤ 7.5 g/kWh • CO ≤ 3.5 g/kWh (As per CPCB II norms) |
- 16 | Stack Details | Mild steel stack with flanged joints; height as per CPCB formula: $H = h + 0.2\sqrt{KVA} = 3 + 0.2\sqrt{1300} \approx 10.2$ m above roof level per set | 36.05551275463989
- 17 | Stack Quantity | 2 Nos (individual stack for each DG set) | 7.211102550927979
- 18 | Noise Level at 1 m distance | ≤ 75 dB(A) – within CPCB norm | 10.21110255092798
- 19 | Noise Control Measures | • Acoustic Enclosure (≤ 75 dB(A)) • Vibration isolators under skid base • Greenbelt & acoustic barriers along DG yard boundary |
- 20 | Location | Utility block (away from production & office area) |
- 21 | Ventilation System | Forced air intake & exhaust with acoustic louvers |
- 22 | Emission Control | • Stack emission monitoring (PM, NO_x, SO_x) – quarterly • Use of low-sulphur HSD |
- 23 | Lube Oil Handling | Drained to closed HDPE drum; sent to authorized recycler (HW 5.1) |
- 24 | Spill Control | Impervious floor, containment dyke, absorbent pads available |
- 25 | Safety & Fire Protection | Fire extinguishers (CO₂ + dry chemical) at DG yard; earthing pit per IS 3043 |
- 26 | Authority Approval | DG sets to comply with CPCB-II emission & noise certification; HSD tank under PESO license |

Sr.No. | Parameter | Standard / Limit | Plant DG Result / Provision

- 1 | Emissions (CPCB-II) | PM ≤ 0.3 g/kWh NO_x+HC ≤ 7.5 g/kWh CO ≤ 3.5 g/kWh | Cummins CPCB-II compliant engines
 - 2 | Stack Height | $H = h + 0.2\sqrt{KVA}$ | 6.5 m above roof per set
 - 3 | Noise | ≤ 75 dB(A) at 1 m | Acoustic enclosure fitted
 - 4 | Fuel Type | Low-sulphur HSD | BS-VI HSD used
 - 5 | Used Oil Disposal | To authorized recycler | As per HW Rule 5.1
 - 6 | DG Area Containment | Impervious floor + bund | Provided
- | Back to Index | |

[SHEET: Pol control meas]

Sr.No. | Type | Source | Pollutants Likely | Control Measures / Equipment | Remarks | |

- 1 | AIR POLLUTION | a. DG Set (2 × 500 kVA, standby) | PM, SO_x, NO_x, CO (from diesel combustion) | • Acoustic enclosure to control noise • Adequate stack height as per CPCB formula ($H = h + 0.2\sqrt{KVA}$) ~6.5 m above roof • Low-sulphur HSD (<0.05%) fuel • Regular maintenance & emission monitoring | Operates only during power outage | | Back to Index
- 2 | AIR POLLUTION | b. PNG / CNG-fired Boiler (500 kg steam/hr) | NO_x, trace CO | • Use of low-NO_x burner • Stack height 12 m above roof • Online temperature & pressure monitoring • Periodic stack emission testing | PNG is clean fuel, minimal SO_x | |
- 3 | AIR POLLUTION | c. HVAC systems / AHUs | Dust, microbial aerosols | • HEPA filters (0.3 μm) at terminal outlets • Pre-filters (10 μm) at return air • Periodic filter replacement as per SOP | Ensures cleanroom Class 10,000–100,000 compliance | |
- 4 | AIR POLLUTION | d. Solvent & detergent handling (TnBP, Triton X-100) | VOC vapours | • Closed mixing vessels, nitrogen blanketing • Solvent vapor condenser + activated-carbon adsorption unit • Explosion-proof zone classification (ATEX) | Emission < 50 mg/Nm³ VOC ensured | |
- 5 | AIR POLLUTION | e. Laboratory fume hoods / exhausts | Trace acidic or organic vapours | • Fume hoods with local scrubbers or HEPA filters • Ducted exhaust at safe height | Minimal emissions, intermittent source | |

Sr.No. | Type | Source | Type of Wastewater | Pollutants Likely | Treatment / Control Equipment | |

- 1 | WATER POLLUTION | a. Process & WFI drains | Process effluent containing protein residues, buffers, mild solvents, detergents | pH 6–8, COD 1,000–2,000 mg/L, BOD 400–800 mg/L, low TDS | Effluent Treatment

Plant (ETP): • Collection & equalization tank (15 m³) • pH correction & neutralization tank • Primary clarifier • Biological MBR / MBBR reactor • Tertiary filtration (UF + RO) • RO permeate reused for gardening / utilities • RO reject → MEE + ATFD | |

2 | WATER POLLUTION | b. Solvent-detergent streams (TnBP phase) | High COD, solvent traces | Trace VOCs, COD > 10,000 mg/L | Dedicated solvent holding tank → evaporation or incineration via TSDF | |

3 | WATER POLLUTION | c. Domestic sewage (staff 506) | Black / grey water | BOD ~250 mg/L | STP (40 m³/day): MBBR + UF + chlorination | |

4 | WATER POLLUTION | d. Cooling tower blow-down, softener reject | High TDS, hardness | TDS 2,000–3,000 mg/L | Collected in neutralization tank → mixed with RO reject → MEE | |

Sr.No. | Type | Source | Type of Waste | Category | Control / Disposal Method | |

1 | SOLID / HAZARDOUS WASTE POLLUTION | Process residues, filter aids, spent carbon, ETP sludge | Solid / semi-solid | HW 28.2 / 35.3 | Sent to Authorized TSDF (CHWTSDF) for landfill/incineration | |

2 | SOLID / HAZARDOUS WASTE POLLUTION | Spent solvent mix (TnBP + detergent) | Liquid | HW 28.1 | Sent to Solvent recovery or TSDF | |

3 | SOLID / HAZARDOUS WASTE POLLUTION | Used oil from DG set | Liquid | HW 5.1 | Sold to MPCB-authorized recycler | |

4 | SOLID / HAZARDOUS WASTE POLLUTION | Biomedical waste (lab disposables, plasma bags) | Bio-infectious | BMW Cat. 4 / 5 | Sent to Authorized CBWTF | |

5 | SOLID / HAZARDOUS WASTE POLLUTION | Non-hazardous recyclable waste | Paper, plastic, metal, glass | Non-hazardous | Segregation → authorized recyclers | |

6 | SOLID / HAZARDOUS WASTE POLLUTION | Organic waste (canteen, sludge) | Biodegradable | Non-hazardous | Composting / manure | |

Sr.No. | Type | Source | Noise Level (dB-A) | Control Measures | | |

1 | NOISE POLLUTION | DG sets | 75–80 | Acoustic enclosure, antivibration mounts, green belt | | |

2 | NOISE POLLUTION | Compressors, pumps, blowers | 70–75 | Foundation damping pads, acoustic barrier | | |

3 | NOISE POLLUTION | HVAC & AHU | 60–65 | Acoustic lining, flexible connectors | | |

4 | NOISE POLLUTION | General utilities | < 55 | Periodic maintenance, ear protection for workers | | |

Sr.No. | Type | Equipment / Facility | Capacity / Function | Purpose | | |

1 | SOLID WASTE MANAGEMENT | ETP | 70 m³/day (MBBR + UF + RO + MEE) | Treat & recycle process effluent | | |

2 | SOLID WASTE MANAGEMENT | STP | 40 m³/day (MBBR + UF) | Treat domestic sewage | | |

3 | SOLID WASTE MANAGEMENT | Air pollution stacks | Boiler – 12 m; DG – 6.5 m above roof | Emission dispersion | | |

4 | SOLID WASTE MANAGEMENT | Activated carbon filter | 1 × 500 kg | VOC adsorption from S-D exhaust | | |

5 | SOLID WASTE MANAGEMENT | Scrubber (if acid used) | 1 × 3,000 m³/hr | Fume removal from buffer prep / lab exhaust | | |

6 | SOLID WASTE MANAGEMENT | Noise enclosure | DG & compressors | Noise reduction | | |

7 | SOLID WASTE MANAGEMENT | Greenbelt | ≥ 33 % of plot | Dust, noise & micro-climate control | | |

| Back to Index | | | | |

[SHEET: Heat treat_Reaction_Tank]
Sr.No. | Vessel | Working vol (L) | No. of units recommended
1 | Plasma pooling tank (refrigerated) | 2000 | 1 primary + 1 standby (or reserve)
2 | Caprylic acid reaction tank (jacketed) | 2000 | 1 (or 2 for staggered batches)
3 | S-D mixing tank (jacketed, sealed) | 2000 | 1 (with dedicated solvent bund)
4 | Clarification / settling tank or DAF feed | 2500 | 1
5 | Pasteurizer (container) | capacity to hold per-batch vials (900) | 1 tunnel / basket line sized to throughput
6 | Buffer / formulation tanks (jacketed) | 500–1,500 | 2–3 (for different buffers)
7 | Waste / solvent hold tank (bunded) | 1,000–2,000 | 1
| Back to Index | |
[SHEET: Fuel Consmpt]
Sr. No. | Fuel Type | Purpose / Area of Use | Approx. Annual Consumption | Unit
1 | Electricity | Cleanroom HVAC, process equipment (centrifuges, lyophilizers, pumps, lighting, DG auxiliaries, WFI generation, chillers, lab & office) | 3.5 – 4.0 million kWh / year | kWh
2 | HSD (High-Speed Diesel) | Stand-by DG sets (2 × 500 kVA) for emergency power | ≈ 25 – 30 KL / year | KL (≈ 25,000 – 30,000 L)**
3 | CNG / PNG | Boiler / hot-water generation for WFI plant, sterilization steam, HVAC re-heat coils | ≈ 150,000 – 180,000 Sm³ / year | Standard m³ (Sm³)
4 | LPG (optional small cylinders) | Laboratory instruments / flame sterilizers | ≤ 500 kg / year | kg
| Back to Index | | |
[SHEET: Water]
Sr.No. | Item | Litres (L / year) | Cubic metres (m³ / year) | Notes
| A. Water Inputs | | |
1 | Domestic water (506 ppl × 100 L/p/d) | 18469000 | 18469 | Toilets, canteen, housekeeping
| WFI (process) | 6205470 | 6205.47 | WFI for formulation, CIP, rinses
| Other process water (25% of WFI) | 1551368 | 1551.37 | CIP makeup, utility washes
| Extra process water (10% of plasma vol) | 41400 | 41.4 | Misc. process losses, small uses
2 | Process Water | 7798238 | 7798.24 |
| Total Water Input | 34065476 | 34065.48 | A = sum of above
| B. Water Outputs / Wastewater | | |
1 | Domestic sewage → STP (80% of domestic) | 14775200 | 14775.2 | Black/gray water to STP
2 | Process wastewater → ETP (99% of process) | 15440511.24 | 15440.51124 | Process drains, WFI rejects, CIP effluent
| Total Wastewater Generated | 30215711.240000002 | 30215.71124 | B = sum of above
| C. Balance / Losses / Product incorporation | | |
1 | Unaccounted losses / product incorporation / evaporation (A – B) | 3849764.759999998 | 3849.7687600000027 | ~11.3% of input — includes water in products, steam losses, sampling, evaporation, bleed, equipment hold-up

Reagent Details:

Preparation of PF-RR-12 Stock buffer :

Calculations: For the Preparation of 40mM Sodium Citrate pH 7.0 + 0.6M Sodium Chloride.

Stock Buffer (PF-RR-09):0.4M Sodium Citrate pH 7.0.

Formula:

$$C1 \times V1 = C2 \times V2$$

C1 = concentration of stock

V1 = volume of stock you need to take

C2 = desired (working) concentration

V2 = final total volume of working solution

Applying the formula to prepare the working buffer:

$$C1 \times V1 = C2 \times V2$$

C1 = 0.4M Sodium Citrate, pH 7.0.

V1 = volume of stock you need to take _____ L.

C2 = desired (working) concentration 40mM Sodium Citrate, pH 7.0.

V2 = final total volume of working solution _____ L.

$$V1 = (C2 \times V2) / C1$$

$$C2 = 0.04M ; V2 = 1.0 L ; C1 = 0.4M$$

$$V1 = (0.04 \times 1.0) / 0.4$$

$$V1 = 0.1L$$

Take 0.1 L (PF-RR-09) Stock buffer solution and add 0.6M sodium Chloride.

Calculations: To prepare the 0.6M Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.6M Sodium Chloride (MW = 58.44 g/mol)

$$\text{Weight of solute(g)} = 0.6 \times 58.44 \times 1 = 35.06 \text{ g.}$$

Preparation Method:

Weigh 35.06 g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.6 M Sodium Chloride (MW = 58.44 g/mol).

$$\text{Weight of solute(g)} = 0.6 \times 58.44 \times \text{_____ L} = \text{_____ g.}$$

Weight _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Preparation of Stock buffer (PF-RR-12):

Take 0.1 L (PF-RR-09) Stock buffer solution and add 0.6M sodium Chloride and dissolve it, and make up the volume with water to one litre.

Check and record the details:

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.2M Citric Acid (MW = 192.124 g/mol)
Weight of solute(g)=0.2×192.124x1=38.424g.
Preparation Method:
Weigh 38.424g of Citric Acid and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ volume of 0.2M Citric Acid (MW = 192.124g/mol).
Weight of solute(g)=0.2×192.124 x _____ L= _____ g.
Weigh _____ gm of Citric Acid and dissolve in water to make a _____ L solution.
Check and record the details:

Reagent Details:
Preparation of IG-RR-08 working buffer from Stock buffer (IG-RR-07):
Calculations: For the Preparation of 25mM Sodium acetate pH 5.2 +1.0M Sodium Chloride.
Stock Buffer (PF-RR-07):0.1M Sodium acetate, pH 5.35 + 4.0 M Sodium Chloride.
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.1M Sodium Acetate pH 5.35.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 25mM Sodium Acetate pH 5.2
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
 $C2 = 0.025M$; $V2 = 1.0\text{ L}$; $C1 = 0.1M$
 $V1 = (0.025 \times 1.0) / 0.1$
 $V1 = 0.25L$
Take 0.25 L (PF-RR-07) Stock buffer solution and dilute it with water to make up a final volume of 1 L.
Check and record the details:
Preparation Details:

Reagent Details:
Preparation of PF-RR-035 working buffer from Stock buffer (PF-RR-05):
Calculations: For the Preparation of 0.2M Citric Acid.
Stock Buffer taken from (PF-RR-05):1.0 M Citric Acid.
Dilution Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = Concentration of Stock Citric Acid.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 0.2M Citric Acid.
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
C2=0.2M ; V2= 1.0 L; C1=1.0M
 $V1 = (0.2 \times 1.0) / 1.0$
V1 = 0.2L
Take 0.2 L (PF-RR-05) Stock buffer solution and dilute with water, and make up to 1L.
Check and record the details:

Reagent Details:
Preparation of PF-RR-29 working buffer from Stock buffer (PF-RR-11):
Calculations: For the Preparation of 20mM Sodium Citrate pH 7.0 + 0.16M Sodium Chloride.
Stock Buffer (PF-RR-11):0.04M Sodium Citrate pH 7.0 + 0.32M Sodium Chloride
Formula:.
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.04M Sodium Citrate pH 7.0 + 0.32M Sodium Chloride.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 20mM Sodium Citrate, pH 7.0 + 0.16M Sodium Chloride.
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$.
C2=0.02M ; V2= 1.0 L; C1=0.04M
 $V1 = (0.02 \times 1.0) / 0.04$
V1 = 0.5L
Take 0.5 L (PF-RR-11) Stock buffer solution and dilute with water, and make up to 1L.
Check and record the details:

Reagent Details:

Formula:

Sodium Acetate(M.Wt): 82.03g/mol.

Acetic Acid (M.Wt): 60.05g/ mol

Preparation of 1.0 M Sodium Acetate pH 5.2 buffer

Formula:

Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol)×Volume (L).

Calculation: To prepare 1 L of 1.0 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=1.0×82.03× 1.0=82.03g.

Preparation Method:

Weigh 82.03g of Sodium Acetate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 1.0 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=1.0×82.03× _____ L= _____ g.

Weigh _____ gm of Sodium Acetate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 1.0 M Acetic Acid.

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 1.0 M.

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 1.0 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ × V₂)/C₁.

C₂=1.0 M ; V₂= 1.0 L; C₁=17.5 M

V₁ = (1.0 × 1.0)/17.5

V₁ = 0.057 L

Take 0.057 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 1.0 M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ _____ × V₂ _____) /17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Procedure for Preparation of 1.0 M Sodium Acetate pH 5.2.

To prepare a pH 5.2 solution, 1.0 M Sodium Acetate solution is titrated with 1.0 M Acetic acid so that the pH attains pH 5.2.

Preparation Details:

Reagent Details:
Preparation of PF-RR-24 working buffer from Stock buffer (PF-RR-23):
Calculations: For the Preparation of 50mM Sodium acetate pH 4.5.
Stock Buffer (PF-RR-23):0.4M Sodium acetate, pH 4.6.
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.4M Sodium Acetate pH 4.6.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 50mM Sodium Acetate pH 4.5
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$.
C2=0.05M ; V2= 1.0 L; C1=0.4M
 $V1 = (0.05 \times 1.0) / 0.4$
V1 = 0.125L
Take 0.125 L (PF-RR-23) Stock buffer solution and dilute with water, and make up to 1L.

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.4M Sodium Acetate (MW = 80.03 g/mol)
Weight of solute(g)=0.4×80.03 = 32.01g.
Preparation Method:
Weigh 32.01g of Sodium Acetate and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.4M Sodium Acetate (MW = 80.03 g/mol).
Weight of solute(g)=0.4×80.03 x _____L= _____gm
Weigh _____gm of Sodium Acetate and dissolve in water to make a _____ L solution.
Check and record the details:
Preparation Details:

Reagent Details:

Formula:

Sodium Acetate(M.Wt): 82.03g/mol.

Acetic Acid (M.Wt): 60.05g/ mol

Preparation of 0.2 M Sodium Acetate pH 4.2 buffer

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol)

×Volume (L).

Calculation: To prepare 1 L of 0.2 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.2×82.03× 1.0=16.406 g.

Preparation Method:

Weigh 16.406 g of Sodium Acetate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.2 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.2×82.03× _____ L= _____ g.

Weigh _____ gm of Sodium Acetate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.2 M Acetic Acid.

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 0.2 M.

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 0.2 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ × V₂)/C₁.

C₂=0.2 M ; V₂= 1.0 L; C₁=17.5 M

V₁ = (0.2 × 1.0)/17.5

V₁ = 0.011 L

Take 0.011 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 0.2M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ _____ × V₂ _____) /17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Procedure for Preparation of 0.2 M Sodium Acetate pH 4.2.

To prepare a pH 4.2 solution, 0.2 M Sodium Acetate solution is titrated with 0.2 M Acetic acid so that the pH attains pH 4.2.

Preparation Details:

Name of Reagent | Grade / Purity | Manufacturer / Supplier | Lot / Batch No | Storage Condition | Expiry Date

Reagent Details:
Preparation of PF-RR-10 working buffer from Stock buffer (PF-RR-31):
Calculations: For the Preparation of 20mM Sodium Citrate pH 7.0 + 0.06M Sodium Chloride.
Stock Buffer (PF-RR-31):0.2M Sodium Citrate pH 7.0 + 0.6M Sodium Chloride
Formula:.
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.2M Sodium Citrate pH 7.0 + 0.6M Sodium Chloride.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 20mM Sodium Citrate, pH 7.0 + 0.06M Sodium Chloride.
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$.
C2=0.02M ; V2= 1.0 L; C1=0.2M
 $V1 = (0.02 \times 1.0) / 0.2$
V1 = 0.1L
Take 0.1 L (PF-RR-31) Stock buffer solution and dilute with water, and make up to 1L.
Check and record the details:

TITLE- CONCEPTUAL LAYOUT-GF REVISION R0
SCALE 1:1

SIZE A0 DWG.NO 01

Reagent Details:

Preparation of PF-RR-31 Stock buffer :

Calculations: For the Preparation of 0.2M Sodium Citrate pH 7.0 + 0.6M Sodium Chloride.

Stock Buffer (PF-RR-09):0.4M Sodium Citrate pH 7.0.

Formula:

$$C1 \times V1 = C2 \times V2$$

C1 = concentration of stock

V1 = volume of stock you need to take

C2 = desired (working) concentration

V2 = final total volume of working solution

Applying the formula to prepare the working buffer:

$$C1 \times V1 = C2 \times V2$$

C1 = 0.4M Sodium Citrate pH 7.0 .

V1 = volume of stock you need to take _____ L.

C2 = desired (working) concentration 0.2M Sodium Citrate, pH 7.0.

V2 = final total volume of working solution _____ L.

$$V1 = (C2 \times V2) / C1$$

C2=0.2M; V2= 1.0 L; C1=0.4M

$$V1 = (0.2 \times 1.0) / 0.4$$

$$V1 = 0.5L$$

Take 0.5 L (PF-RR-09) Stock buffer solution and add 0.6M sodium Chloride.

Calculations: To prepare the 0.6M Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.6M Sodium Chloride (MW = 58.44 g/mol)

$$\text{Weight of solute(g)} = 0.6 \times 58.44 \times 1 = 35.06g$$

Preparation Method:

Weigh 35.06 g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 0.6 M Sodium Chloride (MW = 58.44 g/mol).

$$\text{Weight of solute(g)} = 0.6 \times 58.44 \times \text{_____ L} = \text{_____ g}$$

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Preparation of Stock buffer (PF-RR-31):

Take 0.5 L (PF-RR-09) Stock buffer solution and add 0.6 M sodium chloride. Dissolve it, and then make up the volume to 1 L with water.

Check and record the details:

Preparation Details:

Reagent Details:
Formula & Calculations:
Formula: Use the formula to calculate the molarity:
 $Molarity (M) = (Per\ cent\ by\ Weight / 100) * (Density\ in\ g/mL) * 1000 / Molar\ Mass.$
Example: Molarity of Glacial Acetic Acid
Molar Mass of CH_3COOH : ~60.05 g/mol
Density: ~1.05 g/mL
Purity: 100%
Acetic Acid (MW = 60.05 g/mol).
Calculation:
 $Molarity = (100 / 100) * 1.05\ g/mL * 1000\ mL/L / 60.05\ g/mol \approx 17.5\ M.$
Calculation: To prepare 1 L of 0.4 M.
Applying the formula to prepare the working buffer:
 $C1 \cdot V1 = C2 \cdot V2$
 $C1 = 17.5\ M$ acetic acid.
 $V1$ = volume of stock needed to take.
 $C2$ = desired (working) concentration 0.4 M acetic acid.
 $V2$ = final total volume of working solution for one liter.
 $V1 = (C2 \times V2) / C1.$
 $C2=0.4\ M; V2= 1.0\ L; C1=17.5\ M$
 $V1 = (0.4 \times 1.0) / 17.5$
 $V1 = 0.0228\ L$
Take 0.0228 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.
To prepare various volumes:
 $V1$ = volume of stock needed to take _____ L.
 $C2$ = desired (working) concentration 0.4M acetic acid.
 $V2$ = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / 17.5.$
 $V1=$ _____ L.
Take $V1$ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.
Check and record the details:

Reagent Details:
Preparation of IG-RR-17 working buffer from Stock buffer (IG-RR-16):
Calculations: For the Preparation of 0.2M Glycine pH 7.0.
Stock Buffer (IG-RR-16):0.8M Glycine pH 7.0.
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.8M Glycine pH 7.0.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 0.2 M Glycine pH 7.0
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
C2=0.2M ; V2= 1.0 L; C1=0.8M
 $V1 = (0.2 \times 1.0) / 0.8$
V1 = 0.25L
Take 0.25 L (IG-RR-16) Stock buffer solution and dilute with water, and make up to 1L.

CTE excel sheet-application for consent to establish (CTE) displayed.
List of raw materials page no. 115 to be prepared

Reagent Details:

Formula:

Sodium Acetate(M.Wt): 82.03g/mol.

Acetic Acid (M.Wt): 60.05g/ mol

Sodium Chloride:58.44g/mol

Preparation of 0.1 M Sodium Acetate pH 5.35 buffer

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.1 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.1×82.03× 1.0=8.203g.

Preparation Method:

Weigh 8.203 g of Sodium Acetate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.1M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.1×82.03× _____ L= _____ g.

Weigh _____ gm of Sodium Acetate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.1 M Acetic Acid.

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 0.1 M acetic acid

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 0.1 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ × V₂)/C₁.

C₂=0.1 M ; V₂= 1.0 L; C₁=17.5 M

V₁ = (0.1 × 1.0)/17.5

V₁ = 0.0057 L

Take 0.0057 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 0.1 M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ _____ × V₂ _____) /17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Preparation of 4.0 M Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 4 M Sodium Chloride (MW = 58.44g/mol).

Weight of solute(g)=4×58.44 × 1.0= 233.76g.

Preparation Method:

Weigh 233.76g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 4 M Sodium Chloride (MW = 58.44g/mol).

Weight of solute(g)=0.1×58.44× _____ L= _____ g.

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Procedure for Preparation of 0.1 M Sodium Acetate + 4 M Sodium Chloride pH 5.35

To prepare a pH 5.35 solution, 0.1 M Sodium Acetate solution was added to this 4M Sodium Chloride was added and completely dissolved and then titrated with 0.1 M Acetic acid so that the pH attains pH 5.35 and made up to 1 L.

Reagent Details:
Preparation of IG-RR-23 working buffer from Stock buffer (IG-RR-22):
Calculations: For the Preparation of 0.5M Sodium Hydroxide.
Stock Buffer (IG-RR-22):2.0M Sodium Hydroxide,
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 2.0 M Sodium Hydroxide.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 0.5M Sodium Hydroxide.
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$.
C2=0.5M; V2= 1.0 L; C1=2.0M
 $V1 = (0.5 \times 1.0) / 2.0$
V1 = 0.25L
Take 0.25 L (IG-RR-22) Stock buffer solution and dilute with water, and make up to 1L.
Check and record the details:

Reagent Details:
Preparation of PF-RR-04 working buffer from Stock buffer (PF-RR-03):
Calculations: For the Preparation of 20mM Sodium Citrate pH 7.0 + 0.12M Sodium Chloride + 2.6 mM Calcium Chloride.
Stock Buffer (PF-RR-03):0.2M Sodium Citrate pH 7.0 + 1.2M Sodium Chloride + 26mM Calcium Chloride.
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.2M Sodium Citrate pH 7.0 + 1.2M Sodium Chloride + 26mM Calcium Chloride.
V1 = volume of stock you need to take _____L.
C2 = desired (working) concentration 20mM Sodium Citrate, pH 7.0 + 0.12M Sodium Chloride + 2.6 mM Calcium Chloride.
V2 = final total volume of working solution _____L.
 $V1 = (C2 \times V2) / C1$
C2=0.02M; V2= 1.0 L; C1=0.2M
 $V1 = (0.02 \times 1.0) / 0.2$
V1 = 0.1L
Take 0.1 L (PF-RR-03) Stock buffer solution and dilute with water, and make up to 1L.

Reagent Details:
Formula & Calculations:
Formula: Use the formula to calculate the molarity:
 $Molarity (M) = (Per\ cent\ by\ Weight / 100) * (Density\ in\ g/mL) * 1000 / Molar\ Mass.$
Example: Molarity of Glacial Acetic Acid
Molar Mass of CH_3COOH : ~60.05 g/mol
Density: ~1.05 g/mL
Purity: 100%
Acetic Acid (MW = 60.05 g/mol).
Calculation:
 $Molarity = (100 / 100) * 1.05\ g/mL * 1000\ mL/L / 60.05\ g/mol \approx 17.5\ M.$
Calculation: To prepare 1 L of 0.1M.
Applying the formula to prepare the working buffer:
 $C_1 V_1 = C_2 V_2$
 $C_1 = 17.5\ M$ acetic acid.
 V_1 = volume of stock needed to take.
 C_2 = desired (working) concentration 0.1M acetic acid.
 V_2 = final total volume of working solution for one liter.
 $V_1 = (C_2 \times V_2) / C_1.$
 $C_2 = 0.1\ M; V_2 = 1.0\ L; C_1 = 17.5\ M$
 $V_1 = (0.1 \times 1.0) / 17.5$
 $V_1 =$ Take 0.0057 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.
To prepare various volumes:
 V_1 = volume of stock needed to take _____ L.
 C_2 = desired (working) concentration 0.1M acetic acid.
 V_2 = final total volume of working solution _____ L.
 $V_1 = (C_2 \times V_2) / 17.5.$
 $V_1 =$ _____ L.
Take V_1 _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Reagent Details:

Preparation of PF-RR-13 Stock buffer :

Calculations: For the Preparation of 20mM Sodium Citrate pH 7.0 + 1.0 M Sodium Chloride.

Stock Buffer (PF-RR-09):0.4M Sodium Citrate pH 7.0.

Formula:

$$C1 \times V1 = C2 \times V2$$

C1 = concentration of stock

V1 = volume of stock you need to take

C2 = desired (working) concentration

V2 = final total volume of working solution

Applying the formula to prepare the working buffer:

$$C1 \times V1 = C2 \times V2$$

C1 = 0.4M Sodium Citrate, pH 7.0.

V1 = volume of stock you need to take _____ L.

C2 = desired (working) concentration 20mM Sodium Citrate, pH 7.0.

V2 = final total volume of working solution _____ L.

$$V1 = (C2 \times V2) / C1$$

$$C2 = 0.02M ; V2 = 1.0 L ; C1 = 0.4M$$

$$V1 = (0.02 \times 1.0) / 0.4$$

$$V1 = 0.05L$$

Take 0.05 L (PF-RR-09) Stock buffer solution and add 1.0M sodium Chloride.

Calculations: To prepare the 1 M Sodium Chloride.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 1 M Sodium Chloride (MW = 58.44 g/mol)

$$\text{Weight of solute(g)} = 1 \times 58.44 \times 1 = 58.44 \text{ g.}$$

Preparation Method:

Weigh 58.44 g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ L of 1.0 M Sodium Chloride (MW = 58.44 g/mol).

$$\text{Weight of solute(g)} = 1.0 \times 58.44 \times \text{_____} = \text{_____} \text{ g.}$$

Weight _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Preparation of Stock buffer (PF-RR-13):

Take 0.05 L (PF-RR-09) Stock buffer solution and add 1.0 M sodium chloride. Dissolve it, and then make up the volume to 1 L with water.

Check and record the details:

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.4M Tri-Sodium Citrate (MW = 258.06g/mol)
Weight of solute(g)=0.4×258.06 x 1=103.224g.
Preparation Method:
Weigh 103.224g of Tri-sodium citrate and dissolve in water to make a 1 L solution.
Preparation for required volumes:
To prepare _____ of 0.4M Tri -Sodium Citrate (MW = 258.06g/mol).
Weight of solute(g)=0.4 x 258.06 x _____L= _____gm
Weigh _____gm of Tri-sodium citrate and dissolve in water to make a _____ L solution.
Check and record the details:
Preparation Details:
Name of Reagent | Grade / Purity | Manufacturer / Supplier | Lot / Batch No | Storage Condition | Expiry Date
| | | |
Final volume prepared | Weighed Quantity | pH (8 to 9) | Conductivity (3 to 5 mS/cm) | Storage Condition:
| | |

Reagent Details:
Formula:
Glycine : (M.Wt): 75.07g/mol.
Sodium Hydroxide : (M.Wt): 40 g/ mol
Preparation of 0.8 M Glycine pH 7.0 buffer
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.8 M Glycine (MW = 75.07g/mol).
Weight of solute(g)=0.8×75.07.0x 1.0=60.056 g.
Preparation Method:
Weigh 60.056 g of Glycine and dissolve it in water to make a 1 L solution.
Preparation for required volumes:
To prepare _____ of 0.8 M Glycine (MW = 75.07g/mol).
Weight of solute(g)=0.8×75.07█x _____ L= _____g.
Weigh _____gm of Glycine and dissolve in water to make a _____ L solution.
Calculations: To prepare the 1 M Sodium Hydroxide.
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 1N Sodium Hydroxide (MW = 40.0 g/mol)
Weight of solute(g)=1×40 = 40.00█g.
Preparation Method:
Weigh 40.00 g of Sodium Hydroxide and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 1N Sodium Hydroxide (MW = 40.0 g/mol).
Weight of solute(g)=1×40.0 x _____ L= _____gm
Weigh _____gm of Sodium Hydroxide and dissolve in water to make a _____ L solution.
Procedure for Preparation of 0.8 M Glycine pH 7.0.
To prepare a pH 7.0 solution, 0.8 M Glycine solution is pH adjusted with 1 M sodium Hydroxide so that the pH attains 7.0.

FIRST FLOOR

Reagent Details:

Formula:

Sodium Acetate(M.Wt): 82.03g/mol.

Acetic Acid (M.Wt): 60.05g/ mol

Preparation of 1.0 M Sodium Acetate pH 5.8 buffer

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 1.0 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=1.0×82.03× 1.0=82.03g.

Preparation Method:

Weigh 82.03g of Sodium Acetate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 1.0 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=1.0×82.03× _____ L= _____ g.

Weigh _____ gm of Sodium Acetate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 1.0 M Acetic Acid.

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 1.0 M.

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 1.0 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ × V₂)/C₁.

C₂=1.0 M ; V₂= 1.0 L; C₁=17.5 M

V₁ = (1.0 × 1.0)/17.5

V₁ = 0.057 L

Take 0.057 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 1.0 M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ × V₂) /17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Procedure for Preparation of 1.0 M Sodium Acetate pH 5.8.

To prepare a pH 5.8 solution, 1.0 M Sodium Acetate solution is titrated with 1.0 M Acetic acid so that the pH attains pH 5.8.

Reagent Details:
Preparation of PF-RR-22 working buffer from Stock buffer (PF-RR-21):
Calculations: For the Preparation of 20mM Sodium acetate pH 5.2.
Stock Buffer (PF-RR-21):0.2M Sodium acetate pH 5.35.
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.2M Sodium Acetate pH 5.35.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 20mM Sodium Acetate pH 5.2
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$.
C2=0.02M ; V2= 1.0 L; C1=0.2M
 $V1 = (0.02 \times 1.0) / 0.2$
V1 = 0.1L
Take 0.1 L (PF-RR-21) Stock buffer solution and dilute with water, and make up to 1L.
Check and record the details:

Reagent Details:

Formula:

Sodium Citrate (M.Wt): 258.07.

Citric acid (M.Wt): 192.124

Preparation of PF-RR-09 stock buffer:

Preparation of 0.4M Sodium Citrate pH 7.0

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.4M Citric Acid (MW = 192.124 g/mol)

Weight of solute(g)=0.4×192.124×1=76.85g.

Preparation Method:

Weigh 76.85g of Citric Acid and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.4M Citric Acid (MW = 192.124g/mol).

Weight of solute(g)=0.4×76.85x _____ L= _____ g.

Weigh _____ gm of Citric Acid and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.4M Tris Sodium Citrate.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.4M Tris Sodium Citrate (MW = 258.07 g/mol)

Weight of solute(g)=0.4×258.07 x1=103.228g

Preparation Method:

Weigh 103.228g of Tris Sodium Citrate and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 0.4M Tris Sodium Citrate (MW = 258.07 g/mol).

Weight of solute(g)=0.4×258.07x _____ L= _____ g.

Weigh _____ gm of Tris Sodium Citrate and dissolve in water to make a _____ L solution.

Procedure for Preparation of PF-RR-09 stock

To prepare a pH 7.0 solution, 0.4 M Tris Sodium Citrate solution is titrated with 0.4 M citric acid so that the pH attains pH 7.0.

For Example, to prepare a 1 L solution, take 0.4 M Tri Sodium Citrate and adjust the pH with the 0.4 M Citric acid to get the pH 7.0 and make up the final volume to 1 L.

Check and record the details:

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 30mM sodium chlorolride (MW = 58.44g/mol)
Weight of solute(g)=1×1.753=1.753g.
Preparation Method:
Weigh 1.753 g of sodium chloride
To prepare 25mM Tris 1L solution from 1M Tris stock solution formula is M1(Molarity of stock) x V1
(volume of stock)= M2 (Molarity of working) xV2 (volume of working).
Take 25mL of 1M tris solution and add weighed amount of sodium chloride as required and dissolve in water
to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 30mM NaCl (MW = 58.44g/mol).
Weight of solute(g)=1.753x _____ L= _____ gm
Weigh _____ gm of NaCl.
To prepare _____ of 25mM Tris
Take 25mL x _____ L= _____ mL of 1M Tris
Dissolve pre weighed NaCl in 25mM Tris solution to make a _____ L solution.
Adjust the pH to 7.5 using concentrated HCl/NaOH solution
Check and record the details:
Preparation Details:

Reagent Details:

Formula:

Sodium Acetate(M.Wt): 82.03g/mol.

Acetic Acid (M.Wt): 60.05g/ mol

Preparation of 0.2 M Sodium Acetate pH 5.35 buffer

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.2 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.2×82.03× 1.0=16.40g.

Preparation Method:

Weigh 16.40g of Sodium Acetate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.2 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.2×82.03× _____ L= _____ g.

Weigh _____ gm of Sodium Acetate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.2 M Acetic Acid.

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 1.0 M.

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 0.2 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ x V₂)/C₁.

C₂=0.2 M ; V₂= 1.0 L; C₁=17.5 M

V₁ = (0.2 x 1.0)/17.5

V₁ = 0.011 L

Take 0.011 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 0.2 M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ x V₂) /17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Procedure for Preparation of 0.2 M Sodium Acetate pH 5.35.

To prepare a pH 5.35 solution, 0.2 M Sodium Acetate solution is titrated with 0.2 M Acetic acid so that the pH attains pH 5.35.

Preparation Details:

Reagent Details:
Formula & Calculations:
Formula: $M1 \times V1 = M2 \times V2$.
Calculation: To prepare 1 L of 0.01M sodium hydroxide from 0.5M sodium hydroxide stock solution calculate quantity required of stock solution as below:
0.5M sodium hydroxide stock solution required quantity= $0.01 \times 1 / 0.5 = 0.02$ L
Preparation Method:
To prepare 0.01M sodium hydroxide 1L solution from 0.5M sodium hydroxide stock solution formula is $M1(\text{Molarity of stock}) \times V1(\text{volume of stock}) = M2(\text{Molarity of working}) \times V2(\text{volume of working})$.
Take 0.02L of 0.5M sodium hydroxide solution and make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.01M sodium hydroxide
Take 0.02L x _____ L = _____ L of 0.5M sodium hydroxide
Make sodium hydroxide solution to _____ L solution.
Check and record the details:
Preparation Details:
Name of Reagent | Grade / Purity | Manufacturer / Supplier | Lot / Batch No | Storage Condition | Expiry
Date
|||
Final volume prepared | Weighed Quantity | Storage Condition:
||
Date of Preparation | Prepared By | Checked By (QC/Analyst)
||

Reagent Details:

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Hydrochloric Acid

Molar Mass of HCL: ~36.46 g/mol

Density: ~1.18 g/mL

Purity: 37%

HCL Acid (Molarity = 12.0M).

Calculation:

Molarity = (37 / 100) * 1.18 g/mL * 1000 mL/L / 36.46 g/mol ≈ 12M.

Calculation: To prepare 1 L of 1.0 M.

Applying the formula to prepare the working buffer:

$C1 \cdot V1 = C2 \cdot V2$

$C1 = 12$ M HCL acid.

$V1$ = volume of stock needed to take.

$C2$ = desired (working) concentration 1.0 M HCL acid.

$V2$ = final total volume of working solution for one litre.

$V1 = (C2 \times V2) / C1$.

$C2 = 1.0$ M ; $V2 = 1.0$ L; $C1 = 12$ M

$V1 = (1.0 \times 1.0) / 12$.

$V1 = 0.0833$ L

Take 0.0833 L of the Stock solution of HCL acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

$V1$ = volume of stock needed to take _____ L.

$C2$ = desired (working) concentration 1.0 M HCL acid.

$V2$ = final total volume of working solution _____ L.

$V1 = (C2 \times V2) / 12$.

$V1 =$ _____ L.

Take $V1$ _____ L of the Stock solution of HCL acid and add it to a volumetric flask, making up the final volume _____ L.

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 5 mM Sodium acetate (MW = 82.0343g/mol)
Weight of solute(g)=0.005×82.0343=0.41017g.
Preparation Method:
Weigh 82.034 g of sodium Acetate and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.005 M Sodium Acetate (MW = 82.034 g/mol).
Weight of solute(g)=0.005×82.034 _____L= _____gm
Weigh _____gm of Sodium Acetate and dissolve in water to make a _____ L solution.
Check and record the details:

Reagent Details:
Preparation of IG-RR-06 working buffer from Stock buffer (IG-RR-05):
Calculations: For the Preparation of 20mM Sodium acetate pH 5.7.
Stock Buffer (IG-RR-05):0.2M Sodium acetate pH 5.8.
Formula:

$C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.2M Sodium Acetate pH 5.8.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 20mM Sodium Acetate pH 5.7
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
C2=0.02M ; V2= 1.0 L; C1=0.2M
 $V1 = (0.02 \times 1.0) / 0.2$
V1 = 0.1L
Take 0.1 L (IG-RR-05) Stock buffer solution and dilute with water, and make up to 1L.
Check and record the details:

Reagent Details:
Preparation of IG-RR-25 working buffer from Stock buffer (IG-RR-05):
Calculations: For the Preparation of 0.002M Sodium Acetate pH 5.7.
Stock Buffer (IG-RR-05):0.2M Sodium acetate, pH 5.8.
Formula:

$C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.2M Sodium Acetate pH 5.8.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 0.002M Sodium Acetate pH 5.7
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
C2=0.02M ; V2= 1.0 L; C1=0.2M
 $V1 = (0.02 \times 1.0) / 0.2$
V1 = 0.1L
Take 0.1 L (IG-RR-05) Stock buffer solution and dilute with water, and make up to 1L.
Check and record the details:

Preparation Details:

Reagent Details:

Formula:

Sodium Acetate(M.Wt): 82.03g/mol.

Acetic Acid (M.Wt): 60.05g/ mol

Preparation of 0.2 M Sodium Acetate pH 5.8 buffer

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol)

×Volume (L).

Calculation: To prepare 1 L of 0.2 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.2×82.03× 1.0=16.40g.

Preparation Method:

Weigh 16.40g of Sodium Acetate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.2 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.2×82.03× _____ L= _____g.

Weigh _____ gm of Sodium Acetate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.2 M Acetic Acid.

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 1.0 M.

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 0.2 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ × V₂)/C₁.

C₂=0.2 M ; V₂= 1.0 L; C₁=17.5 M

V₁ = (0.2 × 1.0)/17.5

V₁ = 0.011 L

Take 0.011 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 0.2 M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ _____ × V₂ _____) /17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Procedure for Preparation of 0.2 M Sodium Acetate pH 5.8.

To prepare a pH 5.8 solution, 0.2 M Sodium Acetate solution is titrated with 0.2 M Acetic acid so that the pH attains pH 5.8.

Check and record the details:

Preparation Details:

Name of Reagent | Grade / Purity | Manufacturer / Supplier | Lot / Batch No | Storage Condition | Expiry

Date

Sodium Acetate | | | |

Acetic Acid | | | |

Reagent Details:

Formula & Calculations:

Formula: $M_1 \times V_1 = M_2 \times V_2$.

Calculation: To prepare 1 L of 0.5M sodium hydroxide from 2M sodium hydroxide stock solution calculate quantity required of stock solution as below:

0.5M sodium hydroxide stock solution required quantity= $0.5 \times 1/2 = 0.25\text{L}$

Preparation Method:

To prepare 0.5M sodium hydroxide 1L solution from 2M sodium hydroxide stock solution formula is

$M_1(\text{Molarity of stock}) \times V_1(\text{volume of stock}) = M_2(\text{Molarity of working}) \times V_2(\text{volume of working})$.

Take 0.25L of 2M sodium hydroxide solution and make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 0.5M sodium hydroxide

Take 0.25L x _____ L = _____ L of 2M sodium hydroxide

Make sodium hydroxide solution to _____ L solution.

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 1.0 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=1.0×82.03× 1.0=82.03g.

Preparation Method:

Weigh 82.03g of Sodium Acetate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 1.0 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=1.0×82.03× _____ L= _____ g.

Weigh _____ gm of Sodium Acetate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 1.0 M Acetic Acid.

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 1.0 M.

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 1.0 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ x V₂)/C₁.

C₂=1.0 M ; V₂= 1.0 L; C₁=17.5 M

V₁ = (1.0 x 1.0)/17.5

V₁ = 0.057 L

Take 0.057 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 1.0 M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ x V₂) /17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Procedure for Preparation of 1.0 M Sodium Acetate pH 4.0.

To prepare a pH 4.0 solution, 1.0 M Sodium Acetate solution is titrated with 1.0 M Acetic acid so that the pH attains pH 4.0.

Check and record the details:

Preparation Details:

Name of Reagent | Grade / Purity | Manufacturer / Supplier | Lot / Batch No | Storage Condition | Expiry

Date

Sodium Acetate | | | |

Acetic Acid | | | |

Reagent Details:
Preparation of IG-RR-19 working buffer from Stock buffer (IG-RR-18):
Calculations: For the Preparation of 0.2M Glycine pH 9.0 + 0.15 M Sodium Chloride.
Stock Buffer (IG-RR-18):0.8M Glycine pH 9.0 + 0.6M Sodium Chloride.
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.8M Glycine pH 9.0 + 0.6 M Sodium Chloride.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 0.2 M Glycine, pH 9.0 + 0.15 M Sodium Chloride.
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
 $C2 = 0.2M$; $V2 = 1.0 L$; $C1 = 0.8M$
 $V1 = (0.2 \times 1.0) / 0.8$
 $V1 = 0.25L$
Take 0.25 L (IG-RR-18) Stock buffer solution and dilute with water, and make up to 1L.
Check and record the details:

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.18M sodium chloride (MW = 58.44g/mol)
Weight of solute(g)=1×10.519=10.519g.
Preparation Method:
Weigh 10.519g of sodium chloride
To prepare 25mM Tris 1L solution from 1M Tris stock solution formula is M1(Molarity of stock) x V1
(volume of stock)= M2 (Molarity of working) xV2 (volume of working).
Take 25mL of 1M tris solution and add weighed amount of sodium chloride as required and dissolve in water
to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.18M NaCl (MW = 58.44g/mol).
Weight of solute(g)=10.519x _____ L= _____ gm
Weigh _____ gm of NaCl.
To prepare _____ of 25mM Tris
Take 25mL x _____ L= _____ mL of 1M Tris
Dissolve pre weighed NaCl in 25mM Tris solution to make a _____ L solution.
Adjust the pH to 7.5 using concentrated HCl/NaOH solution
Check and record the details:

Reagent Details:

Formula:

Sodium Acetate(M.Wt): 82.03g/mol.

Acetic Acid (M.Wt): 60.05g/ mol

Preparation of 0.4 M Sodium Acetate pH 4.6 buffer

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.4 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.4×82.03× 1.0=32.81g.

Preparation Method:

Weigh 32.81 g of Sodium Acetate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.4 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.4×82.03× _____ L= _____ g.

Weigh _____ gm of Sodium Acetate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.4 M Acetic Acid.

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 0.4 M.

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 0.4 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ x V₂)/C₁.

C₂=0.4 M ; V₂= 1.0 L; C₁=17.5 M

V₁ = (0.4 x 1.0)/17.5

V₁ = 0.022 L

Take 0.022 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 0.4 M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ _____ x V₂ _____) /17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Procedure for Preparation of 0.4 M Sodium Acetate pH 4.6.

To prepare a pH 4.6 solution, 0.4 M Sodium Acetate solution is titrated with 0.4 M Acetic acid so that the pH attains pH 4.6.

Check and record the details:

Preparation Details:

Name of Reagent | Grade / Purity | Manufacturer / Supplier | Lot / Batch No | Storage Condition | Expiry

Reagent Details:

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 0.2M.

Applying the formula to prepare the working buffer:

$C_1 V_1 = C_2 V_2$

C_1 = 17.5 M acetic acid.

V_1 = volume of stock needed to take.

C_2 = desired (working) concentration 0.2 M acetic acid.

V_2 = final total volume of working solution for one litre.

$V_1 = (C_2 \times V_2) / C_1$.

$C_2 = 0.2$ M; $V_2 = 1.0$ L; $C_1 = 17.5$ M

$V_1 = (0.2 \times 1.0) / 17.5$

$V_1 = 0.011$ L

Take 0.011 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

V_1 = volume of stock needed to take _____ L.

C_2 = desired (working) concentration 0.2 M acetic acid.

V_2 = final total volume of working solution _____ L.

$V_1 = (C_2 \times V_2) / 17.5$.

$V_1 =$ _____ L.

Take V_1 _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up the final volume _____ L.

Check and record the details:

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.2M Sodium citrate monohydrate (MW = 294.1g/mol)
Weight of solute(g)=1×38.42=38.42g.
Preparation Method:
Weigh 38.42 g of Sodium citrate monohydrate and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.2M Sodium citrate monohydrate (MW = 192.12g/mol).
Weight of solute(g)=1×38.42 _____L= _____gm
Weigh _____gm of Sodium citrate monohydrate and dissolve in water to make a _____ L solution.
Adjust the pH to 7.5 with sodium hydroxide or hydrochloric acid.
Check and record the details:

Reagent Details:
Preparation of IG-RR-11 working buffer from Stock buffer (IG-RR-10):
Calculations: For the Preparation of 20mM Sodium acetate pH 4.0.
Stock Buffer (IG-RR-10):1.0M Sodium acetate, pH 4.0.
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 1.0 M Sodium Acetate pH 4.0.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 20mM Sodium Acetate pH 4.0
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$.
C2=0.02M ; V2= 1.0 L; C1=1.0M
 $V1 = (0.02 \times 1.0) / 1.0$
V1 = 0.02L
Take 0.02 L (IG-RR-10) Stock buffer solution and dilute it with water, making up to 1 L.
Check and record the details:

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 0.2M Citric Acid (MW = 192.12g/mol)
Weight of solute(g)=1×38.424=38.424g.
Preparation Method:
Weigh 38.424 g of Citric acid and dissolve in water to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 0.2M Citric acid (MW = 192.12g/mol).
Weight of solute(g)=1×38.424 _____ L= _____ gm
Weigh _____ gm of Citric acid and dissolve in water to make a _____ L solution.

TITLE- CONCEPTUAL LAYOUT-GF REVISION R0
SCALE 1:1

SIZE A0 DWG.NO 01

Reagent Details:

Formula:

Glycine : (M.Wt): 75.07g/mol.

Sodium Hydroxide : (M.Wt): 40 g/ mol.

Sodium Chloride : (M.Wt): 58.44 g/ mol.

Preparation of 0.8 M Glycine pH 7.0 buffer

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.8 M Glycine (MW = 75.07g/mol).

Weight of solute(g)=0.8×75.07×1.0=60.056 g.

Preparation Method:

Weigh 60.056 g of Glycine and dissolve it in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.8 M Glycine (MW = 75.07g/mol).

Weight of solute(g)=0.8×75.07× _____ L= _____ g.

Weigh _____ gm of Glycine and dissolve in water to make a _____ L solution.

Calculations: To prepare the 1 M Sodium Hydroxide.

Formula & Calculations:

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 1N Sodium Hydroxide (MW = 40.0 g/mol)

Weight of solute(g)=1×40 = 40.00g.

Preparation Method:

Weigh 40.00 g of Sodium Hydroxide and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 1N Sodium Hydroxide (MW = 40.0 g/mol).

Weight of solute(g)=1×40.0 x _____ L= _____ gm

Weigh _____ gm of Sodium Hydroxide and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.6 M Sodium Chloride.

Formula & Calculations:

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.6 M Sodium Chloride (MW = 58.44 g/mol)

Weight of solute(g)=0.6 × 58.44 x 1 = 35.06g.

Preparation Method:

Weigh 35.06 g of Sodium Chloride and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 0.6M Sodium Chloride (MW = 58.44 g/mol).

Weight of solute(g)=0.6×58.44 x _____ L= _____ gm

Weigh _____ gm of Sodium Chloride and dissolve in water to make a _____ L solution.

Procedure for Preparation of 0.8 M Glycine+ 0.6M Sodium Chloride

pH 9.0.

To prepare a pH 9.0 solution, 0.8 M Glycine solution is pH adjusted with 1 M sodium Hydroxide so that the pH attains 9.0 and 0.6M Sodium Chloride salt is added to the solution and dissolved to make up the final volume.

Preparation Details:

Name of Reagent | Grade / Purity | Manufacturer / Supplier | Lot / Batch No | Storage Condition | Expiry Date

Glycine | | | | |

Sodium Hydroxide | | | | |

Sodium Chloride | | | | |

Final volume prepared | Measured Quantity | pH (9.0± 0.1) | Conductivity (7± 1 ms/cm) | Storage Condition

Reagent Details:

Formula:

Sodium Acetate(M.Wt): 82.03g/mol.

Acetic Acid (M.Wt): 60.05g/ mol

Preparation of 0.2 M Sodium Acetate pH 4.0 buffer

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol)

×Volume (L).

Calculation: To prepare 1 L of 0.2 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.2×82.03× 1.0=16.406 g.

Preparation Method:

Weigh 16.406 g of Sodium Acetate and dissolve in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.2 M Sodium Acetate (MW = 82.03g/mol).

Weight of solute(g)=0.2×82.03× _____ L= _____g.

Weigh _____ gm of Sodium Acetate and dissolve in water to make a _____ L solution.

Calculations: To prepare the 0.2 M Acetic Acid.

Formula & Calculations:

Formula: Use the formula to calculate the molarity:

Molarity (M) = (Per cent by Weight / 100) * (Density in g/mL) * 1000 / Molar Mass.

Example: Molarity of Glacial Acetic Acid

Molar Mass of CH₃COOH: ~60.05 g/mol

Density: ~1.05 g/mL

Purity: 100%

Acetic Acid (MW = 60.05 g/mol).

Calculation:

Molarity = (100 / 100) * 1.05 g/mL * 1000 mL/L / 60.05 g/mol ≈ 17.5 M.

Calculation: To prepare 1 L of 0.2 M.

Applying the formula to prepare the working buffer:

C₁V₁=C₂V₂

C₁ = 17.5 M acetic acid.

V₁ = volume of stock needed to take.

C₂ = desired (working) concentration 0.2 M acetic acid.

V₂ = final total volume of working solution for one litre.

V₁ = (C₂ × V₂)/C₁.

C₂=0.2 M ; V₂= 1.0 L; C₁=17.5 M

V₁ = (0.2 × 1.0)/17.5

V₁ = 0.011 L

Take 0.011 L of the Stock solution of acetic acid and add it to a volumetric flask, making up the volume

to 1 L.

To prepare various volumes:

V₁ = volume of stock needed to take _____ L.

C₂ = desired (working) concentration 0.2M acetic acid.

V₂ = final total volume of working solution _____ L.

V₁ = (C₂ _____ × V₂ _____) /17.5.

V₁= _____ L.

Take V₁ _____ L of the Stock solution of acetic acid and add it to a volumetric flask, making up

the final volume _____ L.

Procedure for Preparation of 0.2 M Sodium Acetate pH 4.0.

To prepare a pH 4.0 solution, 0.2 M Sodium Acetate solution is titrated with 0.2

M Acetic acid so that the pH attains pH 4.0.

Check and record the details:

Reagent Details:
Preparation of IG-RR-28 working buffer from Stock buffer (IG-RR-27):
Calculations: For the Preparation of 15mM Sodium acetate pH 4.2.
Stock Buffer (IG-RR-27):0.2M Sodium acetate pH 4.2.
Formula:
 $C1 \times V1 = C2 \times V2$
C1 = concentration of stock
V1 = volume of stock you need to take
C2 = desired (working) concentration
V2 = final total volume of working solution
Applying the formula to prepare the working buffer:
 $C1 \times V1 = C2 \times V2$
C1 = 0.2M Sodium Acetate pH 4.2.
V1 = volume of stock you need to take _____ L.
C2 = desired (working) concentration 15mM Sodium Acetate pH 4.2
V2 = final total volume of working solution _____ L.
 $V1 = (C2 \times V2) / C1$
C2=0.015M ; V2= 1.0 L; C1=0.2M
 $V1 = (0.015 \times 1.0) / 0.2$
V1 = 0.75L
Take 0.75 L (IG-RR-27) Stock buffer solution and dilute with water, and make up to 1L.
Check and record the details:

1) Sewage & Effluent Treatment: Clearly mark the physical location, dimensions, and layout of the Effluent Treatment Plant (ETP) / Sewage Treatment Plant (STP). Provide structural calculations proving adequate capacity for processing waste.
Response: ETP and STP layout with required details is pending and shall be shared ASAP.

2) Organic Waste Converter (OWC): Designate a dedicated, ventilated space for a mechanical OWC, stating its processing capacity in kg/day based on your expected workforce.
Response: Plasma: 20.4MT/year or 68T/day, LVP: 7.9MT/year or 26T/day

3) Process Flow & Water Balance Chart: Submit a detailed quantitative water balance diagram showing domestic and industrial consumption, recycling rates, and a commitment to Zero Liquid Discharge (ZLD).
Response:
Plasma:
LVP:

4) Hazardous Waste Management Plan: Since ethanol-based fractionation is utilized, submit storage, handling, and disposal plans for hazardous/chemical solvents
Response:
Plasma:
LVP:

Sr.No. | Item | Litres (L / year) | Cubic metres (m³ / year) | Notes
| A. Water Inputs | | |
1 | Domestic water (506 ppl × 100 L/p/d) | 1,84,69,000 | 18,469.00 | Toilets, canteen, housekeeping
| WFI (process) | 62,05,470 | 6,205.47 | WFI for formulation, CIP, rinses
| Other process water (25% of WFI) | 15,51,368 | 1,551.37 | CIP makeup, utility washes
| Extra process water (10% of plasma vol) | 41,400 | 41.4 | Misc. process losses, small uses
2 | Process Water | 77,98,238 | 7,798 |
| Total Water Input | 2,62,67,238 | 26,267.24 | A = sum of above
| | |
| B. Water Outputs / Wastewater | | |
1 | Domestic sewage → STP (80% of domestic) | 1,47,75,200 | 14,775.20 | Black/gray water to STP
2 | Process wastewater → ETP (99% of process) | 77,20,256 | 7,720.26 | Process drains, WFI rejects, CIP effluent
| Total Wastewater Generated | 2,24,95,456 | 22,495.46 | B = sum of above
| | |
| C. Balance / Losses / Product incorporation | | |
1 | Unaccounted losses / product incorporation / evaporation (A – B) | 37,71,782 | 3,771.78 | ~14.36% of input — includes water in products, steam losses, sampling, evaporation, bleed, equipment hold-up
Category | Type of Water/Steam | Estimated Quantity per day | Estimated Quantity per year | Purpose
Product Vehicle | Water for Injection (WFI) | ~62,200 – 62,500 L | ~14928000 – 15000000 L | Main solvent; added q.s. to reach final batch volume.
Equipment Cleaning | Purified Water (PW) | 5,000 – 8,000 L | 1200000 – 1920000 L | Initial rinses for mixing tanks, piping, and filling lines (CIP).
Final Rinse | Water for Injection (WFI) | 2,000 – 3,000 L | 480000 – 720000 L | Final rinse of product-contact surfaces to ensure a pyrogenicity.
Sterilization | Pure Steam (Clean Steam) | ~1,500 – 2,500 kg | ~360000 – 600000 kg | Used in autoclaves for terminal sterilization and SIP of lines.
Utility Heating | Industrial Steam | ~5,000 – 7,000 kg | ~1200000 – 1680000 Kg | Indirect heating for jacketed vessels and WFI generation.
Cooling | Process Water | 10,000 L | 2400000+ L | Non-contact cooling for jacketed vessels after sterilization.
Wastewater | Cleaning-in-Place (CIP) Effluent | 5,000 – 8,000 L | 1200000 – 1920000 L | Treatment in an Effluent Treatment Plant (ETP)
Output Category | Output Stream | Estimated Quantity per Day | Estimated Quantity per Year | Remarks
Treated Water Recovery | Treated Water for Reuse / Discharge | ~3,500 – 6,800 L | ~840,000 – 1,632,000 L
| Recovered after primary and secondary treatment
Reject Water / Losses | RO Reject / Evaporation / Handling Losses | ~500 – 1,600 L | ~120,000 – 384,000 L
| Depends on treatment efficiency and recovery system
Sludge Generation | ETP Sludge / Solid Waste | ~20 – 50 kg | ~4,800 – 12,000 kg | To be disposed through authorized waste handler
Final Discharge | Treated Effluent | As per discharge norms | As per regulatory limits | Suitable for reuse/discharge after compliance testing
Sr. No. | Process / Source | Type of Hazardous Waste | Approx. Quantity / Year
1 | Solvent recovery & viral inactivation (TnBP + detergent process) | Spent solvent mixture (Tri-n-butyl phosphate + Triton X-100 / Polysorbate 80) | 1.0 – 1.5 KL / year
2 | Filtration & purification units | Used filter aids / depth filter media contaminated with protein or solvent | 0.8 – 1.0 MT / year
3 | Activated carbon beds (viral removal, deodorization) | Spent activated carbon with adsorbed organic residues | 0.5 – 0.7 MT / year
4 | Chromatography / TFF cleaning (CIP) | Residues of buffers, cleaning agents, NaOH / HCl neutralization sludge | 2.0 – 3.0 MT / year (dry solids)
5 | ETP operation | Sludge containing proteinaceous organic matter & trace solvents | 5.0 – 6.0 MT / year
6 | ETP / RO reject water | High-TDS / COD effluent (liquid) | ~ 900 – 1,000 m³ / year
7 | Resin & membrane replacement | Spent chromatography resin, UF/DF membranes, PVDF filters | 0.5 – 1.0 MT / year
8 | Laboratory & QC activities | Contaminated lab glassware, pipette tips, chemical bottles | 200 – 250 kg / year
9 | Oil from DG sets, compressors, hydraulic systems | Used lubricating oil | 50 – 100 L / year
10 | DG set maintenance | Oil-soaked cotton waste, filters | 50 – 100 kg / year
11 | Production packaging & vial washing | Contaminated packaging (plastic, foil, paper) | 0.3 – 0.5 MT / year
12 | Spill & floor washings | Absorbent material, mopping waste, PPE, gloves | 0.5 MT / year
Hazardous Waste | API Residue / Chemical Sludge | 50 – 200 kg | 12000 – 48000 kg | High-temperature incineration (>1,200°C).

Reagent Details:

Formula & Calculations:

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 2M sodium hydroxide (MW = 40g/mol)

Weight of solute(g)=1×80=80g.

Preparation Method:

Weigh 80 g of Sodium hydroxide and dissolve in water to make a 1 L solution.

Preparation for different volumes:

To prepare _____ of 2M sodium hydroxide (MW = 80g/mol).

Weight of solute(g)=1×80x _____L= _____gm

Weigh _____gm of sodium hydroxide and dissolve in water to make a _____ L solution.

Check and record the details:

Reagent Details:

Formula:

Glycine : (M.Wt): 75.07g/mol.

HCL: 12M

Sodium Chloride (M.Wt): 58.44g/mol

Preparation of 0.2 M Glycine pH 4.0 buffer

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.2 M Glycine (MW = 75.07g/mol).

Weight of solute(g)=0.2×75.07.0x 1.0=15.01 g.

Preparation Method:

Weigh 15.01 g of Glycine and dissolve it in water to make a 1 L solution.

Preparation for required volumes:

To prepare _____ of 0.2 M Glycine (MW = 75.07g/mol).

Weight of solute(g)=0.2×75.07.0x _____ L= _____ g.

Weigh _____ gm of Glycine and dissolve in water to make a _____ L solution.

Applying the formula to prepare the 1M HCL working buffer:

$C1 \times V1 = C2 \times V2$

$C1 = 12$ M HCL acid.

$V1$ = volume of stock needed to take.

$C2$ = desired (working) concentration 1.0 M HCL acid.

$V2$ = final total volume of working solution for one litre.

$V1 = (C2 \times V2)/C1$.

$C2=1.0$ M ; $V2= 1.0$ L; $C1=12$ M

$V1 = (1.0 \times 1.0)/12$.

$V1 = 0.0833$ L

Take 0.0833 L of the Stock solution of HCL acid and add it to a volumetric flask, making up the volume to 1 L.

To prepare various volumes:

$V1$ = volume of stock needed to take _____ L.

$C2$ = desired (working) concentration 1.0 M HCL acid.

$V2$ = final total volume of working solution _____ L.

$V1 = (C2 \times V2) / 12$.

$V1 =$ _____ L.

Take $V1$ _____ L of the Stock solution of HCL acid and add it to a volumetric flask, making up the final volume _____ L.

Calculations: To prepare the 0.15 M Sodium Chloride.

Formula & Calculations:

Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).

Calculation: To prepare 1 L of 0.15 M Sodium Chloride (MW = 58.44 g/mol)

Weight of solute(g)=0.15 × 58.44 × 1 = 8.766g.

Preparation Method:

Weigh 8.766 g of Sodium Chloride and dissolve in water to make a 1 L solution.

Procedure for Preparation of 0.2 M Glycine pH 4.0 + 0.15 M NaCl.

To prepare a pH 4.0 solution, 0.2 M Glycine solution is pH adjusted with 1 M HCL so that the pH attains 4.0, then add the 0.15 M sodium chloride, then make up the final volume.

LIST OF FEED PARAMETERS TO BE CONSIDER FOR DESIGN

[Sr. No.|Parameter |Value |Unit |
	pH	10-12	NA
	Oil & Grease	20-150	mg/L
	TDS	1000-8000	mg/L
	TSS	<200	ppm
	COD	<2250	ppm
	BOD	<1100	ppm

LIST OF OUTLET PARAMETERS REQUIRED

[Sr. No.|Parameter |Value |Unit |
	pH	6.5-8.5	NA
	Oil & Grease	<100	mg/L
	TDS	<500	mg/L
	TSS	<50	mg/L
	COD	<250	mg/L
	BOD	<100	mg/L

[SHEET: Possession Let]

||||| Back to Index

[SHEET: DG Set]

Sr.No. | Parameter | Description / Specification |

- 1 | Make / Model | Cummins / Kirloskar / Mahindra (example – confirm at procurement) | Back to Index
- 2 | Type | Silent Type, Auto-start, Water-cooled, Turbocharged Diesel Generator |
- 3 | Rating / Capacity | 2 × 1300 kVA each (standby operation, load sharing optional) |
- 4 | Fuel Used | High-Speed Diesel (HSD) – BS-VI grade, low sulphur (<0.05%) |
- 5 | Rated Power Output | ~400 kW per DG set (0.8 PF) |
- 6 | Total Installed Capacity | 2,600 kVA (2 sets × 1300 kVA) |
- 7 | Operating Hours / Year | ~800–1,000 hours per year (emergency + load testing only) |
- 8 | Fuel Consumption | ~55–60 L/hour @ full load |
- 9 | Estimated Annual HSD Consumption | ≈ 27,000 L / year (≈ 27 KL / year) |
- 10 | Storage Capacity (HSD Tank) | 10 KL aboveground double-walled MS tank with vent, dyke, and spill tray as per PESO norms |
- 11 | Cooling System | Water-cooled, with radiator and jacket water heater |
- 12 | Lube Oil System | Forced lubrication; oil drain point connected to collection tray |
- 13 | Starting System | 24V battery start with automatic mains failure (AMF) panel |
- 14 | Exhaust System | Silencer with flexible coupling; insulated exhaust manifold |
- 15 | Emission Parameters (at rated load) | • PM ≤ 0.3 g/kWh • NO_x + HC ≤ 7.5 g/kWh • CO ≤ 3.5 g/kWh (As per CPCB II norms) |
- 16 | Stack Details | Mild steel stack with flanged joints; height as per CPCB formula: $H = h + 0.2\sqrt{KVA} = 3 + 0.2\sqrt{1300} \approx 10.2$ m above roof level per set | 36.05551275463989
- 17 | Stack Quantity | 2 Nos (individual stack for each DG set) | 7.211102550927979
- 18 | Noise Level at 1 m distance | ≤ 75 dB(A) – within CPCB norm | 10.21110255092798
- 19 | Noise Control Measures | • Acoustic Enclosure (≤ 75 dB(A)) • Vibration isolators under skid base • Greenbelt & acoustic barriers along DG yard boundary |
- 20 | Location | Utility block (away from production & office area) |
- 21 | Ventilation System | Forced air intake & exhaust with acoustic louvers |
- 22 | Emission Control | • Stack emission monitoring (PM, NO_x, SO_x) – quarterly • Use of low-sulphur HSD |
- 23 | Lube Oil Handling | Drained to closed HDPE drum; sent to authorized recycler (HW 5.1) |
- 24 | Spill Control | Impervious floor, containment dyke, absorbent pads available |
- 25 | Safety & Fire Protection | Fire extinguishers (CO₂ + dry chemical) at DG yard; earthing pit per IS 3043 |
- 26 | Authority Approval | DG sets to comply with CPCB-II emission & noise certification; HSD tank under PESO license |

Sr.No. | Parameter | Standard / Limit | Plant DG Result / Provision

- 1 | Emissions (CPCB-II) | PM ≤ 0.3 g/kWh NO_x+HC ≤ 7.5 g/kWh CO ≤ 3.5 g/kWh | Cummins CPCB-II compliant engines
- 2 | Stack Height | $H = h + 0.2\sqrt{KVA}$ | 6.5 m above roof per set
- 3 | Noise | ≤ 75 dB(A) at 1 m | Acoustic enclosure fitted
- 4 | Fuel Type | Low-sulphur HSD | BS-VI HSD used
- 5 | Used Oil Disposal | To authorized recycler | As per HW Rule 5.1
- 6 | DG Area Containment | Impervious floor + bund | Provided

| Back to Index |

[SHEET: Pol control meas]

Sr.No. | Type | Source | Pollutants Likely | Control Measures / Equipment | Remarks |

- 1 | AIR POLLUTION | a. DG Set (2 × 500 kVA, standby) | PM, SO_x, NO_x, CO (from diesel combustion) | • Acoustic enclosure to control noise • Adequate stack height as per CPCB formula ($H = h + 0.2\sqrt{KVA}$) ~6.5 m above roof • Low-sulphur HSD (<0.05%) fuel • Regular maintenance & emission monitoring | Operates only during power outage | | Back to Index
- 2 | AIR POLLUTION | b. PNG / CNG-fired Boiler (500 kg steam/hr) | NO_x, trace CO | • Use of low-NO_x burner • Stack height 12 m above roof • Online temperature & pressure monitoring • Periodic stack emission testing | PNG is clean fuel, minimal SO_x |
- 3 | AIR POLLUTION | c. HVAC systems / AHUs | Dust, microbial aerosols | • HEPA filters (0.3 µm) at terminal outlets • Pre-filters (10 µm) at return air • Periodic filter replacement as per SOP | Ensures cleanroom Class 10,000–100,000 compliance |
- 4 | AIR POLLUTION | d. Solvent & detergent handling (TnBP, Triton X-100) | VOC vapours | • Closed mixing vessels, nitrogen blanketing • Solvent vapor condenser + activated-carbon adsorption unit • Explosion-proof zone classification (ATEX) | Emission < 50 mg/Nm³ VOC ensured |
- 5 | AIR POLLUTION | e. Laboratory fume hoods / exhausts | Trace acidic or organic vapours | • Fume hoods with local scrubbers or HEPA filters • Ducted exhaust at safe height | Minimal emissions, intermittent source |

Sr.No. | Type | Source | Type of Wastewater | Pollutants Likely | Treatment / Control Equipment |

- 1 | WATER POLLUTION | a. Process & WFI drains | Process effluent containing protein residues, buffers, mild solvents, detergents | pH 6–8, COD 1,000–2,000 mg/L, BOD 400–800 mg/L, low TDS | Effluent Treatment

Plant (ETP): • Collection & equalization tank (15 m³) • pH correction & neutralization tank • Primary clarifier • Biological MBR / MBBR reactor • Tertiary filtration (UF + RO) • RO permeate reused for gardening / utilities • RO reject → MEE + ATFD | |

2 | WATER POLLUTION | b. Solvent-detergent streams (TnBP phase) | High COD, solvent traces | Trace VOCs, COD > 10,000 mg/L | Dedicated solvent holding tank → evaporation or incineration via TSDF | |

3 | WATER POLLUTION | c. Domestic sewage (staff 506) | Black / grey water | BOD ~250 mg/L | STP (40 m³/day): MBBR + UF + chlorination | |

4 | WATER POLLUTION | d. Cooling tower blow-down, softener reject | High TDS, hardness | TDS 2,000–3,000 mg/L | Collected in neutralization tank → mixed with RO reject → MEE | |

Sr.No. | Type | Source | Type of Waste | Category | Control / Disposal Method | |

1 | SOLID / HAZARDOUS WASTE POLLUTION | Process residues, filter aids, spent carbon, ETP sludge | Solid / semi-solid | HW 28.2 / 35.3 | Sent to Authorized TSDF (CHWTSDF) for landfill/incineration | |

2 | SOLID / HAZARDOUS WASTE POLLUTION | Spent solvent mix (TnBP + detergent) | Liquid | HW 28.1 | Sent to Solvent recovery or TSDF | |

3 | SOLID / HAZARDOUS WASTE POLLUTION | Used oil from DG set | Liquid | HW 5.1 | Sold to MPCB-authorized recycler | |

4 | SOLID / HAZARDOUS WASTE POLLUTION | Biomedical waste (lab disposables, plasma bags) | Bio-infectious | BMW Cat. 4 / 5 | Sent to Authorized CBWTF | |

5 | SOLID / HAZARDOUS WASTE POLLUTION | Non-hazardous recyclable waste | Paper, plastic, metal, glass | Non-hazardous | Segregation → authorized recyclers | |

6 | SOLID / HAZARDOUS WASTE POLLUTION | Organic waste (canteen, sludge) | Biodegradable | Non-hazardous | Composting / manure | |

Sr.No. | Type | Source | Noise Level (dB-A) | Control Measures | | |

1 | NOISE POLLUTION | DG sets | 75–80 | Acoustic enclosure, antivibration mounts, green belt | | |

2 | NOISE POLLUTION | Compressors, pumps, blowers | 70–75 | Foundation damping pads, acoustic barrier | | |

3 | NOISE POLLUTION | HVAC & AHU | 60–65 | Acoustic lining, flexible connectors | | |

4 | NOISE POLLUTION | General utilities | < 55 | Periodic maintenance, ear protection for workers | | |

Sr.No. | Type | Equipment / Facility | Capacity / Function | Purpose | | |

1 | SOLID WASTE MANAGEMENT | ETP | 70 m³/day (MBBR + UF + RO + MEE) | Treat & recycle process effluent | | |

2 | SOLID WASTE MANAGEMENT | STP | 40 m³/day (MBBR + UF) | Treat domestic sewage | | |

3 | SOLID WASTE MANAGEMENT | Air pollution stacks | Boiler – 12 m; DG – 6.5 m above roof | Emission dispersion | | |

4 | SOLID WASTE MANAGEMENT | Activated carbon filter | 1 × 500 kg | VOC adsorption from S-D exhaust | | |

5 | SOLID WASTE MANAGEMENT | Scrubber (if acid used) | 1 × 3,000 m³/hr | Fume removal from buffer prep / lab exhaust | | |

6 | SOLID WASTE MANAGEMENT | Noise enclosure | DG & compressors | Noise reduction | | |

7 | SOLID WASTE MANAGEMENT | Greenbelt | ≥ 33 % of plot | Dust, noise & micro-climate control | | |

| Back to Index | | | | |

[SHEET: Heat treat_Reaction_Tank]
Sr.No. | Vessel | Working vol (L) | No. of units recommended
1 | Plasma pooling tank (refrigerated) | 2000 | 1 primary + 1 standby (or reserve)
2 | Caprylic acid reaction tank (jacketed) | 2000 | 1 (or 2 for staggered batches)
3 | S-D mixing tank (jacketed, sealed) | 2000 | 1 (with dedicated solvent bund)
4 | Clarification / settling tank or DAF feed | 2500 | 1
5 | Pasteurizer (container) | capacity to hold per-batch vials (900) | 1 tunnel / basket line sized to throughput
6 | Buffer / formulation tanks (jacketed) | 500–1,500 | 2–3 (for different buffers)
7 | Waste / solvent hold tank (bunded) | 1,000–2,000 | 1
| Back to Index | |
[SHEET: Fuel Consmpr]
Sr. No. | Fuel Type | Purpose / Area of Use | Approx. Annual Consumption | Unit
1 | Electricity | Cleanroom HVAC, process equipment (centrifuges, lyophilizers, pumps, lighting, DG auxiliaries, WFI generation, chillers, lab & office) | 3.5 – 4.0 million kWh / year | kWh
2 | HSD (High-Speed Diesel) | Stand-by DG sets (2 × 500 kVA) for emergency power | ≈ 25 – 30 KL / year | KL (≈ 25,000 – 30,000 L)**
3 | CNG / PNG | Boiler / hot-water generation for WFI plant, sterilization steam, HVAC re-heat coils | ≈ 150,000 – 180,000 Sm³ / year | Standard m³ (Sm³)
4 | LPG (optional small cylinders) | Laboratory instruments / flame sterilizers | ≤ 500 kg / year | kg
| Back to Index | | |
[SHEET: Water]
Sr.No. | Item | Litres (L / year) | Cubic metres (m³ / year) | Notes
| A. Water Inputs | | |
1 | Domestic water (506 ppl × 100 L/p/d) | 18469000 | 18469 | Toilets, canteen, housekeeping
| WFI (process) | 6205470 | 6205.47 | WFI for formulation, CIP, rinses
| Other process water (25% of WFI) | 1551368 | 1551.37 | CIP makeup, utility washes
| Extra process water (10% of plasma vol) | 41400 | 41.4 | Misc. process losses, small uses
2 | Process Water | 7798238 | 7798.24 |
| Total Water Input | 26267238 | 26267.24 | A = sum of above
| B. Water Outputs / Wastewater | | |
1 | Domestic sewage → STP (80% of domestic) | 14775200 | 14775.2 | Black/gray water to STP
2 | Process wastewater → ETP (99% of process) | 7720256 | 7720.26 | Process drains, WFI rejects, CIP effluent
| Total Wastewater Generated | 22495456 | 22495.46 | B = sum of above
| C. Balance / Losses / Product incorporation | | |
1 | Unaccounted losses / product incorporation / evaporation (A – B) | 3771782 | 3771.78 | ~14.36% of input — includes water in products, steam losses, sampling, evaporation, bleed, equipment hold-up
| Back to Index | | |
[SHEET: Non Haz Waste]
Sr. No. | Source / Process Area | Type of Non-Hazardous Waste | Approx. Quantity / Year
1 | ETP / STP treatment | Biological sludge (after dewatering) | 8 – 10 MT/year (wet)
2 | Process area & lab washing | Treated water (ETP + RO permeate) | ~12,000 m³/year
3 | Packaging line | Empty glass vials (non-contaminated rejects) | 0.5 – 1.0 MT/year (~50,000 pcs)
4 | Packaging & labeling | Paperboard cartons, labels, paper scrap | 1.5 – 2.0 MT/year
5 | Procurement / stores area | Corrugated boxes, stretch film, plastic wrapping | 1.0 – 1.5 MT/year
6 | Maintenance workshop | Metal scrap (iron, steel, aluminum parts) | 0.8 – 1.2 MT/year
7 | Utility & HVAC area | Spent filters (air filters, bag filters, prefilters) | 0.3 – 0.5 MT/year
8 | Admin & office areas | Office paper waste, packaging waste | 1.0 – 1.5 MT/year
9 | Canteen / pantry | Organic kitchen waste | 1.5 – 2.0 MT/year
10 | General housekeeping | Sweepings, mopping dust, non-contaminated PPE | 0.5 – 0.8 MT/year
11 | Cooling tower & utilities | Blowdown & scale sludge (non-toxic) | 1.0 – 1.5 MT/year
12 | Electrical systems | Cable cuttings, wire ends, plastic conduits | 0.2 – 0.3 MT/year
13 | Gardening & green area | Dry leaves, grass clippings | 0.3 – 0.5 MT/year
14 | Water purification & softener | Spent ion-exchange resins (non-toxic) | 0.2 MT/year
15 | Misc. activities | Empty HDPE / PET bottles (non-contaminated) | 0.1 – 0.2 MT/year
| Back to Index | | |
[SHEET: Raw Material]
Sr.No. | Item | Annual requirement (rounded) | Unit | Notes |
1 | Source human plasma | 414000 | L | Primary raw material (cold chain required) | Back to Index
2 | Water for Injection (WFI) | 6205000 | L | Assumed 15,000 L WFI / 1,000 L plasma |
3 | Sodium chloride (NaCl) | 10350 | kg | 25 kg / 1,000 L plasma × 413.7 |
4 | Sodium citrate / acetate | 2070 | kg | 5 kg / 1,000 L |
5 | Glycine | 4140 | kg | 10 kg / 1,000 L |
6 | Caprylic (Octanoic) acid | 3310 | kg | 8 kg / 1,000 L |
7 | Triton X-100 / Polysorbate-80 | 2070 | L | 5 L / 1,000 L |
8 | Tri(n-butyl) phosphate (TnBP) | 1241 | L | 3 L / 1,000 L |
9 | PBS / Tris buffer components | 8275 | kg | 20 kg / 1,000 L |
10 | Acids / NaOH (dilute) | 82740 | L | 200 L / 1,000 L (process neutralization) |
11 | Activated carbon (GAC) | 20685 | kg | 50 kg / 1,000 L |
12 | Filter aids (depth filter media) | 41370 | kg | 100 kg / 1,000 L |
13 | 0.2 µm sterile filters (cartridges) | 8300 | units | 20 units / 1,000 L |
14 | PVDF / sterile filter cartridges | 4140 | units | 10 units / 1,000 L |

15 | Chromatography resins (total across steps) | 20685 | kg | 50 kg / 1,000 L |
 16 | TFF membranes / UF-DF modules | 4140 | modules | 10 modules / 1,000 L |
 17 | Albumin stabilizer (Na-octanoate, etc.) | 4965 | kg | 12 kg / 1,000 L |
 18 | Fibrin sealant reagents (thrombin, substrates) | 2070 | kg | 5 kg / 1,000 L |
 19 | Preservatives (if used) | 4140 | kg | 10 kg / 1,000 L |
 20 | Nitrogen gas (compressed) | 206850 | m³ | 500 m³ / 1,000 L |
 21 | Sterile glass vials (all sizes) | 1037500 | units | Total vials + 5% spare (see note below) |
 22 | Rubber stoppers | 1037500 | units | Match vials (one per vial) |
 23 | Flip-off seals | 1037500 | units | Match vials |
 24 | Labels | 1040000 | units | one per vial + spares |
 25 | Cartons (≈10 vials/carton) | 98810 | cartons | Round up to supplier pack sizes |
 26 | Laboratory consumables (pipette tips, plates, etc.) | Estimate 4,000 | packs | Itemised procurement per lab list |
 27 | Spare filters / membranes (replacement spares) | +20% of above | — | |
 28 | Cold-chain storage (freezer/refrigeration units) | qty per plant | — | |
 | | Back to Index | | |

[SHEET: List of Products]

Product | Protein availability (gm) | Protein Recovery | Conc. / vial | No. of vials /batch | Total
 (Considering

15 Batches / month) | Per Annum

Albumin (gm) | 40000 | 20000 | 20 GM | 900 | 13500 | 162000

Human IgG (gm) | 12500 | 6250 | 5 GM | 1000 | 15000 | 180000

Factor VIII in IU | 1000000 | 12500 IU | 250 IU | 50 | 750 | 9000

Factor IX in IU | 1000000 | 90000 IU | 600 IU | 150 | 2250 | 27000

Fibrinogen (gm) | 3000 | 1500 | 70 mg | 80 | 1200 | 14400

Thrombin in IU | 900000 | 90000 | 1000 IU | 1400 | 21000 | 252000

Based on vessel size, the batch size assumed is 1000 liters, on every alternate date, a new batch can be initiated, therefore 15 batches shall be processed per month (one batch/ day). | | | | |

[SHEET: Hazardous Waste]

Sr. No. | Process / Source | Type of Hazardous Waste | Approx. Quantity / Year

1 | Solvent recovery & viral inactivation (TnBP + detergent process) | Spent solvent mixture (Tri-n-butyl phosphate + Triton X-100 / Polysorbate 80) | 1.0 – 1.5 KL / year

2 | Filtration & purification units | Used filter aids / depth filter media contaminated with protein or solvent | 0.8 – 1.0 MT / year

3 | Activated carbon beds (viral removal, deodorization) | Spent activated carbon with adsorbed organic residues | 0.5 – 0.7 MT / year

4 | Chromatography / TFF cleaning (CIP) | Residues of buffers, cleaning agents, NaOH / HCl neutralization sludge | 2.0 – 3.0 MT / year (dry solids)

5 | ETP operation | Sludge containing proteinaceous organic matter & trace solvents | 5.0 – 6.0 MT / year

6 | ETP / RO reject water | High-TDS / COD effluent (liquid) | ≈ 900 – 1,000 m³ / year

7 | Resin & membrane replacement | Spent chromatography resin, UF/DF membranes, PVDF filters | 0.5 – 1.0 MT / year

8 | Laboratory & QC activities | Contaminated lab glassware, pipette tips, chemical bottles | 200 – 250 kg / year

9 | Oil from DG sets, compressors, hydraulic systems | Used lubricating oil | 50 – 100 L / year

10 | DG set maintenance | Oil-soaked cotton waste, filters | 50 – 100 kg / year

11 | Production packaging & vial washing | Contaminated packaging (plastic, foil, paper) | 0.3 – 0.5 MT / year

12 | Spill & floor washings | Absorbent material, mopping waste, PPE, gloves | 0.5 MT / year

Reagent Details:
Formula & Calculations:
Formula: Weight of solute (g)=Molarity (M)×Molecular Weight (g/mol) ×Volume (L).
Calculation: To prepare 1 L of 30mM sodium chlorolride (MW = 58.44g/mol)
Weight of solute(g)=1×1.753=1.753■g.
Preparation Method:
Weigh 1.753 g of sodium chloride
To prepare 25mM Tris 1L solution from 1M Tris stock solution formula is M1(Molarity of stock) x V1
(volume of stock)= M2 (Molarity of working) xV2 (volume of working).
Take 25mL of 1M tris solution and add weighed amount of sodium chloride as required and dissolve in water
to make a 1 L solution.
Preparation for different volumes:
To prepare _____ of 30mM NaCl (MW = 58.44g/mol).
Weight of solute(g)=1.753x _____ L= _____ gm
Weigh _____ gm of NaCl.
To prepare _____ of 25mM Tris
Take 25mL x _____ L= _____ mL of 1M Tris
Dissolve pre weighed NaCl in 25mM Tris solution to make a _____ L solution.
Adjust the pH to 2 using concentrated HCl/NaOH solution
Check and record the details:
Preparation Details:
