TABLE OF CONTENTS

1. Objective: 4
2. Scope: 4
3. Responsibilities: 4
4. Description of Machine: 5
5. Technical Specification of System/Equipment: 6
6. Scope of Supply: 7
7. Identification of Components for Calibration: 8
8. Component for Certification: 8
9. Abbreviations: 9
10. Change control: 10
11. Design qualification evaluation and conclusion: 10
12. Design qualification protocol approval sheet: 11

1. Objective:

To establish the documented evidences for the qualification of machine design as per the user requirement specifications (URS).

2. Scope:

This protocol will define the responsibilities, acceptance criteria, basis of design, technical specifications, list of major bought out parts, utility Requirements, safety & cGMP features and documentation requirements.

The Protocol also defines the basis of Installation Qualification, (IQ) and Operational Qualification (OQ) and Performance Qualification (PQ).

The Design Qualification is an essential part of the qualification mechanism and will serve as a basic document for the validation responsibility.

3. Responsibilities:

M/s. EGYPTIAN COMPANY FOR DRUGS AND VETERINARY VACCINES, EGYPT.

To provide the URS for the Equipment.

To perform design qualification.

M/S. FABTECH TECHNOLOGIES INTERNATIONAL LTD.

1. To design, engineer and provide the complete technical details of the equipment pertaining to its design qualification viz.

- i. Machine overview
- ii. Equipment orientation with layout,
- iii. Specifications of the sub-components / bought out items, and their make, model & quantity, and backup records/ brochures,
- iv. Details of Utilities,
- v. Identification of components for calibration
- vi. Material of construction of major components
- vii. Brief operational description
- viii. Safety features and alarms
- ix. Pre-installation requirements

2. To confirm the safe delivery of the equipment to the user site.
3. To ensure that no un-authorized and / or unrecorded design modifications shall take place. If at any point in time, any change is desired in the mutually agreed design, Change control procedure shall be followed and documented.
4. To ensure the proper installation and commissioning of the equipment.

4. Description of Machine

Cold Room With Refrigeration System

A. DESCRIPTION:

Cold Rooms are made out of insulated Prefabricated PUF Panels. Pre-Fabricated type PUF Panels consist of two facing of relatively thin metal sheet of high strength enclosing a core, which is relatively thick and light but has adequate stiffness in a direction normal to face of the panel. The Core is made of Polyurethane which is the best insulation material in the World.

The Advantages of insulated panels with polyurethane are excellent and durable thermal insulation. High load bearing capacity at low weight absolute water and vapour barrier excellent air tightness and free of thermal bridges which results in considerable energy savings. Surface finish facings providing resistance to weather and aggressive environment.

B. PURPOSE:

The purpose of this document is to verify supply of equipment/system as per the user requirement. The reference of the document is our offer and/or Purchase Order. The user will go through the documents to verify requirement is satisfied.

5. Technical Specification of System / Equipment :

Description	ROOM 5
	FG Release
* Cold Room Size	13987 mm
	5297 mm
	4000 mm
* Room Temperature	2 to 8 Deg
* Refrigeration Capacity	4TR
* Cooling Capacity	12096 Kcal/Hr
* Compressor	Make - COPELAND / DANFOSS/EQUIVALENT Hermetic
	SCROLL
* Refrigerant	Freon R 404a
* Refrigerant ET	(-)5 Deg C
* Refrigerant CT	50 Deg C
* Condenser	Air Cooled
* Condenser Fan	Axial Type
* Evaporator	Fan Coil UNIT
* Electrical Power Supply	380V (+/- 10%) 50Hz
* Door Cold Room mm	1800 x 3000 – Sliding
* No of Doors	2 No
* PUF Panel THICK mm	100
* Cool Down Time	6 Hour
* PUF Panel Covering	GIPP / GIPP
* Columns	NIL
* Ante Room	NIL(Additional
	Panel 5mx4m)

|PRE FABRICATED PUF PANELS |
* Density	40 Kg/Mt3 CFC Free
* Panel Assembly Type	Tongue & Groove with CAMLOCK
* Panel Covering	Inner: SS Pre-Coated Sheet
	Outer: GI Pre-coated Sheet
* Locking Arrangement	CAMLOCK

|COLD ROOM PANELS |
|* Insulation Thickness |100mm |

6. SCOPE OF SUPPLY:

Condensing Unit	
Compressor	COPELAND / Danfoss / Emerson /Equivalent Make,
	Semi Hermetic
Compressor Accessories	CCH etc if required
Condenser	Air Cooled Type with Copper Tubes and Aluminium
	Fins
Evaporator Unit	Fan Coil UNIT manufactured with Aluminum Fins and
	Copper Tubes, of required Surface Area, and the
	same shall be provided with required size Axial
	Fans, and with Drain PAN, and required standard
	Accessories.
Controls	Switches, Thermostats, Thermostatic Expansion
	Valves,
	Solenoid Valve, Temperature Controller cum
	Indicators, etc
	Provided as required.
Electrical Cum Control	Complete Full Function Electrical Panel equipped
Panel	with Terminal Block, Contactors, Thermal Overload
Relays with Single Phasing Preventers, Off Delay	
Timer, Push Buttons, Indicating Lamps, with	
Interlocking System. Electrical Wiring from Panel	

|to Motors & Instruments. |
 ||
 |Refrigeration Piping |Interconnecting Refrigeration piping inside |
 |condensing unit and evaporator unit shall be |
 |providing with require valves and fittings. And |
 |External Refrigeration Piping from Condensing Unit|
 |to Evaporator Unit shall be done at site. |
 ||
 |Insulation |Suction Line Insulation |
 ||
 |Refrigerant and Oil |First Charge |
 ||
 |PUF Panels |Prefabricated PUF Panels, 100mm Thick, with GI / |
 |GI Pre |
 |coated Inner & Outer Surface (as per Tech |
 |Specifications), |
 |for walls and ceiling, average of 40Kg/M3 Density |
 |complete |
 |with Camlocks. . |
 ||
 |Panel Doors |80mm Thick & As per Technical Specifications Inner|
 |& |
 |Outer Surface with Hardware such as Lock, Hinges, |
 |Door |
 |Closer |
 ||
 |Accessories |Installation Accessories such as Silicon Sealant, |
 |Angles, Channels & Hardware etc. |

7. IDENTIFICATION OF COMPONENTS FOR CALIBRATION

10. Design qualification summary:

Design parameters and functional specification (DQ) for Cold storage with Refrigeration Unit are studied for M/s. Egyptian company for Drugs and veterinary vaccines project. System functional specification & design specification was checked with the in-house requirement and cGMP requirements, and found satisfactory.

11. Change Control:

Any changes in the design and functional requirements mentioned above should be documented along with justifications for these.

The approval team should approve these changes.

24		

1. OBJECTIVE:

The purpose of this document is to provide the appropriate design and performance requirements for Deep freezer, so as to meet the in-house requirements as well as compliance with current Good Manufacturing Practices.

The User Requirements Specification (URS) is written to facilitate to identify the company's needs and proposes a design suitable for Hilleman laboratories.

2.0 SCOPE

This document is applicable for the Deep freezer used for storage of Rota virus bulk antigen in different size of containers.

3.0 EQUIPMENT DESCRIPTION

The Deep freezer is to store the Rota virus bulk fluid. The deep freezers placed at a temperature of 25°C or ambient and the humidity in the area is 55 ± 5 %.

The shelves and inner chamber is made of stainless steel and the outer body is made of mild steel duly powder coated.

The Freezer is insulated with high density non-CFC polyurethane which helps in preventing the loss of temperature, thermal protection and structural strength. Enhanced acoustic insulation helps to reduce compressor sound. Double doors ensure that exposure to incoming air is kept to a minimum even when the outer door is opened. Both the doors are latched.

The down-feed evaporator for efficient refrigerant flow and washable condenser filter to maintain peak cooling efficiency. The filter also is washable for economy and do-it-yourself maintenance.

Deep freezer design hermetically sealed compressor for low temperature applications. A highly efficient vapour compression refrigeration cycle helps in attaining the required temperature within a short time period. The combination of efficient technology and construction brings the added benefit of considerable energy savings.

The temperature up to -86°C is controlled by a digital temperature indicator cum controller. The instrument is designed to work on 220V AC Supply (Model with 110V).

Salient Points

- Ecofriendly Non-CFC refrigerants.
- The whole unit is mounting on castors for free movement of the freezer.
- Key operated mechanical door lock is a standard feature.
- Specially designed air-cooled condenser ensures peak performance even at high ambient conditions.
- Microprocessor based control system with digital LED display of temperature.
- Main door with inner FRP Lining and durable magnetic gasket. Durable inner doors for each compartment.
- A hot line on the mouth of the chamber is provided to minimize cooling losses and to help improve the cooling efficiency.
- Should have Standby Cooling System to significantly minimize breakdowns. The switchover to Standby system is automatic & immediate upon detection of a fault in Primary. If desired, the switchovers can also be scheduled or manual ones.
- Automatic defrost by utilizing a heater to defrost the condenser coils, which cycles on and off, preventing any ice build-up. Their robust compressors and CFC-free insulation help ensure temperature uniformity

The following SS cans with Rota virus bulk will be stored. The provided slotted angle racks can be adjusted as per size of container

Can size -Liters	OD (inches)	Height (inches)
2	4	14.9
5	9	8.7
20	9	24

1. OBJECTIVE:

The purpose of this document is to provide the appropriate design and performance requirements for Dispensing booth, so as to meet the in-house requirements as well as compliance with current Good Manufacturing Practices.

The User Requirements Specification (URS) is written to facilitate to identify the company's needs and proposes a design suitable for Hilleman laboratories.

2.0 SCOPE

This document is applicable for the Dispensing booth used for ware house and process activities.

3.0 EQUIPMENT DESCRIPTION

Dispensing booth shall be operated as clean room work station. It is provided with HEPA filter, which prevents the airborne dusts by down draught technique. The unit eliminates powder contamination to protect the operator and the surrounding environment. Dispensing booth is also called sampling booth or weighing booth. It shall be designed to maintain the Reverse laminar air supply from the HEPA Filter through blower and the exhaust connects to the outside the work place. System shall be installed in grade C area. The air intake for the blower shall be from the surrounding grade C area and should maintain the required face velocity from the filter face. The mode of operation shall be of recirculation type. All the safety interlocks shall be considered with respect to operator and product contamination. There shall be pre-filter at least 10 µ grade provided above the HEPA to decrease the load on HEPA filter which is of 0.3 µ filter.

System shall contain the following main components:

1. Motor with blower
2. Fluorescent Lamp
3. Pre filter
4. HEPA filter
5. Magnehelic Gauge

Equipment design and principle of working

The Dispensing booth station is required to be designed to provide cleanliness under the area to meet grade A requirements.

1. HEPA filters shall be of having filtration efficiency of 0.3 µ

particles and the MOC of micro fiber-glass media.

2. Noise Level: Not more than 80 dB at one meter distance from equipment.

3. Integrity test port at upstream of HEPA filters.

4. Blower shall statically and dynamically balance to supply air flow with sufficient capacity and static pressure.

5. LAF surrounding glass length shall be up to the working height.

6. Local indication of power supply to be provided.

7. Non- viable particle/ viable particle should meet grade A requirement.

8. Design shall be made for ease of maintenance.

9. Monochromatic light, Florescent light and UV light fixtures shall be fixed .

10. Initial/final pressure drop limits to be provided for these LAF's from supplier end.

4.0 Capacity /Model

5.0 Drawings

All drawings to be provided in hard copy prior to supply for approval.

6.0 Expected documentation

The Supplier shall provide the documentation for preliminary review. The Supplier shall provide documentation reflecting "as-built" condition with final delivery.

1. OBJECTIVE:

The purpose of this document is to provide the appropriate design and performance requirements for Filter Integrity tester, so as to meet the in-house requirements as well as compliance with current Good Manufacturing Practices.

The User Requirements Specification (URS) is written to facilitate to identify the company's needs and proposes a design suitable for Hilleman laboratories.

2.0 SCOPE

This document is applicable for the Filter Integrity tester used for process activities.

3.0 EQUIPMENT DESCRIPTION

The integrity testing equipment is required to be verifying the integrity of the both hydrophilic and hydrophobic filters. The filters are using for filtration of gases like compressed air and nitrogen, liquids like aqueous products, detoxification agent (NaOCl), disinfectant solutions and water for injection at a temperature of 25°C or ambient and the humidity in the area is 55 ± 5 %.

The system shall be suitable for wetting of the filters with suitable wetting fluids like IPA, Water and methanol at supplier specified concentration.

The system shall be suitable for testing of integrity by bubble point method and the Maximum pressure applied will be 100 psi.

The system will be used for testing the integrity of disc filters, capsule filters and cartridge filters.

System shall have the feature for wetting the filters at a pressure NMT 1.0 Kg/Cm2.

OPERATIONAL AND DESIGN REQUIREMENTS

1. Details of input material (RM/Intermediate)

1. RM

Type of RM : Filters

Characteristics of RM : PTFE/ PVDF/ PES/N66
Membrane filters (Housing is cartridge or capsule)

2. Intermediate

Description : Compressed air/ Nitrogen

Characteristics : Gas

2. Information of output/utility (product) :

The system shall be tested the integrity of the filters by various test procedures

like bubble point, Water intrusion test etc and shall give the result, the result

shall be printed digitally and graphical representation.

The system shall also print the result whether pass/ fail on the print out along

with the operator details.

The data shall be stored in the system itself during paper outages/ out of stock/

printer malfunctioning.

5.0 PROCESS DESCRIPTION

The Hydrophobic filters are using for filtration of the gases like compressed air and nitrogen which are going to be used into the Lyo process, hence the environment or utility after filtration shall be sterile, to have assurance over the sterility due to the filtered gas, the filter used for filtration shall be confirmed for its integrity at specified pore size.

The Hydrophilic filters (0.2 μ Cartridge or Capsule filters) are using for filtration of the final product bulk solution into the sterile vessel. To have assurance over the sterility on filtered solution, the filters used in the process are to be tested for integrity for specified pore size.

Equipment design and principle of working

The equipment is required to be design to perform the integrity test of the 0.2/0.22 μ hydrophilic/ hydrophobic filters by bubble point method.

The filters are of different types such as capsule, cartridge and disc filters and required to be tested the bubble point after wetting the filter membrane using filter supplier recommendations.

The equipment shall be suitable to work by the means of nitrogen as well as compressed air and the result shall be given accurate.

The equipment shall be portable and easy to handle during idle conditions or as and when required.

6.0 FUNCTIONAL REQUIREMENTS

The system shall have the multi-level passwords and each level shall have its unique features.

System shall have provision to store multiple recipes for different type of filters and the number of recipes shall be at least 10.

System shall show the display during the time of test running for its stage and the pressure applied.

It should have the provision for making or modify entries for the variable details like filter serial number/ catalog number, operator name, Employee code, etc...

It should have periodic password expiry or facility to change the password at its own level as and when required.

The system shall have the feature to store the tested data for a period of time to have back up.

It shall also have the provision to transfer the data to other portable computers or data collection system.

The system shall be suitable for changing the UOM of the pressure as per requirement

The test report shall be customized as per requirement on site during installation.

The system shall also have facility to check the integrity of filters by other methods like Water intrusion test, diffusion method, hydro corr test, air flow measurement etc...

7.0 Data collection and reporting

The following parameters should be recorded and stored in the system

automatically while complying to the norms of 21CFR part 11 whichever is applicable.

Recipe provision / data saving / data back-up / data security requirements:

Recipe provision required Yes ☐ No ☐

Data saving facility required Yes ☐ No ☐

(If yes mention the device for saving: _____ / Supplier to specify)

Data back-up required (during power failure) Yes ☐ No ☐ No ☐

(If yes mention the device for saving: _____ / Supplier to specify)

Data back-up required (during life-cycle) Yes ☐ No ☐

(If yes mention the device for saving: _____ / Supplier to specify)

Data security required (during life-cycle) Yes ☐ No ☐

(If yes mention the device for saving: _____ / Supplier to specify)

Performance Features

The system shall be suitable for operating at the following parameters

Condition	Limit
Temperature	23 ± 2 °C
RH	NMT 60%
Wetting solution	Methanol/ IPA/ Water
Gas	Compressed air/ Nitrogen
Operating Pressure	100 psi
Data reporting	Data with graph
Report type	Customized as per user requirement
Electric supply	3.5 Amps

Capacity

One filter at a time and shall complete the cycle with minimum possible time

Data backup for recipe storage is at least 10 and test reports shall be stored for 500 No's

Automation and safety features

The recipe shall be designed and saved, can be retrieved for execution.

The system shall not be affected due to the wetting solution or gases being used and it shall have provision to protect against them.

The testing shall be done automatically for all steps once the set up done and commanded for start the test.

It shall be protected with the different level passwords.

The software of the system shall be protected for virus attacks

The Integrity testing equipment should have a PLC/HMI that includes all process instruments to control the critical parameters associated with the Integrity testing equipment and also enable the operator to run auto & manual operation as per process and instrumentation diagram flow.

The control system features considered for control system should comply with the 21 CFR part 11 norms

The System should have at least three different access levels.

Operator

View/ Load recipe

Entry of Filter details

Start or abort the test

System status (e.g. Ready, Running) shall be displayed

Print reports

Supervisor

View / Load recipe

Creation/ deletion of recipe

Review the backup data

Print the reports (Current and back up)

Administrator

Password management

Modification of Functional configuration

Recipe modification

Considerations for electronic compliance

The electrical system of the equipment shall be housed as per the cGMP and cGEP standards, with adequate safety.

8.0 Drawings

All drawings to be provided in AutoCAD and hard copy prior to supply for approval

Expected documentation

The Supplier shall provide the documentation for preliminary review.

The Supplier shall provide documentation reflecting “as-built” condition with final delivery.

Following documents shall be delivered by the suppliers during the procurement life cycle:

S.No	Document details	Required (✓/ ✗)
1	Design Specification document (Hardware)	
2	Functional Specification (operational details)	
3	PLC Alarm/Interlock/Safety/ communication/power

Specification of PUF panels: -

PUF Panels: -

60 mm Thick PUF Panel with cam lock 0.45 mm Thick PPGI Sheet on both side of the surface Inclusive

Flashing Silicon Sealant, Aluminum Pop Rivets and Cam Lock Plug, With Bubble wrapping

Manual Sliding door with lock

Manual Sliding Door W 1500 mm x H 2100 mm Single leaf Heavy duty 60 mm thickness for Positive temp.

(Density 42kg/m³) with both side 0.6 mm PPGI Sheet Heavy duty Aluminum Track Aluminum Door Profile, SS

304 Door Opener & Closure EPDM

Gasket Cladding for Installation on 60 mm Thick Panels SS 304 Integrated Pad Lock,

PUF Slab

60 mm Thick PUF Slab with One side Trafelt

Lighting: LED type light

Working Condition: - 2-8 °C

5.0 | Construction Material | Prefabricated Construction

Panel MOC : PPGI

Type of insulation : PUF

Density of panels : 40 +/- 2 Kg/m³

Thickness of insulation : 60 mm

Type of panel : free Standing

Wall lamination : Inside/Outside-PPGI

Ceiling lamination : Inside/Outside-PPGI

6.0 | Component Details | Refrigeration System:

Should designed for Summer / Monsoon seasons

Indoor design 2°C

Operation design for 24hrs

Control Logic: -

The evaporator fan is interconnected with the compressor. First the evaporator fan starts, if the HP/LP switch and thermostat are all found healthy then only compressor will start. This is to protect the compressor. In case, if any of these are not working, the compressor will not start.

The compressor is interconnected with the temperature controller. The sensor linked with temperature controller senses the return air temp in room, if the temp is below the set parameter the compressor will trip and vise – versa.

The thermostatic expansion valve is provided in between the condenser and near evaporator unit. The need of expansion valve is to regulate the flow of refrigerant as per load in room. The probe connected to valve is mounted just after the evaporator, it senses the refrigerant required as per the requirement the valve regulate.

For the safety of compressor, the High pressure and Low-pressure switch is provided in condenser unit. If the discharge pressure is high the compressor will trip and if the suction pressure is low, the compressor will trip automatically.

7.0 | Utility Requirements | 230 Volt AC / 1 Phase, 50 Hz

8.0 | Accessories | Inclusive of all accessories as required for normal operation of equipment

9.0 | Documents Required | Complete documentation Package with following documents should be delivered at least one month in advance.

Design Qualification (DQ)

Installation Qualification (IQ)

Operational Qualification (OQ)

Performance Qualification (PQ)

Operational manual (2 Sets)

Maintenance manual (2 Sets)

Spare part list

Other certificates should be delivered after performing relevant test/calibration before installation

10.0 | Training | The vendor shall impart successful training for operation and maintenance for at least two personnel from user department and engineering /projects department and shall provide evaluation report.

11.0 | Commissioning scope | The supplier/vendor shall provide complete commissioning of the cold room. The supplier/vendor shall ensure that the equipment is fully functional and meets all the specified requirements.

12.0 | Operational requirements | Equipment should be user-friendly

13.0 | Startup support | The supplier/vendor shall assist with the startup of the equipment

14.0 | Deviations | Any deviations or modifications to the standard machine specifications must be clearly communicated and documented.

Deviations should not negatively impact the overall performance and functionality

15.0 | Cleaning procedures | The supplier/vendor shall provide detailed instructions on cleaning and maintenance procedures.

16.0 | Packaging | The equipment and its components should be packaged securely to prevent any damage during transportation.

The supplier/vendor should use suitable packaging materials and techniques to ensure safe delivery.

17.0 | Delivery | The supplier/vendor shall arrange for the safe transportation and delivery to the specified location.

They should provide a clear delivery schedule and keep the user informed of any delays or changes.

2.0 | Purpose of Use | Dynamic pass boxes used to maintain the cleanliness and integrity of controlled environments

3.0 | Justification | The primary function of a dynamic pass box is to maintain the cleanliness and integrity of controlled environments.

4.0 | Equipment Details | The dynamic Pass box is provided with electromagnetic interlocking arrangement for doors. The electromagnetic locking device is maintained with help of two Electric magnet fixed on each door. As soon as one door is opened the opposite side's magnet lock remain activated & door gets lock into pass box and white light will get "ON". And when both doors are in locked condition white light will get "OFF"

5.0 | Construction Material | All parts to be designed and manufactured in line with the current standards

6.0 | Component Details | Should be over all size of DPB 1170(W) x 1170 (D) x 1590(H) MM

Should have Fresh air pre-filters Box type, EU-7 rating, 3 µ

Should have Return air pre-filters Box type, EU-4 rating, 10 µ

Should have HEPA filters Box type, EU-13 rating, 0.3 µ

Should have centrifugal type blower

Should have pass box controller

Should have provision of LED type tube light

Should have electromagnetic lock

Should have door release button with status indication

Should have magnehelic gauges across HEPA filters

Should have DOP/PAO port

Should have MCB

Should be noise level of the dynamic pass box is less than 75dB at 1 meter from Dynamic pass box

Should have provision of Alarm warnings system

7.0 | Utility Requirements | Electrical Supply: 1 Phase + Neutral + Earthing

1.0 | Name of Equipment | Vial Sticker Labelling Machine

2.0 | Purpose of Use | The equipment being defined is intended to receive product Vial from an infeed conveyor, apply a label, overprint batch coding details and discharge the Vial onto an out feed conveyor. The equipment will provide label for Vial transport through the machine.

The labeler system will be operated adjacent to conveyor systems on an integrated packaging line and will be located in a designated operating area within a CGMP packaging operation.

3.0 | Justification | This URS defines the automatic labeling machine to place pressure sensitive labels on vaccine Vials.

Applying a pressure sensitive label to vials.

Printing product information on the label.

Inspecting pre-printed and printed characters on the label.

4.0 | Equipment Details | The equipment shall be mounted in Packing area with controlled environment, temperature range of 15 to 40 °C.

5.0 | Construction Material | All parts to be designed and manufactured in line with the Mild steel structure clad with stainless steel 304 sheet to meet GMP norms.

6.0 | Machine Details | Should have Output Speed: 150 to 250 Products/Minute (Speed depends on label length and products size)

Should have Dimensions: Approx. 2135 mm L x 1230 mm W x 875 + 50 mm H.

Should have Net Weight Approx. 450 Kg

Should have Label Length: 30 mm to 180 mm

Should have Label Width: 16 mm to 100 mm

Should have Label Roll Diameter: Max. 300 mm X ID 75 mm.

Should have Round Glass Vials: 2 mL to 10 mL.

Should have Label Roll Empty - Machine Stop System with Alarm.

Should have Missing Label in Roll - Machine Stop System with Alarm.

| | | Should have Special Label Sensor for sensing Transparent Film Labels which does not have any sensing mark on it.

Should have Option of Thermal Ink Jet Printer with various speed ranges available.

Toughened Glass or Acrylic Safety Cabinet for Machine.

Should have tower Light showing the machine status / operation.

Should have Color or Mono Touch Screen with PLC for machine operation and showing various error messages and information on display.

Should be Special Sensing system for checking missing label on product.

Should have be Low Compressed Air - Machine Stop with Alarm system for pneumatically operated coding system

Should have Vision System for checking Barcode, presence or absence of Coding or pharma code on labels.

Should have Online pneumatically operated product rejection system.

7.0 | 7.0 | Utility Requirements | Electrical supply: 1 Phase + Neutral + Earthing

Electrical load: 1 KW

8.0 | 8.0 | Accessories | All accessories should be included as required for normal operation of equipment

9.0 | 9.0 | Documents Required | Complete documentation Package with following documents should be delivered at least one month in advance.

Design Qualification (DQ)

Installation Qualification (IQ)

Operational Qualification (OQ)

Performance Qualification (PQ)

Operational manual (2 Sets)

Maintenance manual (2 Sets)

Spare part list

Other certificates should be delivered after performing relevant test/calibration before installation

10.0 | 10.0 | Training | The vendor shall impart successful training for operation and maintenance for at least two personnel from user department and engineering /projects department and shall provide evaluation report.

11.0 | 11.0 | Commissioning scope | The supplier/vendor shall provide complete commissioning of the Vial Sticker Labelling Machine.

This includes installation, setup, and integration of the machine into the existing production line.

The supplier/vendor shall ensure that the machine is fully functional and meets all the specified requirements.

12.0 | 12.0 | Operational requirements | The Vial Sticker Labelling Machine should have a capacity of 150-250 vials per minute.

It should be capable of accurately applying labels to vials of different sizes and shapes.

The machine should have a user-friendly interface for easy operation and control.

It should be compatible with the existing production line and integrate smoothly with other equipment

Post installation support

The supplier/vendor shall provide post-installation support for the Vial Sticker Labelling Machine.

13.0 | 13.0 | Startup support | The supplier/vendor shall assist with the startup of the machine after installation.

They should provide guidance on initial production runs and help optimize the machine settings.

14.0 | 14.0 | Deviations | Any deviations or modifications to the standard machine specifications must be clearly communicated and documented.

Deviations should not negatively impact the overall performance and functionality of the machine.

15.0 | 15.0 | Cleaning procedures | The supplier/vendor shall provide detailed instructions on cleaning

and maintenance procedures.

16.0 | 16.0 | Packaging | The Vial Sticker Labelling Machine should be packaged securely to prevent any damage during transportation.

The supplier/vendor should use suitable packaging materials and techniques to ensure safe delivery.

17.0 | 17.0 | Delivery | The supplier/vendor shall arrange for the safe transportation and delivery of the Vial Sticker Labelling Machine to the specified location.

They should provide a clear delivery schedule and keep the user informed of any delays or changes.

1.0 | Name of Equipment | De-Dusting tunnel

2.0 | Purpose of Use | The Equipment will be used for online removing of dust.

3.0 | Justification | This URS defines the de-dusting tunnel machine used for removing of dust.

4.0 | Equipment Details | The equipment shall be mounted in controlled environment, temperature range of 15 to 40 °C.

5.0 | Construction Material | All parts to be designed and manufactured in line with mild steel structure clad with stainless steel 304 sheet to meet GMP norms

6.0 | Component Details | Should have Combination Filter Efficiency 5 Micron & 10 Micron.

Should have Pre Filter:- EU 6, 95% Down to 5 Micron.

Should have Supply Motor Blower.

Should have Exhaust Motor Blower.

Should have SS 304 Dust Collector Tray.

Should have PVC Curtains Front & Back Side.

Should have Emergency Switch:- Entry & Exit Side.

Should have SS Air Nozzle.

Should have SS Perforation Grill.

Should have Exhaust Duct.

1.0 | Name of Equipment | Electric Stacker

2.0 | Purpose of Use | The electric stacker used to safe movement of materials and products. Its use can

contribute to improved productivity, reduced operational costs, and enhanced safety and compliance.

3.0 | Justification | An electric stacker can significantly enhance the efficiency of material handling and stacking tasks. It allows for quicker and more precise movements of goods, reducing downtime and increasing overall productivity.

4.0 | Equipment Details | It is used in warehouses and distribution centers to lift and move loads vertically and horizontally

5.0 | Construction Material | All parts to be designed and manufactured in line with the current standards

6.0 | Component Details | Should be fully Electric drive

Should be maximum capacity 2000 Kg

Should be lift height 4500 mm

Should be wheel type "polyurethane"

Should be Stacker travel speed (Laden / Unladen) 5/5.3 Km/h

Should be lift speed (Laden/ unladen) 58/148 mm/sec

Should have Electromagnetic Breaks

Should have AC traction motor

Should have 1.5 KW drive motor

Should have 3 KW lift motor

Should have safety belly button switch for operators' safety

Should have battery discharge indicator

Should have provision of quick battery change system

Should have 24 V and 210 AH capacity of battery

Should have provision of battery charging port

Should have Electric power steering system for smooth operation while maneuvering in confined area

Should have provision of control system

1.0 | Name of Equipment | Air-cooled Screw Air Compressor unit

2.0 | Purpose of Use | Compressed air is commonly used for instrumentation and control systems within pharmaceutical manufacturing facilities. It provides a clean and reliable source of pneumatic power for various sensors, actuators, and control devices used in process automation, ensuring precise and consistent operations.

3.0 | Justification | In pharmaceutical manufacturing, maintaining aseptic conditions is paramount to prevent contamination and ensure product quality. Compressed air can be used for aseptic operations, such as sterilizing equipment, providing clean air for various sensors, actuators, and control devices used in process automation, ensuring precise and consistent operations.

4.0 | Equipment Details | 21 CFM capacity Air Cooled Screw air compressor units comprising of sealed Screw compressor, including refrigerant air dryer & receiver. are to be installed at outside premises in provided space.

5.0 | Construction Material | All parts to be designed and manufactured in line with the current standards

6.0 | Component Details | Should be screw type air compressor.

Should be actual capacity of Air compressor 21 CFM

Should be compressor receiver capacity 200 liters

Should be refrigerant type air dryer

Should be pressure of air compressor 10kg/cm2

Should have dry Paper Type Suction Air Filter with Silencer

Should have three-way solenoid valve required for load/unload regulation of the compressor

Should have air / oil temperature switch

Should have provision to shut down the compressor in case of too high element outlet air temperature

Should have sight glass for oil level indication and oil filling arrangement

Should have safety valve

Should have oil draining arrangement

Should have three stage Air Oil Separation system

Should have emergency stop button

7.0 | Utility Requirements | Electrical Supply: 3 Phase + Neutral + Earthing

TABLE OF CONTENTS

CHAPTER 1 INTRODUCTION

1.1 Project Objective Statement:

The objective of this project is to establish and operate a state-of-the-art Human Plasma Derived Medicinal Products (HPDMP) manufacturing facility with an annual production capacity of 150,000 liters. This capacity will be subsequently increased to 500,000 liters per annum in the near future.

This facility aims to consistently and efficiently produce high-quality plasma derived products such as Human Serum Albumin (HSA), Human Normal Immunoglobulin (IgG), Hemophilia factors VIII, IX, Fibrin sealant etc. and Monoclonal antibodies (Mabs) while ensuring compliance with regulatory standards and best industry practices.

The primary goals of this project include:

Meeting Growing Demand: To address the increasing demand for plasma-derived products, ensuring a stable and reliable supply of essential treatments.

Quality Assurance: Implementing rigorous quality control and quality assurance processes to consistently produce safe and effective plasma derived products that meet or exceed regulatory requirements.

Operational Efficiency: Optimizing manufacturing processes to maximize productivity, minimize waste, and reduce operational costs to maintain competitiveness in the market.

Regulatory Compliance: Adhering to all relevant regulations and standards, including current Good Manufacturing Practices (cGMP), to ensure product safety, quality and efficacy.

Safety and Sustainability: Prioritizing the safety of both employees and the environment by implementing robust safety measures and eco-friendly practices throughout the facility.

Research and Development: Supporting ongoing research and development efforts to improve product quality, expand the product portfolio, and explore innovative techniques and newer technologies.

Supply Chain Reliability: Building a secure and efficient supply chain to source raw materials, transport finished products, and ensure timely deliveries to end users.

Stakeholder Satisfaction: Ensuring customer satisfaction by providing consistent and reliable plasma-derived products while maintaining a favorable relationship with employees, investors, and the local community.

By achieving these objectives, this Human Plasma Derived Medicinal Products manufacturing facility will play a pivotal role in meeting the critical healthcare needs of patients while contributing to advancements in the plasma industry.

Statutory Regulation

(A detailed list of provided in the References section at the end of the document)

In general, the following guidelines are referred to:

National Blood Policy, NBTC, Ministry of Health and Family Welfare.

National Policy for Access to Plasma Derived Medicinal Products from Human Plasma for

Clinical/Therapeutic Use: Addendum to National Blood Policy, NBTC, Ministry of Health and Family Welfare.

Technical manual, DGHS, MOHFW Govt. of India 2003.

Drugs and Cosmetic act 1940 and rules thereunder.

Schedule M Drugs and Cosmetic act 1940.

ISPE Baseline Guide Vol. 6, Biopharmaceutical Manufacturing Facilities ISPE Baseline Guide Vol. 3, Sterile Manufacturing Facilities.

WHO Good manufacturing practices for biological products.

Good manufacturing practice guideline for human and veterinary medicinal product.

PIC/s Guide to Good Manufacturing Practice for Medicinal Products.

USFDA Guidance for Industry – Sterile Drug Products produced by Aseptic Processing.

Executive Summary of The Project:

The Human Plasma Derived Medicinal Products manufacturing facility will be a green field project. The area earmarked for the project is approx. 6 acres in an industrial area on the outskirts of Nagpur city.

Different areas for the plasma manufacturing facility are identified and listed below:

Bulk Manufacturing Facility (for processing 150,000 L / annum)

Formulation, Fill Finish with lyophilization & Packaging

QC and R&D block

Administrative and QA Block

Ware House for Plasma, Packaging, Testing lab (for 32,000 L plasma)

Ware House (Finished Goods Storage)

Expansion area

Bulk Manufacturing Facility (for processing additional 350,000 L / annum)

Ware House for Plasma, Packaging, Testing lab (for additional 32,000 L plasma)

Supporting Blocks

Canteen

Engineering Office

Boiler House

Work Shop

Substation and Generator

Bore Well

Bio-Kill System

WTP/ETP/STP System

Fire Fighting System

Scrap Yard

Guard House and Reception Room

Security Cabin/Post

Boundary Wall and Parking etc.

Internal Roads and Drainage System

Rainwater Harvesting System

PROPOSED SITE PLAN

Annexure A : PLOT LAYOUT GF - (BULK MANUFACTURING)

Annexure B : Conceptual Layout – GF (Bulk manufacturing)

Figure 1: Proposed Site Plan

The company has identified different products to be manufactured in stagewise manner. List of products proposed to be manufactured are as follows:

Stage-1:

Albumin

Human Immunoglobulin

Factor VIII

Factor IX

Fibrin sealant

Fibrinogen

Stage-2:

Anti-D

Factor XI

Factor XIII

Hepatitis B IgG

Measles IgG

Protein C

Rabies IgG

Tetanus IgG

Thrombin

Varicella Zoster IgG

Table 1: Working Time Model Bulk Manufacturing

Table 2: Working Time Model Fill Finish

Environment Due Diligence:

As the proposed facility is required to handle biological products, proper segregation of type of wastes generated shall be adopted. Based on the categorization of the waste, appropriate treatment philosophy shall be adopted. Following broad categories are identified as wastes:

Process waste

General wash

Solid Process waste

General Solid wastes – Packaging materials etc.,

Gaseous waste from Process & Labs

Sewage

The facility shall be designed as zero waste discharge plant; meaning that every possible waste within the facility is categorized, treated with appropriate treatment step in line local pollution control board guidelines and then discharged safely. Soil contamination due to waste is also considered as a key factor and necessary steps & waste handling methods are adopted to avoid the same. As part of the design, all biologically waste will be treated in Primary treatment systems before letting it into a common wastewater treatment plant.

For the facility design, a detailed EHS document shall be prepared to identify risks and mitigation plans. During design, Construction & operation, EHS policy shall be made integral part of the sustainable operation.

CHAPTER 2

MARKET ANALYSIS

2.1 Human Plasma Derived Products and Its Share in The Total Components:

There are several medicinal products which are derived from human blood plasma by Plasma fractionation. The process for large scale purification was developed about 60 years ago by Cohn and co-workers. Therapeutically important proteins are Human serum albumin (HSA), Immunoglobulin G (IgG), Coagulation factor VIII, factor IX and Protease inhibitors.

HSA is one of the most abundant proteins in plasma and, together with IgGs, constitutes 80% of total plasma proteins. According to the data, HSA represented approximately 50% of total sales of therapeutic plasma protein products. The purified HSA is required for the treatment of hypo proteinemia, burn and heavy loss of blood due to injuries and other medical conditions. Plasma contains about 60 g/L of protein, out of which about 57 grams are used for many therapeutic products. This makes this human material unique as a source of multiple therapeutic products.

The concentration of different plasma proteins is variable. HSA is major protein component, followed by IgG. The wide concentration range of plasma proteins (less than 1 mg/mL to 40 g/L) is one of the potential challenges in designing separation and purification procedures.

2.2 Volume of Human Plasma Fractionated Worldwide (2022 to 2032):

In 2010, 78 fractionation plants were operating in the world, 25 of which were in China, 26 in Europe and 8 in the United States of America. The world plasma fractionation capacity was about 48.4 million liters. More than 500 tons of human serum albumin (HSA) and more than 40 tons of intravenous immunoglobulins (IVIg) are produced annually from more than 34 million liters of plasma. Total plasma marked of 2008 is depicted in pie chart (Figure 2).

Figure 2: Total plasma market of 2008 (Source: Marketing Research Bureau, Inc)

In 2015-16, the worldwide plasma market grew to a \$21,174 Million, almost doubled in terms of revenue from 2008. As compared to the 2008 statistics, in 2016 to IVIg and SCIG had a major share in plasma market, increasing from 29% to 47%. The market share for Albumin also grew from 9.7% to 15.7%. The market share for Factor VIII and Factor IX remained almost the same of 1 to 2 % from 2008 to 2016.

Figure 3: Plasma market in 2016 (Source: Marketing Research Bureau, Inc)

Global Plasma Fractionation Market Forecasts from 2022 to 2032

The Global Plasma Fractionation Market Size was valued at USD 27.1 Billion in 2022 (Fig 3).

The Market Size is growing at a CAGR of 6.7% from 2022 to 2032.

The Worldwide Plasma Fractionation Market Size is expected to reach USD 51.8 Billion by 2032.

Asia Pacific region is expected to grow the fastest during the forecasted period.

Figure 4: Global Fractionation Market

Companies in Domestic and International markets:

Key Market Players (Indian Manufacturers)

Plasma Gen Biosciences Pvt. Ltd. Bangalore

Reliance Life Sciences, Mumbai

Biocon Limited Bangalore

Intas Pharmaceuticals Ltd. Ahmedabad

Virchow Biotech, Hyderabad

Fusion Healthcare, Hyderabad

ICHOR Biologics Pvt. Ltd., Hyderabad

Bharat Serums and Vaccines Limited, Mumbai (Sales and marketing)

Global plasma Market Overview:

Table 5: Plasma Derived Therapy Market Share, By Region, 2022 *

Source: Precedence Research, Plasma derived market size, A report 2032

Future roadmap for plasma fractionation industry in India:

Global plasma fractionation program, plasma protein therapies & newer clinical indications for use of these products, has led to a rapidly increasing demand.

Due to the limited volumes of plasma available for fractionation and fractionation capacities, has led to various challenges in availability of these products.

Unfortunately, plasma fractionation program did not get enough attention, focus and motivation in India because of challenges like availability of plasma, less components processing units, cold chain infrastructure, political will and availability of solid plasma ecosystem.

As per literature information, in 2020 India, wasted 6.5 Lakh units of blood and blood components on annual basis (Source: Print line Media Pvt Ltd). A report published by Ministry of Health and FW (2018-2019); the total collection of blood was 12.2 million units out of which 75.05% of blood was componentized by NACO supported blood component separating unit (BCSU). Thus, the wastage of 24.95% hampered the availability of blood components to the patients. Though, with the passage of time there has been a significant improvement in the overall blood banking systems and availability of plasma products in India, still much needs to be done considering clinical needs of the country.

There is a need to create a vision document for short-term, mid-term and long-term self-sufficiency of plasma products in India. This can be divided into following two categories:

Availability of safe plasma: How to overall increase the quantity and quality of plasma for fractionation:

Increase voluntary blood collection, with increased repeat donor base.

As a part of the licensing process blood component separation should be mandatory and a plan for current licensed blood banks to migrate to complete blood separation units in the next 3 years.

Making blood component therapy mandatory in clinical practice, so that blood therapy can be minimized, and patients can use plasma products, which are relatively safer and easily accessible.

Create a solid regulatory pathway for permitting source plasma collection.

Regulatory system reform: Create a facilitative regulatory landscape for plasma industry to grow and evolve which would involve office of DCGI, NIB, Department of AIDS Control (DAC), IPC, NPPA, NACO, clinicians, patient groups, industry representatives and NGOs by;

Forming a national level body for steering plasma protein initiative in India.

Making a robust regulatory system for collection.

Controlling pricing for plasma and increasing indigenous manufacturing capabilities.

More funding for products and patient care.

Fast track regulatory approval for importing different categories of plasma/fractions/intermediate.

2.4 Market Trend for The Next 10 Years and Shift in Products (2023-2032):

With the growth of IgG sales, some relatively niche plasma proteins have had a significant impact on the market in the 2010s.

C1 esterase inhibitor (C1-INH): In 2010, the sales of C1 esterase inhibitor (C1-INH) for the treatment of hereditary angioedema (HAE) amounted to about \$200 million globally. This was 1.5% of total plasma proteins sales because the product had just been launched in late 2008 in the United States, and European sales were limited by the product's approval confined to only a few countries. By 2016, the sales reached over \$1.1 billion (5.2% of global PDMPs sales), as the product gained rapid acceptance mainly in the United States where the awareness of treatment and diagnosis of HAE were boosted by Shire and CSL Behring. As a result, C1-INH became the fourth largest plasma protein in terms of dollar sales worldwide, behind IgG, albumin and plasma-derived factor VIII. The market for C1-INH is continuing to grow strongly, and it is likely to increase its share in the future. A new formulation for subcutaneous injection will further facilitate product adoption. In addition, C1-INH is under investigation for transplant where antibody mediated rejection (AMR) has occurred.

Alpha-1 Antitrypsin (AAT): Other specialty products which continue to grow at a stronger pace is prothrombin complex concentrate (PCC) as well as alpha-1 antitrypsin (AAT). Global sales of AAT reached \$1.0 billion in 2016, or 4.7% of the total market. This is up slightly from 4.1% of sales in 2010, as the market in the United States has sustained approximately a low two-digit annual sales growth for the past 6 years, driven mostly by new patient identification and higher dosing. Most of the global AAT sales are generated in the United States, though sales of this therapy in Europe are trending upward after approval through the central European Medicines Agency (EMA) in August 2015. AAT is also under investigation for new indications, such as graft vs. host disease after hematopoietic stem cell transplantation (HSCT) as well as type 1 diabetes. If either of these areas show clinical trial success, the market would be expected to experience higher demand for the therapy.

Prothrombin complex concentrate (PCC): PCC have nearly reached the \$500 million in sales mark in 2016, up from under \$300 million in 2010. This impressive growth was due to the introduction of the first four-factor (factors II, VII, IX and X) coagulation product in the United States by CSL Behring in 2013 for the urgent reversal of vitamin K antagonist (VKA) anticoagulation in adults with acute major bleeding. Sales of this product reached close to \$200 million within four years of product launch. Sales also increased in Europe for the same indication, while at present little PCC is used in other markets around the world.

In the United States, the market share of the plasma-derived factor VIII sales fell from 11% in 2010 to 9% in 2016, while the share of plasma-derived factor IX products fell from 20% to 6%. The latter's market share drop was due to the faster adoption of the extended half-life factor IX products than those of factor VIII, because they offer longer intervals between infusions than the standard recombinant and plasma-derived products.

Globally, the plasma-derived factor VIII market share went from 27% in 2010 to 21% in 2016. For, the plasma-derived factor IX' market share fell from 34% in 2010 to 21% in 2016. According to NPPA report of 2022, government has set the pricing for scheduled drugs and plasma products.

2.5 Government Market and the Rates:

A market survey and several documents and reports were studied to see the price of various plasma products in government and private sector respectively (Table 6 and Table 7).

Table 6: Pricing of Plasma Products (Government of India)

CHAPTER 3 TECHNOLOGY

3.1 Analysis of Various Technologies Available (Centrifugation and filtration for solid / Liquid

Separation, Thermal and Chemical Inactivation Procedure, Ultrafiltration / Diafiltration, Nanofiltration, Chromatography or Any Other Technology or Any Hybrid Model)

Several technologies are utilized for plasma purification at commercial scale, each has its advantages, disadvantages and applications in isolating specific proteins of human interest. Some of the key methods are as under:

Methods for Plasma purification

Plasma Fractionation method with ethyl alcohol

Cohn+ Liquid Chromatography

Heat Shock technology

Ammonium sulphate+ Liquid Chromatography

Ion Exchange Chromatography (IEC)

Plasma Fractionation Method with ethyl alcohol:

Cohn and colleagues developed a protein purification method by using plasma fractionation technique for the first time. This approach is based on albumin solubility difference with other plasma proteins. As compared to other plasma proteins, albumin sediments are at lower pH and higher ethanol concentration. In this method there are five important parameters for separation of plasma protein.

Ethyl alcohol (8- 40%)

Temperature (-3 to -10 °C)

pH (4.5-7.2)

Protein concentration (5.1- 8 %)

Ionic strength (0.14- 0.01).

Protein separation is based on the increase in ethyl alcohol concentration thus albumin will be seen in the last fraction.

The method is suitable for large-scale and industrial production.

Disadvantages of Method:

Purity of the product

Denaturation of protein

The Cohn method combined with liquid chromatography:

The original Cohn method was modified by Oncley et al. in 1949 and Kistler-Nitschman et al. in 1962 in order to improve albumin purity.

The method is used for the purification of plasma proteins at the industrial scale

In this method after ethanol precipitation liquid chromatography step is added. Albumin is a by- product and other important therapeutic proteins including factor VIII, intravenous immunoglobulin (IVIG) and some other proteins are isolated from plasma.

Advantages:

Increased purity of proteins

Higher yields

Process Flow Diagram -Modified Cohn Method

Cohn Modified

Supernatant A

Heat shock method:

Albumin is stable during thermal fluctuation comparing to the other proteins of the plasma; therefore, it can be purified by heat shock purification method.

Albumin protein resists to increasing temperature up to 60°C at which potential pathogen are inactivated. After inactivation 0.04 M caprylic acid is added to stabilize the protein at pH 5 at 60°C.

At this stage other proteins of the serum are denatured and precipitated in solution. The final product (albumin) is concentrated by precipitation and ultrafiltration with purity of app 98%

Ammonium Sulphate precipitation combined with liquid chromatography:

Another method for albumin purification is ammonium sulphate precipitation combined with liquid chromatography which yields approximately more than 90 percent purified albumin.

In this method albumin is separated from immunoglobulins by 50% ammonium sulphate. Then lipids are removed using ice- cold acetone at 2-8°C.

For further purification of albumin from other contaminating proteins (especially transferrin which is the main contaminant, DNases and immunoglobulins), ion exchange and size exclusion chromatography are used.

Ion exchange chromatography (IEC):

IEC is widely used for albumin and other protein purification. Among them the anion exchange method has the most widely used. Three major steps of anion exchange consisting pre-treatment, purification and polishing.

The purification consists of two anion and cation exchange chromatography followed by polishing step comprising of two ultrafiltration and one gel filtration steps.

Process Flow Diagram Purification and Polishing Methods for Human Serum

Albumin (HSA)

The limitations of method:

Long processing time

To overcome these limitations, the new method for ion exchange membrane chromatography (IEM) using ameliorated adsorbers was developed.

The membrane chromatography method is simple and has high separation efficiencies due to shorter diffusion times, reduction in buffer usage, small foot print requirements. No complex hardware or packing is required.

Disadvantage:

Expensive membrane

Low efficiency

Table No 8: Comparison of Different Methods for Industrial Application

3.2 Recommending a Cost Effective and High Productivity Technology:

On the basis of table 8, for purity analysis and percentage recovery there are individual methods like fractionation and combined methods like Cohn + LC and IEC which can be considered.

Lifenthy should accept the method which give high productivity and acceptable quality of desired protein (purity levels) as per the regulatory expectations.

Cohn method when combined with chromatographic techniques is the most well-known method. In this method other proteins of plasma such as coagulation factors, immunoglobulins etc. would be separated in upstream, and albumin will be separated in the last fraction. Due to the robustness and high purity of plasma in large volumes, this technique, is cost- effective for plasma therapeutic protein production. Hence, this method currently seems to be a major method for albumin production.

However, taking into consideration, the latest developments in plasma fractionation technologies the detailed method along with the process flow diagram is recommended in section 4 of this document.

3.3 Obligations for technology service provider:

The selected Technology service provider shall have the following obligations:

Technology Transfer Plan:

To provide a detailed plan outlining the steps and timeline for the technology transfer. This plan shall include milestones, responsibilities, and contingencies. There should be a Lifenity steering committee to monitor the progress. All the deviations/changes should be approved by the committee.

Documentation:

To provide detailed documentation that describes the technology (Methods), equipment URS, buffer compositions, process steps, product specifications, and relevant data etc., This documentation is crucial for Lifenity to understand and replicate the technology.

Checklist of the details to be provided to Lifenity by the technology service provider:

Manufacturing:

RMs PPM and SPM and excipient specifications and source.

Dispensing instructions.

Detailed process flow diagrams.

Process validation requirements.

Batch Manufacturing record (BMR), SOPs, Master formulas.

List of SOPs for operation of equipment and other relevant procedures.

List of specifications and In-process controls (IPC).

Process flow diagrams (PFD) along with description of chromatography and other critical process steps.

Details of Equipment (Capacities, designs, qualification and placement with utilities requirements.

Manufacturing implementation sequence/model with process time for each unit operation.

Control strategy based on PPQ lots defining CPPs, CQAs and IPCs.

Yield calculation.

Cleaning procedures and validation.

Quality Control and Assurance:

Requirements of different areas for QC activities.

List of general and product related SOPs and STPs with specifications.

Raw materials and Active starting materials control and release strategies.

List of documentation for QC and QA activities.

Procedures for batch release, recall and complaints handling by quality assurance department.

Details of ware housing activities (Receipts of incoming RMS and active materials, sampling, Quarantine, testing and, release activities.

Cold chain requirements in ware house storage areas for active materials and finished products.

QC tests, STPs and specifications.

Validation of analytical and microbiology techniques.

Stability protocols as per regulatory expectations.

List of SOPs for operation of equipment and other relevant procedures.

List of OOS, OOT and any other quality related events/incidents relevant to Lifenity.

Details of primary packaging and secondary packaging materials with sources.

EHS:

SOPs and STPs related to EHS

Training:

It is the responsibility of technology transfer partner to provide on job training and qualification of the staff for each unit operation. Lifenity is responsible to provide necessary resources for trainings.

Training will comprise of knowledge transfer sessions, hands-on training, and exchange of personnel.

Lab Scale Implementation:

Lifenity shall initiate the technology transfer at lab scale to test its feasibility and performance in a real-world setting before full-scale deployment. The technology service provider shall provide the lab scale technology.

Regulatory Compliance:

Technology provider to ensure that the provided technology and its implementation comply with relevant regulatory requirements and support necessary approvals from regulatory authorities.

Scale-Up and Commercialization:

Technology provider shall provide support for Scale up of the technology for commercial production, at least three batches of each product and deployment. This shall involve optimizing manufacturing processes, securing additional resources, and launching the manufactured product with the given technology into the market.

Monitoring and Evaluation:

Provide continuous monitoring support at the production floor to Lifenity scientists for the performance of the transferred technology and conducting evaluations to assess its impact, identify areas of improvement and address any technology related issues that may arise.

Post-Transfer Support:

Providing ongoing support to address any challenges, optimize processes, and explore further opportunities.

CHAPTER 4

MANUFACTURING

4.1 As per the project implementation model, the following products shall be manufactured from 150,000L/Year of plasma.

Albumin

Factor VIII

Factor IX

Human Immunoglobulin (IgG)

Fibrin sealant

Fibrinogen

4.2 Manufacturing Process for Deriving the Above Suggested Products Derived from Plasma

4.2.1 Process Flow Diagram- Common Fractionation Steps

PFD- 1

PROCEDURE FOR COMMON FRACTIONATION STEPS:

P.1.F CUTTING AND POOLING

Approved plasma bags issued by QA are collected and thawed in a thawing tank with suitable provision for placement, retrieval and subsequent removal of thawing medium from the tank. The bags are checked for leakages after thawing and discarded if leakage is found. The thawed bags are cut under a bench type laminar flow and plasma collected in to suitable containers and finally pooled in process vessel to be taken for the next step.

P.2.F FILTRATION

Collected plasma after thawing is filtered to remove any suspended particles which may clog chromatography resins and column bed supports. Filtration is done using a depth filter which doesn't bind any proteins of interest. Filtered plasma is collected in a suitable tank with provisions to connect to a chromatography system for following process steps.

P.3.F CHROMATOGRAPHY – 1F

Filtered plasma is subjected to chromatography 1F to separate coagulation factor– F-VIII from rest of the fractions of interest. This step is essential to both separate F-VIII and also further polish plasma for

other chromatography steps. Fraction of interest is collected using patterns on chromatograms, can be programmed for automatic collection.

P.4.F LOAD PREPARATION FOR 2F

pH of the collected eluate from Chromo – 1F, is adjusted to 7.0 and loaded on the next chromatography column.

P.5.F CHROMATOGRAPHY – 2F

pH adjusted eluate from Step 4 is subjected to chromatography -2F to separate F -IX from the remaining fractions. F-IX is collected separately for further process and remaining fractions are further processed.

P.6.F TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION

F-IX depleted sample is collected and concentrated by TFF. Trans-membrane pressures (TMP) are adjusted to achieve maximum permeate flow while minimizing fouling of the membrane. Automated TFF skids are used to precisely control and maintain the TMP.

P.7.F CHROMATOGRAPHY – 3F

Concentrated solution from Step-6 is subjected to chromatography-3F to separate buffer components from earlier steps and the sample is condition for further process steps. The main purpose of this step is to maintain suitable conditions for removal of other abundant protein impurities which may interfere with polishing chromatography steps of individual fractions.

P.8.F IMPURITY REMOVAL

pH of the eluate from Step-7 is adjusted to precipitate impurities from products of interest.

P.9.F EUGLOBULIN PRECIPITATION

Impurities like Euglobulin are precipitated using precise temperature and pH conditions. Temperature is maintained at less than 10 °C and pH less than 6.

P.10.F PRECIPITATE SEPERATION USING CENTRIFUGATION

The sample if passed through a continuous centrifuge to separate the precipitate. Precipitates are separated as a slurry and discarded. Supernatant is used for the subsequent steps.

4.2.2 Process Flow Diagram IVIG

IVIG PURIFICATION PROCESS:

P.11.F LOAD PREPARATION FOR 4F

Conductivity of supernatant from Step # 10 is adjusted to facilitate favorable conditions for separation of IVIG and Albumin.

P.12.I CHROMATOGRAPHY – 4F

Conductivity adjusted sample is subjected to Chromatography 4F to separate Albumin from IVIG, this is the most critical chromatography step. Unlike in Cohn's process this gives a single step separation. The chromatography step is also operated in both flow through and elution modes to achieve the required separation. Albumin and IVIG are separated as different fractions after this step and collected in different process vessels. Individual fractions are processed separately to further purify and polished suitable for filling in glass vials.

P.13.I TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION

IVIG fraction is collected and concentrated to about batch volume using TFF. Trans- membrane pressures (TMP) are adjusted to achieve maximum permeate flow while minimizing fouling of the membrane. Automated TFF skids can be used to precisely control and maintain the TMP.

P.14.I pH AND CONDUCTIVITY ADJUSTMENT

Both pH and conductivity of concentrated solution from step 13 is adjusted using NaOH and Acetic acid.

P.15.I FILTRATION

pH and conductivity adjusted, concentrated IVIG fraction is filtered using 1.2-micron filter to clarify, suitable for loading on next chromatography step.

P.16.I CHROMATOGRAPHY - 5I

Filtered IVIG sample is subjected to Chromatography 5I to further purify IVIG from other protein impurities. Impurities and IVIG are collected as separate fractions, impurities are discarded and IVIG is further processed.

P.17.I pH ADJUSTMENT

pH of the fraction collected from step 16 is adjusted with 1M Acetic acid for following viral inactivation step. This is ideally done in the same vessel in which the fraction is collected.

P.18.I CONDUCTIVITY ADJUSTMENT

Conductivity of collected fraction is adjusted. This is ideally done in the same vessel in which the fraction is collected and pH adjusted.

P.19.I LOW pH TREATMENT FOR VIRAL INACTIVATION

pH of the collected fraction is adjusted to 4.0 with 1M Acetic acid. This is held at pH 4.0 at 37 °C for 10 hours for viral inactivation. This step is most critical with regulatory and quality prospective.

P.20.I FILTRATION

Viral inactivated IVIG fraction is filtered using 1.2-micron filter to clarify, suitable for loading on next chromatography step.

P.21.I SOLVENT DETERGENT TREATMENT FOR VIRAL INACTIVATION - VERY CRITICAL STEP FOR REGULATORS

The solvent/detergent (S/D) pathogen inactivation method was developed for the inactivation of enveloped viruses in plasma-derived medicinal products. Currently, S/D treatment for pathogen reduction of plasma for transfusion and plasma-derived medicinal products is the most common, validated and robust industrial method for the virucidal treatment of blood products. Although many millions of therapeutic doses of S/D inactivated products have been used to date, there is no report on transmission of viral infections caused by enveloped viruses in recipients. The safety of the S/D treatment is also shown by the absence of reports of toxicity or antibodies against neoantigens after large- scale exposure of patients to several million transfused units.

1% TNBP and 1% Triton X are added calculated as final volume v/v. TNBP and Triton are prepared in a buffer before addition to the bulk of fraction. Stock solutions are prepared.

P.22.I CHROMATOGRAPHY - 6I – FINAL CHROMATOGRAPHY STEP IN IVIG PROCESS

Filtered IVIG sample is subjected to Chromatography 6I to effectively remove added solvents and detergents in P.21.1 This also works for removal of endotoxins in the solution. IVIG bound to resin at an Acidic pH is selectively eluted using elution buffers at pH 9.0 in a process called as pH gradient elution.

P.23.I pH ADJUSTMENT

pH of the eluate from Chromatography 6I step is adjusted to preserve structural stability of IVIG and provide more stable conditions.

P.24.I NANO FILTRATION – (OPTIONAL STEP)

Nano filtration further ascertains barrier mode removal of viral particles from IVIG solution.

Plano make filters are used in the process.

P.25.I TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION AND DIA FILTRATION

IVIG fraction is concentrated using TFF about 5% IVIG w/v concentration followed by buffer exchange by dia-filtration at the same TFF running conditions.

P.26.I TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION

Dia-Filtered IVIG is concentrated to 6% w/v to facilitate final formulation at 5% w/v using the same TFF conditions. TFF conditions are maintained as in previous steps.

P.27.I FORMULATION

Buffered IVIG solution is formulated by adding 10% w/v pharmacopeial grade Mannitol. pH of this final solution is maintained at 4.2.

P.28.I PRE-FINAL FILTRATION

Filtration is done to decrease turbidity of the solution and also decrease microbial load on final sterile filtration step. This filtration is done using sandwich filter rated 1.2/0.6 micron.

P.29.I STERILE FILTRATION

Sterile filtration is done to further reduce bio burden and the process is not claimed a sterile operation. Final terminal filtration is performed before fill-finish stage.

P.30.I FILLING IN TO VIALS

Washed, sterile and pyrogen free vials are used to fill bulk solution of IVIG.

4.2.3 Process Flow Diagram Albumin Purification:

ALBUMIN PURIFICATION PROCESS:

P.31.A CHROMATOGRAPHY – 7A

Albumin fraction from chromatography step 4F is used to load on Chromatography 7A and separation is achieved by binding and elution mode. This step is final chromatography step in Albumin process.

P.32.A TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION

Elate collected from Chromo-7A is concentrated to 6-7% w/v and collected in a vessel suitable for next process step.

P.33.A HEAT TREATMENT

Concentrated albumin solution is collected in a process vessel having control for temperature and time (57 degree C/ 3 hours). End point of completion of heat treatment is taken as stable optical density@ 600 nm. Heating of material results in a slightly turbid solution with suspended impurities. This solution is cooled to room temperature or even up to 10 °C for better separation. Chromatography is performed at room temperature.

P.34.A CENTRIFUGATION AND FILTRATION

Albumin solution after heat treatment is centrifuged and filtered to remove suspended proteinaceous contaminant particles formed during heat treatment. Continuous centrifuge can be used for this step.

P.35.A CONCENTRATION AND DIA FILTRATION

Above heat treated sample is Concentrated to 12% and Dia filtered.

P.36.A CAPRYLATE ADDITION AND pH ADJUSTMENT

Caprylate is added to concentrated and dia. filtered solution. The pH of the solution is adjusted to 4.5. An IPQC check is done to check actual caprylate concentration and if required, adjusted the concentration.

P.37.A LOW pH INCUBATION

Solution is incubated at room temperature for about 7 hours followed by filtration to remove suspended particles.

P.38.A pH ADJUSTMENT

pH of the above solution is adjusted to 7.0

P.39.A CONCENTRATION AND DIA FILTRATION

Albumin solution is concentrated to formulation concentration and finally subjected to Pasteurization at 60 °C and finally filled.

4.2.4 Process Flow Diagram Factor IX

FACTOR IX PURIFICATION PROCESS:

P.40.N LOAD PREPARATION CHROMATOGRAPHY 8N

Elate from chromatography step 2F is suitably adjusted for pH and Conductivity followed by concentration using TFF. Solvent and detergent are added to achieve viral inactivation, followed by filtration.

P.41.N CHROMATOGRAPHY 8N

Chromatography 8N is performed in adsorption mode and eluted fraction is collected in a separate process tank

P.42.N LOAD PREPARATION CHROMATOGRAPHY 9N

Elate from chromatography step 8N is suitably adjusted for pH and conductivity followed by concentration using TFF.

P.43.N CHROMATOGRAPHY 9N

Chromatography is performed in adsorption mode and eluate fraction is collected in a separate process tank. This fraction is suitably concentrated and passed through a nano filter to achieve viral removal. This fraction is sterile filtered, formulated and filled in suitable vials.

4.2.5 Process Flow Diagram Thrombin

THROMBIN PURIFICATION STEPS:

P.44.T LOAD FOR CHROMATOGRAPHY 10T

Load from chromatography 10T is obtained from fraction of chromatography 8N.

P.45.T CHROMATOGRAPHY 10T

Chromatography 10T is performed in adsorption mode and eluate fraction is collected in a separate process tank. This fraction is suitably concentrated and passed through a nano filter to achieve viral removal. This fraction is sterile filtered, formulated and filled in suitable vials.

4.2.6 Process Flow Diagram Fibrinogen:

FIBRINOGEN PURIFICATION STEPS:

P.46.F LOAD FOR CHROMATOGRAPHY 11F

Load from chromatography 11F is obtained from fraction of chromatography 1F. The solution is precipitated and solubilized in suitable buffer solution.

P.47.F CHROMATOGRAPHY 11F Chromatography 11F is performed in adsorption mode and eluate fraction is collected in separate process tank. This fraction is suitably concentrated and passed through a nano filter to achieve viral removal. This fraction is sterile filtered, formulated and filled in suitable vials.

4.2.7 Process Flow Diagram Factor VIII

FACTOR VIII PURIFICATION PROCESS

P.48.E LOAD FOR CHROMATOGRAPHY 12E

Load from chromatography 12E is obtained from fraction of chromatography 1F, is filtered and checked for conductivity and pH, adjust pH and conductivity, if required before loading on the chromatography column.

P.49.E CHROMATOGRAPHY 12E

Chromatography 12E is performed in non-adsorption mode and flow through fraction is collected in a separate process tank.

P.50.E LOAD FOR CHROMATOGRAPHY 13E

Load for chromatography 13E is obtained from fraction of chromatography 12E, fraction is checked for conductivity and pH, adjust the conductivity and pH, if required before loading on the chromatography column.

P.51.E CHROMATOGRAPHY 13E

Chromatography 13E is performed in adsorption mode and eluted fraction is collected in a separate process tank. This fraction is suitably concentrated and passed through a nano filter to achieve viral removal. This fraction is sterile filtered, formulated and filled in vials.

4.2.8 Manufacturing for Stage-2 Products (PFD)

ANTI D IgG

Factor XI

ANTI MEASLES

TETANUS IMMUNOGLOBULIN

HEPATITIS-B IMMUNOGLOBULIN

RABIES IMMUNOGLOBULIN

4.3 Equipment Required to Manufacture for the Proposed Capacity of 150,000 L / annum

4.3.1 Equipment's for Plasma Bulk Manufacturing Facility

4.3.2 Equipment's for Fill Finish Production facility

4.3.3 Equipment's for QC / R&D

4.3.4 Equipment for QA

4.3.5 Equipment's for Plasma storage

4.3.6 Equipment in Finished Goods Storage

4.3.7 Equipment in Engg / Critical System

4.4 Detailed design

This document describes the strategic approach to the facility design, technology basis and products selected in stage 1 (150,000 L/ annum) and Stage 2 (500,000 L / annum)

The site is situated on the outskirts of Nagpur city spread over 6 acres.

The process design shall be based on Chromatography system-based separation.

It will be dedicated to manufacture of Human plasma fractions which include the following products in

Stage 1

Albumin

Human Immunoglobulin

Factor VIII

Factor IX

Fibrin sealant

Fibrinogen

The plasma processing capacity in Stage 1 will be 150,000 L / annum

The facility design shall have scope of increasing the plasma processing capacity to 500,000 L / annum.

Besides the products identified in stage 1 the following products have been identified in Stage 2. An

appropriate Technology partner shall be identified for providing the process know-how.

Anti-D

Factor XI

Factor XIII

Hepatitis B IgG

Measles IgG

Protein C

Rabies IgG

Tetanus IgG

Thrombin

Varicella Zoster IgG

The plant is designed as a monobloc facility which will be constructed as a two-floor facility

The ground floor shall contain the following operational units

Bulk plasma fractionation unit (150,000 L/ annum)

Warehouse Plasma storage (32000 L)

Admin / QA / Reception

Warehouse (RM/PPM/SPM/ Finished goods)

Electrical transformer area

Engineering workshop

Utility block

Raw water storage tank

Borewell

Boiler room

Chiller room

Kill tank system

Scrap yard

FUTURE EXPANSION AREA

Bulk plasma fractionation unit (350,000 L/ annum)

Warehouse Plasma storage (32000 L)

The first floor shall contain the following areas

Canteen area

Water system and engineering store

SPM store

Visual inspection

Label store

Change rooms

Fill finish with Lyo area

Quality Control area

Service area (for AHU's)

CHAPTER 5

PROPOSED SITE PLAN

Concept design including Structural, Architectural, Civil and Electrical:

FIG 1: CONCEPTUAL SITE MASTER PLAN

Conceptual Lay out Ground Floor (Bulk Manufacturing):

The bulk manufacturing area is designed in a manner to provide unidirectional flow of man, material and waste from the facility to avoid mix-ups and cross contamination.

All the ancillary functions are located on the ground floor and separated from bulk manufacturing area.

In the ground floor following facilities are present:

Bulk manufacturing facility -01

Bulk manufacturing facility -02 (Future provision)

Quarantine Plasma Storage/Testing lab/Ware house

Future provision for plasma storage

Finished goods storage & dispatch

Administrative Block

Utility Block

Workshop

DG Set and Transformer area

UG collection tank, ETP/STP & Kill Tank

Bore well, UG 500KL storage tanks

Chiller and Boiler rooms

UG SUMP

Bulk Manufacturing Block

Change Rooms :Bulk manufacturing facility-01, personnel entering the processing area will undergo a series of two dress changes applicable to clean rooms of different classifications. The separate change rooms

are provided for male and Females.

Locker Room: This shall be the first change where the personnel remove their street shoes and clothes and keep these belongings in the provided double door lockers.

For the exit from facilities, separate change rooms are provided.

In exit change room personnel shall remove the clothing (Overall, head gear, gown and pant and reach the Locker room and put on their street clothes from the lockers and will exit the facility.

Preparation and Processing areas:

To support the manufacturing operations Buffer Prep.(Support area) shall be responsible to prepare various materials, reagent, chemicals and sterile materials to be used in the manufacturing operations.

The provisions for dry and moist heat sterilisations are provided in this area.

The manufacturing facility is construed and designed in a manner to protect product from any mix-ups, cross contamination and making the operator's work path and activities less complex and enabling compliance.

The processing areas for thawing of bulk material (Plasma), fractionation and downstream processing (Chromatography) are separately provided in the lay out to avoid any mix ups and cross contamination.

Plasma storage/ Testing lab /ware house/ Future provision plasma storage:

All the incoming and released raw materials, packaging material required to support the manufacturing shall be stored in the ware house.

All the incoming plasma shall be sampled and tested in ware house testing lab.

There is a provision for the storage at -20degrees C for of plasma in the ware house.

For the envisaged future expansion of manufacturing capacities from 150000Lit.to.500000Lit / year an additional storage area is reserved in the ware house, this area shall be furnished during future expansion of the capacities.

Finished goods storage and despatch:

All the released material shall be stored in the released cold rooms. At the time of shipment, the packed material shall be transferred from finished goods dispatch area in the ground Floor.

Administrative Block:

All the administrative support functions shall be dealt in this block.

Holding tank /ETP/STP:

All the liquid waste generated in the bulk manufacturing area shall be properly segregated. The biological waste material shall be transferred to holding tank from there it will be transferred to kill tank for final processing and discharge to ETP through holding tank.

03 UG water storage tanks (5KL) each & Utility Block:

The ground water shall be transferred to UG storage 03 tanks having capacities of 5KL each. The raw water will be treated and will be used as feed water for the generation of PW, WFI and clean steam.

Engineering work shop:

All the maintenance and repair activities shall be undertaken in the work shop.

DG and Transformer room:

For the uninterrupted power supply separate area is designed in the lay out.

Chiller and Boiler room:

The facility of chilled water and plant steam required for various system shall be routed through chillers and boilers room.

First Floor: On the first-floor following facilities are housed:

Formulation / Fill Finish area

Finished goods quarantine

Labeling, packing & Visual Inspection

Water System and Eng. store

Bulk Store

SPM store

PPM store

R&D lab

QA/QC

Canteen

FIG 2: CONCEPTUAL LAYOUT FOR BULK MANUFACTURING FACILITY

The bulk manufacturing area is designed in a manner to provide unidirectional flow of man, material and waste from the facility to avoid mix-ups and cross contamination.

All the ancillary functions are located on the ground floor and separated from bulk manufacturing area.

In the ground floor of Bulk manufacturing facilities following key areas are present:

Bag Cutting and pooling area

Plasma Thawing Area

Downstream processing (Chromatography)

Columns packaging & skids

Washing area

DHS / Autoclave area

Cold room

Buffer Preparation

Plasma day store

Chemical Day store

Change rooms

Change Rooms: Bulk manufacturing facility -01, personnel entering the processing area will undergo a series of two dress changes applicable to clean rooms of different classifications. The separate change rooms are provided for male and Females.

Locker Room: This will be the first change where the personnel remove their street shoes and clothes and keep these belongings in the provided double door lockers.

For the exit from facilities separate change rooms are provided.

In exit change room personnel shall remove the clothing (Overall, head gear, gown and pant and reach the Locker room and put on their street clothes from the lockers and will exit the facility.

Preparation and Processing areas:

To support the manufacturing operations Buffer preparation (Support)area shall be responsible to prepare various materials, reagent, chemicals and sterile materials to be used in the manufacturing operations.

The provisions for dry and moist heat sterilisations are provided in the area.

The manufacturing facility is construed and designed in a manner to protect product from any mix-ups, cross contamination and making the operator's work path and activities less complex and enabling compliance.

The processing areas (Upstream) bag cutting , pooling and segregated plasma thawing areas are provided.

There are separate areas for Plasma fractionation and downstream processing in stagewise manner (Chromatography) provided in the lay out to avoid any mix ups and cross contamination.

For packing of chromatographic columns dedicated area is provided in the layout of bulk manufacturing facility

Cold Rooms:

Cold rooms are provided in the facilities for the storage of heat labile materials like chromatographic gels, in process samples and materials.

FIG 3: CONCEPTUAL LAYOUT FOR BULK PLASMA STORAGE FACILITY

Plasma storage facility is housed on the ground floor adjacent to the raw material storage area.

All the Raw materials shall take through the dedusting tunnel to clean and remove the dust from the external surface of RM containers. After sampling of RM, the goods shall be transferred to RM quarantine area pending the testing and release of materials from quality control lab.

The RMs which do not meet the specifications shall be transferred to rejection room. Rejection room has access control. Only authorised persons are allowed to enter the area.

In coming plasms is taken inside the ware house through plasma receipt corridor.

Incoming plasms is sampled in plasma sampling room, equipped with (RLAF), remaining plasma is transferred to plasma quarantine area having -20 degrees C cold facility.

After the completion of serological testing and other necessary test in the serology lab and QC lab

plasma is shifted to released plasma cold room at -20degrees C.

Barcoding for identification of each lot of bulk plasma is done in Barcoding room.

There is a provision for future expansion of cold facilities to cater to 500000 Lit Plasma.

FIG 4: CONCEPTUAL LAYOUT FOR FILL FINISH FACILITY

Fill finish facility is housed on first floor of the bulk manufacturing facilities.

For entry into the area separate entries for males, females and visitors are provided. After series of changes, personnel shall enter into the core areas of fill finish facility.

In the core area formulation area is present.

In the formulation area all the released bulks shall be formulated on campaign basis. The formulated bulks shall be filled, capped through automatic machine and inspected for any abnormalities (particulate matter) visually. Separate laundry area is provided for washing of soiled gowns.

Following are the key areas in Fill Finish facility

1. Formulation
2. Fill Finish area
3. Lyophilisation
4. Change Room
5. Disinfectant and Material Prep area
6. Cold room
7. Clean laundry
8. Packing area

FIG 5: QC AND R&D FACILITY

On the FF of Bulk manufacturing facilities R&D, Quality Assurance and quality control facilities are located.

Four labs are dedicated for research and development activities. The technology at small scale shall be transferred to R&D labs.

Adjacent to this, quality control labs are housed. Primarily quality control labs shall be responsible for testing

Raw materials, PPM and SPMs.

In-process testing of intermediate products

Bulk plasma -Physicochemical and microbiological test

Formulated Bulk plasma products

Fill finished plasma products

Microbial testing of critical utilities.

Microbial testing of environmental samples from clean rooms.

Following labs are envisaged in quality control

- 1 Sample receipt
2. Chemical / Glassware Storage
- 3 TOC / LPC
4. Instrument Room
5. Balance Room
- 6 Wet Lab(Chemical)
7. Hot Zone/ Washing
8. MLT
9. Incubator rooms
- 10 Sterility room
- 11 Washing & Sterilization area
- 12 Media prep and Storage
- 13 BET Room
- 14 Stability Testing

Quality Assurance:

Annexed to QC labs quality assurance department is located. In quality assurance following functions of site will be undertaken

Documentation and control

Trend analysis of critical utilities and Change management

Audits, Inspections, Pest control and Vendors management

Validation. Qualification and Calibration

Complaints and Recalls

Lot Release and Product review.

Trainings

FIG 6: ELEVATION DRAWING

5.3 Lay out Philosophy:

Plasma fractionation and processing is complex and critical manufacturing operation with respect to the receipt of plasma (Starting material) its downstream processing, formulation and fill finish. The facility requires strict cGMP and regulatory compliance to ensure the product quality and safety of the operator and environment.

The facility lay out adheres to GMP guidelines (Schedule M of Drugs and cosmetic act 1940 and Rules 1945).

The layout philosophy is based on the integral evaluation of processes, potential risks, man and material movement, generation and flow of solid and liquid waste etc.

The manufacturing facility is construed and designed in a separate block to protect product from any mix-ups, cross contamination and making the operator's work path and activities less complex and enabling compliance. Flow of personnel, clean and dirty materials are unidirectional with logical sequence of operations.

HVAC zoning of the facility (control areas) for the manufacturing operations is done based on the operation and its criticality (Plasma collection, fractionation, purification, and storage) to minimize the risk of contamination and to maintain physical conditions like temperature and humidity. The physical conditions should also be suitable to the comforts of the personnel working with protective clothing.

In the lay out provision for separate change rooms for entry and exit from clean areas is made. Change rooms design contains airlocks to provide physical separation of the different stages of gowning.

CHAPTER 6

SOURCING AND HANDLING OF RAW MATERIAL

6.1 Exchange Value of Plasma per Liter and Projected Value Over a Period of Seven Years:

As per the literature survey and discussion with different stake holders the exchange value of plasma in 2023-2024 is INR 2200/Liter and in next 5 years the estimated plasma price shall be expected to be ≈INR 2800/L.

Figure 8: Exchange value of plasma per liter and projected value in INR

6.2 Donors' Selection Criteria:

In India, the plasma industry is dependent on voluntary blood donation. Human blood is the source of plasma which is used to manufacture various therapeutic plasma proteins after fractionation.

In blood banks the cellular components (RBC, WBC, and platelets etc.), are separated out for different applications and the plasma is collected from blood banks by plasma fractionators for clinical / therapeutic use as per "National Plasma Policy" of Ministry of Health & Family Welfare.

The selection and management of blood donors is an essential part of the blood donation process. National health authorities and blood transfusion services are responsible for ensuring that the national system is in place for the selection of all blood donors through an assessment of their suitability to donate blood.

Following are the selection criteria for donors:

Health

Age (18-65 years)

Time between blood donations

Blood pressure

Body temperature

Hemoglobin content etc.

Test for HBsAg*

Test for anti-HIV*

Test for anti-HCV*

*All three tests should be negative. An additionally test for STD is also performed.

6.3 Plasma Donation Testing, Epidemiological Surveillance, Post Donation Information:

Plasma Donation testing:

The collected plasma is screened for the following:

Test for HBsAg

Test for anti-HIV

Test for anti-HCV

All three tests should be negative. Additionally test for STD is also performed.

Epidemiological surveillance, post donation information:

To ensure optimal long-term safety of plasma for fractionation, it is recommended to establish continuous epidemiological surveillance of the donor population.

The objective of this survey is to know, as precisely as possible, the prevalence and disease incidence, and trends of infectious markers that are relevant to the safety of medicinal plasma products so that appropriate counter-measures can be taken in a timely manner.

The system should not only be able to gather epidemiological data at the national and regional level but also among the donor populations that are providing blood or plasma for fractionation at individual blood establishments within a country or a region. The information from the epidemiological surveillance can furthermore be used to detect and assess.

Differences in disease patterns between donor population.

Trends of infectious marker.

The relevance of any preventive measures such as a strengthening of donor selection process, additional exclusion criteria, or implementation of any additional screening tests to avoid contamination of plasma products.

To detect any new or emerging pathogens in the community.

6.4 Handling of Blood, Plasma Freezing, Storage, Cold Chain and Complete Logistics Plan:

Handling of Blood:

A standardized and validated procedure for the bleeding shall be followed.

The presterilized container (Bags) shall be used to collect the blood.

Identity of the donor should be confirmed with relevant documents before venipuncture.

The collected blood used for plasma fractionation should be mixed well with the anticoagulant solution to avoid risks of activation of the coagulation cascade.

Presently, automated blood collectors are used in which plasma is separated from cells and the cells are resuspended and returned to donor in series of return cycles.

In most of the centers the centrifugation or filtration or combination of both process is followed to separate the cellular components from plasma.

The collected blood should be weighed and labelled properly in order to ensure full traceability at each stage of plasma production.

Information on the label of the blood storage containers should include:

Name of the blood product

Volume or weight

Unique donor identification number

Name of the blood collection center

Shelf life

Storage temperature

Name, content and volume of anticoagulant

Laboratory samples should also have the same information and must be stored securely at appropriate temperature

Blood Holding:

It has been shown that whole blood anticoagulated with CPD, transported and stored at 22°C for up to 8 hr prior to separation of plasma is suitable for the production of plasma for fractionation.

However, storage of blood beyond 24 hours the factor VIII activity is reduced by 15 to 20 percent. Rapid cooling of whole blood to 22°C +/- 2°C after collection protects factor VIII and may allow storage of blood for 24 hr.

Transportation/storage of collected blood at 4°C with different anticoagulants (ACD, ACD-adenine, or CPD) consistently appears to reduce the FVIII content, but not necessarily that of other proteins.

Blood holding time for the extraction of various components should be validated by the company.

Plasma Processing and Transportation:

After separation of plasma, freezing is an important processing step that has an impact on content of factor VIII. Several aspects of the freezing conditions of plasma for fractionation have been evaluated in this document based on the literature search.

Freezing of Plasma:

The requirements for the temperature at which plasma should be frozen depend upon the type of proteins to be fractionated.

As per pharmacopeial guidelines, recovered or apheresis plasma for fractionation to be used for the manufacturing of labile proteins (Factor VIII concentrate) should be frozen rapidly, within 24 hours of collection, at -20 °C or below.

However, freezing conditions are currently under debate. It is suggested that recovered plasma used to

manufacture stable plasma proteins (e.g., albumin and immunoglobulins) should be frozen within 72 hours of collection at –20 °C or below.

Plasma freezing process should be validated by life Nity to extract the desired plasma proteins.

Storage of Plasma:

Plasma for fractionation should be stored at –20 °C or below. When plasma is stored at -20°C it has the shelf life of 2 years. However, when plasma is stored below -20°C has shelf life of 3 years.

Stability/Shelf-life studies should be conducted on at least three Pooled Plasma bulks during initial phase as a minimum by the company and subsequently one batch of pooled plasma should be taken for stability on annually basis after approval from the quality assurance department. The stability studies should be well documented.

Transportation of plasma and its validation:

Transport of plasma pools (Bulk) and samples to the processing site should be done according to approved and validated procedures. Temperature monitoring device should be used to record the temperature during transportation. Any deviations in the temperature during transportation should be notified to QA department for impact assessment (compliance and quality).

Simulation studies should be conducted at site to validate the packaging and its transportation.

6.5 Sourcing of Plasma from Government and Non-Government Blood Banks:

There are different sources of plasma in India- Government, NGOs and some private facilities recognized by the government. The Govt. has the full responsibility for the blood program.

The surplus plasma from government hospitals and blood collection centers and blood banks are sold through tenders.

As a minimum there are certain conditions for plasma fractionator to fulfill before applying for plasma procurement as follows:

The plasma fractionator must be licensed by the Government of India for plasma fractionation and manufacturing clinically usable products in a cGMP facility.

The fractionator is accountable to update plasma procurement center about the nature and quantity of all the products manufactured from the plasma received from the center.

The fractionator must ensure that none of the products recovered from this plasma are exported before fulfilling domestic demand.

Buy Back policy:

In some cases, government buy plasma derived products from the fractionator for use.

6.6 Equipment for Proper Collection, Storage and Separation of Blood Components:

Following is the list of equipment required during the different stages of blood processing:

Blood Collection

Donor weighing balance

Haemoglobinometer

Sphygmomanometer

Stethoscope

Blood mixer and shaker

Tube stripper and Di-electric tube sealer

Needle destroyer

Blood Processing

Refrigerated Centrifuges

Double pan balance

Plasma Expresser- Manual/Automated

Blood Storage

Blood Bank Refrigerator

-20°C freezers

-80°C deep freezers

Platelet Agitator and Incubator

Cell Separators (Apheresis machine)

Blood Testing

pH Meter

Cell Counter (optional)

Coagulometer (optional)

Automated Cell Grouping system (optional)

Equipment for Gel technology (optional)

Table top centrifuge

Serological water bath

ELISA reader (plate reader / Strip reader)

VDRL shaker

Blood Distribution

Transportation vans (optional)

Insulated blood bags container with provision for storage between 2 °C to 8 °C

6.7 Importing of Plasma from Neighboring Countries and Indian Regulations:

India is highly import dependent for its plasma product needs, which are considered to be life-saving medicines. At this point in time, India produces majorly only two plasma products, albumin and intravenous immunoglobulin (IVIg) from local plasma.

Because of changing disease pattern, improved clinical diagnostic facilities, affordability, medical tourism and many other factors the demand of blood products is increasing. This creates a huge demand and supply gap and many patients lose battle of life because of non-availability of these products. Various hyper-immune plasma proteins (Anti-D, tetanus immunoglobulin, hepatitis-B immunoglobulin, and rabies immunoglobulin) are 100% imported or prepared from imported bulk.

6.7.1 Indian Regulations & Regulatory Bodies:

The Plasma Policy aims at making available, easily accessible and adequate supply of high quality of human plasma derived proteins for clinical/ therapeutic use. In India the plasma is separated from safe and quality blood from voluntary non-remunerated regular blood donor. Blood and plasma are regulated by different rules mention in drugs and cosmetic act 1940 and by different regulatory agencies as mentioned below.

Following regulations and rules are applicable:

The Drugs and Cosmetics Rules, 1945, framed under the Drugs and Cosmetics Act, 1940:

Includes human blood under the definition of "Drugs" under Section 2(b)

Regulates functions of blood banks, which provide recovered plasma for plasma fractionation (Part XII C specifically regulates the collection and storage of plasma for fractionation)

The National AIDS Control Organization (NACO), under the Ministry of Health and Family Welfare) to oversee operation of blood banking services in India.

National Blood Transfusion Council (NBTC) is the apex policy-making body, under NACO, making central licensing mandatory, increasing voluntary donation base and setting of quality standards.

State Blood Transfusion Councils (SBTCs) are responsible for the smooth functioning of blood transfusion services at a state level.

Drug Standard Control Organization (CDSCO) and State Drug Control Organizations' play a vital role in key aspects such as, approval of licenses, and enforcement of standard transfusion practices to ensure safe,

quality and efficacious blood and its components in clinical practices.

National Institute of Biologicals (NIB) Nodal governmental organization under the Ministry of Health and Family Welfare responsible for the testing and release of biologicals in India including blood plasma.

CHAPTER 7

PRODUCTION PROGRAM

7.1 Product and Product mix:

In phase 1 of the project the following products are proposed to be manufactured from normal human plasma.

Human Serum Albumin

Normal Immunoglobulin

Factor VIII

Factor IX

Fibrin Sealant

Depending upon the market demand and production capacities, product mix strategy can be formulated.

Various permutations and combinations are possible to manufacture different products. On the basis of PFD given in Chapter 4, different products shall be purified in different steps during the downstream processing of pooled plasma bulk (fractionation of plasma).

However, it is suggested that Lifinity shall take the first campaign of product which is at the highest demand followed by the products with moderate and low demand. As an alternate, the high yielding product shall be manufacture first to have sufficient stock followed by a campaign for low yield and moderately yield products.

Plasma requirements based on the manufacturing capacities:

Considering 1,50,000 Liters of plasma processing capacity, plasma bags requirement are presented in table below:

Table:9

Production Capacities and Yield Calculations:

HSA is major protein component, followed by IgG in plasma. The wide concentration range of plasma proteins (less than 1 mg/mL to 40 g/L is one of the potential challenges in designing production capacities.

Source: (J.D. Andrade et al. Plasma protein adsorption: the big twelve, Ann. N.Y. Acad. Sci., p. 158-172,1990. & Chapter -2 of DPR).

However, for calculation purpose below mentioned protein concentrations in normal plasma are considered.

It has been reported in the literature that depending upon the downstream processing and sterile/terminal filtration, recovery of the protein of interest is 50% at final stage.

Source: (Overview of Albumin and Its Purification Methods: Adv Pharm Bull, 2016, 6(4), 495-507 doi: 10.15171/apb.2016.063 <http://apb.tbzmed.ac.ir>) as shown in the table below.

Basis of Yield calculations:

Based on vessel size, the batch size assumed is 1000 liters, on every alternate date, a new batch can be initiated, therefore 15 batches shall be processed per month (one batch/ alternate day).

The yield for 1000 liters batch is as mentioned below.

Table 10: Yield for 1000L batch

In the EOI document, the phase 1 target is to process 1,50,000 Liters of plasma annually. The output obtained with 1.5 lac liters of plasma for the products mentioned for stage1 is as under.

Table 11: 150,000 Lit annual capacity

Therefore, to achieve the plasma processing target, 15,000 liters of plasma shall be processed on monthly basis at site.

Production Scaleup from 150,000 to 500,000 lit per annum:

Lifinity will increase its plasma processing capacity to 500,000 liters annually in phase 2 of the project implementation.

To achieve the plasma processing target, 50,000 liters of plasma shall be processed monthly. Two strategies, can be followed:

Strategy 1:

To keep number of batches equivalent to stage-1 (i.e., 15 batches per month), the individual batch size shall be 3400 liters. The yield calculations are given below.

Table 12: Yield for 3400 L batch

Strategy 2:

Alternatively, if the batch size is further increased to 5000 liters, the number batches shall be reduced to 10 batches per month as one batch can be initiated after every 3 days. The yield for a 5000 liters batch is as mentioned below.

Table 13: Yield for 5000 L batch

Total Production capacity:

The total production capacity with 500,000 Lit. of Plasma/year is given in the table below.

Table 14: Total production capacity with 500,000 Lit. of Plasma/year

Note:

For scale up to 500,000 Liters only 6 products (HSA, IgG, F-VIII, F-IX Fibrin Sealant, Fibrinogen) are considered.

Fibrin sealant is prepared by mixing Fibrinogen and Thrombin; therefore, production capacity of fibrin sealant is equal to the production capacity of Thrombin.

CHAPTER 8

PROJECT IMPLEMENTATION MODEL

Lifinity shall implement the PDMP manufacturing in a phased manner.

A suitable technology partner for the Plasma fractions shall be identified and contracted with for process know-how. The agreement will fulfil criteria mentioned in Section 3.3 of this document.

The project shall be initiated at small scale to establish the process for the products identified in stage 1.

Once the process, yields and quality are established as per the specifications, the project will proceed to the commercial scale stage

Commercial scale:

The company will initially procure 150,000 liters of plasma per year for fractionation to produce the following product in Phase-1.

Human Serum Albumin (HSA)

Human Immunoglobulin (IgG)

Factor VIII

Factor IX

Fibrin sealant

Fibrinogen

All the areas of the manufacturing block (Facility-1) will have sufficient space to cater the volumes and products without compromising on any of the cGMP and regulatory expectations.

The following systems installed during Phase-1 of the project will also be matching the requirements for Phase-2 (Expansion Project) capacities.

Clean utilities

Black utilities

Filling

Freeze drying and

Packaging lines for the final product

8.2 Facility Expansion:

For handling additional 350,000L of Plasma:

In Phase-2, the company shall procure additional 350,000 Liters of plasma to manufacture the following additional products.

Anti-D IgG

Factor XI & XIII

Fibrinogen

Hepatitis B IgG

Immunoglobulin G

Measles IgG

Protein C

Rabies IgG

Tetanus IgG

Thrombin

Varicella Zoster IgG

While implementing Phase-2 of the project, Lifenity shall extend the manufacturing operations to Facility-2 and shall procure the following additional systems to match the capacities of processing 350,000 L/year of plasma which are as follow:

Tank Systems

Chromatography Systems

Autoclaves

Dry heat sterilizers

Quality control and Quality assurance units developed during Phase-1 will be also cater to the Phase -2 products and other ancillary activities.

Central ware house space shall be adequate for future expansion. However, the additional cold Chain equipment (Freezers) and storage racks etc. for the storage of active material (plasma) and finished products shall be procured during Stage 2 expansion.

In Phase-1 of the project the bulk manufacturing operations will run in a single shift of 8 hours working /day, with effective working for 6 hours. The shifts can further be evaluated based on number of batches for processing/week. Likewise, the filling operations will run in scale down mode to meet the market requirement.

Monoclonal antibodies (Mabs) – Future considerations:

A monoclonal antibody are Y-shaped glycoproteins that detect and bind strongly to their antigen.

Monoclonal antibodies stems from a single white blood cell clone. Monoclonals not only bind to a single epitope of a target antigen but also activates immune responses, e.g. antibody-dependent cell-mediated cytotoxicity (ADCC) and recruits further immune cells such as phagocytes and are thus highly specific

Monoclonal antibody production:

Several technologies for monoclonal antibody production have been developed and the respective downstream processes are optimized. Some of the industrial scale technologies are:

Hybridoma cells production

Phage display technologies

Single B cell technologies

Hybridoma production:

In this technology fusion of antibody producing B cells of an immunized mouse with myeloma cells is done produce unlimited antibodies. Hybridoma cell line that can be maintained indefinitely

Disadvantages:

Use of lab animals for immunisation

Risk of mutations in the antibody with aging of hybridoma

Expression of additional variable domains by the cell line

Long lead times and labour-intensive operation

Phage display technology:

Phage display technology circumvent several disadvantages of hybridoma technologies and speed up the process of Mab generation.

The technology relies on molecular biology and cell culture methods to genetically engineer bacteriophages to display antibodies on their surface.

In this method binding of bacteriophages with desired antibodies onto immobilized antigens is done. The high affinity binders are then used to infect bacteria and collect their DNA for sequencing. The sequence help to design genes to be used in antibody production in cell cultures.

The overall process is much faster than hybridoma cell generation and doesn't need any laboratory animals.

Single B cell technologies:

Single B cell technologies are another milestone in Mab development. The technique involves the screening and sorting of ex vivo cultures of single B cells from blood samples of immunized animals or humans to select for promising antibody candidates.

Genetic information is then extracted from the candidate cells mRNA after reverse transcription into cDNA, amplification and subsequent sequencing and cloning into expression vectors for Mab production.

In this method there is no need to create a hybridoma cell line, thus process become efficient and timeline are shorted by several weeks.

Depending upon the process to be adopted for the manufacturing of monoclonal antibody a new production block shall be designed to meet the process and cGMP requirements.

Detailed working for the Mabs manufacturing unit will be proposed separately in future.

In general, the Mab production suite shall have cell culture, fermentation, harvesting, primary purification, secondary purification, sterile filtration.

However, for formulation and fill finish existing facilities shall be used areas.

Table 15: Following steps are performed in Mabs production (General)

For implementation of Mabs project in future, there shall be a requirement of cell culture and molecular biology labs in the quality control with some additional piece of equipment.

Present lay out of quality control unit will be adequate for plasma products (Phase-1 & 2).

However, for Mabs products testing, expansion in existing QC to cater the cell culture need shall be required.

CHAPTER 9

GMP AND REGULATORY CONSIDERATIONS

9.1 Premises, Layout & Process Engineering:

Plasma fractionation and processing is complex and critical manufacturing operation with respect to the receipt of plasma (Starting material) its downstream processing, formulation and fill finish.

Plasma fractionation facility require strict cGMP and regulatory compliance to ensure the product quality and safety of the products and operators. The facility's layout and process engineering are critical components for setting up of the green field project. Following are key considerations for setting up a plasma fractionation facility with respect to Premises, Layout and Process engineering:

Location and Surroundings:

The factory building(s) for manufacture of plasma products shall be situated and shall have measures to avoid risk of contamination from external environment including open sewage, drains, public lavatory or any factory which produce disagreeable or obnoxious odor or fumes, excessive soot, dust, smoke, chemical or biological emission.

Building:

The building(s) used for the purpose shall be designed, constructed, adapted and maintained to suit the manufacturing operations so as to permit production under hygienic conditions. They shall conform to the conditions laid down in the Factories Act, 1948 (63 of 1948).

Premises - General Requirements:

The premises used for manufacturing, processing, warehousing, packaging, labelling and testing purposes shall be:

Compatible with other products manufacturing operations that may be carried out in the same or adjacent area.

The manufacturing facility shall be designed / constructed / maintained to prevent entry of insects, pests, birds, vermin's and rodents. Interior surface (walls, floors and ceilings) shall be smooth and free from cracks, and permit easy cleaning, painting and disinfection.

There should be adequate space for orderly and logical placement of equipment, materials and movement of personnel in order to prevent:

(a) The risk of mix-up between different categories of products or with raw materials, intermediates and in-process material.

(b) Possibilities of contamination and cross- contamination by providing suitable segregation, zoning and access controls etc.

Layout Considerations:

During designing of facility, Lifenity must ensure the following points:

Plasma products will be produced in an independent block/building.

The facility is designed to prevent cross-contamination between process areas, easy cleaning and ensure the efficient flow of materials and personnel.

The facility design adheres to GMP guidelines (Schedule M of Drugs and cosmetic act 1940 and Rules 1945).

Ancillary areas like rest and refreshment rooms are separate from manufacturing areas.

Facilities for changing, storing clothes and for washing and toilet purposes are easily accessible and adequate for the number of users. Provision for separate toilets for males and females is made and toilet is not connected with production or storage areas.

Change rooms design contains airlocks to provide physical separation of the different stages of gowning. Flushed effectively with filtered air. Change rooms are of the same grade as the area into which it opens finally.

Provision of separate change rooms for entry and exit from clean areas.

Hand-washing facilities are provided in the first change room.

Flow of personnel, clean and dirty materials are unidirectional with logical sequence of operations.

Sinks and drains are excluded from Grade A and B areas where aseptic operations are carried out.

Drains are fitted with effective easily cleanable traps and with air brakes to prevent backflow.

The production and dispensing areas are well lighted, effectively ventilated.

HVAC Zoning:

Air supply for manufacturing area will be filtered through bacteria retaining filters (HEPA Filters) and will be at a pressure higher than in the adjacent areas unless otherwise required.

The filters to be checked for performance on installation and periodically thereafter and maintain written records.

HVAC zoning of the facility (control areas) for the manufacturing operations is done based on the operation and its criticality (Plasma collection, fractionation, purification, and storage) to minimize the risk of contamination and to maintain physical conditions like temperature and humidity. The physical conditions should also be suitable to the comforts of the personnel working with protective clothing.

Routine microbial and particulate counts of the manufacturing area will be carried out during manufacturing operations to assess the effective ness of HVAC.

The results of particulate matter and microbes to be continuously monitored against documented in-house standards and regulatory guidelines.

Based on the quality of air, manufacturing facility is divided into different grades/ Zones. In general, plasma processing facility is divided into four grades (Classes) based on the air cleanliness levels (Microbial and Particulate matter (Refer to table No 15 and 16).

Facility Grades:

Grade A: Clean rooms are used for high-risk operations, and require a unidirectional airflow system to maintain high air quality. Unidirectional airflow should provide a homogeneous air velocity of 0.36–0.54 m/s (guidance value) at a defined test position 15–30 cm below the terminal filter or air distributor system.

The velocity at working level should not be less than 0.36 m/s.

Grade B: In aseptic preparation and filling, this is the background environment for the Grade A zone.

Grades C and D: Clean areas for carrying out less critical stages of the manufacturing of plasma products -downstream processing, chromatographic purification and solution preparations.

Table 16: Recommended Maximum Allowable Particle in clean room

Table 17: Recommended limits for Microbial contamination in Clean Rooms

Clean Utility Systems:

Pure steam, purified water and water for injection are the clean utilities required to support the clean operations in plasmas manufacturing/processing facilities. Monitor the clean utilities for the quality and compliance regularly as per the laid procedures and the regulatory standards.

Equipment Placement:

Equipment and processing areas will be arranged to facilitate efficient workflow and minimize the risk of contamination. Ensure that equipment and materials are easily accessible for maintenance and cleaning. Processing areas must be equipped with dedicated equipment designed for specific purpose.

Waste Management:

Waste will be removed from the manufacturing area or sent to the bio-waste system in a safe manner. To ensure containment compliance with the environment, the facility must implement measures to prevent accidental spills or leaks. This includes the use of appropriate containment systems, spill response plans, and monitoring for any environmental impacts.

All sewage waste pipes will run below natural ground level (however this depends on the actual site conditions along the pipe routing) in proper gradient and connected to nearest available chamber.

Procedures must be in place for the safe removal of different types of waste such as chemical, biological, expired reagents, unused samples and solvents etc.

Design the drainage systems in such a way that effluents can be effectively neutralized or decontaminated to minimize the risk of cross-contamination.

Provisions should be there for the proper and safe storage of waste materials awaiting disposal.

Toxic substances and flammable materials must be stored in suitably designed, separate, enclosed cupboards, as required by national legislation.

Liquid effluent poses a safety or contamination risk (Biological liquid waste), should be treated in the

kill tank before its discharge into non biological /main drain.

Testing Facilities:

Testing facilities must be located in the separate building/floor.

Validation and Documentation:

Lifenity and PMC will validate the facility layout and design to ensure it meets GMP and regulatory requirements. Comprehensive documentation of the facility's layout and design, including as-built drawings shall be maintained at site and a robust document control system shall be established in quality Assurance department to maintain records.

Accessibility and Safety:

Ensure that the facility layout allows for easy access in the event of an emergency. The facilities must be equipped with safety features like fire hydrant systems, eyewash and body shower stations where ever necessary.

Quality Assurance & Regulatory Compliance:

The quality assurance system appropriate to the manufacture of plasma products shall ensure that the products are designed and developed in a way that takes account of the requirements of GMP and other associated codes such as those of GLP and GCP.

Adequate arrangement must be made at site for manufacture, supply chain and use of the correct starting and packaging materials.

Self-Inspection and Quality audit:

In the quality assurance department of Lifenity adequate procedures shall be designed to ensure self-inspections and quality audits periodically.

Plasma Process Considerations:

Plasma fractionation involves critical steps to separate plasma into its various components and produce high-quality plasma-derived products while adhering to Good Manufacturing Practices (GMP) and regulatory requirements.

Following are the key considerations for plasma processing:

Plasma Collection and Testing: A reliable and secure source of plasma, involving strict donor selection, screening and testing plan in place to screen for infectious agents, including HIV, Hepatitis B and C, and other potential contaminants in pooled plasma.

Fractionation Process: A well-defined fractionation process to separate plasma into its various protein components, such as albumin, immunoglobulins, and plasma factors. Robust filtration and purification processes will be followed by Lifenity to separate and purify these proteins.

Process Validation: The fractionation process must be validated to demonstrate its ability to consistently produce products. Process performance qualification (PPQ) shall be performed on first three initial batches to ensure that the process is in a state of control during commercial production.

Process Control and Monitoring: Robust process control systems to monitor critical process parameters (e.g., temperature, pH, pressure) in real-time. Written procedures must be in place for addressing deviations and out-of-specification results.

Raw Material Control: Documented procedures for receiving, testing, and release of raw materials and starting materials used in the fractionation process. Lifenity must ensure that all materials meet quality, safety standards and plasma source traceability.

Safety: Validated viral and pathogen inactivation and removal steps to ensure the safety of plasma-derived products. Implement measures to prevent contamination during processing.

Quality Control Testing: Comprehensive quality control testing plan, including in-process testing and final product testing, to ensure the safety, purity, and potency of the plasma products. Specifications for raw materials, intermediates, and final products shall be written and approved.

Equipment monitoring, Calibration and Validation: All the critical equipment used in the manufacturing and control of plasma are maintained, calibrated and qualified as per the written procedures.

Training and Qualification: Ensure that all personnel involved in the plasma fractionation process are well-trained with respect to the SOPs and STPs, understand GMP requirements, and are aware of their roles in ensuring product quality and safety.

Maintain records of personnel training and qualifications.

Writing and editing documentation: Documentation for all existing processes must be written and edited regularly, to ensure that all new hires and other personnel can understand the best practices and standards

Risk assessments of current equipment/processes: Assessment of current processes and equipment to determine potential risks and mitigation plan shall be in place.

Traceability: A robust documentation system must be in place for tracking and tracing individual plasma donations and the products derived from them.

Packaging and Labelling: Appropriate packaging and labelling procedures for the final plasma-derived products, ensuring they meet regulatory requirements.

Post-Market Surveillance: Post-market surveillance system to monitor the safety and efficacy of products in the market.

9.2 Regulatory Guidelines GMP, Drugs and Cosmetics act 1940 and Rules, CDSCO, WHO- GMP

Indian Guidelines:

The Drugs and Cosmetics Rules, 1945, framed under the Drugs and Cosmetics Act 1940:

Includes human blood under the definition of "Drugs" under Section 2 (b)

Regulates functions of blood banks, which provide recovered plasma for plasma fractionation

Part XII C specifically regulates the collection and storage of plasma for fractionation

In the year 1967, Central Govt. (Ministry of Health) enacted a separate provision in Schedule F Part XII B of Drugs & Cosmetics Rules.

Schedule F of the Drugs and Cosmetics Rules specifically pertains to the requirements for the manufacture, sale, and distribution of plasma-derived products, including immunoglobulins, clotting factor concentrates, and other blood

Drugs and Cosmetics Rules, Part X-B: Conditions for License (Rule 122EA to Rule 122P)

Destruction of infected blood and implementation of Bio-Medical Wastes (Management and Handling) Rules, 1996

Applicable forms for License:

The National AIDS Control Organization (NACO), under the Ministry of Health and Family Welfare) to oversee operation of blood banking services in India.

National Blood Transfusion Council (NBTC) is the apex policy-making body, under NACO, making central licensing mandatory, increasing voluntary donation base and setting of quality standards.

Similarly, State Blood Transfusion Councils (SBTCs) are responsible for the smooth functioning of blood transfusion services at a state level.

Drug Standard Control Organization (CDSCO) and State Drug Control Organizations play a vital role in approval of licenses, and enforcement of standard transfusion practices to ensure safe, quality and efficacious blood and its components in clinical practices.

National Institute of Biologicals (NIB) is the nodal governmental organization under the Ministry of Health and Family Welfare responsible for the testing and release of biologicals in India including blood plasma.

Policies and Guidelines for Fractionation:

The National Blood Policy 2002 regulates blood quality and the Guidelines of NBTC 2016 has been brought

out by NACO. NBTC has formulated guidelines for recovery of processing charges for blood and blood Components across blood banks in all sectors. It has also laid down uniform norms for issuance of No Objection Certificates (NOCs) for new blood banks, renewal of license, criteria for designation blood bank as RBTC, Guideline on bulk transfer of blood and Guidelines on exchange of surplus plasma with indigenous fractionators has been released by NBTC to support voluntary blood donation and rationalize blood utilization.

National Policy for Access to Plasma Derived Medicinal Products from Human Plasma for Clinical / Therapeutic Use covers the process of collecting standard plasma and transporting them under optimum conditions for fractionation, identifying critical parameters for safety, and ensuring compliance with regulatory requirements and training.

National Pharmaceutical Pricing Authority: Under the Ministry of Chemicals and Fertilizers, Department of Pharmaceuticals, the prices of medicines are controlled by the National Pharmaceutical Pricing Authority. Currently, plasma products under price control include albumin, AHF, anti-D immunoglobulin, anti-tetanus immunoglobulin and anti-rabies immunoglobulin however plasma itself is not under price control.

Pre-clinical safety and Clinical Evaluation of Plasma derived products:

European guidelines

Preclinical:

June 2011 EMA/CHMP/ICH/731268/1998 Committee for medicinal products for human use (CHMP)

Clinical Evaluation of Plasma derived products: Guideline on clinical investigation of recombinant and human plasma-derived factor IX products: 21 May 2015, EMA/CHMP/BPWP/144552/2009 Rev. 1, Corr. 1 Committee for medicinal products for human use (CHMP).

Guideline on clinical investigation of recombinant and human plasma-derived factor VIII products: 21 May

2015 EMA/CHMP/BPWP/144533/2009 rev Committee for medicinal products for human use (CHMP).

Guidance on the Clinical Investigation of Human Normal Immunoglobulin for Intravenous Administration (IVIg). CPMP/BPWP/388/95 rev.1.

Guidance on the Clinical Investigation of Human Normal Immunoglobulin for Subcutaneous and Intramuscular Use. EMEA/CPMP/BPWP/283/00.

Indian guidelines

As per Indian drugs and cosmetic act human blood plasma is included under the definition of "Drugs" under Section 2 (b)

As per the Indian regulations if the company which manufactures human plasma products similar to the composition and product profile currently marketed then the clinical trial waiver is given for marketing authorization. The company shall apply to DCGI &SLA for the waiver with relevant supporting documents. In case of hyper immune sera products appropriate clinical trial for safety and efficacy shall be conducted.

9.3 Containment Compliance

Blood and blood-derived products are highly sensitive and can be easily contaminated. Bloodborne pathogens, such as HIV, hepatitis B and C, can pose significant risks to both staff and patients if proper containment procedures are not followed. Maintaining a contained environment helps minimize the risk of spreading infectious diseases in the population.

Containment measures in the manufacturing premises shall be established such as isolation rooms, negative pressure environments, controlled airflow systems and proper handling procedures.

Plasma fractionation facilities must adhere to specific biosafety levels as defined by regulatory authorities, such as the Centers for Disease Control and Prevention (CDC). Plasma fractionation facilities operate at BSL-2 (Biosafety Level 2). It must include:

Access control, lab coats, gloves, eye protection (PPE) to be used by personnel working in the facility, and the use of biological safety cabinets during procedures.

Continuous monitoring of air pressure differentials, temperature, and humidity within the clean rooms.

Alarms should be triggered if any parameter falls outside the acceptable range.

Scheduled regular maintenance, testing, and certification of the HVAC system.

The exhaust air from the clean rooms potential for any contaminating microbes should be passed through the scrubbers to protect the environment.

9.4 Validation of Processes, Equipment and Services

Approaches to validation:

Lifinity will organize and plan qualification and validation in a manner that will ensure product quality, safety and efficacy throughout its life-cycle.

Qualification and validation shall be done in accordance with predetermined protocols, and the results to be documented, in reports.

An appropriate and effective quality management system shall be in place at Lifinity supporting the organization, planning, execution and management of qualification and validation activities.

Senior management will provide sufficient resources to perform validation in a timely manner. Management and persons responsible from quality assurance and manufacturing to be actively involved in the validation activities.

All relevant SOPs for operation, maintenance and calibration shall be prepared during qualification.

Training shall be provided to operators, and training records need to be updated and maintained.

Equipment Qualification/Validation:

Equipment qualification helps mitigate risks, prevent equipment failures, reduce downtime, enhance product quality, and ensures the overall operational excellence of an organization.

Equipment Validation comprises a series of steps which includes User Requirement Specification (URS), Design, Installation, Operational, and Performance Qualification.

User Requirement Specification (URS): Lifinity will prepare a document describing the requirements for the equipment to be sourced. The requirements will include specifications and must ensure that possible GMP risks are addressed; include technical requirements; and associated documentation.

Design qualification (DQ): DQ will provide the documented evidence that the design specifications were met and are in accordance with the URS. FAT and SAT needs to be performed where required, to verify the suitability of the system at site, prior to the subsequent stages of qualification and this must be appropriately documented.

Installation qualification (IQ): IQ will provide documented evidence that the installation was complete and satisfactory, including supporting utilities. The design specifications, including purchase specifications, drawings, manuals, lists of spare parts and vendor details, will be verified during IQ. Components installed must be verified, and documented evidence should be provided that components meet specifications, are traceable and are of the appropriate construction material. Applicable control and measuring devices, identified through impact or risk assessment, should be calibrated.

Operational Qualification (OQ): OQ should provide documented evidence that utilities, systems or equipment operate in accordance with operational specifications. Tests will be designed to demonstrate satisfactory operation over the normal operating range, as well as at the limits of its operating conditions. Worst-case conditions must be included in the testing. Operation controls, alarms, switches, displays and other operational components shall be tested.

Performance qualification (PQ): PQ will normally follow the successful completion of IQ and OQ. PQ will be performed under conditions simulating the intended use, to provide documented evidence that equipment/system can consistently perform.

Process validation:

Process validation is defined as the collection and evaluation of data, from the process design stage through commercial production, which establishes scientific evidence that a process is capable of consistently delivering quality product. It ensures that quality, safety and efficacy by design are built into the product.

Collect and evaluate the data throughout the life-cycle of a product from the process design stage through to commercial production and provides scientific evidence that a process is capable of consistently delivering a quality product.

Data need to be available for inspection at Lifinity manufacturing location.

A risk-assessment approach will be followed, to determine the scope and extent to which process(es) and starting material variability may affect product quality.

The critical process steps and critical process parameters (CPPs) will be identified, justified monitored and documented based on relevant studies carried out during the design stage and process knowledge.

Lifinity will ensure that the principles of process validation described in the guidelines are implemented.

Evaluate and compare the historical data when there is a change in the process.

When changes are planned to existing systems or processes need to be followed and documented. Sufficient data is collected to demonstrate that the revised process and product will meet desired quality, consistent and approved specifications.

CHAPTER 10

ALLIED EQUIPMENT & FACILITIES

10.1 Technology Based Allied Equipment Requirements

Refer section 13 Annexures

10.2 Facilities

Laboratories for allied testing should be separated from Production and Quality control labs. However, the materials required for testing such as media, filters, filtration devices etc. can be taken from QC labs. Dedicated glass ware should be used for any testing activities.

Example of allied test/activities are ETP samples, Black utilities, Ground water, testing of clean steam for physical parameters, compressed air and calibration activities etc.

Specialized temperature-controlled warehouse for storage of RMs, In-Process materials and finished goods:

Adequate areas shall be designed to allow sufficient and orderly warehousing of various categories of materials and products like starting and packaging materials, intermediates, bulks and finished products, products in quarantine, released, rejected, returned or recalled, machine and equipment spare parts and change items etc.

Warehousing areas need to be designed and adapted to ensure good storage conditions. Ware house shall be clean, dry and maintained with acceptable temperature and humidity limits where ever required.

Temperature and humidity will be monitored and recorded. A temperature monitoring and recording system that are independent from the temperature regulation system with alarm systems will be placed.

Storage areas must have program for pest control. The record shall be maintained.

Proper racks, bins and platforms must be provided for the storage of materials. The quarantine area in the warehousing will be clearly demarcated. Access to the areas must be restricted to authorized persons.

There shall be a separate sampling area in the warehousing for active and sterile raw materials/starting materials and excipients from the unsterile RMs.

Sampling and dispensing of sterile materials shall be conducted under aseptic condition conforming to Grade A(LAF). Sampling of sterile materials shall be performed in a dedicated area within the manufacturing facility in the absence of suitable areas in the ware house. Segregation shall be provided for the storage of rejected, recalled or returned materials or products.

Materials or products in this area should be suitably marked and secured. Access to these areas and materials must be restricted.

Highly hazardous, poisonous and explosive materials such as alcohols, narcotics and other substances presenting potential risks of abuse, fire or explosion shall be stored in explosion proof area, away from the central ware house in safe and secure manner.

Adequate fire protection measures shall be provided in conformity with the rules of the concerned civic authority in the ware house.

Printed packaging materials shall be stored in safe, separate and secure areas. Regular checks shall be made to ensure adequate steps are taken against spillage, breakage and leakage of containers.

Receiving and dispatch bays shall protect materials and products from adverse weather conditions.

The ware house shall have different areas for the receipt, quarantine, undertest, released, hazardous and rejected materials.

Primary packaging materials, labels, and secondary packaging material and finished products shall be stored in the separate area of the ware house with access controls systems in the critical areas of the ware house.

Incoming critical materials (such as sterile solutions, plasma bag and testing reagents) shall be physically quarantined immediately after receipt and until they are released for use by the authorized person.

Materials and reagents shall be stored under the conditions established by the manufacturer and in an orderly manner that permits segregation by batch or lot and stock rotation. Storage, issuance and usage should follow the "first-expiring first-out" principle (FEFO).

10.3 Materials Required Like Resins, Filters etc.

Ion exchange resins

Size exclusion resin – 1

Size exclusion resin - 2

Multi grade filters (MGF)

Softener

Filters 0.5 Micron

SMBS (Sodium Metabisulphite)

Chlorine

Common Salt

NaOH

Hydrochloric acid

10.4 SOP/STP and Biological Waste Management

The SOP's and STP for the allied testing facilities are as under:

Procedure for Decontamination of chemical and biological waste.

Procedure for estimation of BOD and COD in ETP samples.

pH determination of ETP samples.

Procedure for testing compressed air and pure steam.

Procedure for calibration of measuring devices of manufacturing, ware house, quality control and engineering.

Procedure for treatment of Biowaste

Procedure for collection segregation and disposal of Biowaste

Training on Biowaste management

Procedure for usage of treated water for horticulture purpose

Procedure for discharge of Biowaste in common drainage system

Procedure for management of spillage control

Biowaste management (BWM):

The disposal of sewage and effluents (solid, liquid and gas) from the manufactory should be in conformity with the requirements of Environment Pollution Control Board. All bio-medical waste must be destroyed as per the provisions of the Bio-Medical Waste (Management and Handling) Rules, 1996 and amendments thereof. Additional precautions to be taken for the storage and disposal of rejected waste material. Records shall be maintained for all disposal of waste. Provisions shall be made for the proper and safe storage of waste materials awaiting disposal. Hazardous, toxic substances and flammable materials shall be stored in suitably designed and segregated, enclosed areas in conformity with Central and State Legislations.

CHAPTER 11

SUBSIDY CONSIDERATIONS

11.1 Location / SEZ Considerations in Maharashtra

Special Economic Zone (SEZ) is a specifically delineated duty-free enclave with all required infrastructure provided under single administrative umbrella primarily meant for locating industries which manufacture and export goods and services.

These enclaves shall be deemed to be foreign territory for the purposes of trade operations and duties and tariffs.

Under section 3, a Special Economic Zone can be established either by Central Government, State Government or its agencies, private / public / joint sector or any person for manufacture of goods or rendering services or for both or as a free trade and warehousing zone.

As per the requirements of SEZ, the unit must be segregated into processing and non-processing areas. A processing area is that area in which all the manufacturing activities are performed. At least 50% of the total area shall be earmarked.

The non-processing area is the area which is intended to provide support facilities to the processing area activities and may include support areas like utilities block, power generation plant (DG), engineering services, ETP and other infrastructures as per the requirements of the current project.

In SEZ 100 percent Foreign Direct Investments are allowed (FDI) in some of the selected categories.

As per MIHAN-SEZ guidelines (Rules and Procedures) following class of incentives are available to SEZ enterprises.

11.2 Custom and Excise

SEZ units may import or procure from the domestic sources, duty free, all their requirements of capital goods, raw materials, consumables, spares, packing materials, office equipment, DG sets etc. for implementation of their project in the Zone without any license or specific approval.

11.3 Duty Free Import/Domestic Procurement of Goods for Setting up of SEZ Units

Goods imported/procured locally duty free could be utilized over the approval period of 5 years.

11.4 Sales Exemption

Domestic sales by SEZ units will be exempt from single administrative document (SAD). Domestic sale of finished products, by-products on payment of applicable custom duty. Domestic sale rejects, waste and scrap on payment of applicable Custom duty on the transaction value.

11.5 Income Tax:

Physical export benefit 100%.

IT exemption (10A) for first 5 years and 50% for 2 years thereafter.

Reinvestment allowance to the extent of 50% of ploughed back profits.

11.6 Carry forward of losses & Commercial borrowing:

Banking / Insurance/External Commercial Borrowing.

Setting up Off-shore Banking Units (OBUs) is allowed in SEZs. OBU's allowed 100% Income Tax exemption on profit for 3 years and 50 % for next two years.

External commercial borrowings by units up to \$ 500 million a year allowed without any maturity restrictions.

11.7 Central Sales Tax:

Exemption to sales made from Domestic Tariff Area to SEZ units.

11.8 Service Tax:

Exemption from Service Tax to SEZ units.

11.9 Other Exemptions:

Freedom to bring in export proceeds without any time limit.

Flexibility to keep 100% of export proceeds in exchange earners foreign currency account (EEFC). Freedom to make overseas investment from it.

Exemption from interest rate surcharge on import finance.

SEZ units allowed to 'write-off' unrealized export bills.

11.10 Additional Incentives:

The additional incentives are exemption of import license, custom examination of imported goods, exemption from public hearing under Environment Impact Assessment Notification etc.

CHAPTER 12

PROJECT TIMELINES

CHAPTER 13

BUDGET ESTIMATES

Budget Estimates

List of Annexures

Annexure 1: Administration Equipment and Office Furniture

Annexure 2: Canteen Equipment

Annexure 3: Utility Equipment

Annexure 4: Plasma Storage Equipment

Annexure 5: Bulk Plasma Manufacturing Equipment

Annexure 6: Fill Finish Equipment

Annexure 7: QC / R&D Equipment

Annexure 8: QA Equipment

Annexure 9: Finished Goods Storage

Annexure 10 : ETP / STP

CHAPTER 14

REVENUE AND COST ESTIMATION AND PAYBACK PERIOD

YIELD CALCULATIONS FOR PLASMA FRACTIONS

REVENUE FORECAST IN CRORE INR FROM PROCESSING 150,000 L / ANNUM

PROFIT AND LOSS STATEMENT FOR STAGE 1 – 150,000 L/ ANNUM

CHAPTER 15

RECOMMENDATION

The objective of this project is to establish and operate a state-of-the-art Human Plasma Derived Medicinal Products (HPDMP) manufacturing facility with an aim to address the increasing demand for plasma-derived products by Optimized manufacturing processes maximize productivity, minimize waste, and reduce operational costs in order to maintain competitiveness in the market.

This Human Plasma Derived Medicinal Products manufacturing facility will play a pivotal role in meeting the critical healthcare needs of patients while contributing to advancements in the plasma industry.

In phase-1 of the project annual production capacity will be 150,000 liters of plasma processing, which

will be subsequently increased to 500,000 liters per annum in future.

In this report several technologies utilized for plasma purification at commercial scale were evaluated exhaustively with its merits and demerits. Some of the key technologies evaluated are:

Plasma Fractionation method with ethyl alcohol

Cohn+ Liquid Chromatography

Heat Shock technology

Ammonium sulphate+ Liquid Chromatography

Chromatographic

It is concluded and recommended that Chromatographic purification with sterile filtration is best technology for the purification of plasma proteins for stage-1 products as it will give highly productivity and acceptable quality of desired proteins (purity levels) as per the regulatory expectations.

For stage-2 products, the technology evaluation and recommendations will be made in future.

CHAPTER 16

Layouts

Annexure A: - Plot Layout-GF (Bulk Manufacturing)

Annexure B: - Conceptual Layout-GF (Bulk Manufacturing)

Annexure C: - Conceptual Layouts-FF (Fill Finish)

Annexure D: - Terrace Floor (Future Provision)

Annexure E:- Section and Elevation Layout

S. No. | CONTENTS | Page No.

1 | INTRODUCTION |

1.1 | Project Objective Statement |

1.2 | Executive summary of the project |

||

2 | MARKET ANALYSIS |

2.1 | Human Plasma Derived products and its share in the total components |

2.2 | Volume of Plasma fractionated worldwide (2008-2032) and

projections |

2.3 | Current market share of companies in domestic and international

markets |

2.4 | Market Trend for the next 10 years and shift in products (2023-2032) |

2.5 | Government Market and the rates |

||

3 | TECHNOLOGY |

3.1 | Analysis of various Technologies available (Centrifugation and filtration for solid / liquid separation, thermal and chemical inactivation procedure, ultrafiltration / diafiltration, nanofiltration, Chromatography or any other Technology or any Hybrid model) |

3.2 | Recommending a cost effective and high productivity technology |

3.3 | Obligations for technology service provider |

||

4 | MANUFACTURING |

4.1 | For various Plasma Derived Medicinal Products (PDMP) such as Albumin, IgG, Factor VIII, IX, Fibrin sealant and Fibrinogen (Stage 1)

Manufacturing process flow diagram |

4.2 | Based on the Technology proposed the manufacturing process to be suggested for deriving the above suggested products and also any other new products derived from Plasma |

4.3 | Equipment required to manufacture for the proposed capacity |

4.4 | Detailed Design |

||

5 | PROPOSED SITE PLAN |

5.1 | Concept Design including Structural, Architectural, Civil and Electrical Design |

5.2 | Site Master Plan |

5.3 | Layout philosophy |

||

6 | SOURCING AND HANDLING OF RAW MATERIAL |

6.1 | Exchange value of Plasma per litre and projected value over a period of five years |

6.2 | Donors selection criteria |

6.3 | Plasma donation testing, epidemiological surveillance, post donation information |

6.4 | Handling of blood, Plasma freezing, storage, cold chain and complete logistics plan |

6.5 | Sourcing of Plasma from Government and non- government blood banks |

6.6 | Equipment for proper storage and separation of blood components |

6.7 | Importing of plasma from neighbouring countries and Indian regulations |

6.8 | Improvement in collection practices in lieu of whole blood and policies and regulations |

7 | PRODUCTION PROGRAM |

7.1 Product and product mix
7.2 Production capacities
7.3 Yield calculations
8 PROJECT IMPLEMENTATION MODEL
8.1 Human Serum Albumin (HSA)
8.2 Human Immunoglobulin (IgG)
8.3 Factor VIII and Factor IX, Fibrin sealant and Fibrinogen
8.4 Monoclonal Antibodies (Mabs)- future considerations
9 GMP AND REGULATORY CONSIDERATIONS
9.1 Layout & Process Engineering
9.2 Design to meet GMP, WHO-GMP. US-FDA etc., compliances.
9.3 Containment compliance
9.4 Validation of processes, equipment and services
10 ALLIED EQUIPMENTS & FACILITIES
10.1 Technology based allied equipment requirements
10.2 Facilities like laboratories for testing, specialized temperature controlled warehouse for storing raw materials, in-process materials and finished products
10.3 Materials required like resins, filters etc.
10.4 STPs, BMW etc.
11 SUBSIDY CONSIDERATIONS
11.1 Location / SEZ considerations in Maharashtra
11.2 Capex / Opex subsidies for special projects
11.3 GST exemptions
11.4 IT exemptions
11.5 Loan at special rates
12 PROJECT TIMELINES From concept to commissioning
12.1 Activity wise PERT chart
12.2 Civil, Electrical and Mechanical completion timelines along with equipment procurement, installation and validation
12.3 Product validation
13 BUDGET ESTIMATES
13.1 Budget estimate for Manufacturing block
13.2 Budget estimate for Quality Control block
13.3 Budget estimate for Fill finish block
13.4 Budget estimate for supporting blocks (Administration, Clean and Black utilities)
13.5 Proposed list of equipment and its budget (Mfg/QC/ Engg)
13.6 Any other estimates
14 REVENUE AND COST ESTIMATION AND PAYBACK PERIOD
14.1 Revenue projections for next 7 years for each Plasma Derived Medicinal Products (PDMP) and consolidated one
14.2 Capex and Opex projections for the 7 year period
14.3 Direct and Indirect cost estimates (RM, consumables, power, utilities, manpower etc.)
14.4 Breakeven Point Analysis at different capacity utilisation
14.5 Working capital estimates for 7 years
14.6 Cash flow statement for 7 years
14.7 IRR workings
15 RECOMMENDATIONS
15.1 Summary of the proposed Technology and key suggestions

S/No. | Step | Purpose | Remark
1 | Cell culture and Fermentation | To generate the desired bulk of antibodies |
2 | Centrifugation | To remove cell debris, lipids, and clotted material |
3 | Filtration (0.45 µm) | To remove smaller contaminating material |
4 | Concentration (UF) | To concentrate the desired antibodies in the material |
5 | Ion exchange Chromatography (IEC) | To remove nucleic acids and endotoxins |
6 | Size exclusion chromatography (SEC) | SEC is preferred over IEC because size is relatively constant and charge on the protein may vary depending upon the pH as molecules are protonated and deprotonated
7 | Immunoaffinity Chromatography | Antibody will bind to specific antigen attached to the agarose matrix
| It will help to achieve highest purity
8 | Sterile filtration | To remove microbial contamination |

CHAPTER 1 INTRODUCTION

Project Objective Statement:

The objective of this project is to establish and operate a state-of-the-art Human Plasma Derived Medicinal Products (HPDMP) manufacturing facility with an annual production capacity of 150,000 liters.

This capacity will be subsequently increased to 500,000 liters per annum in the near future.

This facility aims to consistently and efficiently produce high-quality plasma derived products such as Human Serum Albumin (HSA), Human Normal Immunoglobulin (IgG), Hemophilia factors VIII, IX, Fibrin sealant etc. and Monoclonal antibodies (Mabs) while ensuring compliance with regulatory standards and best industry practices.

The primary goals of this project include:

Meeting Growing Demand: To address the increasing demand for plasma-derived products, ensuring a stable and reliable supply of essential treatments.

Quality Assurance: Implementing rigorous quality control and quality assurance processes to consistently produce safe and effective plasma derived products that meet or exceed regulatory requirements.

Operational Efficiency: Optimizing manufacturing processes to maximize productivity, minimize waste, and reduce operational costs to maintain competitiveness in the market. **Regulatory Compliance:** Adhering to all relevant regulations and standards, including current Good Manufacturing Practices (cGMP), to ensure product safety, quality and efficacy.

Safety and Sustainability: Prioritizing the safety of both employees and the environment by implementing robust safety measures and eco-friendly practices throughout the facility.

Research and Development: Supporting ongoing research and development efforts to improve product quality, expand the product portfolio, and explore innovative techniques and newer technologies.

Supply Chain Reliability: Building a secure and efficient supply chain to source raw materials, transport finished products, and ensure timely deliveries to end users.

Stakeholder Satisfaction: Ensuring customer satisfaction by providing consistent and reliable plasma-derived products while maintaining a favorable relationship with employees, investors, and the local community.

By achieving these objectives, this Human Plasma Derived Medicinal Products manufacturing facility will play a pivotal role in meeting the critical healthcare needs of patients while contributing to advancements in the plasma industry.

Statutory Regulation

(A detailed list of provided in the References section at the end of the document) In general, the following guidelines are referred to:

National Blood Policy, NBTC, Ministry of Health and Family Welfare.

National Policy for Access to Plasma Derived Medicinal Products from Human Plasma for

Clinical/Therapeutic Use: Addendum to National Blood Policy, NBTC, Ministry of Health and Family Welfare.

Technical manual, DGHS, MOHFW Govt. of India 2003.

Drugs and Cosmetic act 1940 and rules thereunder.

Schedule M Drugs and Cosmetic act 1940.

ISPE Baseline Guide Vol. 6, Biopharmaceutical Manufacturing Facilities ISPE Baseline Guide Vol. 3, Sterile Manufacturing Facilities.

WHO Good manufacturing practices for biological products.

Good manufacturing practice guideline for human and veterinary medicinal product.

PIC/s Guide to Good Manufacturing Practice for Medicinal Products.

USFDA Guidance for Industry – Sterile Drug Products produced by Aseptic Processing.

Executive Summary of The Project:

The Human Plasma Derived Medicinal Products manufacturing facility will be a green field project. The area earmarked for the project is approx. 6 acres in an industrial area on the outskirts of Nagpur city. Different areas for the plasma manufacturing facility are identified and listed below:

Bulk Manufacturing Facility (for processing 150,000 L / annum)

Formulation, Fill Finish with lyophilization & Packaging

QC and R&D block

Administrative and QA Block

Ware House for Plasma, Packaging, Testing lab (for 32,000 L plasma)

Ware House (Finished Goods Storage)

Expansion area

Bulk Manufacturing Facility (for processing additional 350,000 L / annum)

Ware House for Plasma, Packaging, Testing lab (for additional 32,000 L plasma)

Supporting Blocks

Canteen

Engineering Office

Boiler House

Work Shop

Substation and Generator

Bore Well

Bio-Kill System

WTP/ETP/STP System

Fire Fighting System

Scrap Yard

Guard House and Reception Room

Security Cabin/Post

Boundary Wall and Parking etc.

Internal Roads and Drainage System

Rainwater Harvesting System

PROPOSED SITE PLAN

Annexure A

Figure 1: Plot Layout GROUND FLOOR

Annexure B

Figure 2: Conceptual Layout – GF

The company has identified different products to be manufactured in stagewise manner. List of products proposed to be manufactured are as follows:

Stage-1:

Albumin

Human Immunoglobulin

Factor VIII

Factor IX

Fibrin sealant

Fibrinogen

Stage-2:

Anti-D

Factor XI

Factor XIII

Hepatitis B IgG

Measles IgG

Protein C

Rabies IgG

Tetanus IgG

Thrombin

Varicella Zoster IgG

Table 1: Working Time Model Bulk Manufacturing

Table 2: Working Time Model Fill Finish

Environment Due Diligence:

As the proposed facility is required to handle biological products, proper segregation of type of wastes generated shall be adopted. Based on the categorization of the waste, appropriate treatment philosophy shall be adopted. Following broad categories are identified as wastes:

Process waste

General wash

Solid Process waste

General Solid wastes – Packaging materials etc.,

Gaseous waste from Process & Labs

Sewage

The facility shall be designed as zero waste discharge plant; meaning that every possible waste within the facility is categorized, treated with appropriate treatment step in line local pollution control board guidelines and then discharged safely. Soil contamination due to waste is also considered as a key factor and necessary steps & waste handling methods are adopted to avoid the same. As part of the design, all biologically waste will be treated in Primary treatment systems before letting it into a common wastewater treatment plant.

For the facility design, a detailed EHS document shall be prepared to identify risks and mitigation plans. During design, Construction & operation, EHS policy shall be made integral part of the sustainable operation.

CHAPTER 2 MARKET ANALYSIS

Human Plasma Derived Products and Its Share in The Total Components:

There are several medicinal products which are derived from human blood plasma by Plasma fractionation.

The process for large scale purification was developed about 60 years ago by Cohn and co-workers.

Therapeutically important proteins are Human serum albumin (HSA), Immunoglobulin G (IgG), Coagulation factor VIII, factor IX and Protease inhibitors.

HSA is one of the most abundant proteins in plasma and, together with IgGs, constitutes 80% of total plasma proteins. According to the data, HSA represented approximately 50% of total sales of therapeutic plasma protein products. The purified HSA is required for the treatment of hypo proteinemia, burn and heavy loss of blood due to injuries and other medical conditions. Plasma contains about 60 g/L of protein, out of which about 57 grams are used for many therapeutic products. This makes this human material unique as a source of multiple therapeutic products.

The concentration of different plasma proteins is variable. HSA is major protein component, followed by IgG. The wide concentration range of plasma proteins (less than 1 mg/mL to 40 g/L) is one of the potential challenges in designing separation and purification procedures.

Volume of Human Plasma Fractionated Worldwide (2022 to 2032):

In 2010, 78 fractionation plants were operating in the world, 25 of which were in China, 26 in Europe and

8 in the United States of America. The world plasma fractionation capacity was about 48.4 million liters. More than 500 tons of human serum albumin (HSA) and more than 40 tons of intravenous immunoglobulins (IVIg) are produced annually from more than 34 million liters of plasma. Total plasma marked of 2008 is depicted in pie chart (Figure 2).

Figure 3: Total plasma market of 2008 (Source: Marketing Research Bureau, Inc)

In 2015-16, the worldwide plasma market grew to a \$21,174 Million, almost doubled in terms of revenue from 2008. As compared to the 2008 statistics, in 2016 to IVIg and SCIG had a major share in plasma market, increasing from 29% to 47%. The market share for Albumin also grew from 9.7% to 15.7%. The market share for Factor VIII and Factor IX remained almost the same of 1 to 2 % from 2008 to 2016.

Figure 4: Plasma market in 2016 (Source: Marketing Research Bureau, Inc) Global Plasma Fractionation Market Forecasts from 2022 to 2032

The Global Plasma Fractionation Market Size was valued at USD 27.1 Billion in 2022 (Fig 3).

The Market Size is growing at a CAGR of 6.7% from 2022 to 2032.

The Worldwide Plasma Fractionation Market Size is expected to reach USD 51.8 Billion by 2032.

Asia Pacific region is expected to grow the fastest during the forecasted period.

Global plasma Market Overview:

Table 5: Plasma Derived Therapy Market Share, By Region, 2022 *

Source: Precedence Research, Plasma derived market size, A report 2032

Future roadmap for plasma fractionation industry in India:

Global plasma fractionation program, plasma protein therapies & newer clinical indications for use of these products, has led to a rapidly increasing demand.

Due to the limited volumes of plasma available for fractionation and fractionation capacities, has led to various challenges in availability of these products.

Unfortunately, plasma fractionation program did not get enough attention, focus and motivation in India because of challenges like availability of plasma, less components processing units, cold chain infrastructure, political will and availability of solid plasma ecosystem.

As per literature information, in 2020 India, wasted 6.5 Lakh units of blood and blood components on annual basis (Source: Print line Media Pvt Ltd). A report published by Ministry of Health and FW (2018-2019); the total collection of blood was 12.2 million units out of which 75.05% of blood was componentized by NACO supported blood component separating unit (BCSU). Thus, the wastage of 24.95% hampered the availability of blood components to the patients. Though, with the passage of time there has been a significant improvement in the overall blood banking systems and availability of plasma products in India, still much needs to be done considering clinical needs of the country.

There is a need to create a vision document for short-term, mid-term and long-term self-sufficiency of plasma products in India. This can be divided into following two categories:

Availability of safe plasma: How to overall increase the quantity and quality of plasma for fractionation:

Increase voluntary blood collection, with increased repeat donor base.

As a part of the licensing process blood component separation should be mandatory and a plan for current licensed blood banks to migrate to complete blood separation units in the next 3 years.

Making blood component therapy mandatory in clinical practice, so that blood therapy can be minimized, and patients can use plasma products, which are relatively safer and easily accessible.

Create a solid regulatory pathway for permitting source plasma collection.

Regulatory system reform: Create a facilitative regulatory landscape for plasma industry to grow and evolve which would involve office of DCGI, NIB, Department of AIDS Control (DAC), IPC, NPPA, NACO, clinicians, patient groups, industry representatives and NGOs by;

Forming a national level body for steering plasma protein initiative in India.

Making a robust regulatory system for collection.

Controlling pricing for plasma and increasing indigenous manufacturing capabilities.

More funding for products and patient care.

Fast track regulatory approval for importing different categories of plasma/fractions/intermediate.

Market Trend for The Next 10 Years and Shift in Products (2023-2032):

With the growth of IgG sales, some relatively niche plasma proteins have had a significant impact on the market in the 2010s.

C1 esterase inhibitor (C1-INH): In 2010, the sales of C1 esterase inhibitor (C1-INH) for the treatment of hereditary angioedema (HAE) amounted to about \$200 million globally. This was 1.5% of total plasma proteins sales because the product had just been launched in late 2008 in the United States, and European sales were limited by the product's approval confined to only a few countries. By 2016, the sales reached over \$1.1 billion (5.2% of global PDMPs sales), as the product gained rapid acceptance mainly in the United States where the awareness of treatment and diagnosis of HAE were boosted by Shire and CSL Behring. As a result, C1-INH became the fourth largest plasma protein in terms of dollar sales worldwide, behind IgG, albumin and plasma-derived factor VIII. The market for C1-INH is continuing to grow strongly, and it is likely to increase its share in the future. A new formulation for subcutaneous injection will further facilitate product adoption. In addition, C1-INH is under investigation for transplant where antibody mediated rejection (AMR) has occurred.

Alpha-1 Antitrypsin (AAT): Other specialty products which continue to grow at a stronger pace is prothrombin complex concentrate (PCC) as well as alpha-1 antitrypsin (AAT). Global sales of AAT reached \$1.0 billion in 2016, or 4.7% of the total market. This is up slightly from 4.1% of sales in 2010, as the

market in the United States has sustained approximately a low two-digit annual sales growth for the past 6 years, driven mostly by new patient identification and higher dosing. Most of the global AAT sales are generated in the United States, though sales of this therapy in Europe are trending upward after approval through the central European Medicines Agency (EMA) in August 2015. AAT is also under investigation for new indications, such as graft vs. host disease after hematopoietic stem cell transplantation (HSCT) as well as type 1 diabetes. If either of these areas show clinical trial success, the market would be expected to experience higher demand for the therapy.

Prothrombin complex concentrate (PCC): PCC have nearly reached the \$500 million in sales mark in 2016, up from under \$300 million in 2010. This impressive growth was due to the introduction of the first four-factor (factors II, VII, IX and X) coagulation product in the United States by CSL Behring in 2013 for the urgent reversal of vitamin K antagonist (VKA) anticoagulation in adults with acute major bleeding. Sales of this product reached close to \$200 million within four years of product launch. Sales also increased in Europe for the same indication, while at present little PCC is used in other markets around the world.

In the United States, the market share of the plasma-derived factor VIII sales fell from 11% in 2010 to 9% in 2016, while the share of plasma-derived factor IX products fell from 20% to 6%. The latter's market share drop was due to the faster adoption of the extended half-life factor IX products than those of factor VIII, because they offer longer intervals between infusions than the standard recombinant and plasma-derived products.

Globally, the plasma-derived factor VIII market share went from 27% in 2010 to 21% in 2016. For, the plasma-derived factor IX' market share fell from 34% in 2010 to 21% in 2016. According to NPPA report of 2022, government has set the pricing for scheduled drugs and plasma products.

Government Market and the Rates:

A market survey and several documents and reports were studied to see the price of various plasma products in government and private sector respectively (Table 6 and Table 7).

CHAPTER 3 TECHNOLOGY

Analysis of Various Technologies Available (Centrifugation and filtration for solid / Liquid Separation, Thermal and Chemical Inactivation Procedure, Ultrafiltration / Diafiltration, Nanofiltration, Chromatography or Any Other Technology or Any Hybrid Model)

Several technologies are utilized for plasma purification at commercial scale, each has its advantages, disadvantages and applications in isolating specific proteins of human interest. Some of the key methods are as under:

Methods for Plasma purification

Plasma Fractionation method with ethyl alcohol

Cohn+ Liquid Chromatography

Heat Shock technology

Ammonium sulphate+ Liquid Chromatography

Ion Exchange Chromatography (IEC)

Plasma Fractionation Method with ethyl alcohol:

Cohn and colleagues developed a protein purification method by using plasma fractionation technique for the first time. This approach is based on albumin solubility difference with other plasma proteins. As compared to other plasma proteins, albumin sediments are at lower pH and higher ethanol concentration. In this method there are five important parameters for separation of plasma protein.

Ethyl alcohol (8- 40%)

Temperature (-3 to -10 °C)

pH (4.5-7.2)

Protein concentration (5.1-8 %)

Ionic strength (0.14- 0.01).

Protein separation is based on the increase in ethyl alcohol concentration thus albumin will be seen in the last fraction.

The method is suitable for large-scale and industrial production.

Disadvantages of Method:

Purity of the product

Denaturation of protein

The Cohn method combined with liquid chromatography:

The original Cohn method was modified by Oncley et al. in 1949 and Kistler-Nitschmann et al. in 1962 in order to improve albumin purity.

The method is used for the purification of plasma proteins at the industrial scale

In this method after ethanol precipitation liquid chromatography step is added. Albumin is a by- product and other important therapeutic proteins including factor VIII, intravenous immunoglobulin (IVIG) and some other proteins are isolated from plasma.

Advantages:

Increased purity of proteins

Higher yields

Cohn Modified

Supernatant A

Heat shock method:

Albumin is stable during thermal fluctuation comparing to the other proteins of the plasma; therefore, it can be purified by heat shock purification method.

Albumin protein resists to increasing temperature up to 60°C at which potential pathogen are inactivated.

After inactivation 0.04 M caprylic acid is added to stabilize the protein at pH 5 at 60°C.

At this stage other proteins of the serum are denatured and precipitated in solution. The final product (albumin) is concentrated by precipitation and ultrafiltration with purity of app 98%

Ammonium Sulphate precipitation combined with liquid chromatography:

Another method for albumin purification is ammonium sulphate precipitation combined with liquid chromatography which yields approximately more than 90 percent purified albumin. In this method albumin is separated from immunoglobulins by 50% ammonium sulphate. Then lipids are removed using ice- cold acetone at 2-8°C.

For further purification of albumin from other contaminating proteins (especially transferrin which is the main contaminant, DNases and immunoglobulins), ion exchange and size exclusion chromatography are used.

Ion exchange chromatography (IEC):

IEC is widely used for albumin and other protein purification. Among them the anion exchange method has the most widely used. Three major steps of anion exchange consisting pre- treatment, purification and

polishing.

The purification consists of two anion and cation exchange chromatography followed by polishing step comprising of two ultrafiltration and one gel filtration steps.

Process Flow Diagram Purification and Polishing Methods for Human Serum Albumin (HSA)

The limitations of method:

Long processing time

To overcome these limitations, the new method for ion exchange membrane chromatography (IEM) using ameliorated adsorbers was developed.

The membrane chromatography method is simple and has high separation efficiencies due to shorter diffusion times, reduction in buffer usage, small foot print requirements. No complex hardware or packing is required.

Disadvantage:

Expensive membrane

Low efficiency

Table No 8: Comparison of Different Methods for Industrial Application

Recommending a Cost Effective and High Productivity Technology:

On the basis of table 8, for purity analysis and percentage recovery there are individual methods like fractionation and combined methods like Cohn + LC and IEC which can be considered.

Lifinity should accept the method which give high productivity and acceptable quality of desired protein (purity levels) as per the regulatory expectations.

Cohn method when combined with chromatographic techniques is the most well-known method. In this method other proteins of plasma such as coagulation factors, immunoglobulins etc. would be separated in upstream, and albumin will be separated in the last fraction. Due to the robustness and high purity of plasma in large volumes, this technique, is cost- effective for plasma therapeutic protein production. Hence, this method currently seems to be a major method for albumin production.

However, taking into consideration, the latest developments in plasma fractionation technologies the detailed method along with the process flow diagram is recommended in section 4 of this document.

Obligations for technology service provider:

The selected Technology service provider shall have the following obligations:

Technology Transfer Plan:

To provide a detailed plan outlining the steps and timeline for the technology transfer. This plan shall include milestones, responsibilities, and contingencies. There should be a Lifinity steering committee to monitor the progress. All the deviations/changes should be approved by the committee.

Documentation:

To provide detailed documentation that describes the technology (Methods), equipment URS, buffer compositions, process steps, product specifications, and relevant data etc., This documentation is crucial for Lifinity to understand and replicate the technology.

Checklist of the details to be provided to Lifinity by the technology service provider:

Manufacturing:

RMs PPM and SPM and excipient specifications and source.

Dispensing instructions.

Detailed process flow diagrams.

Process validation requirements.

Batch Manufacturing record (BMR), SOPs, Master formulas.

List of SOPs for operation of equipment and other relevant procedures.

List of specifications and In-process controls (IPC).

Process flow diagrams (PFD) along with description of chromatography and other critical process steps.

Details of Equipment (Capacities, designs, qualification and placement with utilities requirements.

Manufacturing implementation sequence/model with process time for each unit operation.

Control strategy based on PPQ lots defining CPPs, CQAs and IPCs.

Yield calculation.

Cleaning procedures and validation.

Quality Control and Assurance:

Requirements of different areas for QC activities.

List of general and product related SOPs and STPs with specifications.

Raw materials and Active starting materials control and release strategies.

List of documentation for QC and QA activities.

Procedures for batch release, recall and complaints handling by quality assurance department.

Details of ware housing activities (Receipts of incoming RMS and active materials, sampling, Quarantine, testing and, release activities.

Cold chain requirements in ware house storage areas for active materials and finished products.

QC tests, STPs and specifications.

Validation of analytical and microbiology techniques.

Stability protocols as per regulatory expectations.

List of SOPs for operation of equipment and other relevant procedures.

List of OOS, OOT and any other quality related events/incidents relevant to Lifinity.

Details of primary packaging and secondary packaging materials with sources.

EHS:

SOPs and STPs related to EHS

Training:

It is the responsibility of technology transfer partner to provide on job training and qualification of the staff for each unit operation. Lifinity is responsible to provide necessary resources for trainings.

Training will comprise of knowledge transfer sessions, hands-on training, and exchange of personnel.

Lab Scale Implementation:

Lifinity shall initiate the technology transfer at lab scale to test its feasibility and performance in a real-world setting before full-scale deployment. The technology service provider shall provide the lab scale technology.

Regulatory Compliance:

Technology provider to ensure that the provided technology and its implementation comply with relevant regulatory requirements and support necessary approvals from regulatory authorities.

Scale-Up and Commercialization:

Technology provider shall provide support for Scale up of the technology for commercial production, at least three batches of each product and deployment. This shall involve optimizing manufacturing processes, securing additional resources, and launching the manufactured product with the given technology into the market.

Monitoring and Evaluation:

Provide continuous monitoring support at the production floor to Lifinity scientists for the performance of the transferred technology and conducting evaluations to assess its impact, identify areas of improvement and address any technology related issues that may arise.

Post-Transfer Support:

Providing ongoing support to address any challenges, optimize processes, and explore further opportunities.

CHAPTER 4 MANUFACTURING

As per the project implementation model, the following products shall be manufactured from 150,000L/Year of plasma.

Albumin

Factor VIII

Factor IX

Human Immunoglobulin (IgG)

Fibrin sealant

Fibrinogen

Manufacturing Process for Deriving the Above Suggested Products Derived from Plasma

Process Flow Diagram- Common Fractionation Steps

PFD- 1

PROCEDURE FOR COMMON FRACTIONATION STEPS:

P.1.F CUTTING AND POOLING

Approved plasma bags issued by QA are collected and thawed in a thawing tank with suitable provision for placement, retrieval and subsequent removal of thawing medium from the tank. The bags are checked for leakages after thawing and discarded if leakage is found. The thawed bags are cut under a bench type laminar flow and plasma collected in to suitable containers and finally pooled in process vessel to be taken for the next step.

P.2.F FILTRATION

Collected plasma after thawing is filtered to remove any suspended particles which may clog chromatography resins and column bed supports. Filtration is done using a depth filter which doesn't bind any proteins of interest. Filtered plasma is collected in a suitable tank with provisions to connect to a chromatography system for following process steps.

P.3.F CHROMATOGRAPHY – 1F

Filtered plasma is subjected to chromatography 1F to separate coagulation factor– F-VIII from rest of the fractions of interest. This step is essential to both separate F-VIII and also further polish plasma for other chromatography steps. Fraction of interest is collected using patterns on chromatograms, can be programmed for automatic collection.

P.4.F LOAD PREPARATION FOR 2F

pH of the collected eluate from Chromo – 1F, is adjusted to 7.0 and loaded on the next chromatography column.

P.5.F CHROMATOGRAPHY – 2F

pH adjusted eluate from Step 4 is subjected to chromatography -2F to separate F -IX from the remaining fractions. F-IX is collected separately for further process and remaining fractions are further processed.

P.6.F TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION

F-IX depleted sample is collected and concentrated by TFF. Trans-membrane pressures (TMP) are adjusted to achieve maximum permeate flow while minimizing fouling of the membrane. Automated TFF skids are used to precisely control and maintain the TMP.

P.7.F CHROMATOGRAPHY – 3F

Concentrated solution from Step-6 is subjected to chromatography-3F to separate buffer components from earlier steps and the sample is condition for further process steps. The main purpose of this step is to maintain suitable conditions for removal of other abundant protein impurities which may interfere with polishing chromatography steps of individual fractions.

P.8.F IMPURITY REMOVAL

pH of the eluate from Step-7 is adjusted to precipitate impurities from products of interest.

P.9.F EUGLOBULIN PRECIPITATION

Impurities like Euglobulin are precipitated using precise temperature and pH conditions. Temperature is maintained at less than 10 °C and pH less than 6.

P.10.F PRECIPITATE SEPERATION USING CENTRIFUGATION

The sample if passed through a continuous centrifuge to separate the precipitate. Precipitates are separated as a slurry and discarded. Supernatant is used for the subsequent steps.

Process Flow Diagram IVIG

IVIG PURIFICATION PROCESS:

P.11.F LOAD PREPARATION FOR 4F

Conductivity of supernatant from Step # 10 is adjusted to facilitate favorable conditions for separation of IVIG and Albumin.

P.12.I CHROMATOGRAPHY – 4F

Conductivity adjusted sample is subjected to Chromatography 4F to separate Albumin from IVIG, this is the most critical chromatography step. Unlike in Cohn's process this gives a single step separation. The chromatography step is also operated in both flow through and elution modes to achieve the required separation. Albumin and IVIG are separated as different fractions after this step and collected in different process vessels. Individual fractions are processed separately to further purify and polished suitable for filling in glass vials.

P.13.I TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION

IVIG fraction is collected and concentrated to about batch volume using TFF. Trans- membrane pressures (TMP) are adjusted to achieve maximum permeate flow while minimizing fouling of the membrane. Automated TFF skids can be used to precisely control and maintain the TMP.

P.14.I pH AND CONDUCTIVITY ADJUSTMENT

Both pH and conductivity of concentrated solution from step 13 is adjusted using NaOH and Acetic acid.

P.15.I FILTRATION

pH and conductivity adjusted, concentrated IVIG fraction is filtered using 1.2-micron filter to clarify, suitable for loading on next chromatography step.

P.16.I CHROMATOGRAPHY - 5I

Filtered IVIG sample is subjected to Chromatography 5I to further purify IVIG from other protein impurities. Impurities and IVIG are collected as separate fractions, impurities are discarded and IVIG is further processed.

P.17.I pH ADJUSTMENT

pH of the fraction collected from step 16 is adjusted with 1M Acetic acid for following viral inactivation step. This is ideally done in the same vessel in which the fraction is collected.

P.18.I CONDUCTIVITY ADJUSTMENT

Conductivity of collected fraction is adjusted. This is ideally done in the same vessel in which the fraction is collected and pH adjusted.

P.19.I LOW pH TREATMENT FOR VIRAL INACTIVATION

pH of the collected fraction is adjusted to 4.0 with 1M Acetic acid. This is held at pH 4.0 at 37 °C for 10 hours for viral inactivation. This step is most critical with regulatory and quality prospective.

P.20.I FILTRATION

Viral inactivated IVIG fraction is filtered using 1.2-micron filter to clarify, suitable for loading on next chromatography step.

P.21.I SOLVENT DETERGENT TREATMENT FOR VIRAL INACTIVATION - VERY CRITICAL STEP FOR REGULATORS

The solvent/detergent (S/D) pathogen inactivation method was developed for the inactivation of enveloped

viruses in plasma-derived medicinal products. Currently, S/D treatment for pathogen reduction of plasma for transfusion and plasma-derived medicinal products is the most common, validated and robust industrial method for the virucidal treatment of blood products. Although many millions of therapeutic doses of S/D inactivated products have been used to date, there is no report on transmission of viral infections caused by enveloped viruses in recipients. The safety of the S/D treatment is also shown by the absence of reports of toxicity or antibodies against neoantigens after large-scale exposure of patients to several million transfused units.

1% TNBP and 1% Triton X are added calculated as final volume v/v. TNBP and Triton are prepared in a buffer before addition to the bulk of fraction. Stock solutions are prepared.

P.22.I CHROMATOGRAPHY - 6I – FINAL CHROMATOGRAPHY STEP IN IVIG PROCESS

Filtered IVIG sample is subjected to Chromatography 6I to effectively remove added solvents and detergents in P.21.1 This also works for removal of endotoxins in the solution. IVIG bound to resin at an Acidic pH is selectively eluted using elution buffers at pH 9.0 in a process called as pH gradient elution.

P.23.I pH ADJUSTMENT

pH of the eluate from Chromatography 6I step is adjusted to preserve structural stability of IVIG and provide more stable conditions.

P.24.I NANO FILTRATION – (OPTIONAL STEP)

Nano filtration further ascertains barrier mode removal of viral particles from IVIG solution. Plano make filters are used in the process.

P.25.I TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION AND DIA FILTRATION IVIG fraction is concentrated using TFF about 5% IVIG w/v concentration followed by buffer exchange by dia-filtration at the same TFF running conditions.

P.26.I TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION

Dia-Filtered IVIG is concentrated to 6% w/v to facilitate final formulation at 5% w/v using the same TFF conditions. TFF conditions are maintained as in previous steps.

P.27.I FORMULATION

Buffered IVIG solution is formulated by adding 10% w/v pharmacopeial grade Mannitol. pH of this final solution is maintained at 4.2.

P.28.I PRE-FINAL FILTRATION

Filtration is done to decrease turbidity of the solution and also decrease microbial load on final sterile filtration step. This filtration is done using sandwich filter rated 1.2/0.6 micron.

P.29.I STERILE FILTRATION

Sterile filtration is done to further reduce bio burden and the process is not claimed a sterile operation. Final terminal filtration is performed before fill-finish stage.

P.30.I FILLING IN TO VIALS

Washed, sterile and pyrogen free vials are used to fill bulk solution of IVIG.

Process Flow Diagram Albumin Purification:

ALBUMIN PURIFICATION PROCESS:

P.31.A CHROMATOGRAPHY – 7A

Albumin fraction from chromatography step 4F is used to load on Chromatography 7A and separation is achieved by binding and elution mode. This step is final chromatography step in Albumin process.

P.32.A TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION

Eluate collected from Chromo-7A is concentrated to 6-7% w/v and collected in a vessel suitable for next process step.

P.33.A HEAT TREATMENT

Concentrated albumin solution is collected in a process vessel having control for temperature and time (57 degree C/ 3 hours). End point of completion of heat treatment is taken as stable optical density@ 600 nm. Heating of material results in a slightly turbid solution with suspended impurities. This solution is cooled to room temperature or even up to 10 °C for better separation. Chromatography is performed at room temperature.

P.34.A CENTRIFUGATION AND FILTRATION

Albumin solution after heat treatment is centrifuged and filtered to remove suspended proteinaceous contaminant particles formed during heat treatment. Continuous centrifuge can be used for this step.

P.35.A CONCENTRATION AND DIA FILTRATION

Above heat treated sample is Concentrated to 12% and Dia filtered.

P.36.A CAPRYLATE ADDITION AND pH ADJUSTMENT

Caprylate is added to concentrated and dia. filtered solution. The pH of the solution is adjusted to 4.5.

An IPQC check is done to check actual caprylate concentration and if required, adjusted the concentration.

P.37.A LOW pH INCUBATION

Solution is incubated at room temperature for about 7 hours followed by filtration to remove suspended particles.

P.38.A pH ADJUSTMENT

pH of the above solution is adjusted to 7.0

P.39.A CONCENTRATION AND DIA FILTRATION

Albumin solution is concentrated to formulation concentration and finally subjected to

Pasteurization at 60 °C and finally filled.

Process Flow Diagram Factor IX

FACTOR IX PURIFICATION PROCESS:

P.40.N LOAD PREPARATION CHROMATOGRAPHY 8N

Eluate from chromatography step 2F is suitably adjusted for pH and Conductivity followed by concentration using TFF. Solvent and detergent are added to achieve viral inactivation, followed by filtration.

P.41.N CHROMATOGRAPHY 8N

Chromatography 8N is performed in adsorption mode and eluted fraction is collected in a separate process tank

P.42.N LOAD PREPARATION CHROMATOGRAPHY 9N

Eluate from chromatography step 8N is suitably adjusted for pH and conductivity followed by concentration using TFF.

P.43.N CHROMATOGRAPHY 9N

Chromatography is performed in adsorption mode and eluate fraction is collected in a separate process tank. This fraction is suitably concentrated and passed through a nano filter to achieve viral removal.

This fraction is sterile filtered, formulated and filled in suitable vials.

Process Flow Diagram Thrombin

THROMBIN PURIFICATION STEPS:

P.44.T LOAD FOR CHROMATOGRAPHY 10T

Load from chromatography 10T is obtained from fraction of chromatography 8N.

P.45.T CHROMATOGRAPHY 10T

Chromatography 10T is performed in adsorption mode and eluate fraction is collected in a separate process tank. This fraction is suitably concentrated and passed through a nano filter to achieve viral removal.

This fraction is sterile filtered, formulated and filled in suitable vials.

Process Flow Diagram Fibrinogen:

FIBRINOGEN PURIFICATION STEPS:

P.46.F LOAD FOR CHROMATOGRAPHY 11F

Load from chromatography 11F is obtained from fraction of chromatography 1F. The solution is precipitated and solubilized in suitable buffer solution.

P.47.F CHROMATOGRAPHY 11F Chromatography 11F is performed in adsorption mode and eluate fraction is collected in separate process tank. This fraction is suitably concentrated and passed through a nano filter to achieve viral removal. This fraction is sterile filtered, formulated and filled in suitable vials.

Process Flow Diagram Factor VIII

FACTOR VIII PURIFICATION PROCESS

P.48.E LOAD FOR CHROMATOGRAPHY 12E

Load from chromatography 12E is obtained from fraction of chromatography 1F, is filtered and checked for conductivity and pH, adjust pH and conductivity, if required before loading on the chromatography column.

P.49.E CHROMATOGRAPHY 12E

Chromatography 12E is performed in non-adsorption mode and flow through fraction is collected in a separate process tank.

P.50.E LOAD FOR CHROMATOGRAPHY 13E

Load for chromatography 13E is obtained from fraction of chromatography 12E, fraction is checked for conductivity and pH, adjust the conductivity and pH, if required before loading on the chromatography column.

P.51.E CHROMATOGRAPHY 13E

Chromatography 13E is performed in adsorption mode and eluted fraction is collected in a separate process tank. This fraction is suitably concentrated and passed through a nano filter to achieve viral removal.

This fraction is sterile filtered, formulated and filled in vials.

Manufacturing for Stage-2 Products (PFD)

ANTI D IgG

Factor XI

ANTI MEASLES

TETANUS IMMUNOGLOBULIN

HEPATITIS-B IMMUNOGLOBULIN

RABIES IMMUNOGLOBULIN

Equipment Required to Manufacture for the Proposed Capacity of 150,000 L / annum

Equipment's for Plasma Bulk Manufacturing Facility

Equipment's for Fill Finish Production facility

Equipment's for QC / R&D

Equipment for QA

Equipment's for Plasma storage

Equipment in Finished Goods Storage

Equipment in Eng. / Critical System

Detailed design

This document describes the strategic approach to the facility design, technology basis and products selected in stage 1 (150,000 L / annum) and Stage 2 (500,000 L / annum)

The site is situated on the outskirts of Nagpur city spread over 6 acres.

The process design shall be based on Chromatography system-based separation.

It will be dedicated to manufacture of Human plasma fractions which include the following products in

Stage 1

Albumin

Human Immunoglobulin

Factor VIII

Factor IX

Fibrin sealant

Fibrinogen

The plasma processing capacity in Stage 1 will be 150,000 L / annum

The facility design shall have scope of increasing the plasma processing capacity to 500,000 L / annum.

Besides the products identified in stage 1 the following products have been identified in Stage

An appropriate Technology partner shall be identified for providing the process know-how.

Anti-D

Factor XI

Factor XIII

Hepatitis B IgG

Measles IgG

Protein C

Rabies IgG

Tetanus IgG

Thrombin

Varicella Zoster IgG

The plant is designed as a monobloc facility which will be constructed as a two-floor facility

The ground floor shall contain the following operational units

Bulk plasma fractionation unit (150,000 L / annum)

Warehouse Plasma storage (32000 L)

Admin / QA / Reception

Warehouse (RM/PPM/SPM/ Finished goods)

Electrical transformer area

Engineering workshop

Utility block

Raw water storage tank

Borewell

Boiler room

Chiller room

Kill tank system

Scrap yard

FUTURE EXPANSION AREA

Bulk plasma fractionation unit (350,000 L / annum)

Warehouse Plasma storage (32000 L)

The first floor shall contain the following areas

Canteen area

Water system and engineering store

SPM store

Visual inspection

Label store

Change rooms

Fill finish with Lyo area

Quality Control area

Service area (for AHU's)

CHAPTER 5 PROPOSED SITE PLAN

Concept design:

Figure 9: Conceptual Layout for Site Master Plan

Site Master Plan

Conceptual Layout Ground Floor (Bulk Manufacturing):

The bulk manufacturing area is designed in a manner to provide unidirectional flow of man, material and waste from the facility to avoid mix-ups and cross contamination.

All the ancillary functions are located on the ground floor and separated from bulk manufacturing area.

In the ground floor following facilities are present:

Bulk manufacturing facility -01

Bulk manufacturing facility -02 (Future provision)

Quarantine Plasma Storage/Testing lab/Ware house

Future provision for plasma storage

Finished goods storage & dispatch

Administrative Block

Utility Block

Workshop

DG Set and Transformer area

UG collection tank, ETP/STP & Kill Tank

Bore well, UG 500KL storage tanks

Chiller and Boiler rooms

UG SUMP

Bulk Manufacturing Block

Change Rooms: Bulk manufacturing facility-01, personnel entering the processing area will undergo a series of two dress changes applicable to clean rooms of different classifications. The separate change rooms are provided for male and Females.

Locker Room: This shall be the first change where the personnel remove their street shoes and clothes and keep these belongings in the provided double door lockers.

For the exit from facilities, separate change rooms are provided.

In exit change room personnel shall remove the clothing (Overall, head gear, gown and pant and reach the Locker room and put on their street clothes from the lockers and will exit the facility.

Preparation and Processing areas:

To support the manufacturing operations Buffer Prep.(Support area) shall be responsible to prepare various materials, reagent, chemicals and sterile materials to be used in the manufacturing operations. The provisions for dry and moist heat sterilisations are provided in this area.

The manufacturing facility is construed and designed in a manner to protect product from any mix-ups, cross contamination and making the operator's work path and activities less complex and enabling compliance.

The processing areas for thawing of bulk material (Plasma), fractionation and downstream processing (Chromatography) are separately provided in the Layout to avoid any mix ups and cross contamination.

Plasma storage/ Testing lab /ware house/ Future provision plasma storage:

All the incoming and released raw materials, packaging material required to support the manufacturing shall be stored in the ware house.

All the incoming plasma shall be sampled and tested in ware house testing lab. There is a provision for the storage at -20degrees C for of plasma in the ware house.

For the envisaged future expansion of manufacturing capacities from 150000Lit.to.500000Lit / year an additional storage area is reserved in the ware house, this area shall be furnished during future expansion of the capacities.

Finished goods storage and despatch:

All the released material shall be stored in the released cold rooms. At the time of shipment, the packed material shall be transferred from finished goods dispatch area in the ground Floor.

Administrative Block:

All the administrative support functions shall be dealt in this block.

Holding tank /ETP/STP:

All the liquid waste generated in the bulk manufacturing area shall be properly segregated. The biological waste material shall be transferred to holding tank from there it will be transferred to kill tank for final processing and discharge to ETP through holding tank.

03 UG water storage tanks (5KL) each & Utility Block:

The ground water shall be transferred to UG storage 03 tanks having capacities of 5KL each. The raw water will be treated and will be used as feed water for the generation of PW, WFI and clean steam.

Engineering work shop:

All the maintenance and repair activities shall be undertaken in the work shop.

DG and Transformer room:

For the uninterrupted power supply separate area is designed in the Layout.

Chiller and Boiler room:

The facility of chilled water and plant steam required for various system shall be routed through chillers and boilers room.

First Floor: On the first-floor following facilities are housed:

Formulation / Fill Finish area

Finished goods quarantine

Labeling, packing & Visual Inspection

Water System and Eng. store

Bulk Store

SPM store

PPM store

R&D lab

QA/QC

Canteen

Figure 10: Conceptual Layout for Bulk Manufacturing Facility

The bulk manufacturing area is designed in a manner to provide unidirectional flow of man, material and waste from the facility to avoid mix-ups and cross contamination.

All the ancillary functions are located on the ground floor and separated from bulk manufacturing area.

In the ground floor of Bulk manufacturing facilities following key areas are present:

Bag Cutting and pooling area

Plasma Thawing Area

Downstream processing (Chromatography)

Columns packaging & skids

Washing area

DHS / Autoclave area

Cold room

Buffer Preparation

Plasma day store

Chemical Day store

Change rooms

Change Rooms: Bulk manufacturing facility -01, personnel entering the processing area will undergo a series of two dress changes applicable to clean rooms of different classifications. The separate change rooms are provided for male and Females.

Locker Room: This will be the first change where the personnel remove their street shoes and clothes and keep these belongings in the provided double door lockers.

For the exit from facilities separate change rooms are provided.

In exit change room personnel shall remove the clothing (Overall, head gear, gown and pant and reach the Locker room and put on their street clothes from the lockers and will exit the facility.

Preparation and Processing areas:

To support the manufacturing operations Buffer preparation (Support) area shall be responsible to prepare various materials, reagent, chemicals and sterile materials to be used in the manufacturing operations.

The provisions for dry and moist heat sterilisations are provided in the area.

The manufacturing facility is construed and designed in a manner to protect product from any mix-ups, cross contamination and making the operator's work path and activities less complex and enabling compliance.

The processing areas (Upstream) bag cutting, pooling and segregated plasma thawing areas are provided.

There are separate areas for Plasma fractionation and downstream processing in stagewise manner (Chromatography) provided in the Layout to avoid any mix ups and cross contamination.

For packing of chromatographic columns dedicated area is provided in the layout of bulk manufacturing facility

Cold Rooms:

Cold rooms are provided in the facilities for the storage of heat labile materials like chromatographic gels, in process samples and materials.

Figure 11: Conceptual Layout for Bulk Plasma Storage Facility

Plasma storage facility is housed on the ground floor adjacent to the raw material storage area. All the Raw materials shall take through the dedusting tunnel to clean and remove the dust from the external surface of RM containers. After sampling of RM, the goods shall be transferred to RM quarantine area pending the testing and release of materials from quality control lab.

The RMs which do not meet the specifications shall be transferred to rejection room. Rejection room has access control. Only authorised persons are allowed to enter the area.

In coming plasmas is taken inside the ware house through plasma receipt corridor.

Incoming plasmas is sampled in plasma sampling room, equipped with (RLAF), remaining plasma is transferred to plasma quarantine area having -20 degrees C cold facility.

After the completion of serological testing and other necessary test in the serology lab and QC lab., plasma is shifted to released plasma cold room at -20degrees C.

Barcoding for identification of each lot of bulk plasma is done in Barcoding room. There is a provision for future expansion of cold facilities to cater to 500000 Lit Plasma.

Figure 12: Conceptual Layout for Fill Finish Facility

Fill finish facility is housed on first floor of the bulk manufacturing facilities.

For entry into the area separate entries for males, females and visitors are provided. After series of changes, personnel shall enter into the core areas of fill finish facility.

In the core area formulation area is present.

In the formulation area all the released bulks shall be formulated on campaign basis. The formulated bulks shall be filled, capped through automatic machine and inspected for any abnormalities (particulate matter) visually. Separate laundry area is provided for washing of soiled gowns.

Following are the key areas in Fill Finish facility

Formulation

Fill Finish area 3.Lyophilisation

Change Room

Disinfectant and Material Prep area

Cold room

Clean laundry

Packing area

Figure 13: Conceptual payout for QC and R&D Facility

On the FF of Bulk manufacturing facilities R&D, Quality Assurance and quality control facilities are located.

Four labs are dedicated for research and development activities. The technology at small scale shall be transferred to R&D labs.

Adjacent to this, quality control labs are housed. Primarily quality control labs shall be responsible for testing

Raw materials, PPM and SPMs.

In-process testing of intermediate products

Bulk plasma -Physicochemical and microbiological test

Formulated Bulk plasma products

Fill finished plasma products

Microbial testing of critical utilities.

Microbial testing of environmental samples from clean rooms.

Quality Assurance:

Annexed to QC labs quality assurance department is located. In quality assurance following functions of site will be undertaken

Documentation and control

Trend analysis of critical utilities and Change management

Audits, Inspections, Pest control and Vendors management

Validation. Qualification and Calibration

Complaints and Recalls

Lot Release and Product review.

Trainings

Figure 14: Elevation Drawing

Layout Philosophy:

Plasma fractionation and processing is complex and critical manufacturing operation with respect to the receipt of plasma (Starting material) its downstream processing, formulation and fill finish. The facility requires strict cGMP and regulatory compliance to ensure the product quality and safety of the operator and environment.

The facility Layout adheres to GMP guidelines (Schedule M of Drugs and cosmetic act 1940 and Rules 1945).

The layout philosophy is based on the integral evaluation of processes, potential risks, man and material movement, generation and flow of solid and liquid waste etc.

The manufacturing facility is construed and designed in a separate block to protect product from any mix-ups, cross contamination and making the operator's work path and activities less complex and enabling compliance. Flow of personnel, clean and dirty materials are unidirectional with logical sequence of operations.

HVAC zoning of the facility (control areas) for the manufacturing operations is done based on the operation and its criticality (Plasma collection, fractionation, purification, and storage) to minimize the risk of contamination and to maintain physical conditions like temperature and humidity. The physical conditions should also be suitable to the comforts of the personnel working with protective clothing.

In the Layout provision for separate change rooms for entry and exit from clean areas is made. Change rooms design contains airlocks to provide physical separation of the different stages of gowning.

CHAPTER 6 SOURCING AND HANDLING OF RAW MATERIAL

Exchange Value of Plasma per Liter and Projected Value Over a Period of Seven Years: As per the literature survey and discussion with different stake holders the exchange value of plasma in 2023-2024 is INR 2200/Liter and in next 5 years the estimated plasma price shall be expected to be ≈INR 2800/L.

Figure 15: Exchange value of plasma per liter and projected value in INR

Donors' Selection Criteria:

In India, the plasma industry is dependent on voluntary blood donation. Human blood is the source of plasma which is used to manufacture various therapeutic plasma proteins after fractionation.

In blood banks the cellular components (RBC, WBC, and platelets etc.), are separated out for different applications and the plasma is collected from blood banks by plasma fractionators for clinical / therapeutic use as per "National Plasma Policy" of Ministry of Health & Family Welfare.

The selection and management of blood donors is an essential part of the blood donation process. National health authorities and blood transfusion services are responsible for ensuring that the national system is in place for the selection of all blood donors through an assessment of their suitability to donate blood.

Following are the selection criteria for donors:

Health

Age (18-65 years)

Time between blood donations

Blood pressure

Body temperature

Hemoglobin content etc.

Test for HBsAg*

Test for anti-HIV*

Test for anti-HCV*

*All three tests should be negative. An additionally test for STD is also performed.

Plasma Donation Testing, Epidemiological Surveillance, Post Donation Information: Plasma Donation testing:

The collected plasma is screened for the following:

Test for HBsAg

Test for anti-HIV

Test for anti-HCV

All three tests should be negative. Additionally test for STD is also performed.

Epidemiological surveillance, post donation information:

To ensure optimal long-term safety of plasma for fractionation, it is recommended to establish continuous epidemiological surveillance of the donor population.

The objective of this survey is to know, as precisely as possible, the prevalence and disease incidence, and trends of infectious markers that are relevant to the safety of medicinal plasma products so that appropriate counter-measures can be taken in a timely manner.

The system should not only be able to gather epidemiological data at the national and regional level but also among the donor populations that are providing blood or plasma for fractionation at individual blood establishments within a country or a region. The information from the epidemiological surveillance can furthermore be used to detect and assess.

Differences in disease patterns between donor population.

Trends of infectious marker.

The relevance of any preventive measures such as a strengthening of donor selection process, additional exclusion criteria, or implementation of any additional screening tests to avoid contamination of plasma products.

To detect any new or emerging pathogens in the community.

Handling of Blood, Plasma Freezing, Storage, Cold Chain and Complete Logistics Plan: Handling of Blood:

A standardized and validated procedure for the bleeding shall be followed.

The presterilized container (Bags) shall be used to collect the blood.

Identity of the donor should be confirmed with relevant documents before venipuncture.

The collected blood used for plasma fractionation should be mixed well with the anticoagulant solution to avoid risks of activation of the coagulation cascade.

Presently, automated blood collectors are used in which plasma is separated from cells and the cells are resuspended and returned to donor in series of return cycles.

In most of the centers the centrifugation or filtration or combination of both process is followed to separate the cellular components from plasma.

The collected blood should be weighed and labelled properly in order to ensure full traceability at each stage of plasma production.

Information on the label of the blood storage containers should include:

Name of the blood product

Volume or weight

Unique donor identification number

Name of the blood collection center

Shelf life

Storage temperature

Name, content and volume of anticoagulant

Laboratory samples should also have the same information and must be stored securely at appropriate

temperature

Blood Holding:

It has been shown that whole blood anticoagulated with CPD, transported and stored at 22°C for up to 8 hr prior to separation of plasma is suitable for the production of plasma for fractionation.

However, storage of blood beyond 24 hours the factor VIII activity is reduced by 15 to 20 percent. Rapid cooling of whole blood to 22°C +/- 2°C after collection protects factor VIII and may allow storage of blood for 24 hr.

Transportation/storage of collected blood at 4°C with different anticoagulants (ACD, ACD- adenine, or CPD) consistently appears to reduce the FVIII content, but not necessarily that of other proteins.

Blood holding time for the extraction of various components should be validated by the company.

Plasma Processing and Transportation:

After separation of plasma, freezing is an important processing step that has an impact on content of factor VIII. Several aspects of the freezing conditions of plasma for fractionation have been evaluated in this document based on the literature search.

Freezing of Plasma:

The requirements for the temperature at which plasma should be frozen depend upon the type of proteins to be fractionated.

As per pharmacopeial guidelines, recovered or apheresis plasma for fractionation to be used for the manufacturing of labile proteins (Factor VIII concentrate) should be frozen rapidly, within 24 hours of collection, at -20 °C or below.

However, freezing conditions are currently under debate. It is suggested that recovered plasma used to manufacture stable plasma proteins (e.g., albumin and immunoglobulins) should be frozen within 72 hours of collection at -20 °C or below.

Plasma freezing process should be validated by life Nity to extract the desired plasma proteins.

Storage of Plasma:

Plasma for fractionation should be stored at -20 °C or below. When plasma is stored at -20°C it has the shelf life of 2 years. However, when plasma is stored below -20°C has shelf life of 3 years.

Stability/Shelf-life studies should be conducted on at least three Pooled Plasma bulks during initial phase as a minimum by the company and subsequently one batch of pooled plasma should be taken for stability on annually basis after approval from the quality assurance department. The stability studies should be well documented.

Transportation of plasma and its validation:

Transport of plasma pools (Bulk) and samples to the processing site should be done according to approved and validated procedures. Temperature monitoring device should be used to record the temperature during transportation. Any deviations in the temperature during

transportation should be notified to QA department for impact assessment (compliance and quality).

Simulation studies should be conducted at site to validate the packaging and its transportation.

Sourcing of Plasma from Government and Non-Government Blood Banks:

There are different sources of plasma in India- Government, NGOs and some private facilities recognized by the government. The Govt. has the full responsibility for the blood program.

The surplus plasma from government hospitals and blood collection centers and blood banks are sold through tenders.

As a minimum there are certain conditions for plasma fractionator to fulfill before applying for plasma procurement as follows:

The plasma fractionator must be licensed by the Government of India for plasma fractionation and manufacturing clinically usable products in a cGMP facility.

The fractionator is accountable to update plasma procurement center about the nature and quantity of all the products manufactured from the plasma received from the center.

The fractionator must ensure that none of the products recovered from this plasma are exported before fulfilling domestic demand.

Buy Back policy:

In some cases, government buy plasma derived products from the fractionator for use.

Equipment for Proper Collection, Storage and Separation of Blood Components: Following is the list of equipment required during the different stages of blood processing: Blood Collection

Donor weighing balance

Haemoglobinometer

Sphygmomanometer

Stethoscope

Blood mixer and shaker

Tube stripper and Di-electric tube sealer

Needle destroyer

Blood Processing

Refrigerated Centrifuges

Double pan balance

Plasma Expresser- Manual/Automated

Blood Storage

Blood Bank Refrigerator

-20°C freezers

-80°C deep freezers

Platelet Agitator and Incubator

Cell Separators (Apheresis machine)

Blood Testing

pH Meter

Cell Counter (optional)

Coagulometer (optional)

Automated Cell Grouping system (optional)

Equipment for Gel technology (optional)

Table top centrifuge

Serological water bath

ELISA reader (plate reader / Strip reader)

VDRL shaker

Blood Distribution

Transportation vans (optional)

Insulated blood bags container with provision for storage between 2 °C to 8 °C

Importing of Plasma from Neighboring Countries and Indian Regulations:

India is highly import dependent for its plasma product needs, which are considered to be life- saving medicines. At this point in time, India produces majorly only two plasma products, albumin and intravenous immunoglobulin (IVIG) from local plasma.

Because of changing disease pattern, improved clinical diagnostic facilities, affordability, medical tourism and many other factors the demand of blood products is increasing. This creates a huge demand and supply gap and many patients lose battle of life because of non- availability of these products. Various hyper-immune plasma proteins (Anti-D, tetanus

immunoglobulin, hepatitis-B immunoglobulin, and rabies immunoglobulin) are 100% imported or prepared from imported bulk.

Indian Regulations & Regulatory Bodies:

The Plasma Policy aims at making available, easily accessible and adequate supply of high quality of human plasma derived proteins for clinical/ therapeutic use. In India the plasma is separated from safe and quality blood from voluntary non-remunerated regular blood donor. Blood and plasma are regulated by different rules mention in drugs and cosmetic act 1940 and by different regulatory agencies as mentioned below.

Following regulations and rules are applicable:

The Drugs and Cosmetics Rules, 1945, framed under the Drugs and Cosmetics Act, 1940:

Includes human blood under the definition of "Drugs" under Section 2(b)

Regulates functions of blood banks, which provide recovered plasma for plasma fractionation (Part XII C specifically regulates the collection and storage of plasma for fractionation)

The National AIDS Control Organization (NACO), under the Ministry of Health and Family Welfare) to oversee operation of blood banking services in India.

National Blood Transfusion Council (NBTC) is the apex policy-making body, under NACO, making central licensing mandatory, increasing voluntary donation base and setting of quality standards.

State Blood Transfusion Councils (SBTCs) are responsible for the smooth functioning of blood transfusion services at a state level.

Drug Standard Control Organization (CDSCO) and State Drug Control Organizations' play a vital role in key aspects such as, approval of licenses, and enforcement of standard transfusion practices to ensure safe, quality and efficacious blood and its components in clinical practices. National Institute of Biologicals (NIB) Nodal governmental organization under the Ministry of Health and Family Welfare responsible for the testing and release of biologicals in India including blood plasma.

CHAPTER 7 PRODUCTION PROGRAM

Product and Product mix:

In phase 1 of the project the following products are proposed to be manufactured from normal human plasma.

Human Serum Albumin

Normal Immunoglobulin

Factor VIII

Factor IX

Fibrin Sealant

Fibrinogen

Depending upon the market demand and production capacities, product mix strategy can be formulated.

Various permutations and combinations are possible to manufacture different products. On the basis of PFD given in Chapter 4, different products shall be purified in different steps during the downstream processing of pooled plasma bulk (fractionation of plasma).

However, it is suggested that Lifenity shall take the first campaign of product which is at the highest demand followed by the products with moderate and low demand. As an alternate, the high yielding product shall be manufacture first to have sufficient stock followed by a campaign for low yield and moderately yield products.

Plasma requirements based on the manufacturing capacities:

Considering 1,50,000 Liters of plasma processing capacity, plasma bags requirement are presented in table below:

Table:9 Plasma requirements based on the manufacturing capacities:

Production Capacities and Yield Calculations:

HSA is major protein component, followed by IgG in plasma. The wide concentration range of plasma proteins (less than 1 mg/mL to 40 g/L is one of the potential challenges in designing production capacities.

Source: (J.D. Andrade et al. Plasma protein adsorption: the big twelve, Ann. N.Y. Acad. Sci., p. 158-172,1990. & Chapter -2 of DPR).

However, for calculation purpose below mentioned protein concentrations in normal plasma are considered.

It has been reported in the literature that depending upon the downstream processing and sterile/terminal filtration, recovery of the protein of interest is 50% at final stage.

Source: (Overview of Albumin and Its Purification Methods: Adv Pharm Bull, 2016, 6(4), 495- 507 doi: 10.15171/apb.2016.063 <http://apb.tbzmed.ac.ir>) as shown in the table below.

Basis of Yield calculations:

Based on vessel size, the batch size assumed is 1000 liters, on every alternate date, a new batch can be initiated, therefore 15 batches shall be processed per month (one batch/ alternate day).

The yield for 1000 liters batch is as mentioned below.

Table 10: Yields for 1000L batch

In the EOI document, the phase 1 target is to process 1,50,000 Liters of plasma annually. The output obtained with 1.5 lac liters of plasma for the products mentioned for stage1 is as under.

Table 11: Yields for 150,000 Lit annual capacity

Therefore, to achieve the plasma processing target, 15,000 liters of plasma shall be processed on monthly basis at site.

Production Scaleup from 150,000 to 500,000 lit per annum:

Lifenity will increase its plasma processing capacity to 500,000 liters annually in phase 2 of the project implementation.

To achieve the plasma processing target, 50,000 liters of plasma shall be processed monthly. Two strategies, can be followed:

Strategy 1: To keep number of batches equivalent to stage-1 (i.e., 15 batches per month), the individual batch size shall be 3400 liters. The yield calculations are given below.

Table 12: Yields for 3400 L batch

Strategy 2: Alternatively, if the batch size is further increased to 5000 liters, the number batches shall be reduced to 10 batches per month as one batch can be initiated after every 3 days. The yield for a 5000 liters batch is as mentioned below.

Table 13: Yields for 5000 L batch

Total Production capacity:

The total production capacity with 500,000 Lit. of Plasma/year is given in the table below.

Table 14: Total production capacity with 500,000 Lit. of Plasma/year

Note:

For scale up to 500,000 Liters only 6 products (HSA, IgG, F-VIII, F-IX Fibrin Sealant, Fibrinogen) are considered.

Fibrin sealant is prepared by mixing Fibrinogen and Thrombin; therefore, production capacity of fibrin sealant is equal to the production capacity of Thrombin.

CHAPTER 8 PROJECT IMPLEMENTATION MODEL

Lifenity shall implement the PDMP manufacturing in a phased manner.

A suitable technology partner for the Plasma fractions shall be identified and contracted with for process know-how. The agreement will fulfil criteria mentioned in Section 3.3 of this document.

The project shall be initiated at small scale to establish the process for the products identified in

stage 1.

Once the process, yields and quality are established as per the specifications, the project will proceed to the commercial scale stage

Commercial scale:

The company will initially procure 150,000 liters of plasma per year for fractionation to produce the following product in Phase-1.

Human Serum Albumin (HSA)

Human Immunoglobulin (IgG)

Factor VIII

Factor IX

Fibrin sealant

Fibrinogen

All the areas of the manufacturing block (Facility-1) will have sufficient space to cater the volumes and products without compromising on any of the cGMP and regulatory expectations.

The following systems installed during Phase-1 of the project will also be matching the requirements for Phase-2 (Expansion Project) capacities.

Clean utilities

Black utilities

Filling

Freeze drying and

Packaging lines for the final product

Facility Expansion:

For handling additional 350,000L of Plasma:

In Phase-2, the company shall procure additional 350,000 Liters of plasma to manufacture the following additional products.

Anti-D IgG

Factor XI & XIII

Fibrinogen

Hepatitis B IgG

Immunoglobulin G

Measles IgG

Protein C

Rabies IgG

Tetanus IgG

Thrombin

Varicella Zoster IgG

While implementing Phase-2 of the project, Lifenity shall extend the manufacturing operations to Facility-2 and shall procure the following additional systems to match the capacities of processing additional 350,000 L/year of plasma which are as follow:

Tank Systems

Chromatography Systems

Autoclaves

Dry heat sterilizers

Quality control and Quality assurance units developed during Phase-1 will be also cater to the Phase -2 products and other ancillary activities.

Central ware house space shall be adequate for future expansion. However, the additional cold Chain equipment (Freezers) and storage racks etc. for the storage of active material (plasma) and finished products shall be procured during Stage 2 expansion.

In Phase-1 of the project the bulk manufacturing operations will run in a single shift of 8 hours working /day, with effective working for 6 hours. The shifts can further be evaluated based on number of batches for processing/week. Likewise, the filling operations will run in scale down mode to meet the market requirement.

Monoclonal antibodies (Mabs) – Future considerations:

A monoclonal antibody are Y-shaped glycoproteins that detect and bind strongly to their antigen.

Monoclonal antibodies stems from a single white blood cell clone. Monoclonals not only bind to a single epitope of a target antigen but also activates immune responses, e.g. antibody-dependent cell-mediated cytotoxicity (ADCC) and recruits further immune cells such as phagocytes and are thus highly specific

Monoclonal antibody production:

Several technologies for monoclonal antibody production have been developed and the respective downstream processes are optimized. Some of the industrial scale technologies are:

Hybridoma cells production

Phage display technologies

Single B cell technologies

Hybridoma production:

In this technology fusion of antibody producing B cells of an immunized mouse with myeloma cells is done produce unlimited antibodies. Hybridoma cell line that can be maintained indefinitely

Disadvantages:

Use of lab animals for immunisation

Risk of mutations in the antibody with aging of hybridoma

Expression of additional variable domains by the cell line

Long lead times and labour-intensive operation

Phage display technology:

Phage display technology circumvent several disadvantages of hybridoma technologies and speed up the process of Mab generation.

The technology relies on molecular biology and cell culture methods to genetically engineer bacteriophages to display antibodies on their surface.

In this method binding of bacteriophages with desired antibodies onto immobilized antigens is done. The

high affinity binders are then used to infect bacteria and collect their DNA for

sequencing. The sequence help to design genes to be used in antibody production in cell cultures.

The overall process is much faster than hybridoma cell generation and doesn't need any laboratory animals.

Single B cell technologies:

Single B cell technologies are another milestone in Mab development. The technique involves the screening and sorting of ex vivo cultures of single B cells from blood samples of immunized animals or humans to select for promising antibody candidates.

Genetic information is then extracted from the candidate cells mRNA after reverse transcription into cDNA, amplification and subsequent sequencing and cloning into expression vectors for Mab production.

In this method there is no need to create a hybridoma cell line, thus process become efficient and timeline are shorted by several weeks.

Depending upon the process to be adopted for the manufacturing of monoclonal antibody a new production block shall be designed to meet the process and cGMP requirements.

Detailed working for the Mabs manufacturing unit will be proposed separately in future.

In general, the Mab production suite shall have cell culture, fermentation, harvesting, primary purification, secondary purification, sterile filtration.

However, for formulation and fill finish existing facilities shall be used areas.

Table 15: Steps performed in MABs production (General)

For implementation of Mabs project in future, there shall be a requirement of cell culture and molecular biology labs in the quality control with some additional piece of equipment.

Present Layout of quality control unit will be adequate for plasma products (Phase-1 & 2). However, for Mabs products testing, expansion in existing QC to cater the cell culture need shall be required.

CHAPTER 9 GMP AND REGULATORY

CONSIDERATIONS

Premises, Layout & Process Engineering:

Plasma fractionation and processing is complex and critical manufacturing operation with respect to the receipt of plasma (Starting material) its downstream processing, formulation and fill finish.

Plasma fractionation facility require strict cGMP and regulatory compliance to ensure the product quality and safety of the products and operators. The facility's layout and process engineering are critical components for setting up of the green field project. Following are key considerations for setting up a plasma fractionation facility with respect to Premises, Layout and Process engineering:

Location and Surroundings:

The factory building(s) for manufacture of plasma products shall be situated and shall have measures to avoid risk of contamination from external environment including open sewage, drains, public lavatory or any factory which produce disagreeable or obnoxious odor or fumes, excessive soot, dust, smoke, chemical or biological emission.

Building:

The building(s) used for the purpose shall be designed, constructed, adapted and maintained to suit the manufacturing operations so as to permit production under hygienic conditions. They shall conform to the conditions laid down in the Factories Act, 1948 (63 of 1948).

Premises - General Requirements:

The premises used for manufacturing, processing, warehousing, packaging, labelling and testing purposes shall be:

Compatible with other products manufacturing operations that may be carried out in the same or adjacent area.

The manufacturing facility shall be designed / constructed / maintained to prevent entry of insects, pests, birds, vermin's and rodents. Interior surface (walls, floors and ceilings) shall be smooth and free from cracks, and permit easy cleaning, painting and disinfection.

There should be adequate space for orderly and logical placement of equipment, materials and movement of personnel in order to prevent:

The risk of mix-up between different categories of products or with raw materials, intermediates and in-process material.

Possibilities of contamination and cross- contamination by providing suitable segregation, zoning and access controls etc.

Layout Considerations:

During designing of facility, Lifinity must ensure the following points:

Plasma products will be produced in an independent block/building.

The facility is designed to prevent cross-contamination between process areas, easy cleaning and ensure the efficient flow of materials and personnel.

The facility design adheres to GMP guidelines (Schedule M of Drugs and cosmetic act 1940 and Rules 1945).

Ancillary areas like rest and refreshment rooms are separate from manufacturing areas.

Facilities for changing, storing clothes and for washing and toilet purposes are easily accessible and adequate for the number of users. Provision for separate toilets for males and females is made and toilet is not connected with production or storage areas.

Change rooms design contains airlocks to provide physical separation of the different stages of gowning. Flushed effectively with filtered air. Change rooms are of the same grade as the area into which it opens finally.

Provision of separate change rooms for entry and exit from clean areas.

Hand-washing facilities are provided in the first change room.

Flow of personnel, clean and dirty materials are unidirectional with logical sequence of operations.

Sinks and drains are excluded from Grade A and B areas where aseptic operations are carried out.

Drains are fitted with effective easily cleanable traps and with air brakes to prevent backflow.

The production and dispensing areas are well lighted, effectively ventilated.

HVAC Zoning:

Air supply for manufacturing area will be filtered through bacteria retaining filters (HEPA Filters) and will be at a pressure higher than in the adjacent areas unless otherwise required.

The filters to be checked for performance on installation and periodically thereafter and maintain written records.

HVAC zoning of the facility (control areas) for the manufacturing operations is done based on the operation and its criticality (Plasma collection, fractionation, purification, and storage) to minimize the risk of contamination and to maintain physical conditions like temperature and humidity. The physical conditions should also be suitable to the comforts of the personnel working with protective clothing.

Routine microbial and particulate counts of the manufacturing area will be carried out during manufacturing operations to assess the effective ness of HVAC.

The results of particulate matter and microbes to be continuously monitored against documented in-house standards and regulatory guidelines.

Based on the quality of air, manufacturing facility is divided into different grades/ Zones. In general, plasma processing facility is divided into four grades (Classes) based on the air cleanliness levels (Microbial and Particulate matter (Refer to table No 15 and 16).

Facility Grades:

Grade A: Clean rooms are used for high-risk operations, and require a unidirectional airflow system to maintain high air quality. Unidirectional airflow should provide a homogeneous air velocity of 0.36–0.54 m/s (guidance value) at a defined test position 15–30 cm below the terminal filter or air distributor system.

The velocity at working level should not be less than 0.36 m/s.

Grade B: In aseptic preparation and filling, this is the background environment for the Grade A zone.

Grades C and D: Clean areas for carrying out less critical stages of the manufacturing of plasma products -downstream processing, chromatographic purification and solution preparations.

Table 16: Recommended Maximum Allowable Particles in Clean Rooms

Table 17: Recommended limits for Microbial contamination in Clean Rooms

Clean Utility Systems:

Pure steam, purified water and water for injection are the clean utilities required to support the clean operations in plasms manufacturing/processing facilities. Monitor the clean utilities for the quality and compliance regularly as per the laid procedures and the regulatory standards.

Equipment Placement:

Equipment and processing areas will be arranged to facilitate efficient workflow and minimize the risk of contamination. Ensure that equipment and materials are easily accessible for maintenance and cleaning. Processing areas must be equipped with dedicated equipment designed for specific purpose.

Waste Management:

Waste will be removed from the manufacturing area or sent to the bio-waste system in a safe manner. To ensure containment compliance with the environment, the facility must implement measures to prevent accidental spills or leaks. This includes the use of appropriate containment systems, spill response plans, and monitoring for any environmental impacts.

All sewage waste pipes will run below natural ground level (however this depends on the actual site conditions along the pipe routing) in proper gradient and connected to nearest available chamber.

Procedures must be in place for the safe removal of different types of waste such as chemical, biological, expired reagents, unused samples and solvents etc.

Design the drainage systems in such a way that effluents can be effectively neutralized or decontaminated to minimize the risk of cross-contamination.

Provisions should be there for the proper and safe storage of waste materials awaiting disposal.

Toxic substances and flammable materials must be stored in suitably designed, separate, enclosed cupboards, as required by national legislation.

Liquid effluent poses a safety or contamination risk (Biological liquid waste), should be treated in the kill tank before its discharge into non biological /main drain.

Testing Facilities:

Testing facilities must be located in the separate building/floor.

Validation and Documentation:

Lifentiy and PMC will validate the facility layout and design to ensure it meets GMP and regulatory requirements. Comprehensive documentation of the facility's layout and design, including as-built drawings shall be maintained at site and a robust document control system shall be established in quality Assurance department to maintain records.

Accessibility and Safety:

Ensure that the facility layout allows for easy access in the event of an emergency. The facilities must be equipped with safety features like fire hydrant systems, eyewash and body shower stations where ever necessary.

Quality Assurance & Regulatory Compliance:

The quality assurance system appropriate to the manufacture of plasma products shall ensure that the products are designed and developed in a way that takes account of the requirements of GMP and other associated codes such as those of GLP and GCP.

Adequate arrangement must be made at site for manufacture, supply chain and use of the correct starting and packaging materials.

Self-Inspection and Quality audit:

In the quality assurance department of Lifentiy adequate procedures shall be designed to ensure self-inspections and quality audits periodically.

Plasma Process Considerations:

Plasma fractionation involves critical steps to separate plasma into its various components and produce high-quality plasma-derived products while adhering to Good Manufacturing Practices (GMP) and regulatory requirements.

Following are the key considerations for plasma processing:

Plasma Collection and Testing: A reliable and secure source of plasma, involving strict donor selection, screening and testing plan in place to screen for infectious agents, including HIV, Hepatitis B and C, and other potential contaminants in pooled plasma.

Fractionation Process: A well-defined fractionation process to separate plasma into its various protein components, such as albumin, immunoglobulins, and plasma factors. Robust filtration and purification processes will be followed by Lifentiy to separate and purify these proteins.

Process Validation: The fractionation process must be validated to demonstrate its ability to consistently produce products. Process performance qualification (PPQ) shall be performed on first three initial batches to ensure that the process is in a state of control during commercial production.

Process Control and Monitoring: Robust process control systems to monitor critical process parameters (e.g., temperature, pH, pressure) in real-time. Written procedures must be in place for addressing deviations and out-of-specification results.

Raw Material Control: Documented procedures for receiving, testing, and release of raw materials and starting materials used in the fractionation process. Lifentiy must ensure that all materials meet quality, safety standards and plasma source traceability.

Safety: Validated viral and pathogen inactivation and removal steps to ensure the safety of plasma-derived products. Implement measures to prevent contamination during processing.

Quality Control Testing: Comprehensive quality control testing plan, including in-process testing and final product testing, to ensure the safety, purity, and potency of the plasma products. Specifications for raw materials, intermediates, and final products shall be written and approved.

Equipment monitoring, Calibration and Validation: All the critical equipment used in the manufacturing and control of plasma are maintained, calibrated and qualified as per the written procedures.

Training and Qualification: Ensure that all personnel involved in the plasma fractionation process are well-trained with respect to the SOPs and STPs, understand GMP requirements, and are aware of their roles in ensuring product quality and safety. Maintain records of personnel training and qualifications.

Writing and editing documentation: Documentation for all existing processes must be written and edited regularly, to ensure that all new hires and other personnel can understand the best practices and standards

Risk assessments of current equipment/processes: Assessment of current processes and equipment to determine potential risks and mitigation plan shall be in place.

Traceability: A robust documentation system must be in place for tracking and tracing individual plasma donations and the products derived from them.

Packaging and Labelling: Appropriate packaging and labelling procedures for the final plasma-derived products, ensuring they meet regulatory requirements.

Post-Market Surveillance: Post-market surveillance system to monitor the safety and efficacy of products in the market.

Regulatory Guidelines GMP, Drugs and Cosmetics act 1940 and Rules, CDSCO, WHO- GMP

Indian Guidelines:

The Drugs and Cosmetics Rules, 1945, framed under the Drugs and Cosmetics Act 1940:

Includes human blood under the definition of "Drugs" under Section 2 (b)

Regulates functions of blood banks, which provide recovered plasma for plasma fractionation

Part XII C specifically regulates the collection and storage of plasma for fractionation

In the year 1967, Central Govt. (Ministry of Health) enacted a separate provision in Schedule F Part XII B of Drugs & Cosmetics Rules.

Schedule F of the Drugs and Cosmetics Rules specifically pertains to the requirements for the manufacture, sale, and distribution of plasma-derived products, including immunoglobulins, clotting factor concentrates, and other blood

Drugs and Cosmetics Rules, Part X-B: Conditions for License (Rule 122EA to Rule 122P)

Destruction of infected blood and implementation of Bio-Medical Wastes (Management and Handling) Rules, 1996

Applicable forms for License:

The National AIDS Control Organization (NACO), under the Ministry of Health and Family Welfare) to oversee operation of blood banking services in India.

National Blood Transfusion Council (NBTC) is the apex policy-making body, under NACO, making central licensing mandatory, increasing voluntary donation base and setting of quality standards. Similarly, State Blood Transfusion Councils (SBTCs) are responsible for the smooth functioning of blood transfusion services at a state level.

Drug Standard Control Organization (CDSCO) and State Drug Control Organizations play a vital role in approval of licenses, and enforcement of standard transfusion practices to ensure safe, quality and efficacious blood and its components in clinical practices.

National Institute of Biologicals (NIB) is the nodal governmental organization under the Ministry of Health and Family Welfare responsible for the testing and release of biologicals in India including blood plasma.

Policies and Guidelines for Fractionation:

The National Blood Policy 2002 regulates blood quality and the Guidelines of NBTC 2016 has been brought out by NACO. NBTC has formulated guidelines for recovery of processing charges for blood and blood Components across blood banks in all sectors. It has also laid down uniform norms for issuance of No Objection Certificates (NOCs) for new blood banks, renewal of license, criteria for designation blood bank as RBTC, Guideline on bulk transfer of blood and Guidelines on exchange of surplus plasma with indigenous fractionators has been released by NBTC to support voluntary blood donation and rationalize blood utilization.

National Policy for Access to Plasma Derived Medicinal Products from Human Plasma for Clinical / Therapeutic Use covers the process of collecting standard plasma and transporting them under optimum conditions for fractionation, identifying critical parameters for safety, and ensuring compliance with regulatory requirements and training.

National Pharmaceutical Pricing Authority: Under the Ministry of Chemicals and Fertilizers, Department of Pharmaceuticals, the prices of medicines are controlled by the National Pharmaceutical Pricing Authority. Currently, plasma products under price control include albumin, AHF, anti-D immunoglobulin, anti-tetanus immunoglobulin and anti-rabies immunoglobulin however plasma itself is not under price control.

Pre-clinical safety and Clinical Evaluation of Plasma derived products: European guidelines

Preclinical:

June 2011 EMA/CHMP/ICH/731268/1998 Committee for medicinal products for human use (CHMP)

Clinical Evaluation of Plasma derived products: Guideline on clinical investigation of recombinant and human plasma-derived factor IX products: 21 May 2015, EMA/CHMP/BPWP/144552/2009 Rev. 1, Corr. 1 Committee for medicinal products for human use (CHMP).

Guideline on clinical investigation of recombinant and human plasma-derived factor VIII products: 21 May 2015 EMA/CHMP/BPWP/144533/2009 rev Committee for medicinal products for human use (CHMP).

Guidance on the Clinical Investigation of Human Normal Immunoglobulin for Intravenous Administration (IVIg). CPMP/BPWG/388/95 rev.1.

Guidance on the Clinical Investigation of Human Normal Immunoglobulin for Subcutaneous and Intramuscular Use. EMEA/CPMP/BPWG/283/00.

Indian guidelines

As per Indian drugs and cosmetic act human blood plasma is included under the definition of "Drugs" under Section 2 (b)

As per the Indian regulations if the company which manufactures human plasma products similar to the composition and product profile currently marketed then the clinical trial waiver is given for marketing authorization. The company shall apply to DCGI &SLA for the waiver with relevant supporting documents. In case of hyper immune sera products appropriate clinical trial for safety and efficacy shall be conducted.

Containment Compliance

Blood and blood-derived products are highly sensitive and can be easily contaminated. Bloodborne pathogens, such as HIV, hepatitis B and C, can pose significant risks to both staff and patients if proper containment procedures are not followed. Maintaining a contained environment helps minimize the risk of spreading infectious diseases in the population.

Containment measures in the manufacturing premises shall be established such as isolation rooms, negative pressure environments, controlled airflow systems and proper handling procedures.

Plasma fractionation facilities must adhere to specific biosafety levels as defined by regulatory authorities, such as the Centers for Disease Control and Prevention (CDC). Plasma fractionation facilities operate at BSL-2 (Biosafety Level 2). It must include:

Access control, lab coats, gloves, eye protection (PPE) to be used by personnel working in the facility, and the use of biological safety cabinets during procedures.

Continuous monitoring of air pressure differentials, temperature, and humidity within the clean rooms.

Alarms should be triggered if any parameter falls outside the acceptable range.

Scheduled regular maintenance, testing, and certification of the HVAC system.

The exhaust air from the clean rooms potential for any contaminating microbes should be passed through the scrubbers to protect the environment.

Validation of Processes, Equipment and Services

Approaches to validation:

Lifinity will organize and plan qualification and validation in a manner that will ensure product quality, safety and efficacy throughout its life-cycle.

Qualification and validation shall be done in accordance with predetermined protocols, and the results to be documented, in reports.

An appropriate and effective quality management system shall be in place at Lifinity supporting the organization, planning, execution and management of qualification and validation activities.

Senior management will provide sufficient resources to perform validation in a timely manner. Management and persons responsible from quality assurance and manufacturing to be actively involved in the validation activities.

All relevant SOPs for operation, maintenance and calibration shall be prepared during qualification.

Training shall be provided to operators, and training records need to be updated and maintained.

Equipment Qualification/Validation:

Equipment qualification helps mitigate risks, prevent equipment failures, reduce downtime, enhance product quality, and ensures the overall operational excellence of an organization.

Equipment Validation comprises a series of steps which includes User Requirement Specification (URS), Design, Installation, Operational, and Performance Qualification.

User Requirement Specification (URS): Lifinity will prepare a document describing the requirements for the equipment to be sourced. The requirements will include specifications and must ensure that possible GMP risks are addressed; include technical requirements; and associated documentation.

Design qualification (DQ): DQ will provide the documented evidence that the design specifications were met and are in accordance with the URS. FAT and SAT needs to be performed where required, to verify the suitability of the system at site, prior to the subsequent stages of qualification and this must be appropriately documented.

Installation qualification (IQ): IQ will provide documented evidence that the installation was complete and satisfactory, including supporting utilities. The design specifications, including purchase specifications, drawings, manuals, lists of spare parts and vendor details, will be verified during IQ. Components installed must be verified, and documented evidence should be provided that components meet specifications, are traceable and are of the appropriate construction material. Applicable control and measuring devices, identified through impact or risk assessment, should be calibrated.

Operational Qualification (OQ): OQ should provide documented evidence that utilities, systems or equipment operate in accordance with operational specifications. Tests will be designed to demonstrate satisfactory operation over the normal operating range, as well as at the limits of its operating conditions. Worst-case conditions must be included in the testing. Operation controls, alarms, switches, displays and other operational components shall be tested.

Performance qualification (PQ): PQ will normally follow the successful completion of IQ and OQ. PQ will be performed under conditions simulating the intended use, to provide documented evidence that equipment/system can consistently perform.

Process validation:

Process validation is defined as the collection and evaluation of data, from the process design stage through commercial production, which establishes scientific evidence that a process is capable of consistently delivering quality product. It ensures that quality, safety and efficacy by design are built into the product.

Collect and evaluate the data throughout the life-cycle of a product from the process design stage through to commercial production and provides scientific evidence that a process is capable of consistently delivering a quality product.

Data need to be available for inspection at Lifinity manufacturing location.

A risk-assessment approach will be followed, to determine the scope and extent to which process(es) and starting material variability may affect product quality.

The critical process steps and critical process parameters (CPPs) will be identified, justified monitored and documented based on relevant studies carried out during the design stage and process knowledge.

Lifinity will ensure that the principles of process validation described in the guidelines are implemented.

Evaluate and compare the historical data when there is a change in the process.

When changes are planned to existing systems or processes need to be followed and documented. Sufficient data is collected to demonstrate that the revised process and product will meet desired quality, consistent and approved specifications.

CHAPTER 10 ALLIED EQUIPMENT & FACILITIES

Technology Based Allied Equipment Requirements

Refer Annexures

Facilities

Laboratories for allied testing should be separated from Production and Quality control labs. However, the materials required for testing such as media, filters, filtration devices etc. can be taken from QC labs. Dedicated glass ware should be used for any testing activities.

Example of allied test/activities are ETP samples, Black utilities, Ground water, testing of clean steam for physical parameters, compressed air and calibration activities etc.

Specialized temperature-controlled warehouse for storage of RMs, In-Process materials and finished goods:

Adequate areas shall be designed to allow sufficient and orderly warehousing of various categories of materials and products like starting and packaging materials, intermediates, bulks and finished products, products in quarantine, released, rejected, returned or recalled, machine and equipment spare parts and change items etc.

Warehousing areas need to be designed and adapted to ensure good storage conditions. Ware house shall be clean, dry and maintained with acceptable temperature and humidity limits where ever required.

Temperature and humidity will be monitored and recorded. A temperature monitoring and recording system that are independent from the temperature regulation system with alarm systems will be placed.

Storage areas must have program for pest control. The record shall be maintained.

Proper racks, bins and platforms must be provided for the storage of materials. The quarantine area in the warehousing will be clearly demarcated. Access to the areas must be restricted to authorized persons.

There shall be a separate sampling area in the warehousing for active and sterile raw materials/starting materials and excipients from the unsterile RMs.

Sampling and dispensing of sterile materials shall be conducted under aseptic condition conforming to Grade A (LAF). Sampling of sterile materials shall be performed in a dedicated area within the manufacturing facility in the absence of suitable areas in the ware house. Segregation shall be provided for the storage of rejected, recalled or returned materials or products.

Materials or products in this area should be suitably marked and secured. Access to these areas and materials must be restricted.

Highly hazardous, poisonous and explosive materials such as alcohols, narcotics and other substances presenting potential risks of abuse, fire or explosion shall be stored in explosion proof area, away from the central ware house in safe and secure manner.

Adequate fire protection measures shall be provided in conformity with the rules of the concerned civic authority in the ware house.

Printed packaging materials shall be stored in safe, separate and secure areas. Regular checks shall be made to ensure adequate steps are taken against spillage, breakage and leakage of containers.

Receiving and dispatch bays shall protect materials and products from adverse weather conditions.

The ware house shall have different areas for the receipt, quarantine, undertest, released, hazardous and rejected materials.

Primary packaging materials, labels, and secondary packaging material and finished products shall be stored in the separate area of the ware house with access controls systems in the critical areas of the ware house.

Incoming critical materials (such as sterile solutions, plasma bag and testing reagents) shall be physically quarantined immediately after receipt and until they are released for use by the authorized person.

Materials and reagents shall be stored under the conditions established by the manufacturer and in an orderly manner that permits segregation by batch or lot and stock rotation. Storage, issuance and usage should follow the "first-expiring first-out" principle (FEFO).

Materials Required Like Resins, Filters etc.

Ion exchange resins

Size exclusion resin – 1

Size exclusion resin - 2

Multi grade filters (MGF)

Softener

Filters 0.5 Micron

SMBS (Sodium Metabisulphite)

Chlorine

Common Salt

NaOH

Hydrochloric acid

SOP/STP and Biological Waste Management

The SOP's and STP for the allied testing facilities are as under:

Procedure for Decontamination of chemical and biological waste.

Procedure for estimation of BOD and COD in ETP samples.

pH determination of ETP samples.

Procedure for testing compressed air and pure steam.

Procedure for calibration of measuring devices of manufacturing, ware house, quality control and engineering.

Procedure for treatment of Biowaste

Procedure for collection segregation and disposal of Biowaste

Training on Biowaste management

Procedure for usage of treated water for horticulture purpose

Procedure for discharge of Biowaste in common drainage system

Procedure for management of spillage control

Biowaste management (BWM):

The disposal of sewage and effluents (solid, liquid and gas) from the manufactory should be in conformity with the requirements of Environment Pollution Control Board. All bio-medical waste must be destroyed as per the provisions of the Bio-Medical Waste (Management and Handling) Rules, 1996 and amendments thereof.

Additional precautions to be taken for the storage and disposal of rejected waste material. Records shall be maintained for all disposal of waste. Provisions shall be made for the proper and safe storage of waste materials awaiting disposal. Hazardous, toxic substances and flammable materials shall be stored in suitably designed and segregated, enclosed areas in conformity with Central and State Legislations.

CHAPTER 11 SUBSIDY CONSIDERATIONS

Location / SEZ Considerations in Maharashtra

Special Economic Zone (SEZ) is a specifically delineated duty-free enclave with all required infrastructure provided under single administrative umbrella primarily meant for locating industries which manufacture and export goods and services.

These enclaves shall be deemed to be foreign territory for the purposes of trade operations and duties and tariffs.

Under section 3, a Special Economic Zone can be established either by Central Government, State Government or its agencies, private / public / joint sector or any person for manufacture of goods or rendering services or for both or as a free trade and warehousing zone.

As per the requirements of SEZ, the unit must be segregated into processing and non- processing areas. A processing area is that area in which all the manufacturing activities are performed. At least 50% of the total area shall be earmarked.

The non-processing area is the area which is intended to provide support facilities to the processing area activities and may include support areas like utilities block, power generation plant (DG), engineering services, ETP and other infrastructures as per the requirements of the current project.

In SEZ 100 percent Foreign Direct Investments are allowed (FDI) in some of the selected categories.

As per MIHAN-SEZ guidelines (Rules and Procedures) following class of incentives are available to SEZ enterprises.

Custom and Excise

SEZ units may import or procure from the domestic sources, duty free, all their requirements of capital goods, raw materials, consumables, spares, packing materials, office equipment, DG sets etc. for implementation of their project in the Zone without any license or specific approval.

Duty Free Import/Domestic Procurement of Goods for Setting up of SEZ Units

Goods imported/procured locally duty free could be utilized over the approval period of 5 years.

Sales Exemption

Domestic sales by SEZ units will be exempt from single administrative document (SAD). Domestic sale of finished products, by-products on payment of applicable custom duty.

Domestic sale rejects, waste and scrap on payment of applicable Custom duty on the transaction value.

Income Tax:

Physical export benefit 100%.

IT exemption (10A) for first 5 years and 50% for 2 years thereafter. Reinvestment allowance to the extent of 50% of ploughed back profits.

Carry forward of losses & Commercial borrowing:

Banking / Insurance/External Commercial Borrowing.

Setting up Off-shore Banking Units (OBUs) is allowed in SEZs. OBU's allowed 100% Income Tax exemption on profit for 3 years and 50 % for next two years.

External commercial borrowings by units up to \$ 500 million a year allowed without any maturity restrictions.

Central Sales Tax:

Exemption to sales made from Domestic Tariff Area to SEZ units.

Service Tax:

Exemption from Service Tax to SEZ units.

Other Exemptions:

Freedom to bring in export proceeds without any time limit.

Flexibility to keep 100% of export proceeds in exchange earners foreign currency account (EEFC). Freedom to make overseas investment from it.

Exemption from interest rate surcharge on import finance. SEZ units allowed to 'write-off' unrealized export bills.

Additional Incentives:

The additional incentives are exemption of import license, custom examination of imported goods, exemption from public hearing under Environment Impact Assessment Notification etc.

CHAPTER 12 PROJECT TIMELINES

CHAPTER 13 BUDGET ESTIMATES

Budget Estimates

Refer to Chapter 17

CHAPTER 14 REVENUE AND COST ESTIMATION AND PAYBACK PERIOD

YIELD CALCULATIONS FOR PLASMA FRACTIONS

REVENUE FORECAST IN CRORE INR FROM PROCESSING PLASMA 150,000 L / ANNUM

PROFIT AND LOSS STATEMENT FOR STAGE 1 – 150,000 L/ ANNUM

CHAPTER 15 RECOMMENDATION

The objective of this project is to establish and operate a state-of-the-art Human Plasma Derived Medicinal Products (HPDMP) manufacturing facility with an aim to address the increasing demand for plasma-derived products by Optimized manufacturing processes maximize productivity, minimize waste, and reduce operational costs in order to maintain competitiveness in the market.

This Human Plasma Derived Medicinal Products manufacturing facility will play a pivotal role in meeting the critical healthcare needs of patients while contributing to advancements in the plasma industry.

In phase-1 of the project annual production capacity will be 150,000 liters of plasma processing, which

will be subsequently increased to 500,000 liters per annum in future.

In this report several technologies utilized for plasma purification at commercial scale were evaluated exhaustively with its merits and demerits. Some of the key technologies evaluated are:

Plasma Fractionation method with ethyl alcohol

Cohn+ Liquid Chromatography

Heat Shock technology

Ammonium sulphate+ Liquid Chromatography

Chromatographic

It is concluded and recommended that Chromatographic purification with sterile filtration is best technology for the purification of plasma proteins for stage-1 products as it will give highly productivity and acceptable quality of desired proteins (purity levels) as per the regulatory expectations.

For stage-2 products, the technology evaluation and recommendations will be made in future.

Method | Purity
% | Advantage | Disadvantage | Clinical Mfg. | Large Scale Mfg. | Rec.
(%)

Plasma Fractionation | 96 | Low cost, easily accessibility, Bacteriostatic nature of process, ethanol is accessible and inexpensive, Safety of therapeutic product | Protein denaturation, Need raw material with high quality, Need to refrigerated tanks,
Flame proof facility and warehouse design for ethanol handling and storage | $\sqrt{\quad} | \sqrt{\quad} | \approx 57$
Cohn+ LC | 99 | Low cost, Quality of manufactured product is superior of Cohn method, High purity, High yield, Safety of therapeutic product | Possibility of protein denaturation and/or aggregation during the addition of ethanol, Flame proof facility and warehouse design for ethanol handling and storage | $\sqrt{\quad} | \sqrt{\quad} | \approx 59$
Heat Shock | 98 | High purity | Protein denaturation | $\sqrt{\quad} | \sqrt{\quad} | \approx 57$
Ammonium sulfate+ LC | N/A | Sufficient purity, Suitable for major laboratory approach, Yield of albumin: ≤ 40 g/liter of serum | Not suitable for major clinical approach, Separate processing areas required for Ammonium sulfate salts | $X | \sqrt{\quad} | \approx 63$
IEC | ≤ 95 | High yield, Adsorption capacity is high, better reproducibility, High recovery, Convenient for large-scale production | High media, Capital costs and Ligand leakage, Interactions between albumin and the ion exchange sorbents,
Slow separation | $\sqrt{\quad} | \sqrt{\quad} | \approx 66$

S/No. | Step | Purpose | Remark
1 | Cell culture and
Fermentation | To generate the desired bulk of
antibodies |
2 | Centrifugation | To remove cell debris, lipids, and clotted material |
3 | Filtration (0.45 µm | To remove smaller contaminating material |
4 | Concentration (UF) | To concentrate the desired antibodies in the material |
5 | Ion exchange Chromatography
(IEC) | To remove nucleic acids and endotoxins |
6 | Size exclusion chromatography (SEC) | | SEC is preferred over IEC because size is relatively constant
and charge on the protein may vary depending upon the pH as molecules are protonated and
deprotonated
7 | Immunoaffinity Chromatography | Antibody will bind to specific antigen attached to the agarose matrix
| It will help to achieve highest purity
8 | Sterile filtration | To remove microbial contamination |

FEASIBILITY AND DETAILED PROJECT REPORT

TABLE OF CONTENTS

S. No. CHAPTERS Page No.

1 INTRODUCTION

- 1.1 Project Objective Statement 8
- 1.2 Executive summary of the project 10

2 MARKET ANALYSIS

- 2.1 Human Plasma Derived products and its share in the total components 17
- 2.2 Volume of Plasma fractionated worldwide (2008-2032) and projections 17
- 2.3 Current market share of companies in domestic and international 19
markets
- 2.4 Market Trend for the next 10 years and shift in products (2023-2032) 24
- 2.5 Government Market and the rates 26

3 TECHNOLOGY

- 3.1 Analysis of various Technologies available (Centrifugation and filtration 31
for solid / liquid separation, thermal and chemical inactivation
procedure, ultrafiltration / diafiltration,
nanofiltration, Chromatography or any other Technology or any Hybrid
model)
- 3.2 Recommending a cost effective and high productivity technology 37
- 3.3 Obligations for technology service provider 37

4 MANUFACTURING

- 4.1 For various Plasma Derived Medicinal Products (PDMP) such 42
as Albumin, IgG, Factor VIII, IX, Fibrin sealant and Fibrinogen (Stage 1)
Manufacturing process flow diagram
- 4.2 Based on the Technology proposed the manufacturing process to be 43
suggested for deriving the above suggested products and also any
other new products derived from Plasma
- 4.3 Equipment required to manufacture for the proposed capacity 63
- 4.4 Detailed Design 70

5 PROPOSED SITE PLAN

- 5.1 Concept Design including Structural, Architectural, Civil and Electrical 73
Design
- 5.2 Site Master Plan 74
- 5.3 Layout philosophy 88

6 SOURCING AND HANDLING OF RAW MATERIAL

- 6.1 Exchange value of Plasma per litre and projected value over a period of 90
five years
- 6.2 Donors selection criteria 90
- 6.3 Plasma donation testing, epidemiological surveillance, post donation 91
information

Page 2

FEASIBILITY AND DETAILED PROJECT REPORT

- 6.4 Handling of blood, Plasma freezing, storage, cold chain and complete 92
logistics plan
- 6.5 Sourcing of Plasma from Government and non- government blood 94
banks
- 6.6 Equipment for proper storage and separation of blood components 94
- 6.7 Importing of plasma from neighbouring countries and Indian 95
Regulations

7 PRODUCTION PROGRAM

- 7.1 Product and product mix 98
- 7.2 Production capacities and Yield calculations 99

8 PROJECT IMPLEMENTATION MODEL

- 8.1 Human Serum Albumin (HSA) 103
- 8.2 Human Immunoglobulin (IgG) 103
- 8.3 Factor VIII and Factor IX, Fibrin sealant and Fibrinogen 103
- 8.4 Monoclonal Antibodies (Mabs)- future considerations 105

9 GMP AND REGULATORY CONSIDERATIONS

- 9.1 Premises, Layout & Process Engineering 109
- 9.2 Regulatory Guidelines 116
- 9.3 Containment compliance 119
- 9.4 Validation of processes, equipment and services 120

10 ALLIED EQUIPMENTS & FACILITIES

- 10.1 Technology based allied equipment requirements 124
- 10.2 Facilities 124
- 10.3 Materials required like resins, filters etc. 125
- 10.4 SOP/STPs, BWM 126

11 SUBSIDY CONSIDERATIONS

- 11.1 Location / SEZ considerations in Maharashtra 128
- 11.2 Custom and Excise 128
- 11.3 Duty Free Import/ Domestic Procurement of Goods 128
- 11.4 Sales Exemption 128
- 11.5 Income Tax 129
- 11.6 Carry forward of Losses and Commercial Borrowing 129
- 11.7 Central Sale Tax 129
- 11.8 Service Tax 129
- 11.9 Other Exemptions 129
- 11.10 Additional Incentives 129

12 PROJECT TIMELINES From concept to commissioning

- 12.1 Project Implementation Schedule 131

CHAPTER 1

INTRODUCTION

Page 7

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

1.1 Project Objective Statement:

The objective of this project is to establish and operate a state-of-the-art Human Plasma Derived Medicinal Products (HPDMP) manufacturing facility with an annual production capacity of 150,000 liters. This capacity will be subsequently increased to 500,000 liters per annum in the near future.

This facility aims to consistently and efficiently produce high-quality plasma derived products such as Human Serum Albumin (HSA), Human Normal Immunoglobulin (IgG), Hemophilia factors VIII, IX, Fibrin sealant etc. and Monoclonal antibodies (Mabs) while ensuring compliance with regulatory standards and best industry practices.

The primary goals of this project include:

Meeting Growing Demand: To address the increasing demand for plasma-derived products, ensuring a stable and reliable supply of essential treatments.

Quality Assurance: Implementing rigorous quality control and quality assurance processes to consistently produce safe and effective plasma derived products that meet or exceed regulatory requirements.

Operational Efficiency: Optimizing manufacturing processes to maximize productivity, minimize waste, and reduce operational costs to maintain competitiveness in the market.

Regulatory Compliance: Adhering to all relevant regulations and standards, including current Good Manufacturing Practices (cGMP), to ensure product safety, quality and efficacy.

Safety and Sustainability: Prioritizing the safety of both employees and the environment by implementing robust safety measures and eco-friendly practices throughout the facility.

Research and Development: Supporting ongoing research and development efforts to improve product quality, expand the product portfolio, and explore innovative techniques and newer technologies.

Supply Chain Reliability: Building a secure and efficient supply chain to source raw materials, transport finished products, and ensure timely deliveries to end users.

Stakeholder Satisfaction: Ensuring customer satisfaction by providing consistent and reliable plasma-derived products while maintaining a favorable relationship with employees, investors, and the local community.

Page 8

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

By achieving these objectives, this Human Plasma Derived Medicinal Products manufacturing facility will play a pivotal role in meeting the critical healthcare needs of patients while contributing to advancements in the plasma industry.

Statutory Regulation

(A detailed list of provided in the References section at the end of the document)

In general, the following guidelines are referred to:

- National Blood Policy, NBTC, Ministry of Health and Family Welfare.
- National Policy for Access to Plasma Derived Medicinal Products from Human Plasma for Clinical/Therapeutic Use: Addendum to National Blood Policy, NBTC, Ministry of

Health and Family Welfare.

- Technical manual, DGHS, MOHFW Govt. of India 2003.
- Drugs and Cosmetic act 1940 and rules thereunder.
- Schedule M Drugs and Cosmetic act 1940.
- ISPE Baseline Guide Vol. 6, Biopharmaceutical Manufacturing Facilities ISPE Baseline Guide Vol. 3, Sterile Manufacturing Facilities.
- WHO Good manufacturing practices for biological products.
- Good manufacturing practice guideline for human and veterinary medicinal product.
- PIC/s Guide to Good Manufacturing Practice for Medicinal Products.
- USFDA Guidance for Industry – Sterile Drug Products produced by Aseptic Processing.

Page 9

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

1.2 Executive Summary of The Project:

The Human Plasma Derived Medicinal Products manufacturing facility will be a green field project. The area earmarked for the project is approx. 6 acres in an industrial area on the outskirts of Nagpur city.

Different areas for the plasma manufacturing facility are identified and listed below:

- Bulk Manufacturing Facility (for processing 150,000 L / annum)
- Formulation, Fill Finish with lyophilization & Packaging
- QC and R&D block
- Administrative and QA Block
- Ware House for Plasma, Packaging, Testing lab (for 32,000 L plasma)
- Ware House (Finished Goods Storage)

Expansion area

- Bulk Manufacturing Facility (for processing additional 350,000 L / annum)
- Ware House for Plasma, Packaging, Testing lab (for additional 32,000 L plasma)

Supporting Blocks

- Canteen
- Engineering Office
- Boiler House
- Work Shop
- Substation and Generator
- Bore Well
- Bio-Kill System
- WTP/ETP/STP System
- Fire Fighting System
- Scrap Yard
- Guard House and Reception Room
- Security Cabin/Post
- Boundary Wall and Parking etc.
- Internal Roads and Drainage System
- Rainwater Harvesting System

FEASIBILITY AND DETAILED PROJECT REPORT

The company has identified different products to be manufactured in stagewise manner. List of products proposed to be manufactured are as follows:

Stage-1:

- Albumin
- Human Immunoglobulin
- Factor VIII
- Factor IX
- Fibrin sealant
- Fibrinogen

Stage-2:

- Anti-D
- Factor XI
- Factor XIII
- Hepatitis B IgG
- Measles IgG
- Protein C
- Rabies IgG
- Tetanus IgG
- Thrombin
- Varicella Zoster IgG

Table 1: Working Time Model Bulk Manufacturing

BULK MANUFACTURING

BULK MANUFACTURING

S/No. PARTICULARS

FACILITY

- 1 Days per year 365 days
 - 2 Effective working days per year (*) 260 days – 300 days
 - 3 Working days per week 5–7
 - 4 Working hours per day 16 – 24
 - 5 Working shifts per day 2-3
 - 6 Working hours per shift 8
 - 7 Effective working hours per shift (**) 7-8(**)
 - 8 (-) Machine setup 1-2
 - 9 (-) Cleaning and change over 8
 - 10 Effective hours for filling line per shift 6
- (*) Effective working days per year should exclude: Public holidays, Scheduled Maintenance, Media fill & Re-qualification of equipment.
- (**) Effective working hours should exclude break, operator gowning. Considering staggered break for critical equipment e.g., filling lines.

Environment Due Diligence:

As the proposed facility is required to handle biological products, proper segregation of type of wastes generated shall be adopted. Based on the categorization of the waste, appropriate treatment philosophy shall be adopted. Following broad categories are identified as wastes:

- Process waste
- General wash
- Solid Process waste
- General Solid wastes – Packaging materials etc.,
- Gaseous waste from Process & Labs
- Sewage

Page 14

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

The facility shall be designed as zero waste discharge plant; meaning that every possible waste within the facility is categorized, treated with appropriate treatment step in line local pollution control board guidelines and then discharged safely. Soil contamination due to waste is also considered as a key factor and necessary steps & waste handling methods are adopted to avoid the same. As part of the design, all biologically waste will be treated in Primary treatment systems before letting it into a common wastewater treatment plant. For the facility design, a detailed EHS document shall be prepared to identify risks and mitigation plans. During design, Construction & operation, EHS policy shall be made integral part of the sustainable operation.

CHAPTER 2

MARKET ANALYSIS

Page 16

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

2.1 Human Plasma Derived Products and Its Share in The Total Components:

There are several medicinal products which are derived from human blood plasma by Plasma fractionation. The process for large scale purification was developed about 60 years ago by Cohn and co-workers. Therapeutically important proteins are Human serum albumin (HSA), Immunoglobulin G (IgG), Coagulation factor VIII, factor IX and Protease inhibitors. HSA is one of the most abundant proteins in plasma and, together with IgGs, constitutes 80% of total plasma proteins. According to the data, HSA represented approximately 50% of total sales of therapeutic plasma protein products. The purified HSA is required for the treatment of hypo proteinemia, burn and heavy loss of blood due to injuries and other medical conditions. Plasma contains about 60 g/L of protein, out of which about 57 grams are used for many therapeutic products. This makes this human material unique as a source of multiple therapeutic products.

The concentration of different plasma proteins is variable. HSA is major protein component, followed by IgG. The wide concentration range of plasma proteins (less than 1 mg/mL to 40 g/L) is one of the potential challenges in designing separation and purification procedures.

2.2 Volume of Human Plasma Fractionated Worldwide (2022 to 2032):

In 2010, 78 fractionation plants were operating in the world, 25 of which were in China, 26 in Europe and 8 in the United States of America. The world plasma fractionation capacity was about 48.4 million liters. More than 500 tons of human serum albumin (HSA) and more than 40 tons of intravenous immunoglobulins (IVIg) are produced annually from more than 34 million liters of plasma. Total plasma market of 2008 is depicted in pie chart (Figure 2).

Figure 3: Total plasma market of 2008 (Source: Marketing Research Bureau, Inc)

Page 17
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

In 2015-16, the worldwide plasma market grew to a \$21,174 Million, almost doubled in terms of revenue from 2008. As compared to the 2008 statistics, in 2016 to IVIg and SCIg had a major share in plasma market, increasing from 29% to 47%. The market share for Albumin also grew from 9.7% to 15.7%. The market share for Factor VIII and Factor IX remained almost the same of 1 to 2 % from 2008 to 2016.

Figure 4: Plasma market in 2016 (Source: Marketing Research Bureau, Inc)

Global Plasma Fractionation Market Forecasts from 2022 to 2032

- The Global Plasma Fractionation Market Size was valued at USD 27.1 Billion in 2022 (Fig 3).
- The Market Size is growing at a CAGR of 6.7% from 2022 to 2032.
- The Worldwide Plasma Fractionation Market Size is expected to reach USD 51.8 Billion by 2032.
- Asia Pacific region is expected to grow the fastest during the forecasted period.

FEASIBILITY AND DETAILED PROJECT REPORT

Future roadmap for plasma fractionation industry in India:

Global plasma fractionation program, plasma protein therapies & newer clinical indications for use of these products, has led to a rapidly increasing demand.

Due to the limited volumes of plasma available for fractionation and fractionation capacities, has led to various challenges in availability of these products.

Unfortunately, plasma fractionation program did not get enough attention, focus and motivation in India because of challenges like availability of plasma, less components processing units, cold chain infrastructure, political will and availability of solid plasma ecosystem.

As per literature information, in 2020 India, wasted 6.5 Lakh units of blood and blood components on annual basis (Source: Print line Media Pvt Ltd). A report published by Ministry of Health and FW (2018-2019); the total collection of blood was 12.2 million units out of which 75.05% of blood was componentized by NACO supported blood component separating unit (BCSU). Thus, the wastage of 24.95% hampered the availability of blood components to the patients. Though, with the passage of time there has been a significant improvement in the overall blood banking systems and availability of plasma products in India, still much needs to be done considering clinical needs of the country.

There is a need to create a vision document for short-term, mid-term and long-term self-sufficiency of plasma products in India. This can be divided into following two categories:

Availability of safe plasma: How to overall increase the quantity and quality of plasma for fractionation:

- Increase voluntary blood collection, with increased repeat donor base.
- As a part of the licensing process blood component separation should be mandatory and a plan for current licensed blood banks to migrate to complete blood separation units in the next 3 years.
- Making blood component therapy mandatory in clinical practice, so that blood therapy can be minimized, and patients can use plasma products, which are relatively safer and easily accessible.
- Create a solid regulatory pathway for permitting source plasma collection.

Page 23

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Regulatory system reform: Create a facilitative regulatory landscape for plasma industry to grow and evolve which would involve office of DCGI, NIB, Department of AIDS Control (DAC), IPC, NPPA, NACO, clinicians, patient groups, industry representatives and NGOs by;

- Forming a national level body for steering plasma protein initiative in India.
- Making a robust regulatory system for collection.
- Controlling pricing for plasma and increasing indigenous manufacturing capabilities.
- More funding for products and patient care.
- Fast track regulatory approval for importing different categories of plasma/fractions/intermediate.

2.4 Market Trend for The Next 10 Years and Shift in Products (2023-2032):

With the growth of IgG sales, some relatively niche plasma proteins have had a significant impact on the market in the 2010s.

1. C1 esterase inhibitor (C1-INH): In 2010, the sales of C1 esterase inhibitor (C1-INH) for the treatment of hereditary angioedema (HAE) amounted to about \$200 million globally. This was 1.5% of total plasma proteins sales because the product had just been launched in late 2008 in the United States, and European sales were limited by the product's approval confined to only a few countries. By 2016, the sales reached over \$1.1 billion (5.2% of global PDMPs sales), as the product gained rapid acceptance mainly in the United States where the awareness of treatment and diagnosis of HAE were boosted by Shire and CSL Behring. As a result, C1-INH became the fourth largest plasma protein in terms of dollar sales worldwide, behind IgG, albumin and plasma-derived factor VIII. The market for C1-INH is continuing to grow strongly, and it is likely to increase its share in the future. A new formulation for subcutaneous injection will further facilitate product adoption. In addition, C1-INH is under investigation for transplant where antibody mediated rejection (AMR) has occurred.

2. Alpha-1 Antitrypsin (AAT): Other specialty products which continue to grow at a stronger pace is prothrombin complex concentrate (PCC) as well as alpha-1 antitrypsin (AAT). Global sales of AAT reached \$1.0 billion in 2016, or 4.7% of the total market. This is up slightly from 4.1% of sales in 2010, as the market in the United States has sustained approximately a low two-digit annual sales growth for the past 6 years, driven mostly by new patient

Page 24

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

identification and higher dosing. Most of the global AAT sales are generated in the United States, though sales of this therapy in Europe are trending upward after approval through the central European Medicines Agency (EMA) in August 2015. AAT is also under investigation for new indications, such as graft vs. host disease after hematopoietic stem cell transplantation (HSCT) as well as type 1 diabetes. If either of these areas show clinical trial success, the market would be expected to experience higher demand for the therapy.

3. Prothrombin complex concentrate (PCC): PCC have nearly reached the \$500 million in sales mark in 2016, up from under \$300 million in 2010. This impressive growth was due to the introduction of the first four-factor (factors II, VII, IX and X) coagulation product in the United States by CSL Behring in 2013 for the urgent reversal of vitamin K antagonist (VKA) anticoagulation in adults with acute major bleeding. Sales of this product reached close to \$200 million within four years of product launch. Sales also increased in Europe for the same indication, while at present little PCC is used in other markets around the world. In the United States, the market share of the plasma-derived factor VIII sales fell from 11% in 2010 to 9% in 2016, while the share of plasma-derived factor IX products fell from 20% to 6%. The latter's market share drop was due to the faster adoption of the extended half-life factor IX products than those of factor VIII, because they offer longer intervals between infusions than the standard recombinant and plasma-derived products. Globally, the plasma-derived factor VIII market share went from 27% in 2010 to 21% in 2016. For, the plasma-derived factor IX' market share fell from 34% in 2010 to 21% in 2016. According to NPPA report of 2022, government has set the pricing for scheduled drugs and plasma products.

2.5 Government Market and the Rates:
A market survey and several documents and reports were studied to see the price of various plasma products in government and private sector respectively (Table 6 and Table 7).

FEASIBILITY AND DETAILED PROJECT REPORT

3.1 Analysis of Various Technologies Available (Centrifugation and filtration for solid / Liquid Separation, Thermal and Chemical Inactivation Procedure, Ultrafiltration / Diafiltration, Nanofiltration, Chromatography or Any Other Technology or Any Hybrid Model)

Several technologies are utilized for plasma purification at commercial scale, each has its advantages, disadvantages and applications in isolating specific proteins of human interest. Some of the key methods are as under:

Methods for Plasma purification

1. Plasma Fractionation method with ethyl alcohol
2. Cohn+ Liquid Chromatography
3. Heat Shock technology
4. Ammonium sulphate+ Liquid Chromatography
5. Ion Exchange Chromatography (IEC)

1. Plasma Fractionation Method with ethyl alcohol:

Cohn and colleagues developed a protein purification method by using plasma fractionation technique for the first time. This approach is based on albumin solubility difference with other plasma proteins. As compared to other plasma proteins, albumin sediments are at lower pH and higher ethanol concentration. In this method there are five important parameters for separation of plasma protein.

- Ethyl alcohol (8- 40%)
- Temperature (-3 to -10 °C)
- pH (4.5-7.2)
- Protein concentration (5.1-.8 %)
- Ionic strength (0.14- 0.01).

Protein separation is based on the increase in ethyl alcohol concentration thus albumin will be seen in the last fraction.

The method is suitable for large-scale and industrial production.

Disadvantages of Method:

- Purity of the product
- Denaturation of protein

Page 31

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

2. The Cohn method combined with liquid chromatography:

The original Cohn method was modified by Oncley et al. in 1949 and Kistler-Nitschman et al. in 1962 in order to improve albumin purity.

The method is used for the purification of plasma proteins at the industrial scale

In this method after ethanol precipitation liquid chromatography step is added. Albumin is a by- product and other important therapeutic proteins including factor VIII, intravenous immunoglobulin (IVIG) and some other proteins are isolated from plasma.

Advantages:

- Increased purity of proteins
- Higher yields

Page 32

FEASIBILITY AND DETAILED PROJECT REPORT

3. Heat shock method:

Albumin is stable during thermal fluctuation comparing to the other proteins of the plasma; therefore, it can be purified by heat shock purification method.

Albumin protein resists to increasing temperature up to 60°C at which potential pathogen are inactivated. After inactivation 0.04 M caprylic acid is added to stabilize the protein at pH 5 at 60°C.

At this stage other proteins of the serum are denatured and precipitated in solution. The final product (albumin) is concentrated by precipitation and ultrafiltration with purity of app 98%

4. Ammonium Sulphate precipitation combined with liquid chromatography:

Another method for albumin purification is ammonium sulphate precipitation combined with liquid chromatography which yields approximately more than 90 percent purified albumin.

In this method albumin is separated from immunoglobulins by 50% ammonium sulphate.

Then lipids are removed using ice- cold acetone at 2-8°C.

For further purification of albumin from other contaminating proteins (especially transferrin which is the main contaminant, DNases and immunoglobulins), ion exchange and size exclusion chromatography are used.

5. Ion exchange chromatography (IEC):

IEC is widely used for albumin and other protein purification. Among them the anion exchange method has the most widely used. Three major steps of anion exchange consisting pre-treatment, purification and polishing.

The purification consists of two anion and cation exchange chromatography followed by polishing step comprising of two ultrafiltration and one gel filtration steps.

Ultrafiltration

Albumin

The limitations of method:

- Long processing time

To overcome these limitations, the new method for ion exchange membrane chromatography (IEM) using ameliorated adsorbers was developed.

The membrane chromatography method is simple and has high separation efficiencies due to shorter diffusion times, reduction in buffer usage, small foot print requirements. No complex hardware or packing is required.

Disadvantage:

- Expensive membrane
- Low efficiency

FEASIBILITY AND DETAILED PROJECT REPORT

3.2 Recommending a Cost Effective and High Productivity Technology:
On the basis of table 8, for purity analysis and percentage recovery there are individual methods like fractionation and combined methods like Cohn + LC and IEC which can be considered.
Lifenity should accept the method which give high productivity and acceptable quality of

desired protein (purity levels) as per the regulatory expectations. Cohn method when combined with chromatographic techniques is the most well-known method. In this method other proteins of plasma such as coagulation factors, immunoglobulins etc. would be separated in upstream, and albumin will be separated in the last fraction. Due to the robustness and high purity of plasma in large volumes, this technique, is cost-effective for plasma therapeutic protein production. Hence, this method currently seems to be a major method for albumin production. However, taking into consideration, the latest developments in plasma fractionation technologies the detailed method along with the process flow diagram is recommended in section 4 of this document.

3.3 Obligations for technology service provider:

The selected Technology service provider shall have the following obligations:

Technology Transfer Plan:

To provide a detailed plan outlining the steps and timeline for the technology transfer. This plan shall include milestones, responsibilities, and contingencies. There should be a Lifenity steering committee to monitor the progress. All the deviations/changes should be approved by the committee.

Documentation:

To provide detailed documentation that describes the technology (Methods), equipment URS, buffer compositions, process steps, product specifications, and relevant data etc., This documentation is crucial for Lifenity to understand and replicate the technology.

Page 37

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Checklist of the details to be provided to Lifenity by the technology service provider:

1. Manufacturing:

- RMs PPM and SPM and excipient specifications and source.
- Dispensing instructions.
- Detailed process flow diagrams.
- Process validation requirements.
- Batch Manufacturing record (BMR), SOPs, Master formulas.
- List of SOPs for operation of equipment and other relevant procedures.
- List of specifications and In-process controls (IPC).
- Process flow diagrams (PFD) along with description of chromatography and other critical process steps.
- Details of Equipment (Capacities, designs, qualification and placement with utilities requirements).
- Manufacturing implementation sequence/model with process time for each unit operation.
- Control strategy based on PPQ lots defining CPPs, CQAs and IPCs.
- Yield calculation.
- Cleaning procedures and validation.

2. Quality Control and Assurance:

- Requirements of different areas for QC activities.
- List of general and product related SOPs and STPs with specifications.
- Raw materials and Active starting materials control and release strategies.
- List of documentation for QC and QA activities.
- Procedures for batch release, recall and complaints handling by quality assurance department.
- Details of warehousing activities (Receipts of incoming RMS and active materials, sampling, Quarantine, testing and, release activities).
- Cold chain requirements in ware house storage areas for active materials and finished products.
- QC tests, STPs and specifications.

Page 38

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

- Validation of analytical and microbiology techniques.
- Stability protocols as per regulatory expectations.
- List of SOPs for operation of equipment and other relevant procedures.
- List of OOS, OOT and any other quality related events/incidents relevant to Lifenity.
- Details of primary packaging and secondary packaging materials with sources.

3. EHS:

- SOPs and STPs related to EHS

4. Training:

It is the responsibility of technology transfer partner to provide on job training and qualification of the staff for each unit operation. Lifenity is responsible to provide necessary resources for trainings.

Training will comprise of knowledge transfer sessions, hands-on training, and exchange of personnel.

5. Lab Scale Implementation:

Lifenity shall initiate the technology transfer at lab scale to test its feasibility and performance in a real-world setting before full-scale deployment. The technology service provider shall provide the lab scale technology.

6. Regulatory Compliance:

Technology provider to ensure that the provided technology and its implementation comply with relevant regulatory requirements and support necessary approvals from regulatory authorities.

7. Scale-Up and Commercialization:

Technology provider shall provide support for Scale up of the technology for commercial production, at least three batches of each product and deployment. This shall involve optimizing manufacturing processes, securing additional resources, and launching the manufactured product with the given technology into the market.

Page 39

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

8. Monitoring and Evaluation:

Provide continuous monitoring support at the production floor to Lifenity scientists for the performance of the transferred technology and conducting evaluations to assess its impact, identify areas of improvement and address any technology related issues that may arise.

9. Post-Transfer Support:

Providing ongoing support to address any challenges, optimize processes, and explore further opportunities.

Page 40

FEASIBILITY AND DETAILED PROJECT REPORT

PROCEDURE FOR COMMON FRACTIONATION STEPS:

P.1.F CUTTING AND POOLING

Approved plasma bags issued by QA are collected and thawed in a thawing tank with suitable provision for placement, retrieval and subsequent removal of thawing medium from the tank. The bags are checked for leakages after thawing and discarded if leakage is found. The thawed bags are cut under a bench type laminar flow and plasma collected in to suitable containers and finally pooled in process vessel to be taken for the next step.

P.2.F FILTRATION

Collected plasma after thawing is filtered to remove any suspended particles which may clog chromatography resins and column bed supports. Filtration is done using a depth filter which doesn't bind any proteins of interest. Filtered plasma is collected in a suitable tank with provisions to connect to a chromatography system for following process steps.

P.3.F CHROMATOGRAPHY – 1F

Filtered plasma is subjected to chromatography 1F to separate coagulation factor– F-VIII from rest of the fractions of interest. This step is essential to both separate F-VIII and also further polish plasma for other chromatography steps. Fraction of interest is collected using patterns on chromatograms, can be programmed for automatic collection.

P.4.F LOAD PREPARATION FOR 2F

pH of the collected eluate from Chromo – 1F, is adjusted to 7.0 and loaded on the next chromatography column.

P.5.F CHROMATOGRAPHY – 2F

pH adjusted eluate from Step 4 is subjected to chromatography -2F to separate F -IX from the remaining fractions. F-IX is collected separately for further process and remaining fractions are further processed.

Page 44

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

P.6.F TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION

F-IX depleted sample is collected and concentrated by TFF. Trans-membrane pressures (TMP) are adjusted to achieve maximum permeate flow while minimizing fouling of the membrane. Automated TFF skids are used to precisely control and maintain the TMP.

P.7.F CHROMATOGRAPHY – 3F

Concentrated solution from Step-6 is subjected to chromatography-3F to separate buffer components from earlier steps and the sample is condition for further process steps. The main purpose of this step is to maintain suitable conditions for removal of other abundant protein impurities which may interfere with polishing chromatography steps of individual fractions.

P.8.F IMPURITY REMOVAL

pH of the eluate from Step-7 is adjusted to precipitate impurities from products of interest.

P.9.F EUGLOBULIN PRECIPITATION

Impurities like Euglobulin are precipitated using precise temperature and pH conditions. Temperature is maintained at less than 10 °C and pH less than 6.

P.10.F PRECIPITATE SEPERATION USING CENTRIFUGATION

The sample is passed through a continuous centrifuge to separate the precipitate. Precipitates are separated as a slurry and discarded. Supernatant is used for the subsequent steps.

FILLING TO VIALS

IVIG PURIFICATION PROCESS:

P.11.F LOAD PREPARATION FOR 4F

Conductivity of supernatant from Step # 10 is adjusted to facilitate favorable conditions for separation of IVIG and Albumin.

P.12.I CHROMATOGRAPHY – 4F

Conductivity adjusted sample is subjected to Chromatography 4F to separate Albumin from IVIG, this is the most critical chromatography step. Unlike in Cohn's process this gives a single step separation. The chromatography step is also operated in both flow through and elution modes to achieve the required separation. Albumin and IVIG are separated as different fractions after this step and collected in different process vessels. Individual fractions are processed separately to further purify and polished suitable for filling in glass vials.

P.13.I TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION

IVIG fraction is collected and concentrated to about batch volume using TFF. Trans-membrane pressures (TMP) are adjusted to achieve maximum permeate flow while minimizing fouling of the membrane. Automated TFF skids can be used to precisely control and maintain the TMP.

P.14.I pH AND CONDUCTIVITY ADJUSTMENT

Both pH and conductivity of concentrated solution from step 13 is adjusted using NaOH and Acetic acid.

P.15.I FILTRATION

pH and conductivity adjusted, concentrated IVIG fraction is filtered using 1.2-micron filter to clarify, suitable for loading on next chromatography step.

P.16.I CHROMATOGRAPHY - 5I

Filtered IVIG sample is subjected to Chromatography 5I to further purify IVIG from other protein impurities. Impurities and IVIG are collected as separate fractions, impurities are discarded and IVIG is further processed.

P.17.I pH ADJUSTMENT

pH of the fraction collected from step 16 is adjusted with 1M Acetic acid for following viral inactivation step. This is ideally done in the same vessel in which the fraction is collected.

P.18.I CONDUCTIVITY ADJUSTMENT

Conductivity of collected fraction is adjusted. This is ideally done in the same vessel in which the fraction is collected and pH adjusted.

P.19.I LOW pH TREATMENT FOR VIRAL INACTIVATION

pH of the collected fraction is adjusted to 4.0 with 1M Acetic acid. This is held at pH 4.0 at 37 °C for 10 hours for viral inactivation. This step is most critical with regulatory and quality prospective.

P.20.I FILTRATION

Viral inactivated IVIG fraction is filtered using 1.2-micron filter to clarify, suitable for loading on next chromatography step.

P.21.I SOLVENT DETERGENT TREATMENT FOR VIRAL INACTIVATION - VERY CRITICAL STEP FOR REGULATORS

The solvent/detergent (S/D) pathogen inactivation method was developed for the inactivation of enveloped viruses in plasma-derived medicinal products. Currently, S/D treatment for pathogen reduction of plasma for transfusion and plasma-derived medicinal products is the most common, validated and robust industrial method for the virucidal treatment of blood products. Although many millions of therapeutic doses of S/D inactivated products have been used to date, there is no report on transmission of viral infections caused by enveloped viruses in recipients. The safety of the S/D treatment is also shown by the absence of reports of toxicity or antibodies against neoantigens after large- scale exposure of patients to several million transfused units.

1% TNBP and 1% Triton X are added calculated as final volume v/v. TNBP and Triton are prepared in a buffer before addition to the bulk of fraction. Stock solutions are prepared.

P.22.I CHROMATOGRAPHY - 6I – FINAL CHROMATOGRAPHY STEP IN IVIG PROCESS

Filtered IVIG sample is subjected to Chromatography 6I to effectively remove added solvents and detergents in P.21.1 This also works for removal of endotoxins in the solution. IVIG bound to resin at an Acidic pH is selectively eluted using elution buffers at pH 9.0 in a process called as pH gradient elution.

P.23.I pH ADJUSTMENT

pH of the eluate from Chromatography 6I step is adjusted to preserve structural stability of IVIG and provide more stable conditions.

P.24.I NANO FILTRATION – (OPTIONAL STEP)

Nano filtration further ascertains barrier mode removal of viral particles from IVIG solution. Plano make filters are used in the process.

P.25.I TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION AND DIA FILTRATION

IVIG fraction is concentrated using TFF about 5% IVIG w/v concentration followed by buffer exchange by dia-filtration at the same TFF running conditions.

P.26.I TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION

Dia-Filtered IVIG is concentrated to 6% w/v to facilitate final formulation at 5% w/v using the same TFF conditions. TFF conditions are maintained as in previous steps.

P.27.I FORMULATION

Buffered IVIG solution is formulated by adding 10% w/v pharmacopeial grade Mannitol. pH of this final solution is maintained at 4.2.

P.28.I PRE-FINAL FILTRATION

Filtration is done to decrease turbidity of the solution and also decrease microbial load on final sterile filtration step. This filtration is done using sandwich filter rated 1.2/0.6 micron.

Page 49

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

P.29.I STERILE FILTRATION

Sterile filtration is done to further reduce bio burden and the process is not claimed a sterile operation. Final terminal filtration is performed before fill-finish stage.

P.30.I FILLING IN TO VIALS

Washed, sterile and pyrogen free vials are used to fill bulk solution of IVIG.

ALBUMIN PURIFICATION PROCESS:

P.31.A CHROMATOGRAPHY – 7A

Albumin fraction from chromatography step 4F is used to load on Chromatography 7A and separation is achieved by binding and elution mode. This step is final chromatography step in Albumin process.

P.32.A TANGENTIAL FLOW FILTRATION (TFF) FOR CONCENTRATION

Eluate collected from Chromo-7A is concentrated to 6-7% w/v and collected in a vessel suitable for next process step.

P.33.A HEAT TREATMENT

Concentrated albumin solution is collected in a process vessel having control for temperature and time (57 degree C/ 3 hours). End point of completion of heat treatment is taken as stable optical density@ 600 nm. Heating of material results in a slightly turbid solution with suspended impurities. This solution is cooled to room temperature or even up to 10 °C for better separation. Chromatography is performed at room temperature.

P.34.A CENTRIFUGATION AND FILTRATION

Albumin solution after heat treatment is centrifuged and filtered to remove suspended proteinaceous contaminant particles formed during heat treatment. Continuous centrifuge can be used for this step.

P.35.A CONCENTRATION AND DIA FILTRATION

Above heat treated sample is Concentrated to 12% and Dia filtered.

P.36.A CAPRYLATE ADDITION AND pH ADJUSTMENT

Caprylate is added to concentrated and dia. filtered solution. The pH of the solution is adjusted to 4.5. An IPQC check is done to check actual caprylate concentration and if required, adjusted the concentration.

Page 51

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

P.37.A LOW pH INCUBATION

Solution is incubated at room temperature for about 7 hours followed by filtration to remove suspended particles.

P.38.A pH ADJUSTMENT

pH of the above solution is adjusted to 7.0

P.39.A CONCENTRATION AND DIA FILTRATION

Albumin solution is concentrated to formulation concentration and finally subjected to Pasteurization at 60 °C and finally filled.

4.4 Detailed design

This document describes the strategic approach to the facility design, technology basis and products selected in stage 1 (150,000 L / annum) and Stage 2 (500,000 L / annum)

The site is situated on the outskirts of Nagpur city spread over 6 acres.

The process design shall be based on Chromatography system-based separation.

It will be dedicated to manufacture of Human plasma fractions which include the following products in Stage 1

- Albumin
- Human Immunoglobulin
- Factor VIII
- Factor IX
- Fibrin sealant
- Fibrinogen

The plasma processing capacity in Stage 1 will be 150,000 L / annum

The facility design shall have scope of increasing the plasma processing capacity to 500,000 L

/ annum.

Besides the products identified in stage 1 the following products have been identified in Stage

2. An appropriate Technology partner shall be identified for providing the process know-how.

- Anti-D
- Factor XI
- Factor XIII
- Hepatitis B IgG
- Measles IgG
- Protein C
- Rabies IgG
- Tetanus IgG
- Thrombin
- Varicella Zoster IgG

Page 70

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

The plant is designed as a monobloc facility which will be constructed as a two-floor facility

The ground floor shall contain the following operational units

- a. Bulk plasma fractionation unit (150,000 L/ annum)
- b. Warehouse Plasma storage (32000 L)
- c. Admin / QA / Reception
- d. Warehouse (RM/PPM/SPM/ Finished goods)
- e. Electrical transformer area
- f. Engineering workshop
- g. Utility block
- h. Raw water storage tank
- i. Borewell
- j. Boiler room
- k. Chiller room
- l. Kill tank system
- m. Scrap yard

FUTURE EXPANSION AREA

- i. Bulk plasma fractionation unit (350,000 L/ annum)
- ii. Warehouse Plasma storage (32000 L)

The first floor shall contain the following areas

1. Canteen area
2. Water system and engineering store
3. SPM store
4. Visual inspection
5. Label store
6. Change rooms
7. Fill finish with Lyo area
8. Quality Control area
9. Service area (for AHU's)

Page 71

PROPOSED SITE PLAN

Page 72

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

5.1 Concept design:

Figure 9: Conceptual Layout for Site Master Plan

Page 73

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

5.2 Site Master Plan

Conceptual Layout Ground Floor (Bulk Manufacturing):

The bulk manufacturing area is designed in a manner to provide unflow of man, material and waste from the facility to avoid mix-ups and cross contamination.

All the ancillary functions are located on the ground floor and separated from bulk manufacturing area.

In the ground floor following facilities are present:

1. Bulk manufacturing facility -01
2. Bulk manufacturing facility -02 (Future provision)
3. Quarantine Plasma Storage/Testing lab/Ware house
4. Future provision for plasma storage
5. Finished goods storage & dispatch
6. Administrative Block
7. Utility Block
8. Workshop
9. DG Set and Transformer area
10. UG collection tank, ETP/STP & Kill Tank
11. Bore well, UG 500KL storage tanks
12. Chiller and Boiler rooms
13. UG SUMP

Bulk Manufacturing Block

Change Rooms: Bulk manufacturing facility-01, personnel entering the processing area will

undergo a series of two dress changes applicable to clean rooms of different classifications. The separate change rooms are provided for male and Females.
Locker Room: This shall be the first change where the personnel remove their street shoes and clothes and keep these belongings in the provided double door lockers.
For the exit from facilities, separate change rooms are provided.
In exit change room personnel shall remove the clothing (Overall, head gear, gown and pant and reach the Locker room and put on their street clothes from the lockers and will exit the facility.

Page 74
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

Preparation and Processing areas:
To support the manufacturing operations Buffer Prep.(Support area) shall be responsible to prepare various materials, reagent, chemicals and sterile materials to be used in the manufacturing operations. The provisions for dry and moist heat sterilisations are provided in this area.
The manufacturing facility is construed and designed in a manner to protect product from any mix-ups, cross contamination and making the operator's work path and activities less complex and enabling compliance.
The processing areas for thawing of bulk material (Plasma), fractionation and downstream processing (Chromatography) are separately provided in the Layout to avoid any mix ups and cross contamination.

Plasma storage/ Testing lab /ware house/ Future provision plasma storage:
All the incoming and released raw materials, packaging material required to support the manufacturing shall be stored in the ware house.
All the incoming plasma shall be sampled and tested in ware house testing lab.
There is a provision for the storage at -20degrees C for of plasma in the ware house.
For the envisaged future expansion of manufacturing capacities from 150000Lit.to.500000Lit / year an additional storage area is reserved in the ware house, this area shall be furnished during future expansion of the capacities.

Finished goods storage and despatch:
All the released material shall be stored in the released cold rooms. At the time of shipment, the packed material shall be transferred from finished goods dispatch area in the ground Floor.

Administrative Block:
All the administrative support functions shall be dealt in this block.

Holding tank /ETP/STP:

Page 75
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

All the liquid waste generated in the bulk manufacturing area shall be properly segregated. The biological waste material shall be transferred to holding tank from there it will be transferred to kill tank for final processing and discharge to ETP through holding tank.

03 UG water storage tanks (5KL) each & Utility Block:
The ground water shall be transferred to UG storage 03 tanks having capacities of 5KL each. The raw water will be treated and will be used as feed water for the generation of PW, WFI and clean steam.

Engineering work shop:
All the maintenance and repair activities shall be undertaken in the work shop.

DG and Transformer room:
For the uninterrupted power supply separate area is designed in the Layout.

Chiller and Boiler room:
The facility of chilled water and plant steam required for various system shall be routed through chillers and boilers room.

First Floor: On the first-floor following facilities are housed:

- 1) Formulation / Fill Finish area
- 2) Finished goods quarantine
- 3) Labeling, packing & Visual Inspection
- 4) Water System and Eng. store
- 5) Bulk Store
- 6) SPM store
- 7) PPM store
- 8) R&D lab
- 9) QA/QC
- 10) Canteen

Page 76
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

Figure 10: Conceptual Layout for Bulk Manufacturing Facility

Page 77
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

The bulk manufacturing area is designed in a manner to provide unidirectional flow of man, material and waste from the facility to avoid mix-ups and cross contamination.
All the ancillary functions are located on the ground floor and separated from bulk manufacturing area.

In the ground floor of Bulk manufacturing facilities following key areas are present:

1. Bag Cutting and pooling area
2. Plasma Thawing Area
3. Downstream processing (Chromatography)
4. Columns packaging & skids
5. Washing area
6. DHS / Autoclave area
7. Cold room
8. Buffer Preparation
9. Plasma day store
10. Chemical Day store
11. Change rooms

Change Rooms: Bulk manufacturing facility -01, personnel entering the processing area will undergo a series of two dress changes applicable to clean rooms of different classifications. The separate change rooms are provided for male and Females.

Locker Room: This will be the first change where the personnel remove their street shoes and clothes and keep these belongings in the provided double door lockers.

For the exit from facilities separate change rooms are provided.

In exit change room personnel shall remove the clothing (Overall, head gear, gown and pant and reach the Locker room and put on their street clothes from the lockers and will exit the facility.

Page 78

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Preparation and Processing areas:

To support the manufacturing operations Buffer preparation (Support) area shall be responsible to prepare various materials, reagent, chemicals and sterile materials to be used in the manufacturing operations. The provisions for dry and moist heat sterilisations are provided in the area.

The manufacturing facility is construed and designed in a manner to protect product from any mix-ups, cross contamination and making the operator's work path and activities less complex and enabling compliance.

The processing areas (Upstream) bag cutting, pooling and segregated plasma thawing areas are provided. There are separate areas for Plasma fractionation and downstream processing in stagewise manner (Chromatography) provided in the Layout to avoid any mix ups and cross contamination.

For packing of chromatographic columns dedicated area is provided in the layout of bulk manufacturing facility

Cold Rooms:

Cold rooms are provided in the facilities for the storage of heat labile materials like chromatographic gels, in process samples and materials.

Page 79

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Figure 11: Conceptual Layout for Bulk Plasma Storage Facility

Page 80

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Plasma storage facility is housed on the ground floor adjacent to the raw material storage area.

All the Raw materials shall take through the dedusting tunnel to clean and remove the dust from the external surface of RM containers. After sampling of RM, the goods shall be transferred to RM quarantine area pending the testing and release of materials from quality control lab.

The RMs which do not meet the specifications shall be transferred to rejection room. Rejection room has access control. Only authorised persons are allowed to enter the area.

In coming plasms is taken inside the ware house through plasma receipt corridor.

Incoming plasms is sampled in plasma sampling room, equipped with (RLAF), remaining plasma is transferred to plasma quarantine area having -20 degrees C cold facility.

After the completion of serological testing and other necessary test in the serology lab and QC lab., plasma is shifted to released plasma cold room at -20degees C.

Barcoding for identification of each lot of bulk plasma is done in Barcoding room.

There is a provision for future expansion of cold facilities to cater to 500000 Lit Plasma.

Page 81

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Figure 12: Conceptual Layout for Fill Finish Facility

Page 82

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Fill finish facility is housed on first floor of the bulk manufacturing facilities.

For entry into the area separate entries for males, females and visitors are provided. After series of changes, personnel shall enter into the core areas of fill finish facility.

In the core area formulation area is present.

In the formulation area all the released bulks shall be formulated on campaign basis. The formulated bulks shall be filled, capped through automatic machine and inspected for any abnormalities (particulate matter) visually. Separate laundry area is provided for washing of soiled gowns.

Following are the key areas in Fill Finish facility

1. Formulation
2. Fill Finish area
3. Lyophilisation
4. Change Room
5. Disinfectant and Material Prep area
6. Cold room

7. Clean laundry
8. Packing area

Page 83
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

Figure 13: Conceptual payout for QC and R&D Facility

Page 84
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

On the FF of Bulk manufacturing facilities R&D, Quality Assurance and quality control facilities are located.

Four labs are dedicated for research and development activities. The technology at small scale shall be transferred to R&D labs.

Adjacent to this, quality control labs are housed. Primarily quality control labs shall be responsible for testing

- Raw materials, PPM and SPMs.
- In-process testing of intermediate products
- Bulk plasma -Physicochemical and microbiological test
- Formulated Bulk plasma products
- Fill finished plasma products
- Microbial testing of critical utilities.
- Microbial testing of environmental samples from clean rooms.

Following labs are envisaged in quality control

- 1 Sample receipt
2. Chemical / Glassware Storage
- 3 TOC / LPC
4. Instrument Room
5. Balance Room
- 6 Wet Lab(Chemical)
7. Hot Zone/ Washing
8. MLT
9. Incubator rooms
10. Sterility room
11. Washing & Sterilization area
12. Media prep and Storage
13. BET Room
14. Stability Testing

Quality Assurance:

Annexed to QC labs quality assurance department is located. In quality assurance following functions of site will be undertaken

Page 85
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

1. Documentation and control
2. Trend analysis of critical utilities and Change management
3. Audits, Inspections, Pest control and Vendors management
4. Validation. Qualification and Calibration
5. Complaints and Recalls
6. Lot Release and Product review.
7. Trainings

Page 86

Figure 14: Elevation Drawing

Page 87
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

5.3 Layout Philosophy:

Plasma fractionation and processing is complex and critical manufacturing operation with respect to the receipt of plasma (Starting material) its downstream processing, formulation and fill finish. The facility requires strict cGMP and regulatory compliance to ensure the product quality and safety of the operator and environment.

The facility Layout adheres to GMP guidelines (Schedule M of Drugs and cosmetic act 1940 and Rules 1945).

The layout philosophy is based on the integral evaluation of processes, potential risks, man and material movement, generation and flow of solid and liquid waste etc.

The manufacturing facility is construed and designed in a separate block to protect product from any mix-ups, cross contamination and making the operator's work path and activities less complex and enabling compliance. Flow of personnel, clean and dirty materials are unidirectional with logical sequence of operations.

HVAC zoning of the facility (control areas) for the manufacturing operations is done based on the operation and its criticality (Plasma collection, fractionation, purification, and storage) to minimize the risk of contamination and to maintain physical conditions like temperature and humidity. The physical conditions should also be suitable to the comforts of the personnel working with protective clothing.

In the Layout provision for separate change rooms for entry and exit from clean areas is made. Change rooms design contains airlocks to provide physical separation of the different stages of gowning.

Page 88

CHAPTER 6
SOURCING AND
HANDLING OF RAW
MATERIAL

Page 89
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

6.1 Exchange Value of Plasma per Liter and Projected Value Over a Period of Seven Years:
As per the literature survey and discussion with different stake holders the exchange value of plasma in 2023-2024 is INR 2200/Liter and in next 5 years the estimated plasma price shall be expected to be ≈INR 2800/L.

Figure 15: Exchange value of plasma per liter and projected value in INR

6.2 Donors' Selection Criteria:
In India, the plasma industry is dependent on voluntary blood donation. Human blood is the source of plasma which is used to manufacture various therapeutic plasma proteins after fractionation.
In blood banks the cellular components (RBC, WBC, and platelets etc.), are separated out for different applications and the plasma is collected from blood banks by plasma fractionators for clinical / therapeutic use as per "National Plasma Policy" of Ministry of Health & Family Welfare.
The selection and management of blood donors is an essential part of the blood donation process. National health authorities and blood transfusion services are responsible for ensuring that the national system is in place for the selection of all blood donors through an assessment of their suitability to donate blood.
Following are the selection criteria for donors:
1. Health
2. Age (18-65 years)
3. Time between blood donations

Page 90
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

- 4. Blood pressure
 - 5. Body temperature
 - 6. Hemoglobin content etc.
 - 7. Test for HBsAg*
 - 8. Test for anti-HIV*
 - 9. Test for anti-HCV*
- *All three tests should be negative. An additionally test for STD is also performed.

6.3 Plasma Donation Testing, Epidemiological Surveillance, Post Donation Information:
Plasma Donation testing:
The collected plasma is screened for the following:
1. Test for HBsAg
2. Test for anti-HIV
3. Test for anti-HCV
All three tests should be negative. Additionally test for STD is also performed.
Epidemiological surveillance, post donation information:
To ensure optimal long-term safety of plasma for fractionation, it is recommended to establish continuous epidemiological surveillance of the donor population.
The objective of this survey is to know, as precisely as possible, the prevalence and disease incidence, and trends of infectious markers that are relevant to the safety of medicinal plasma products so that appropriate counter-measures can be taken in a timely manner.
The system should not only be able to gather epidemiological data at the national and regional level but also among the donor populations that are providing blood or plasma for fractionation at individual blood establishments within a country or a region. The information from the epidemiological surveillance can furthermore be used to detect and assess.
● Differences in disease patterns between donor population.
● Trends of infectious marker.
● The relevance of any preventive measures such as a strengthening of donor selection process, additional exclusion criteria, or implementation of any additional screening tests to avoid contamination of plasma products.
● To detect any new or emerging pathogens in the community.

Page 91
CONFIDENTIAL

6.4 Handling of Blood, Plasma Freezing, Storage, Cold Chain and Complete Logistics Plan:

Handling of Blood:

A standardized and validated procedure for the bleeding shall be followed.

- The presterilized container (Bags) shall be used to collect the blood.
- Identity of the donor should be confirmed with relevant documents before venipuncture.
- The collected blood used for plasma fractionation should be mixed well with the anticoagulant solution to avoid risks of activation of the coagulation cascade.
- Presently, automated blood collectors are used in which plasma is separated from cells

and the cells are resuspended and returned to donor in series of return cycles.

- In most of the centers the centrifugation or filtration or combination of both process is

followed to separate the cellular components from plasma.

- The collected blood should be weighed and labelled properly in order to ensure full

traceability at each stage of plasma production.

- Information on the label of the blood storage containers should include:

- o Name of the blood product
- o Volume or weight
- o Unique donor identification number
- o Name of the blood collection center
- o Shelf life
- o Storage temperature
- o Name, content and volume of anticoagulant
- o Laboratory samples should also have the same information and must be stored securely at appropriate temperature

Blood Holding:

It has been shown that whole blood anticoagulated with CPD, transported and stored at 22°C for up to 8 hr prior to separation of plasma is suitable for the production of plasma for fractionation.

However, storage of blood beyond 24 hours the factor VIII activity is reduced by 15 to 20 percent. Rapid cooling of whole blood to 22°C +/- 2°C after collection protects factor VIII and may allow storage of blood for 24 hr.

Page 92

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Transportation/storage of collected blood at 4°C with different anticoagulants (ACD, ACD-adenine, or CPD) consistently appears to reduce the FVIII content, but not necessarily that of other proteins.

Blood holding time for the extraction of various components should be validated by the company.

Plasma Processing and Transportation:

After separation of plasma, freezing is an important processing step that has an impact on content of factor VIII. Several aspects of the freezing conditions of plasma for fractionation have been evaluated in this document based on the literature search.

Freezing of Plasma:

The requirements for the temperature at which plasma should be frozen depend upon the type of proteins to be fractionated.

As per pharmacopeial guidelines, recovered or apheresis plasma for fractionation to be used for the manufacturing of labile proteins (Factor VIII concentrate) should be frozen rapidly, within 24 hours of collection, at -20 °C or below.

However, freezing conditions are currently under debate. It is suggested that recovered plasma used to manufacture stable plasma proteins (e.g., albumin and immunoglobulins) should be frozen within 72 hours of collection at -20 °C or below.

Plasma freezing process should be validated by life Nity to extract the desired plasma proteins.

Storage of Plasma:

Plasma for fractionation should be stored at -20 °C or below. When plasma is stored at -20°C it has the shelf life of 2 years. However, when plasma is stored below -20°C has shelf life of 3 years.

Stability/Shelf-life studies should be conducted on at least three Pooled Plasma bulks during initial phase as a minimum by the company and subsequently one batch of pooled plasma should be taken for stability on annually basis after approval from the quality assurance department. The stability studies should be well documented.

Transportation of plasma and its validation:

Transport of plasma pools (Bulk) and samples to the processing site should be done according to approved and validated procedures. Temperature monitoring device should be used to record the temperature during transportation. Any deviations in the temperature during

Page 93

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

transportation should be notified to QA department for impact assessment (compliance and quality).

Simulation studies should be conducted at site to validate the packaging and its transportation.

6.5 Sourcing of Plasma from Government and Non-Government Blood Banks:

There are different sources of plasma in India- Government, NGOs and some private facilities recognized by the government. The Govt. has the full responsibility for the blood program. The surplus plasma from government hospitals and blood collection centers and blood banks are sold through tenders.

As a minimum there are certain conditions for plasma fractionator to fulfill before applying

for plasma procurement as follows:

1. The plasma fractionator must be licensed by the Government of India for plasma fractionation and manufacturing clinically usable products in a cGMP facility.
2. The fractionator is accountable to update plasma procurement center about the nature and quantity of all the products manufactured from the plasma received from the center.
3. The fractionator must ensure that none of the products recovered from this plasma are exported before fulfilling domestic demand.

Buy Back policy:

In some cases, government buy plasma derived products from the fractionator for use.

6.6 Equipment for Proper Collection, Storage and Separation of Blood Components:

Following is the list of equipment required during the different stages of blood processing:

Blood Collection

- Donor weighing balance
- Haemoglobinometer
- Sphygmomanometer
- Stethoscope
- Blood mixer and shaker
- Tube stripper and Di-electric tube sealer
- Needle destroyer

Page 94

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Blood Processing

- Refrigerated Centrifuges
- Double pan balance
- Plasma Expresser- Manual/Automated

Blood Storage

- Blood Bank Refrigerator
- -20°C freezers
- -80°C deep freezers
- Platelet Agitator and Incubator
- Cell Separators (Apheresis machine)

Blood Testing

- pH Meter
- Cell Counter (optional)
- Coagulometer (optional)
- Automated Cell Grouping system (optional)
- Equipment for Gel technology (optional)
- Table top centrifuge
- Serological water bath
- ELISA reader (plate reader / Strip reader)
- VDRL shaker

Blood Distribution

- Transportation vans (optional)
- Insulated blood bags container with provision for storage between 2 °C to 8 °C

6.7 Importing of Plasma from Neighboring Countries and Indian Regulations:

India is highly import dependent for its plasma product needs, which are considered to be life-saving medicines. At this point in time, India produces majorly only two plasma products, albumin and intravenous immunoglobulin (IVIG) from local plasma.

Because of changing disease pattern, improved clinical diagnostic facilities, affordability, medical tourism and many other factors the demand of blood products is increasing. This creates a huge demand and supply gap and many patients lose battle of life because of non-availability of these products. Various hyper-immune plasma proteins (Anti-D, tetanus

Page 95

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

immunoglobulin, hepatitis-B immunoglobulin, and rabies immunoglobulin) are 100% imported or prepared from imported bulk.

6.7.1 Indian Regulations & Regulatory Bodies:

The Plasma Policy aims at making available, easily accessible and adequate supply of high quality of human plasma derived proteins for clinical/ therapeutic use. In India the plasma is separated from safe and quality blood from voluntary non-remunerated regular blood donor. Blood and plasma are regulated by different rules mention in drugs and cosmetic act 1940 and by different regulatory agencies as mentioned below.

Following regulations and rules are applicable:

The Drugs and Cosmetics Rules, 1945, framed under the Drugs and Cosmetics Act, 1940:

- Includes human blood under the definition of "Drugs" under Section 2(b)
- Regulates functions of blood banks, which provide recovered plasma for plasma fractionation (Part XII C specifically regulates the collection and storage of plasma for fractionation)

The National AIDS Control Organization (NACO), under the Ministry of Health and Family Welfare) to oversee operation of blood banking services in India.

National Blood Transfusion Council (NBTC) is the apex policy-making body, under NACO, making central licensing mandatory, increasing voluntary donation base and setting of quality standards.

State Blood Transfusion Councils (SBTCs) are responsible for the smooth functioning of blood transfusion services at a state level.

Drug Standard Control Organization (CDSCO) and State Drug Control Organizations' play a vital role in key aspects such as, approval of licenses, and enforcement of standard transfusion practices to ensure safe, quality and efficacious blood and its components in clinical practices.

National Institute of Biologicals (NIB) Nodal governmental organization under the Ministry of Health and Family Welfare responsible for the testing and release of biologicals in India including blood plasma.

Page 96

CONFIDENTIAL

CHAPTER 7
PRODUCTION
PROGRAMPage 97
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

7.1 Product and Product mix:

In phase 1 of the project the following products are proposed to be manufactured from normal human plasma.

- Human Serum Albumin
- Normal Immunoglobulin
- Factor VIII
- Factor IX
- Fibrin Sealant
- Fibrinogen

Depending upon the market demand and production capacities, product mix strategy can be formulated.

Various permutations and combinations are possible to manufacture different products. On the basis of PFD given in Chapter 4, different products shall be purified in different steps during the downstream processing of pooled plasma bulk (fractionation of plasma).

However, it is suggested that Lifinity shall take the first campaign of product which is at the highest demand followed by the products with moderate and low demand. As an alternate, the high yielding product shall be manufacture first to have sufficient stock followed by a campaign for low yield and moderately yield products.

Plasma requirements based on the manufacturing capacities:

Considering 1,50,000 Liters of plasma processing capacity, plasma bags requirement are presented in table below:

Table:9 Plasma requirements based on the manufacturing capacities:

Item	Volume in Liters
Plasma Storage capacity	32000
Plasma required per month	30000
Plasma required per 10 days	10000
Volume of plasma per bag	0.2
No. of bags required per 10 days	50000
No. of bags required per month	150000

Page 98
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

7.2 Production Capacities and Yield Calculations:

HSA is major protein component, followed by IgG in plasma. The wide concentration range of plasma proteins (less than 1 mg/mL to 40 g/L is one of the potential challenges in designing production capacities.

Source: (J.D. Andrade et al. Plasma protein adsorption: the big twelve, Ann. N.Y. Acad. Sci., p. 158-172,1990. & Chapter -2 of DPR).

However, for calculation purpose below mentioned protein concentrations in normal plasma are considered.

It has been reported in the literature that depending upon the downstream processing and sterile/terminal filtration, recovery of the protein of interest is 50% at final stage.

Source: (Overview of Albumin and Its Purification Methods: Adv Pharm Bull, 2016, 6(4), 495-507 doi: 10.15171/apb.2016.063 <http://apb.tbzmed.ac.ir>) as shown in the table below.

Basis of Yield calculations:

Based on vessel size, the batch size assumed is 1000 liters, on every alternate date, a new batch can be initiated, therefore 15 batches shall be processed per month (one batch/alternate day).

The yield for 1000 liters batch is as mentioned below.

Table 10: Yields for 1000L batch

Protein availability	No. of vials	Product Protein Recovery Conc. / vial (gm) /batch
Albumin (gm)	40,000	20000 20 GM 900
Human IgG (gm)	12,500	6250 5 GM 1000
Factor VIII in IU	10,00,000	12500 IU 250 IU 50
Factor IX in IU	10,00,000	90000 IU 600 IU 150
Fibrinogen (gm)	3,000	1500 70 mg 80
Thrombin in IU	9,00,000	90000 1000 IU
Fibrinogen	3000	1490 1000 mg 1400

In the EOI document, the phase 1 target is to process 1,50,000 Liters of plasma annually. The output obtained with 1.5 lac liters of plasma for the products mentioned for stage1 is as under.

Page 99
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

Table 11: Yields for 150,000 Lit annual capacity

No. of	Product Protein availability	Protein Recovery Conc. / Vial
vials/year		
Albumin (gm)	60,00,000	30,00,000 20 gm 1,35,000
Human IgG (gm)	18,75,000	9,37,500 5 gm 1,50,000
Factor VIII in IU	15,00,00,000	18,75,000 250 IU 7,500
Factor IX in IU	15,00,00,000	13,500,000 600 IU 22,500
Fibrinogen (gm)	4,50,000	2,25,000 70 mg 12,000

Thrombin in IU 13,50,00,000 1,35,00,000 1000 IU
Fibrinogen 450,000 225,000 1000 mg 2,10,000

Therefore, to achieve the plasma processing target, 15,000 liters of plasma shall be processed on monthly basis at site.

Production Scaleup from 150,000 to 500,000 lit per annum:
Lifentiy will increase its plasma processing capacity to 500,000 liters annually in phase 2 of the project implementation.

To achieve the plasma processing target, 50,000 liters of plasma shall be processed monthly. Two strategies, can be followed:

Strategy 1: To keep number of batches equivalent to stage-1 (i.e., 15 batches per month), the individual batch size shall be 3400 liters. The yield calculations are given below.

Table 12: Yields for 3400 L batch

No. of vials	Protein	Protein Conc. /	Product manufactured
availability (gm)	Recovery (gm)	Vial	/batch
Albumin 1,36,000	68,000	20 gm	3,060
Human IgG 42,500	21,250	5 gm	3,400
Factor VIII in IU 34,00,000	8,16,000	250 IU	170
Factor IX in IU 34,00,000	8,50,000	600 IU	510
Fibrinogen 10,200	5,100	70 mg	272
Thrombin IU 30,60,000	3,06,000	1000 IU	
Fibrinogen 10,200	5100	1000 mg	4,760

Page 100
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

Strategy 2: Alternatively, if the batch size is further increased to 5000 liters, the number batches shall be reduced to 10 batches per month as one batch can be initiated after every 3 days. The yield for a 5000 liters batch is as mentioned below.

Table 13: Yields for 5000 L batch

No. of vials	Protein	Protein Conc. /	Product manufactured
availability (gm)	Recovery (gm)	Vial	/batch
Albumin 2,00,000	100,000	20 gm	4,500
Human IgG 62,500	31,250	5 gm	5,000
Factor VIII in IU 50,00,000	1,200,000	250 IU	250
Factor IX in IU 50,00,000	1,250,000	600 IU	750
Fibrinogen 15,000	7,500	70 mg	400
Thrombin IU 45,00,000	450,000	1000 IU	
Fibrinogen 15,000	7,500	1000 mg	7,000

Total Production capacity:
The total production capacity with 500,000 Lit. of Plasma/year is given in the table below.
Table 14: Total production capacity with 500,000 Lit. of Plasma/year

Protein	Protein Conc. /	Product No. of vials /Year
availability (gm)	Recovery (gm)	Vial
Albumin 2,00,00,000	1,00,00,000	20 gm 450000
Human IgG 62,50,000	31,25,000	5 gm 500000
Factor VIII in IU 50,00,00,000	12,00,00,000	250 IU 25000
Factor IX in IU 50,00,00,000	12,50,00,000	600 IU 75000
Fibrinogen 15,00,000	7,50,000	70 40000
Thrombin IU 45,00,00,000	4,50,00,000	1000 IU
Fibrinogen 15,00,000	7,50,000	1000 mg 700,000

Note:
1. For scale up to 500,000 Liters only 6 products (HSA, IgG, F-VIII, F-IX Fibrin Sealant, Fibrinogen) are considered.
2. Fibrin sealant is prepared by mixing Fibrinogen and Thrombin; therefore, production capacity of fibrin sealant is equal to the production capacity of Thrombin.

Page 101

FEASIBILITY AND DETAILED PROJECT REPORT

CHAPTER 8
PROJECT
IMPLEMENTATION
MODEL

Page 102
CONFIDENTIAL
FEASIBILITY AND DETAILED PROJECT REPORT

8.1 Lifentiy shall implement the PDMP manufacturing in a phased manner.
A suitable technology partner for the Plasma fractions shall be identified and contracted with for process know-how. The agreement will fulfil criteria mentioned in Section 3.3 of this document.
The project shall be initiated at small scale to establish the process for the products identified in stage 1.
Once the process, yields and quality are established as per the specifications, the project will proceed to the commercial scale stage
Commercial scale:
The company will initially procure 150,000 liters of plasma per year for fractionation to

produce the following product in Phase-1.

- Human Serum Albumin (HSA)
- Human Immunoglobulin (IgG)
- Factor VIII
- Factor IX
- Fibrin sealant
- Fibrinogen

All the areas of the manufacturing block (Facility-1) will have sufficient space to cater the volumes and products without compromising on any of the cGMP and regulatory expectations.

The following systems installed during Phase-1 of the project will also be matching the requirements for Phase-2 (Expansion Project) capacities.

- Clean utilities
- Black utilities
- Filling
- Freeze drying and
- Packaging lines for the final product

Page 103

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

8.2 Facility Expansion:

8.2.1 For handling additional 350,000L of Plasma:

In Phase-2, the company shall procure additional 350,000 Liters of plasma to manufacture the following additional products.

- Anti-D IgG
- Factor XI & XIII
- Fibrinogen
- Hepatitis B IgG
- Immunoglobulin G
- Measles IgG
- Protein C
- Rabies IgG
- Tetanus IgG
- Thrombin
- Varicella Zoster IgG

While implementing Phase-2 of the project, Lifenity shall extend the manufacturing operations to Facility-2 and shall procure the following additional systems to match the capacities of processing additional 350,000 L/year of plasma which are as follow:

- Tank Systems
- Chromatography Systems
- Autoclaves
- Dry heat sterilizers

Quality control and Quality assurance units developed during Phase-1 will be also cater to the Phase -2 products and other ancillary activities.

Central ware house space shall be adequate for future expansion. However, the additional cold Chain equipment (Freezers) and storage racks etc. for the storage of active material (plasma) and finished products shall be procured during Stage 2 expansion.

In Phase-1 of the project the bulk manufacturing operations will run in a single shift of 8 hours working /day, with effective working for 6 hours. The shifts can further be evaluated based on number of batches for processing/week. Likewise, the filling operations will run in scale down mode to meet the market requirement.

Page 104

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

8.2.2 Monoclonal antibodies (Mabs) – Future considerations:

A monoclonal antibody are Y-shaped glycoproteins that detect and bind strongly to their antigen. Monoclonal antibodies stems from a single white blood cell clone. Monoclonals not only bind to a single epitope of a target antigen but also activates immune responses, e.g. antibody-dependent cell-mediated cytotoxicity (ADCC) and recruits further immune cells such as phagocytes and are thus highly specific

Monoclonal antibody production:

Several technologies for monoclonal antibody production have been developed and the respective downstream processes are optimized. Some of the industrial scale technologies are:

- Hybridoma cells production
- Phage display technologies
- Single B cell technologies

Hybridoma production:

In this technology fusion of antibody producing B cells of an immunized mouse with myeloma cells is done produce unlimited antibodies. Hybridoma cell line that can be maintained indefinitely

Disadvantages:

- Use of lab animals for immunisation
- Risk of mutations in the antibody with aging of hybridoma
- Expression of additional variable domains by the cell line
- Long lead times and labour-intensive operation

Phage display technology:

Phage display technology circumvent several disadvantages of hybridoma technologies and speed up the process of Mab generation.

The technology relies on molecular biology and cell culture methods to genetically engineer bacteriophages to display antibodies on their surface.

In this method binding of bacteriophages with desired antibodies onto immobilized antigens is done. The high affinity binders are then used to infect bacteria and collect their DNA for

Page 105

sequencing. The sequence help to design genes to be used in antibody production in cell cultures.
The overall process is much faster than hybridoma cell generation and doesn't need any laboratory animals.

Single B cell technologies:

Single B cell technologies are another milestone in Mab development. The technique involves the screening and sorting of ex vivo cultures of single B cells from blood samples of immunized animals or humans to select for promising antibody candidates.

Genetic information is then extracted from the candidate cells mRNA after reverse transcription into cDNA, amplification and subsequent sequencing and cloning into expression vectors for Mab production.

In this method there is no need to create a hybridoma cell line, thus process become efficient and timeline are shorted by several weeks.

Depending upon the process to be adopted for the manufacturing of monoclonal antibody a new production block shall be designed to meet the process and cGMP requirements.

Detailed working for the Mabs manufacturing unit will be proposed separately in future.

In general, the Mab production suite shall have cell culture, fermentation, harvesting, primary purification, secondary purification, sterile filtration.

However, for formulation and fill finish existing facilities shall be used areas.

Page 106

Table 15: Steps performed in MABs production (General)

S/No. Step Purpose Remark

1 Cell culture and To generate the desired bulk of Fermentation antibodies

2 Centrifugation To remove cell debris, lipids, and clotted material

3 Filtration (0.45 µm To remove smaller contaminating material

4 Concentration (UF) To concentrate the desired antibodies in the material

5 Ion exchange To remove nucleic acids and Chromatography endotoxins (IEC)

6 Size exclusion SEC is preferred over IEC chromatography because size is relatively

(SEC) constant and charge on

the protein may vary depending upon the pH

as molecules are

protonated and

deprotonated

7 Immunoaffinity Antibody will bind to specific It will help to achieve Chromatography antigen attached to the highest purity

agarose matrix

8 Sterile filtration To remove microbial contamination

For implementation of Mabs project in future, there shall be a requirement of cell culture and molecular biology labs in the quality control with some additional piece of equipment.

Present Layout of quality control unit will be adequate for plasma products (Phase-1 & 2).

However, for Mabs products testing, expansion in existing QC to cater the cell culture need shall be required.

Page 107

CHAPTER 9 GMP AND REGULATORY CONSIDERATIONS

Page 108

9.1 Premises, Layout & Process Engineering:

Plasma fractionation and processing is complex and critical manufacturing operation with respect to the receipt of plasma (Starting material) its downstream processing, formulation and fill finish.

Plasma fractionation facility require strict cGMP and regulatory compliance to ensure the product quality and safety of the products and operators. The facility's layout and process engineering are critical components for setting up of the green field project. Following are key considerations for setting up a plasma fractionation facility with respect to Premises, Layout and Process engineering:

Location and Surroundings:

The factory building(s) for manufacture of plasma products shall be situated and shall have measures to avoid risk of contamination from external environment including open sewage, drains, public lavatory or any factory which produce disagreeable or obnoxious odor or fumes, excessive soot, dust, smoke, chemical or biological emission.

Building:

The building(s) used for the purpose shall be designed, constructed, adapted and maintained to suit the manufacturing operations so as to permit production under hygienic conditions. They shall conform to the conditions laid down in the Factories Act, 1948 (63 of 1948).

Premises - General Requirements:

The premises used for manufacturing, processing, warehousing, packaging, labelling and testing purposes shall be:

- Compatible with other products manufacturing operations that may be carried out in the same or adjacent area.
- The manufacturing facility shall be designed / constructed / maintained to prevent entry of insects, pests, birds, vermin's and rodents. Interior surface (walls, floors and ceilings) shall be smooth and free from cracks, and permit easy cleaning, painting and disinfection.
- There should be adequate space for orderly and logical placement of equipment, materials and movement of personnel in order to prevent:

Page 109

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

(a) The risk of mix-up between different categories of products or with raw materials, intermediates and in-process material.

(b) Possibilities of contamination and cross- contamination by providing suitable segregation, zoning and access controls etc.

Layout Considerations:

During designing of facility, Lifenity must ensure the following points:

1. Plasma products will be produced in an independent block/building.
2. The facility is designed to prevent cross-contamination between process areas, easy cleaning and ensure the efficient flow of materials and personnel.
3. The facility design adheres to GMP guidelines (Schedule M of Drugs and cosmetic act 1940 and Rules 1945).
4. Ancillary areas like rest and refreshment rooms are separate from manufacturing areas.
5. Facilities for changing, storing clothes and for washing and toilet purposes are easily accessible and adequate for the number of users. Provision for separate toilets for males and females is made and toilet is not connected with production or storage areas.
6. Change rooms design contains airlocks to provide physical separation of the different stages of gowning. Flushed effectively with filtered air. Change rooms are of the same grade as the area into which it opens finally.
7. Provision of separate change rooms for entry and exit from clean areas.
8. Hand-washing facilities are provided in the first change room.
9. Flow of personnel, clean and dirty materials are unidirectional with logical sequence of operations.
10. Sinks and drains are excluded from Grade A and B areas where aseptic operations are carried out.
11. Drains are fitted with effective easily cleanable traps and with air brakes to prevent backflow.
12. The production and dispensing areas are well lighted, effectively ventilated.

Page 110

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

HVAC Zoning:

Air supply for manufacturing area will be filtered through bacteria retaining filters (HEPA Filters) and will be at a pressure higher than in the adjacent areas unless otherwise required.

The filters to be checked for performance on installation and periodically thereafter and maintain written records.

HVAC zoning of the facility (control areas) for the manufacturing operations is done based on the operation and its criticality (Plasma collection, fractionation, purification, and storage) to minimize the risk of contamination and to maintain physical conditions like temperature and humidity. The physical conditions should also be suitable to the comforts of the personnel working with protective clothing.

Routine microbial and particulate counts of the manufacturing area will be carried out during manufacturing operations to assess the effective ness of HVAC.

The results of particulate matter and microbes to be continuously monitored against documented in-house standards and regulatory guidelines.

Based on the quality of air, manufacturing facility is divided into different grades/ Zones. In general, plasma processing facility is divided into four grades (Classes) based on the air cleanliness levels (Microbial and Particulate matter (Refer to table No 15 and 16).

Facility Grades:

Grade A: Clean rooms are used for high-risk operations, and require a unidirectional airflow system to maintain high air quality. Unidirectional airflow should provide a homogeneous air velocity of 0.36–0.54 m/s (guidance value) at a defined test position 15–30 cm below the terminal filter or air distributor system.

The velocity at working level should not be less than 0.36 m/s.

Grade B: In aseptic preparation and filling, this is the background environment for the Grade A zone.

Grades C and D: Clean areas for carrying out less critical stages of the manufacturing of plasma products -downstream processing, chromatographic purification and solution preparations.

Page 111

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

B 10 5 5 5
C 100 50 25 -
D 200 100 50 -

Clean Utility Systems:

Pure steam, purified water and water for injection are the clean utilities required to support the clean operations in plasma manufacturing/processing facilities. Monitor the clean utilities for the quality and compliance regularly as per the laid procedures and the regulatory standards.

Equipment Placement:

Equipment and processing areas will be arranged to facilitate efficient workflow and minimize the risk of contamination. Ensure that equipment and materials are easily accessible for maintenance and cleaning. Processing areas must be equipped with dedicated equipment designed for specific purpose.

Page 112

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Waste Management:

1. Waste will be removed from the manufacturing area or sent to the bio-waste system in a safe manner. To ensure containment compliance with the environment, the facility must implement measures to prevent accidental spills or leaks. This includes the use of appropriate containment systems, spill response plans, and monitoring for any environmental impacts.
2. All sewage waste pipes will run below natural ground level (however this depends on the actual site conditions along the pipe routing) in proper gradient and connected to nearest available chamber.
3. Procedures must be in place for the safe removal of different types of waste such as chemical, biological, expired reagents, unused samples and solvents etc.
4. Design the drainage systems in such a way that effluents can be effectively neutralized or decontaminated to minimize the risk of cross-contamination.
5. Provisions should be there for the proper and safe storage of waste materials awaiting disposal.
6. Toxic substances and flammable materials must be stored in suitably designed, separate, enclosed cupboards, as required by national legislation.
7. Liquid effluent poses a safety or contamination risk (Biological liquid waste), should be treated in the kill tank before its discharge into non biological /main drain.

Testing Facilities:

Testing facilities must be located in the separate building/floor.

Validation and Documentation:

Lifinity and PMC will validate the facility layout and design to ensure it meets GMP and regulatory requirements. Comprehensive documentation of the facility's layout and design, including as-built drawings shall be maintained at site and a robust document control system shall be established in quality Assurance department to maintain records.

Accessibility and Safety:

Ensure that the facility layout allows for easy access in the event of an emergency. The facilities must be equipped with safety features like fire hydrant systems, eyewash and body shower stations where ever necessary.

Page 113

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Quality Assurance & Regulatory Compliance:

The quality assurance system appropriate to the manufacture of plasma products shall ensure that the products are designed and developed in a way that takes account of the requirements of GMP and other associated codes such as those of GLP and GCP.

Adequate arrangement must be made at site for manufacture, supply chain and use of the correct starting and packaging materials.

Self-Inspection and Quality audit:

In the quality assurance department of Lifinity adequate procedures shall be designed to ensure self-inspections and quality audits periodically.

Plasma Process Considerations:

Plasma fractionation involves critical steps to separate plasma into its various components and produce high-quality plasma-derived products while adhering to Good Manufacturing Practices (GMP) and regulatory requirements.

Following are the key considerations for plasma processing:

1. Plasma Collection and Testing: A reliable and secure source of plasma, involving strict donor selection, screening and testing plan in place to screen for infectious agents, including HIV, Hepatitis B and C, and other potential contaminants in pooled plasma.
2. Fractionation Process: A well-defined fractionation process to separate plasma into its various protein components, such as albumin, immunoglobulins, and plasma factors. Robust filtration and purification processes will be followed by Lifinity to separate and purify these proteins.
3. Process Validation: The fractionation process must be validated to demonstrate its ability to consistently produce products. Process performance qualification (PPQ) shall be performed on first three initial batches to ensure that the process is in a state of control during commercial production.
4. Process Control and Monitoring: Robust process control systems to monitor critical process parameters (e.g., temperature, pH, pressure) in real-time. Written procedures must be in place for addressing deviations and out-of-specification results.
5. Raw Material Control: Documented procedures for receiving, testing, and release of raw materials and starting materials used in the fractionation process. Lifinity must ensure that all materials meet quality, safety standards and plasma source traceability.

Page 114

CONFIDENTIAL

6. Safety: Validated viral and pathogen inactivation and removal steps to ensure the safety of plasma-derived products. Implement measures to prevent contamination during processing.
7. Quality Control Testing: Comprehensive quality control testing plan, including in-process testing and final product testing, to ensure the safety, purity, and potency of the plasma products. Specifications for raw materials, intermediates, and final products shall be written and approved.
8. Equipment monitoring, Calibration and Validation: All the critical equipment used in the manufacturing and control of plasma are maintained, calibrated and qualified as per the written procedures.
9. Training and Qualification: Ensure that all personnel involved in the plasma fractionation process are well-trained with respect to the SOPs and STPs, understand GMP requirements, and are aware of their roles in ensuring product quality and safety. Maintain records of personnel training and qualifications.
10. Writing and editing documentation: Documentation for all existing processes must be written and edited regularly, to ensure that all new hires and other personnel can understand the best practices and standards
11. Risk assessments of current equipment/processes: Assessment of current processes and equipment to determine potential risks and mitigation plan shall be in place.
12. Traceability: A robust documentation system must be in place for tracking and tracing individual plasma donations and the products derived from them.
13. Packaging and Labelling: Appropriate packaging and labelling procedures for the final plasma-derived products, ensuring they meet regulatory requirements.
14. Post-Market Surveillance: Post-market surveillance system to monitor the safety and efficacy of products in the market.

Page 115

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

9.2 Regulatory Guidelines GMP, Drugs and Cosmetics act 1940 and Rules, CDSCO, WHO-GMP

Indian Guidelines:

1. The Drugs and Cosmetics Rules, 1945, framed under the Drugs and Cosmetics Act 1940:
 - Includes human blood under the definition of "Drugs" under Section 2 (b)
 - Regulates functions of blood banks, which provide recovered plasma for plasma fractionation
 - Part XII C specifically regulates the collection and storage of plasma for fractionation
2. In the year 1967, Central Govt. (Ministry of Health) enacted a separate provision in Schedule F Part XII B of Drugs & Cosmetics Rules.
3. Schedule F of the Drugs and Cosmetics Rules specifically pertains to the requirements for the manufacture, sale, and distribution of plasma-derived products, including immunoglobulins, clotting factor concentrates, and other blood
4. Drugs and Cosmetics Rules, Part X-B: Conditions for License (Rule 122EA to Rule 122P)
 - Rule 122 EA Definitions
 - Rule 122F to 122N License Application Procedure / Inspection / Reporting by Inspection Team / Grant or Rejection of License / Duration of license / Appeal provision
 - License granted by Licensing Authority
 - Approval by Central License Approving Authority
 - License is granted & delivered to Applicant
 - Rule 122 O Procedure of Cancellation and Suspension of Licenses
 - Rule 122 P Conditions of licenses:
 - Testing of whole blood / Component / Product Inspections
 - Reporting to SLA / CLAA about changes in staff / premise
 - Directions issued by SLA / CLAA / Recall Directions
 - Conditions for distribution of whole blood / component / products
 - To comply provisions of the Act and Rules
5. Destruction of infected blood and implementation of Bio-Medical Wastes (Management and Handling) Rules, 1996

Page 116

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

6. Applicable forms for License:
 - Product License Renewal
 - Blood and Components 27-C 28-C 26-G
 - Blood Products 27-E 28-E 26-I
7. The National AIDS Control Organization (NACO), under the Ministry of Health and Family Welfare) to oversee operation of blood banking services in India.
8. National Blood Transfusion Council (NBTC) is the apex policy-making body, under NACO, making central licensing mandatory, increasing voluntary donation base and setting of quality standards. Similarly, State Blood Transfusion Councils (SBTCs) are responsible for the smooth functioning of blood transfusion services at a state level.
9. Drug Standard Control Organization (CDSCO) and State Drug Control Organizations play a vital role in approval of licenses, and enforcement of standard transfusion practices to ensure safe, quality and efficacious blood and its components in clinical practices.
10. National Institute of Biologicals (NIB) is the nodal governmental organization under the Ministry of Health and Family Welfare responsible for the testing and release of biologicals in India including blood plasma.

Page 117

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Policies and Guidelines for Fractionation:

1. The National Blood Policy 2002 regulates blood quality and the Guidelines of NBTC

2016 has been brought out by NACO. NBTC has formulated guidelines for recovery of processing charges for blood and blood Components across blood banks in all sectors. It has also laid down uniform norms for issuance of No Objection Certificates (NOCs) for new blood banks, renewal of license, criteria for designation blood bank as RBTC. Guideline on bulk transfer of blood and Guidelines on exchange of surplus plasma with indigenous fractionators has been released by NBTC to support voluntary blood donation and rationalize blood utilization.

2. National Policy for Access to Plasma Derived Medicinal Products from Human Plasma for Clinical / Therapeutic Use covers the process of collecting standard plasma and transporting them under optimum conditions for fractionation, identifying critical parameters for safety, and ensuring compliance with regulatory requirements and training.

3. National Pharmaceutical Pricing Authority: Under the Ministry of Chemicals and Fertilizers, Department of Pharmaceuticals, the prices of medicines are controlled by the National Pharmaceutical Pricing Authority. Currently, plasma products under price control include albumin, AHF, anti-D immunoglobulin, anti-tetanus immunoglobulin and anti-rabies immunoglobulin however plasma itself is not under price control.

Page 118

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Pre-clinical safety and Clinical Evaluation of Plasma derived products:

European guidelines

Preclinical:

1. June 2011 EMA/CHMP/ICH/731268/1998 Committee for medicinal products for human use (CHMP)

2. Clinical Evaluation of Plasma derived products: Guideline on clinical investigation of recombinant and human plasma-derived factor IX products: 21 May 2015, EMA/CHMP/BPWP/144552/2009 Rev. 1, Corr. 1 Committee for medicinal products for human use (CHMP).

3. Guideline on clinical investigation of recombinant and human plasma-derived factor VIII products: 21 May 2015 EMA/CHMP/BPWP/144533/2009 rev Committee for medicinal products for human use (CHMP).

4. Guidance on the Clinical Investigation of Human Normal Immunoglobulin for Intravenous Administration (IVIg). CPMP/BPWG/388/95 rev.1.

5. Guidance on the Clinical Investigation of Human Normal Immunoglobulin for Subcutaneous and Intramuscular Use. EMEA/CPMP/BPWG/283/00.

Indian guidelines

As per Indian drugs and cosmetic act human blood plasma is included under the definition of "Drugs" under Section 2 (b)

As per the Indian regulations if the company which manufactures human plasma products similar to the composition and product profile currently marketed then the clinical trial waiver is given for marketing authorization. The company shall apply to DCGI &SLA for the waiver with relevant supporting documents. In case of hyper immune sera products appropriate clinical trial for safety and efficacy shall be conducted.

9.3 Containment Compliance

Blood and blood-derived products are highly sensitive and can be easily contaminated. Bloodborne pathogens, such as HIV, hepatitis B and C, can pose significant risks to both staff and patients if proper containment procedures are not followed. Maintaining a contained environment helps minimize the risk of spreading infectious diseases in the population.

Page 119

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Containment measures in the manufacturing premises shall be established such as isolation rooms, negative pressure environments, controlled airflow systems and proper handling procedures.

Plasma fractionation facilities must adhere to specific biosafety levels as defined by regulatory authorities, such as the Centers for Disease Control and Prevention (CDC). Plasma fractionation facilities operate at BSL-2 (Biosafety Level 2). It must include:

1. Access control, lab coats, gloves, eye protection (PPE) to be used by personnel working in the facility, and the use of biological safety cabinets during procedures.
2. Continuous monitoring of air pressure differentials, temperature, and humidity within the clean rooms. Alarms should be triggered if any parameter falls outside the acceptable range.
3. Scheduled regular maintenance, testing, and certification of the HVAC system.
4. The exhaust air from the clean rooms potential for any contaminating microbes should be passed through the scrubbers to protect the environment.

9.4 Validation of Processes, Equipment and Services

Approaches to validation:

1. Lifenity will organize and plan qualification and validation in a manner that will ensure product quality, safety and efficacy throughout its life-cycle.
2. Qualification and validation shall be done in accordance with predetermined protocols, and the results to be documented, in reports.
3. An appropriate and effective quality management system shall be in place at Lifenity supporting the organization, planning, execution and management of qualification and validation activities.
4. Senior management will provide sufficient resources to perform validation in a timely manner. Management and persons responsible from quality assurance and manufacturing to be actively involved in the validation activities.
5. All relevant SOPs for operation, maintenance and calibration shall be prepared during qualification.
6. Training shall be provided to operators, and training records need to be updated and maintained.

Page 120

CONFIDENTIAL

Equipment Qualification/Validation:

Equipment qualification helps mitigate risks, prevent equipment failures, reduce downtime, enhance product quality, and ensures the overall operational excellence of an organization.

1. Equipment Validation comprises a series of steps which includes User Requirement Specification (URS), Design, Installation, Operational, and Performance Qualification.
2. User Requirement Specification (URS): Lifenity will prepare a document describing the requirements for the equipment to be sourced. The requirements will include specifications and must ensure that possible GMP risks are addressed; include technical requirements; and associated documentation.
3. Design qualification (DQ): DQ will provide the documented evidence that the design specifications were met and are in accordance with the URS. FAT and SAT needs to be performed where required, to verify the suitability of the system at site, prior to the subsequent stages of qualification and this must be appropriately documented.
4. Installation qualification (IQ): IQ will provide documented evidence that the installation was complete and satisfactory, including supporting utilities. The design specifications, including purchase specifications, drawings, manuals, lists of spare parts and vendor details, will be verified during IQ. Components installed must be verified, and documented evidence should be provided that components meet specifications, are traceable and are of the appropriate construction material. Applicable control and measuring devices, identified through impact or risk assessment, should be calibrated.
5. Operational Qualification (OQ): OQ should provide documented evidence that utilities, systems or equipment operate in accordance with operational specifications. Tests will be designed to demonstrate satisfactory operation over the normal operating range, as well as at the limits of its operating conditions. Worst-case conditions must be included in the testing. Operation controls, alarms, switches, displays and other operational components shall be tested.
6. Performance qualification (PQ): PQ will normally follow the successful completion of IQ and OQ. PQ will be performed under conditions simulating the intended use, to provide documented evidence that equipment/system can consistently perform.

Page 121

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Process validation:

Process validation is defined as the collection and evaluation of data, from the process design stage through commercial production, which establishes scientific evidence that a process is capable of consistently delivering quality product. It ensures that quality, safety and efficacy by design are built into the product.

1. Collect and evaluate the data throughout the life-cycle of a product from the process design stage through to commercial production and provides scientific evidence that a process is capable of consistently delivering a quality product.
2. Data need to be available for inspection at Lifenity manufacturing location.
3. A risk-assessment approach will be followed, to determine the scope and extent to which process(es) and starting material variability may affect product quality.
4. The critical process steps and critical process parameters (CPPs) will be identified, justified monitored and documented based on relevant studies carried out during the design stage and process knowledge.
5. Lifenity will ensure that the principles of process validation described in the guidelines are implemented.
6. Evaluate and compare the historical data when there is a change in the process.
7. When changes are planned to existing systems or processes need to be followed and documented. Sufficient data is collected to demonstrate that the revised process and product will meet desired quality, consistent and approved specifications.

Page 122

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

CHAPTER 10**ALLIED EQUIPMENT & FACILITIES**

Page 123

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

10.1 Technology Based Allied Equipment Requirements

- Refer Annexures

10.2 Facilities

Laboratories for allied testing should be separated from Production and Quality control labs. However, the materials required for testing such as media, filters, filtration devices etc. can be taken from QC labs. Dedicated glass ware should be used for any testing activities. Example of allied test/activities are ETP samples, Black utilities, Ground water, testing of clean steam for physical parameters, compressed air and calibration activities etc. Specialized temperature-controlled warehouse for storage of RMs, In-Process materials and finished goods:

Adequate areas shall be designed to allow sufficient and orderly warehousing of various categories of materials and products like starting and packaging materials, intermediates, bulks and finished products, products in quarantine, released, rejected, returned or recalled, machine and equipment spare parts and change items etc. Warehousing areas need to be designed and adapted to ensure good storage conditions. Warehouse shall be clean, dry and maintained with acceptable temperature and humidity limits where ever required. Temperature and humidity will be monitored and recorded. A temperature monitoring and recording system that are independent from the temperature regulation system with alarm systems will be placed. Storage areas must have program for pest control. The record shall be maintained. Proper racks, bins and platforms must be provided for the storage of materials. The quarantine

area in the warehousing will be clearly demarcated. Access to the areas must be restricted to authorized persons.

There shall be a separate sampling area in the warehousing for active and sterile raw materials/starting materials and excipients from the unsterile RMs.

Sampling and dispensing of sterile materials shall be conducted under aseptic condition conforming to Grade A (LAF). Sampling of sterile materials shall be performed in a dedicated area within the manufacturing facility in the absence of suitable areas in the ware house. Segregation shall be provided for the storage of rejected, recalled or returned materials or products.

Page 124

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Materials or products in this area should be suitably marked and secured. Access to these areas and materials must be restricted.

Highly hazardous, poisonous and explosive materials such as alcohols, narcotics and other substances presenting potential risks of abuse, fire or explosion shall be stored in explosion proof area, away from the central ware house in safe and secure manner.

Adequate fire protection measures shall be provided in conformity with the rules of the concerned civic authority in the ware house.

Printed packaging materials shall be stored in safe, separate and secure areas. Regular checks shall be made to ensure adequate steps are taken against spillage, breakage and leakage of containers.

Receiving and dispatch bays shall protect materials and products from adverse weather conditions.

The ware house shall have different areas for the receipt, quarantine, undertest, released, hazardous and rejected materials.

Primary packaging materials, labels, and secondary packaging material and finished products shall be stored in the separate area of the ware house with access controls systems in the critical areas of the ware house.

Incoming critical materials (such as sterile solutions, plasma bag and testing reagents) shall be physically quarantined immediately after receipt and until they are released for use by the authorized person.

Materials and reagents shall be stored under the conditions established by the manufacturer and in an orderly manner that permits segregation by batch or lot and stock rotation. Storage, issuance and usage should follow the "first-expiring first-out" principle (FEFO).

10.3 Materials Required Like Resins, Filters etc.

- Ion exchange resins
- Size exclusion resin – 1
- Size exclusion resin - 2
- Multi grade filters (MGF)
- Softener
- Filters 0.5 Micron
- SMBS (Sodium Metabisulphite)

Page 125

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

- Chlorine
- Common Salt
- NaOH
- Hydrochloric acid

10.4 SOP/STP and Biological Waste Management

The SOP's and STP for the allied testing facilities are as under:

- Procedure for Decontamination of chemical and biological waste.
- Procedure for estimation of BOD and COD in ETP samples.
- pH determination of ETP samples.
- Procedure for testing compressed air and pure steam.
- Procedure for calibration of measuring devices of manufacturing, ware house, quality control and engineering.
- Procedure for treatment of Biowaste
- Procedure for collection segregation and disposal of Biowaste
- Training on Biowaste management
- Procedure for usage of treated water for horticulture purpose
- Procedure for discharge of Biowaste in common drainage system
- Procedure for management of spillage control

Biowaste management (BWM):

The disposal of sewage and effluents (solid, liquid and gas) from the manufactory should be in conformity with the requirements of Environment Pollution Control Board. All bio-medical waste must be destroyed as per the provisions of the Bio-Medical Waste (Management and Handling) Rules, 1996 and amendments thereof.

Additional precautions to be taken for the storage and disposal of rejected waste material. Records shall be maintained for all disposal of waste. Provisions shall be made for the proper and safe storage of waste materials awaiting disposal. Hazardous, toxic substances and flammable materials shall be stored in suitably designed and segregated, enclosed areas in conformity with Central and State Legislations.

Page 126

CHAPTER 11

SUBSIDY

CONSIDERATIONS

Page 127

CONFIDENTIAL

11.1 Location / SEZ Considerations in Maharashtra

Special Economic Zone (SEZ) is a specifically delineated duty-free enclave with all required infrastructure provided under single administrative umbrella primarily meant for locating industries which manufacture and export goods and services.

These enclaves shall be deemed to be foreign territory for the purposes of trade operations and duties and tariffs.

Under section 3, a Special Economic Zone can be established either by Central Government, State Government or its agencies, private / public / joint sector or any person for manufacture of goods or rendering services or for both or as a free trade and warehousing zone.

As per the requirements of SEZ, the unit must be segregated into processing and non-processing areas. A processing area is that area in which all the manufacturing activities are performed. At least 50% of the total area shall be earmarked.

The non-processing area is the area which is intended to provide support facilities to the processing area activities and may include support areas like utilities block, power generation plant (DG), engineering services, ETP and other infrastructures as per the requirements of the current project.

In SEZ 100 percent Foreign Direct Investments are allowed (FDI) in some of the selected categories.

As per MIHAN-SEZ guidelines (Rules and Procedures) following class of incentives are available to SEZ enterprises.

11.2 Custom and Excise

SEZ units may import or procure from the domestic sources, duty free, all their requirements of capital goods, raw materials, consumables, spares, packing materials, office equipment, DG sets etc. for implementation of their project in the Zone without any license or specific approval.

11.3 Duty Free Import/Domestic Procurement of Goods for Setting up of SEZ Units

Goods imported/procured locally duty free could be utilized over the approval period of 5 years.

11.4 Sales Exemption

Domestic sales by SEZ units will be exempt from single administrative document (SAD).

Domestic sale of finished products, by-products on payment of applicable custom duty.

Page 128

CONFIDENTIAL

FEASIBILITY AND DETAILED PROJECT REPORT

Domestic sale rejects, waste and scrap on payment of applicable Custom duty on the transaction value.

11.5 Income Tax:

Physical export benefit 100%.

IT exemption (10A) for first 5 years and 50% for 2 years thereafter.

Reinvestment allowance to the extent of 50% of ploughed back profits.

11.6 Carry forward of losses & Commercial borrowing:

Banking / Insurance/External Commercial Borrowing.

Setting up Off-shore Banking Units (OBUs) is allowed in SEZs. OBU's allowed 100% Income Tax exemption on profit for 3 years and 50 % for next two years.

External commercial borrowings by units up to \$ 500 million a year allowed without any maturity restrictions.

11.7 Central Sales Tax:

Exemption to sales made from Domestic Tariff Area to SEZ units.

11.8 Service Tax:

Exemption from Service Tax to SEZ units.

11.9 Other Exemptions:

Freedom to bring in export proceeds without any time limit.

Flexibility to keep 100% of export proceeds in exchange earners foreign currency account (EEFC). Freedom to make overseas investment from it.

Exemption from interest rate surcharge on import finance.

SEZ units allowed to 'write-off' unrealized export bills.

11.10 Additional Incentives:

The additional incentives are exemption of import license, custom examination of imported goods, exemption from public hearing under Environment Impact Assessment Notification etc.

PROFIT AND LOSS STATEMENT FOR STAGE 1 – 150,000 L/ ANNUM

CHAPTER 15
RECOMMENDATION

The objective of this project is to establish and operate a state-of-the-art Human Plasma Derived Medicinal Products (HPDMP) manufacturing facility with an aim to address the increasing demand for plasma-derived products by Optimized manufacturing processes maximize productivity, minimize waste, and reduce operational costs in order to maintain competitiveness in the market.

This Human Plasma Derived Medicinal Products manufacturing facility will play a pivotal role in meeting the critical healthcare needs of patients while contributing to advancements in the plasma industry.

In phase-1 of the project annual production capacity will be 150,000 liters of plasma processing, which will be subsequently increased to 500,000 liters per annum in future.

In this report several technologies utilized for plasma purification at commercial scale were evaluated exhaustively with its merits and demerits. Some of the key technologies evaluated are:

1. Plasma Fractionation method with ethyl alcohol
2. Cohn+ Liquid Chromatography
3. Heat Shock technology
4. Ammonium sulphate+ Liquid Chromatography
5. Chromatographic

It is concluded and recommended that Chromatographic purification with sterile filtration is best technology for the purification of plasma proteins for stage-1 products as it will give highly productivity and acceptable quality of desired proteins (purity levels) as per the regulatory expectations.

For stage-2 products, the technology evaluation and recommendations will be made in future.

19 Projector for conference / meeting room 1 3,00,000.00
20 Office Furniture NA 7,00,000.00
Total Amount in INR 31,07,500.00

PROJECT COST SUMMARY - ANNEX 9

FINISHED GOODS STORAGE

- 1 Air curtain 10 1,00,000.00
- 2 PVC pallets 50 3,00,000.00
- 3 Storage racks SS 50 15,00,000.00
- 4 Hydraulic trolley 1 2,50,000.00
- Total Amount in INR 21,50,000.00

PROJECT COST SUMMARY - ANNEX 10

ETP BUDGET ESTIMATE IN INR

Approx Cost

S/No Name of Equipment Qty.

(INR)

- 1 Biowaste reception tank 15000L 1
- 2 Kill tank 500L 2
- 3 Bar Screen NA
- 4 Collection tank NA
- 5 Equalization tank NA 25,00,000.00
- 6 Neutralization tank NA
- 7 Chemical coagulation NA
- 8 Biological oxidation tank NA
- 9 Filtration System NA

STP BUDGET ESTIMATE IN INR

Primary treatment plant : Bar screening - 3 stages, pH

1

correction, BOD & COD removal secondary clarifier

Secondary treatment : Electro coagulation process, Flash

2 8,00,000.00

mixer, HRSC clarifier, Sand filter

Sludge Management: Sludge thickner, Screw pump, Filter

3

press, Sludge storage

Total Amount in INR 33,00,000.00

TECHNOLOGY TRANSFER

DOSSIER

Human Plasma-Derived Medicinal Products

(Albumin / IVIG / Factor VIII / Factor IX / Coagulation Factors)

Scope of Document

This document defines the scope, methodology, responsibilities, technical requirements for the transfer of manufacturing technology for human plasma-derived medicinal products in compliance with WHO cGMP and applicable regulatory requirements.

Prepared for:

BIOHEALTH, BAGHDAD, IRAQ

Prepared by:

BIOBRIDGE HEALTH CARE SOLUTIONS PVT. LTD, PUNE, INDIA

www.biobridge.in

Document No.: TT-BB-HPDMP-001-2026

Version: 2.0

1.2 Technology Transfer Overview

Scope of technology transfer

The objective of this project is to establish and operate a state-of-the-art Human Plasma Derived Medicinal Products (HPDMP) manufacturing facility with an annual plasma processing capacity of 150,000 liters. This facility aims to consistently and efficiently produce high-quality plasma-derived products such as Human Serum Albumin (HSA), Human Normal Immunoglobulin (IgG), Hemophilia factors VIII and IX, Thrombin and Fibrinogen while ensuring compliance with regulatory standards and best industry practices.

Product/Fraction Name:

- Albumin
- Human Immunoglobulin
- Factor VIII
- Factor IX
- Thrombin
- Fibrinogen

Transfer type: Full

Page 3 of 68

Site involved: BioHealth, Amman, Jordan

Transfer strategy (phased / parallel/staggered):

o The plasma fractionation process will be transferred using a staggered strategy in a phase wise manner i.e. transfer of high-risk unit operations (viral safety, Primary chromatography) etc., in the first phase. However, low-risk support operations will be transferred in Parallel, subject to readiness criteria and QA sign-off.

1.3 Roles & Responsibilities

Role Responsibilities

Overall responsibility for plasma fractionation

Head of

operation; ensures compliance with GMP and SOPs,

Manufacturing

approves batch records.

Supervises day-to-day fractionation steps

(precipitation, filtration, and chromatography);
 Production Manager manages staff and equipment readiness. Ensure the complete documentation of activities on time in full.
 Interface for QA activities and GMP batch release.
 Approves SOPs, batch records, deviations, and change controls; ensures regulatory compliance; oversees audits. Overall responsible for the integral evaluation
 Quality Assurance
 of environmental conditions during manufacturing
 (QA) Head
 (Clean rooms), trends of clean utilities and products batch release/rejection. To organize and maintain the training records of personnel.
 Conducts in-process and final product testing (purity, potency, viral safety); validates analytical methods;
 Quality Control (QC) releases test results to QA department for final batch Manager release. Responsible for release of Raw materials and packaging materials after testing for production department. To train the staff for different quality

Page 4 of 68

related procedures and GLP practices. To initiate product stability program.
 Prepares and submits product dossiers in CTD format; maintains communication with Drug Office; ensures Regulatory Affairs
 confidentiality and compliance with current GMP Manager
 guidelines. To ensure products are registered on time as per the business plan.
 Oversees process validation, PPQ runs, RTD studies, Validation Manager equipment qualification, cleaning validation and validation of clean utilities and analytical techniques.
 Ensures cold chain, HVAC, water systems, and Engineering/Utilities cleanroom compliance; preventive maintains Lead equipment and calibration of measuring devices in the facility.
 Implements biosafety, donor screening protocols, and Safety & Compliance
 occupational safety measures; monitors risk Officer
 assessments.
 Maintains master manufacturing formula, SOPs, Documentation/
 logbooks, and traceability of plasma pools; ensures Records Officer
 audit readiness.
 Manages plasma storage, raw material inventory, and Warehouse &
 distribution of final products; ensures cold chain Logistics Lead
 integrity.
 To oversee sterile filtration, final formulation and fill Formulation & Fill–
 finish activities; ensures container closure integrity and Finish Manager
 product labelling as per the requirements.

Page 5 of 68

Technology Transfer Team structure
 Role Responsibilities
 Overall coordination; Timeline management, Risk Tech Transfer Lead management, and Stakeholder alignment. Reports to Head of Manufacturing.
 Process Development Provides process knowledge; supports scale-up, Scientist comparability, and troubleshooting.
 To support preparation of equipment, SOPs, Master Manufacturing
 formulas, Batch records, and batch execution readiness Representative
 at receiving site.
 Quality Assurance Oversees GMP compliance, deviation handling, out of (QA) Lead specification and change control during transfer.
 To support preparation of QC STPs, Specifications and Quality Control (QC) Validation of analytical methods, IPCs strategy,
 Lead initiation of stability testing of PPQ batches and product release testing at new site.
 Leads PPQ planning to oversee equipment Validation Manager
 qualification and cleaning validation.
 Regulatory Affairs & To support dossier updating, variation strategy, and Liaison support in communication with drug office.
 Documentation To support management of BMRs and STPs, SOP Coordinator harmonization, and traceability of transfer records.
 Engineering/Utilities To support engineering team in facility readiness, cold Support chain, cleanroom and clean utilities compliance.
 To support training needs assessments for technical staff, to coordinate in arranging training (External and Training Coordinator
 Internal), competency assessments, and area specific SOP familiarization.

2.0 Product & Regulatory Background

2.1 Product Description

2.1.1 Therapeutic indication

2.1.1.1 Human Albumin 20% infusion

It is used to treat blood volume loss. It works by replacing the body fluids lost due to excessive trauma, bleeding, surgery, or kidney dialysis. Thus, it is helpful in treating low blood albumin levels.

2.1.1.2 Human Normal Immunoglobulin (IVIG):

Immunoglobulin preparations are indicated in several clinical conditions.

An approved list of clinical conditions where IVIG is indicated is as under:

Primary Immunodeficiency (PID) Syndromes

Replacement therapy to promote passive immunity: The following PID syndromes can be treated with intravenous replacement of IgG and are considered well established in-

- Congenital agammaglobulinaemia and hypogammaglobulinaemia
- Common variable immunodeficiency
- X-linked agammaglobulinaemia
- Wiskott-Aldrich syndrome
- Severe combined immunodeficiency

IVIG may be preferred in patients who require an immediate or large increase in intravascular immunoglobulin concentrations, in patients with small muscle mass, and in patients with bleeding tendencies in whom Intramuscular (IM) injections are contraindicated.

Secondary Immunodeficiency (SID) Syndromes

IgG can also be used as replacement therapy in:

- Secondary hypogammaglobulinaemia in patients with B-cell chronic lymphocytic leukemia (CLL) or multiple myeloma (MM) with recurrent infections.
- Pediatric HIV-I infection who have bacterial infections: HIV-infected infants and children with hypogammaglobulinaemia

(IgG <400 mg/dL) should receive IVIG (400 mg/kg once every 2–4 weeks) to prevent serious bacterial infections.

Kawasaki Syndrome

IVIG is used in conjunction with aspirin therapy for initial treatment of the acute phase of Kawasaki disease.

Approximately ≥10% of patients with Kawasaki disease fail to respond to initial treatment with IVIG and aspirin therapy and have persistent fever or recurrent fever after an initial afebrile period. Retreatment with IVIG (within 24–48 hours of persistent or recrudescence fever) and continued aspirin therapy usually is recommended for these patients.

Idiopathic Thrombocytopenic Purpura

IVIG is indicated for the treatment of acute or chronic (e.g., >6 months duration) idiopathic thrombocytopenic Purpura.

Allogeneic Bone marrow transplantation (BMT)

In adults and children undergoing BMT, IVIG can be used to decrease the risk of infections (e.g., septicemia), interstitial pneumonia of infectious or idiopathic etiologies, and acute graft-versus-host disease.

Guillain-Barre syndrome

IVIG initiated within 2 weeks of symptom onset appears to be as effective as plasma exchange.

Chronic Inflammatory Demyelinating Polyneuropathy (CIDP)

IVIG may be used for the treatment of chronic inflammatory demyelinating polyneuropathy to improve neuromuscular disability and impairment and for maintenance therapy to prevent relapse.

2.1.1.3 Human coagulation Factor IX

Is indicated for treatment and prophylaxis of bleeding episodes in patients with Hemophilia B (Congenital Factor IX deficiency or Christmas disease).

2.1.1.4 Human Coagulation Factor VIII

Is indicated for the treatment and prophylaxis of bleeding in patients with hemophilia A (Congenital Factor VIII deficiency).

2.1.1.5 Human Fibrinogen

Therapy and prophylaxis of hemorrhagic diatheses in:

- Congenital hypo-, dys- or fibrinogenemia
- Acquired hypo fibrinogenemia resulting from
 - Disorders of synthesis in cases of severe liver parenchyma damage.
 - Increased intravascular consumption e.g. as a result of disseminated intravascular coagulation, hyperfibrinolysis.
 - Increased loss.

The most important clinical pictures associated with a defibrination syndrome are: Obstetrical complications, acute leukemia especially promyelocytic leukemia, liver cirrhosis, intoxications, extensive injuries, hemolysis after transfusion errors, operative interventions, infections, sepsis, all forms of shock as well as tumors especially in the lung, pancreas, uterus, and prostate.

2.1.1.6 Thrombin

Thrombin is indicated to aid hemostasis whenever oozing blood and minor bleeding from capillaries and small venules is accessible and control of bleeding by standard surgical techniques (such as suture, ligation, or cautery) is ineffective or impractical. In various types of surgeries, solutions of Thrombin may be used in conjunction with an Absorbable Gelatin Sponge.

2.1.2 Dosage form & presentation

S/No. Product/ Fraction Name Dosage Form

- 1 Albumin Injection
- 2 Human normal immunoglobulin Solution for infusion
- 3 Human Coagulation Factor IX Freeze dried
- 4 Human coagulation Factor VIII Freeze dried
- 5 Human Fibrinogen Freeze dried
- 6 Thrombin Freeze dried

Page 9 of 68

2.1.3 Target markets

Plasma fractionation manufacturers are increasingly targeting export markets across Southeast Asia, Africa, Latin America, and select Middle Eastern countries due to rising demand for affordable plasma-derived therapies and limited local manufacturing capacity in those regions. These markets offer regulatory flexibility, growing healthcare infrastructure, and strategic opportunities for firms with WHO-GMP compliance and certification.

2.2 Regulatory Status

2.2.1 Reference product status (commercial)

Product Reference / Commercial Examples (Licensed

Category Status Marketed Products

Human Serum Licensed, marketed plasma Albumin 5%, 20% Albumin (HSA) biologic solutions (CSL, Grifols, etc.)

Human Normal Licensed IVIG/SCIG Privigen, Gamunex-C, Immunoglobulin biologics OCTAGAM, HYQVIA

(IgG) Octapharma, Takeda

Factor VIII Licensed plasma coagulation Alphanate, Humate-P, (Plasma-Derived) factor Koate-DVI

Factor IX Licensed plasma coagulation

AlphaNine SD, Mononine

(Plasma-Derived) factor

Fibrinogen Licensed concentrate for

Fibryga, RiaSTAP

(Plasma-Derived) deficiency

Thrombin Licensed haemostatic agent Human thrombin

(Plasma-Derived) formulations

2.2.2 Applicable guidelines:

- ISPE Baseline Guide Vol. 6, Biopharmaceutical Manufacturing Facilities
- ISPE Baseline Guide Vol. 3, Sterile Manufacturing Facilities.
- WHO Good manufacturing practices for biological products.

Page 10 of 68

- Good manufacturing practice guideline for human and veterinary medicinal product.
- PIC/s Guide to Good Manufacturing Practice for Medicinal Products.
- USFDA Guidance for Industry – Sterile Drug Products produced by Aseptic Processing.

2.3 Critical Quality Attributes (CQAs)

Product/Fraction Name Critical Quality Attributes (CQAs)

Human Serum Albumin (HSA) Description, Identification by SDS-PAGE, pH, Haem content by Absorption at 403 nm, Molecular Size Distribution, Prekallikrein Activator, Total Protein, Bacterial Endotoxin, Bioburden, N -acetyl tryptophan, Sodium Caprylate.

Human Normal Description, pH, Identification by SDS-Immunoglobulin (IgG) PAGE, Osmolality, Total protein,

Thrombogenic (procoagulant) activity, Test

for viral and bacterial antibodies (at an

Immunoglobulin Concentration of 50 g/L),

Distribution of Immunoglobulin G

subclasses, Test for Fc function of

Immunoglobulin, Molecular size by liquid

chromatography, Prekallikrein activator,

Bioburden, Bacterial Endotoxin.

Factor VIII (Plasma-Derived) Description, Identification, pH, Osmolality,

Assay of Human Coagulation Factor VIII,

Bacterial Endotoxins, Bioburden.

Factor IX (Plasma-Derived) Description, Identification, pH (Neat sample),

Osmolality (Neat sample), Assay of Human

Coagulation Factor IX, Specific Activity,

Bioburden, Bacterial Endotoxins, Activity of

Page 11 of 68

Factor II, Activity of Factor VII, Activity of

Factor X.

Fibrinogen (Plasma-Derived) Description, pH, Fibrinogen Assay (Clottable Protein), Bioburden.

Thrombin (Plasma-Derived) Description, pH, Thrombin Assay (Identification), Bioburden.

3.0 Plasma Source & Starting Material Control

3.1 Plasma Collection System

Donor selection criteria

The selection and management of blood donors is an essential part of the blood donation process. Health authorities and blood transfusion services are responsible for ensuring that the national system is in place for the selection of all blood donors through an assessment of their suitability to donate blood. In selecting individuals for blood donation, it is most important to determine whether the person is in good health, to protect the donor against damage to his or her own

health and to protect the recipient against exposure to diseases or to medicinal products from the blood or blood products.

The following are the selection criteria for donors:

1. Health: A licensed physician or a person under the direct supervision of a licensed physician shall determine the health of a donor, and the donor shall be free from any disease transmissible by blood transfusion.
2. Age: Donors shall be healthy persons of either sex between the ages of 18 and 65 years.
3. Time between blood donations
4. Blood pressure: Systolic blood pressure between 12 and 24 kPa (90 and 180 mmHg); diastolic blood pressure between 6.67 and 13.3 kPa (50 and 100 mmHg).
5. Blood Temperature: Temperature not exceeding 37.5 °C.
6. Hemoglobin content: The hemoglobin concentration or erythrocyte volume fraction of the donor's blood shall be within normal limits, as defined by the national control authority or the national blood transfusion authority.

Page 12 of 68

7. Test for HBsAg: Should be negative.
 8. Test for anti-HIV: Should be negative.
 9. Test for anti-HCV: Should be negative.
- An additional test for STD is also performed.

Plasma collection method:

Plasma must be collected only from licensed blood centres and only for fractionation purposes, not for direct transfusion.

Plasma by Plasmapheresis (Preferred & Dedicated Method): Plasma is collected directly from the donor using an automated plasmapheresis machine, and red blood cells are re-infused to the donor.

Regulatory Requirements

- Only approved plasmapheresis machines shall be used
- Equipment must be validated, calibrated, and maintained
- Procedure conducted by trained technical staff
- Donor consent is mandatory

Process Steps

1. Donor selection & screening
 - o Healthy donors meeting eligibility criteria
 - o Medical examination and history review
 2. Blood separation
 - o Blood withdrawn and centrifuged/filtered
 - o Plasma separated; RBCs returned to donor
 3. Anticoagulant
 - o Approved anticoagulant (e.g., ACD)
 4. Volume limits
 - o As prescribed by regulatory (based on donor weight)
 5. Frequency
 - o Controlled donation frequency to ensure donor safety
- Advantages
- High plasma yield
 - Lower protein degradation
 - Preferred for the fractionation industry

Page 13 of 68

Testing strategy (Serology & NAT):

To ensure the viral safety and quality of human plasma intended for fractionation, serological and Nucleic Acid Amplification Testing (NAT) is mandatory for transfusion-transmissible infections, in compliance with applicable regulatory requirements.

Plasma must be negative / non-reactive for:

1. Serology (Non-Reactive)
 - HBsAg
 - Anti-HIV-1 & HIV-2
 - Anti-HCV
 - Syphilis (VDRL/TPHA)
2. NAT Testing (Non-Reactive)
 - HIV-1 RNA
 - HCV RNA
 - HBV DNA

(Testing may be performed on individual donations or validated mini pools)

3.2 Plasma Acceptance Specifications

Acceptance/rejection criteria:

Plasma intended for fractionation shall be accepted only when it is collected from medically eligible and adequately screened donors at a licensed plasma or blood collection center, following informed consent and approved donor selection criteria. Each plasma unit must be collected aseptically using approved anticoagulants and validated collection procedures. The plasma shall be non-reactive for all mandatory serological tests, including HBsAg, Anti-HIV-1 & 2, Anti-HCV antibodies, and Syphilis, and shall be non-reactive for NAT testing for HIV-1 RNA, HBV DNA, and HCV RNA, performed either on individual donations or on validated mini pools.

Only plasma that meets all testing requirements, has complete donor traceability and documentation, and complies with regulatory requirements shall be considered acceptable.

In addition, plasma must meet defined quality attributes, being clear and pale yellow in appearance, free from hemolysis, turbidity, clots, and contained in

Page 14 of 68

intact, leak-proof containers with correct labelling. Plasma shall be frozen within validated timelines, stored and transported under controlled frozen conditions ($\leq -20^{\circ}\text{C}$ or as validated), with documented maintenance of the cold chain and no temperature excursions during storage and transport.

Plasma shall be rejected, if it fails to meet any of the above criteria.

Deviations handling:

There should be systems in place to ensure compliance, all types of quality defects (e.g. in blood bags or test kits), and adverse events or reactions are documented, carefully investigated for causative factors and, where necessary, followed by the implementation of corrective actions to prevent recurrence. The corrective and preventive action system should ensure that nonconformity of the product or quality problems are corrected, that recurrence of the problem is prevented, and that the plasma fractionator is notified according to the agreed procedure. The blood establishment should have methods and procedures in place to channel product or quality problems into the corrective and preventive action system.

4.2 Detailed Unit Operations (per fraction)

4.2.1 Plasma fractionation

4.2.1.1 Objective

The objective of plasma fractionation operation is to manufacture/purify the plasma-derived product using various purification methods including chromatography and TFF.

4.2.1.2 Scientific principle

Plasma fractionation by chromatography is based on the principle of selective protein separation through controlled interactions with a stationary phase Chromatography exploits charge, size, hydrophobicity, and affinity differences to isolate plasma proteins with higher purity and reproducibility.

4.2.2 Albumin

4.2.2.1 Objective

The objective of this operation is to manufacture/purify the
Albumin by various purification methods including
chromatography and TFF.

4.2.2.2 Scientific principle

Albumin is a concentrated human plasma protein solution that
works on the principle of colloid osmotic pressure (oncotic
pressure). It draws water from the interstitial and intracellular
spaces into the vascular compartment, thereby expanding plasma
volume and stabilizing circulation in critically ill patients.

4.2.2.3 Process parameters (CPPs)

Various process parameters (CPPs) for Albumin operation are as
below:

 4.2.3 IVIG
 4.2.3.1 Objective
 The objective of this operation is to manufacture/purify the IVIG by various purification methods including chromatography and TFF.
 4.2.3.2 Scientific principle
 Intravenous immunoglobulin (IVIG) is a sterile, pooled human IgG preparation that provides passive immunity and

Page 33 of 68

immunomodulation. Its scientific principle rests on restoring protective IgG in immunodeficiency and modulating dysregulated immune pathways in autoimmune/inflammatory diseases, with quality, safety, and clinical use governed by regulatory guidance.

 4.2.5 Factor VIII
 4.2.5.1 Objective
 The objective of Factor VIII operation is to manufacture/purify
 the Factor VIII by various purification methods including
 chromatography and TFF
 4.2.5.2 Scientific principle
 • Structure: FVIII is a ~300 kDa glycoprotein composed of
 domains A1, A2, B, A3, C1, and C2.
 • Function: Acts as a cofactor for Factor IXa in the intrinsic
 pathway of coagulation, forming a complex that activates
 Factor X, leading to thrombin generation and fibrin clot
 formation.

Page 39 of 68

• Association: Circulates bound to von Wille brand Factor
 (vWF), which protects FVIII from premature degradation.

4.2.6.1 Objective

The objective of Factor IX operation is to manufacture/purify the
factor IX by various purification methods including
chromatography and TFF.

4.2.6.2 Scientific principle

Page 41 of 68

Factor IX (FIX) is a vitamin K-dependent coagulation protein
essential for thrombin generation via the intrinsic pathway. The
product is manufactured using validated fractionation and
purification steps, with viral safety ensured through orthogonal
inactivation/removal methods.

Potency is expressed in IU based on WHO standards, and the
product is characterized for identity, purity, and activity using
validated analytical methods. FIX is indicated for the treatment
and prophylaxis of bleeding episodes in patients with
hemophilia B.

5.0 Viral Safety Management

5.1 Virus Inactivation / Removal Steps

Human blood is the source of a wide range of medicinal products used for the prevention and treatment of a variety of often life-threatening injuries and diseases. Despite measures such as donor selection, testing of donations and of plasma pools, the transmission of blood-borne viruses by plasma and purified plasma products is still considered to constitute a risk to patients. Viral inactivation methods should be applied to all blood plasma-derived protein solutions. Viral inactivation of plasma is a critical step in ensuring the safety of plasma-derived medicinal products. The objective of viral inactivation is to effectively inactivate or remove enveloped and non-enveloped viruses that may be present in plasma, without adversely affecting the quality or biological activity of plasma proteins.

Page 46 of 68

5.2 Methods for Inactivation

5.2.1 Solvent/Detergent (S/D) treatment

One commonly employed method is Solvent/Detergent (S/D) treatment, which is highly effective against enveloped viruses such as HIV, HBV, and HCV. In this method, plasma or plasma pools are treated with a validated combination of a solvent (e.g., tri-n-butyl phosphate) and a detergent (e.g., Triton X-100 or polysorbate), under controlled temperature and time conditions. The S/D treatment disrupts the lipid envelope of viruses, rendering them non-infectious. Following treatment, the solvent and detergent are removed by validated downstream purification steps. This method is widely accepted by WHO and regulatory authorities due to its robustness and reproducibility.

Organic solvent/detergent mixtures disrupt the lipid membrane of enveloped viruses. Once disrupted, the virus can no longer bind to and infect cells. Non-enveloped viruses are not inactivated.

5.2.2 Pasteurization (Heat treatment)

Another viral inactivation approach is pasteurization (heat treatment), typically involving heating plasma protein solutions at 60 °C for a defined duration, in the presence of stabilizers to protect protein integrity. Pasteurization is effective against a broad range of viruses, including some non-enveloped viruses, and is commonly used for products such as human serum albumin. Process parameters such as temperature, time, and stabilizer concentration are carefully validated to ensure consistent viral inactivation while maintaining product quality.

5.2.3 Low pH treatment

Most proteins are damaged by exposure to the acidic conditions needed to kill viruses. For example, few viruses are killed at pH 5.0 – 5.5, a condition known to inactivate factor VIII. Immune globulin solutions are an exception.

Low pH treatment often combined with incubation at elevated temperatures, is also used as a viral inactivation step, particularly during immunoglobulin manufacturing. Exposure of plasma protein

Page 47 of 68

intermediates to acidic conditions for a defined period contributes to the inactivation of enveloped viruses and is validated as part of the overall viral safety profile of the manufacturing process.

5.3 Viral removal techniques

In addition to inactivation methods, viral removal techniques such as Nano filtration are employed to physically remove viruses based on size exclusion. Nano filtration membranes with defined pore sizes can remove both enveloped and non-enveloped viruses and are considered a highly effective and complementary viral safety measure.

All viral inactivation and removal steps are validated through virus clearance studies, using relevant model viruses in accordance with WHO and ICH Q5A guidelines. These studies demonstrate the cumulative viral reduction capacity of the manufacturing process. The effectiveness of each step is monitored through defined critical process parameters, and changes to the process are subject to formal change control.

Overall, the application of validated viral inactivation and removal methods ensures that plasma-derived medicinal products meet stringent safety standards and comply with national and international regulatory expectations.

6.2 Facility Zoning & HVAC Concept

Air supply for manufacturing area will be filtered through bacteria retaining filters (HEPA Filters) and will be at a pressure higher than in the adjacent areas unless otherwise required.

HVAC zoning of the facility (control areas) for the manufacturing operations is done based on the operation and its criticality (Plasma collection, fractionation, purification, and storage) to minimize the risk of contamination and to maintain physical conditions like temperature and humidity. Cleanroom classification and pressure cascade are critical design elements in a plasma fractionation facility to ensure protection of product quality, prevent cross-contamination, and maintain compliance with requirements for plasma-derived medicinal products. Routine microbial and particulate counts of the manufacturing area will be carried out during manufacturing operations to assess the effectiveness of HVAC.

Page 49 of 68

The results of particulate matter and microbes to be continuously monitored against documented in-house standards and regulatory guidelines. The classification of areas is based on the nature of operations, risk of contamination, and whether the process is open or closed.

6.2.1 Cleanroom Classification

Plasma fractionation facilities typically operate using a combination of controlled but unclassified areas and classified cleanrooms, as most fractionation steps are conducted in closed systems. However, classification is applied wherever there is potential product exposure.

- Plasma receiving, frozen plasma storage, and raw material quarantine areas are generally maintained as controlled, non-classified areas with defined environmental controls, as plasma is frozen and fully contained.
- Plasma thawing, pooling, and open handling areas are normally classified as Grade C (ISO Class 7) cleanrooms. These areas involve handling of plasma before viral inactivation and therefore require controlled particulate and microbiological conditions.
- Fractionation and purification areas operating in closed systems are typically maintained as Grade C, depending on risk assessment. Where open manipulations occur, a minimum of Grade D classification is maintained.
- Viral inactivation and viral removal processing areas, including solvent/detergent treatment and Nano filtration preparation zones, are generally maintained at Grade C or higher, based on process exposure.
- Final sterile filtration and aseptic filling operations (if applicable) are conducted in Grade A environments with a Grade B background.
- Support areas, such as equipment washing, preparation rooms, and utilities, are maintained as Grade D, as appropriate.

Page 50 of 68

6.2.2 Pressure Cascade

A well-defined pressure cascade is maintained to ensure air flows from cleaner areas to less clean areas, thereby preventing ingress of contaminants into critical processing zones.

- Highest positive pressure is maintained in Grade A areas, followed by Grade B, Grade C, and Grade D areas.
- Grade D areas are maintained at a higher pressure relative to adjacent unclassified or controlled areas.
- Raw material receipt, plasma receiving, and waste handling areas are maintained at lower pressure or neutral pressure compared to processing areas.
- Waste corridors and rejected material areas are often maintained at negative pressure relative to clean areas to prevent contamination spread.
- Typical pressure differentials of 10–15 Pa are maintained between adjacent areas of different classifications, with continuous monitoring and alarm systems in place.

6.2.3 Material and Personnel flow

In a GMP-compliant plasma fractionation facility, material flow and personnel flow are designed to be unidirectional, segregated, and controlled to prevent cross-contamination, mix-ups, and microbial contamination.

Material Flow

Material flow within the plasma fractionation facility follows a one-way movement from receipt to dispatch, with clear segregation between quarantine, approved, in-process, and rejected materials. Human plasma is received in a designated plasma receiving area, where it is inspected, logged, and placed under quarantine in controlled frozen storage. Only plasma that has been released by Quality Assurance is transferred to the approved plasma storage area.

From approved storage, plasma is moved in a controlled manner to the

thawing and pooling area, followed by sequential transfer through

Page 51 of 68

fractionation, purification, and viral inactivation/removal steps. Intermediate products move progressively through defined processing zones of increasing cleanliness, with no back-tracking permitted. Rejected materials, waste, and by-products are removed through dedicated waste corridors or exit points, ensuring they do not intersect with routes used for approved materials. Finished products are transferred to designated finished goods storage areas prior to dispatch, maintaining complete traceability throughout the process.

Personnel Flow

Personnel flow is designed to minimize contamination risks and is strictly segregated from material flow wherever possible. Entry into production areas is permitted only to authorized, trained personnel. Staff enter through controlled access points and follow a defined gowning sequence, progressing from general areas to classified processing zones through airlocks and change rooms.

Personnel movement is unidirectional, from lower to higher cleanliness areas, and reverse movement is restricted or requires full de-gowning and re-gowning. Separate entry and exit routes are provided for personnel working in plasma handling, fractionation, filling, and support areas to prevent cross-contamination. Movement between different production areas is controlled by SOPs and access restrictions.

Dedicated personnel flows are established for waste handling, maintenance, and cleaning activities, ensuring these functions do not compromise GMP areas. Training programs ensure that all personnel understand and comply with defined movement patterns and hygiene requirements.

6.3 Utilities Requirements

6.3.1 Water Supply

An adequate supply of suitable pyrogen-free water shall be provided for use during the fractionation process and for the reconstitution and/or dilution of the plasma fractions before filling and freeze-drying.

Page 52 of 68

The two most commonly used types of water are Purified water and Water for injection. Water preparation and delivery systems should be tested at regular intervals for microbes, endotoxin content and conductivity. The water should be a continuously in circulation mode and should have no dead legs.

Water for injections is used for the preparation of final formulations.

6.3.2 Clean steam

An adequate supply of clean steam shall be provided for the operation of sterilizing and cleaning equipment. The steam shall meet the quality of water for injections.

6.3.3 Refrigeration (–30 °C to +5 °C)

Refrigeration is required for:

- Storing various source materials and plasma fractions.
- Plasma for fractionation should be stored at –20 °C or below.
- Keeping the various fractionation areas at the correct temperature.
- Keeping the process equipment at the correct temperature.
- Storing final products and /or under test materials at appropriate storage conditions.
- Storing final products awaiting dispatch at recommended storage conditions.

7.0 Process Validation Strategy

7.1 Validation Master Plan Alignment

Process Validation is the most important under cGMP requirements. The process validation master plan is intended to assist manufacturers in understanding quality management system (QMS) requirements as applicable to process validation and has general applicability to manufacturing process.

Process validation can be defined as documented evidence that the process, operated within established parameters, can perform effectively and reproducibly to produce a medical product meeting its predetermined specifications and quality attributes. Process validation can include the collection and evaluation of data, from the process design stage throughout production, that establish scientifically that a process is capable of consistently delivering a quality product.

Page 53 of 68

Continuous process verification (CPV) has been introduced to cover an alternative approach to process validation based on a continuous monitoring of manufacturing performance. This approach is based on the knowledge from product and process development studies and / or previous manufacturing experience. CPV may be applicable to both a traditional and enhanced approach to pharmaceutical development. It may use extensive in-line, on-line or at-line monitoring and / or controls to evaluate process performance. Process validation should confirm that the control strategy is sufficient to support the process design and quality of the product. The validation should cover all manufactured strengths and all manufacturing sites used for production of the marketed product.

7.2 PPQ Batches (Process performance qualification)

- Number of batches: 03
- Acceptance criteria as per the laid specifications.

8.2 Analytical Methods

Analytical methods play a critical role in ensuring the quality, safety, and efficacy of plasma-derived medicinal products at all stages of manufacturing.

8.2.1 Identity assays

Identity assays are performed to confirm the identity of plasma protein or intermediate at various fractionation, purification, or formulation stages. These assays are primarily based on immunochemical and physicochemical principles.

Commonly used methods include:

Immunochemical Methods: which rely on specific antigen–antibody reactions to confirm protein identity.

- Immuno turbidimetry/ Nephelometry;
- ELISA;
- Radial immunodiffusion.

Electrophoretic techniques: applied to verify molecular weight, protein profile, and homogeneity.

- SDS-PAGE/ Native PAGE;
- Capillary electrophoresis.

Chromatographic techniques: provide confirmatory evidence of identity through characteristic retention times and spectral properties when compared with reference standards.

Size-exclusion or reverse-phase HPLC, together with UV absorbance at 280nm.

8.2.2 Potency assays

Potency assays are designed to demonstrate the biological activity of plasma-derived products. These assays are critical for dose determination and batch release. For immunoglobulin preparations, potency is typically assessed using antigen-specific ELISA or other immunological assays that quantify antibody activity against defined antigens, often calibrated against WHO International Standards. For coagulation factors such as Factor VIII, Factor IX, fibrinogen, and thrombin, functional clotting

Page 60 of 68

assays (one-stage clotting assays, chromogenic assays, or the Clauss method for fibrinogen) are employed to measure their ability to participate effectively in the coagulation cascade. Albumin potency is generally demonstrated through physicochemical characteristics and binding capacity studies, supported by compliance with specifications rather than a direct biological assay.

8.2.3 Purity & Impurity testing methods

Purity and impurity testing is done to ensure that the final product consists predominantly of the desired protein and that contaminants arising from plasma, processing steps, or degradation are adequately controlled.

Purity is commonly evaluated using:

- SDS-PAGE;
- Capillary electrophoresis;
- Chromatographic techniques such as ion-exchange and size-exclusion HPLC,

Product-related impurities:

- Aggregates & fragments – SEC-HPLC
- Residual solvents (e.g., ethanol): Gas chromatography (GC)
- Process-related impurities: Precipitating agents, Residual caprylate / PEG

- Host plasma impurities: Prekallikrein activator (PKA),

Complement activation (C3a, C5a)

- Endotoxin: Bacterial Endotoxin Test (LAL)

8.2.4 Viral markers

Viral marker testing forms the cornerstone of viral safety in plasma fractionation and is applied to source plasma, plasma pools, intermediates, and, where required, final products. Source plasma is screened using validated serological assays for markers such as HBsAg, anti-HIV-1/2, anti-HCV, and syphilis, with anti-HBc testing applied according to regulatory requirements. In parallel, nucleic acid testing (NAT) is performed for HIV-1 RNA, HCV RNA, and HBV DNA to

Page 61 of 68

significantly reduce the window period for viral detection. Additional NAT testing for Parvovirus B19 DNA and, where applicable, HAV RNA is carried out on plasma pools to ensure compliance with regulatory limits. These routine tests are complemented by viral clearance studies, in which dedicated viral inactivation and removal steps (such as solvent/detergent treatment, pasteurization, low pH incubation, or nano filtration) are validated using model viruses to demonstrate robust and reproducible viral safety of the plasma-derived medicinal products.

9.0 Stability & Shelf-Life Data

Stability studies should be performed, taking into account ICH guidelines, especially "Quality of Biotechnological Products: Stability Testing of Biotechnological/Biological products" (Q5C), WHO Technical Reports, EMA/FDA guidelines, and national regulations.

The purpose of stability testing is to provide evidence that the quality of a drug substance or drug product varies with time under the influence of a variety of environmental and physical factors such as temperature, humidity, light, or agitation. Stability testing establishes and confirms a re-test period or shelf life for the drug substance & drug product under the recommended storage conditions. Shelf life is also referred to as dating period or expiry period in some regions.

9.1 Stability Study Design

The plasma-derived products need precisely defined storage temperatures, the storage conditions for the real-time/real-temperature stability studies may be confined to the proposed storage temperature.

Accelerated and Stress Conditions

The expiration dating should be based on real-time/real- temperature data. However, it is strongly suggested that studies be conducted on the drug substance and drug product under accelerated and stress conditions. Studies under accelerated conditions may provide useful support data for establishing the expiration date, provide product stability information for future product development (e.g., preliminary assessment of proposed manufacturing changes such as change in formulation, scale-up), assist in validation of analytical methods for the stability program, or generate information which may help

Page 62 of 68

elucidate the degradation profile of the drug substance or drug product. Studies under stress conditions may be useful in determining whether accidental exposures to conditions other than those proposed (e.g., during transportation) are deleterious to the product and for evaluating which specific test parameters may be the best indicators of product stability. Studies of the exposure of the drug substance or drug product to extreme conditions may help to reveal patterns of degradation; if so, such changes should be monitored under proposed storage conditions. The data of accelerated and stress stability studies are important for regulatory filing of the product with commitment of submission of rolling stability data at real time and temperature While the tripartite guideline on stability describes the conditions of the accelerated and stress study, the applicant should note that those conditions may not be appropriate for biotechnological/biological products. Conditions should be carefully selected on a case-by-case basis.

9.2 Stability-Indicating Parameters

There is no single stability-indicating assay or parameter that profiles the stability characteristics of a biological product. Consequently, the manufacturer should propose a stability-indicating profile that provides assurance that changes in the identity, purity and potency of the product will be detected. At the time of submission, applicants should have validated the methods that comprise the stability-indicating profile and the data should be available for review. The determination of which tests should be included will be product-specific.

Potency

When the intended use of a product is linked to a definable and measurable biological activity, testing for potency should be part of the stability studies. For the purpose of stability testing of the products described in this guideline, potency is the specific ability or capacity of a product to achieve its intended effect. It is based on the measurement of some attribute of the product and is determined by a suitable quantitative method. In general, potencies of biotechnological/biological products tested by different laboratories can be compared in a meaningful way only if expressed in relation to that of an appropriate reference material. For that purpose, a reference material calibrated

directly or indirectly against the corresponding national or international reference material should be included in the assay. Potency studies should be performed at appropriate intervals as defined in the stability protocol and the results should be reported in units of biological activity calibrated, whenever possible, against nationally or internationally recognized standard. Where no national or international reference standards exist, the assay results may be reported in in-house derived units using a characterized reference material. In some biotechnological/biological products, potency is dependent upon the conjugation of the active ingredient(s) to a second moiety or binding to an adjuvant.

Dissociation of the active ingredient(s) from the carrier used in conjugates or adjuvants should be examined in real-time/real-temperature studies (including conditions encountered during shipment). The assessment of the stability of such products may be difficult since, in some cases, in vitro tests for biological activity and physicochemical characterization are impractical or provide inaccurate results. Appropriate strategies (e.g., testing the product prior to conjugation/binding, assessing the release of the active compound from the second moiety, in vivo assays) or the use of an appropriate surrogate test should be considered to overcome the inadequacies of in vitro testing.

Purity and Molecular Characterization

For the purpose of stability testing of the products described in this guideline, purity is a relative term. Due to the effect of glycosylation, deamidation, or other heterogeneities, the absolute purity of a biotechnological/biological product is extremely difficult to determine. Thus, the purity of a biotechnological/biological product should be typically assessed by more than one method and the purity value derived is method-dependent. For the purpose of stability testing, tests for purity should focus on methods for determination of degradation products. The degree of purity, as well as individual and total amounts of degradation products of the biotechnological/biological product entered into the stability studies, should be reported and documented whenever possible. Limits of acceptable degradation should be derived from the analytical profiles of batches of the drug substance and drug product used in the preclinical and clinical studies. The use of relevant physicochemical, biochemical and immunochemical analytical

methods should permit a comprehensive characterization of the drug substance and/or drug product (e.g., molecular size, charge, hydrophobicity) and the accurate detection of degradation changes that may result from deamidation, oxidation, sulfoxidation, aggregation or fragmentation during storage. As examples, methods that may contribute to this include electrophoresis (SDS-PAGE, immuno electrophoresis, Western blot, iso-electro focusing), high-resolution chromatography (e.g., reversed-phase chromatography, gel filtration, ion exchange, affinity chromatography), and peptide mapping. Wherever significant qualitative or quantitative changes indicative of degradation product formation is detected during long-term, accelerated and/or stress stability studies, consideration should be given to potential hazards and to the need for characterisation and quantification of degradation products within the long-term stability program. Acceptable limits should be proposed and justified, taking into account the levels observed in material used in preclinical and clinical studies. For substances that cannot be properly characterized or products for which an exact analysis of the purity cannot be determined through routine analytical methods, the company should propose and justify alternative testing procedures.

Other Product Characteristics

The following product characteristics, though not specifically relating to biotechnological/biological products, should be monitored and reported for the drug product in its final container: Visual appearance of the product (colour and opacity for solutions/suspensions; colour, texture and dissolution time for powders), visible particulates in solutions or after the reconstitution of powders or lyophilized cakes, pH, and moisture level of powders and lyophilized products. Sterility testing or alternatives (e.g., container/closure integrity testing) should be performed at a minimum initially and at the end of the proposed shelf-life.

Additives (e.g., stabilizers, preservatives) or excipients may degrade during the storage period of the drug product. If there is any indication during preliminary stability studies that reaction or degradation of such materials adversely affect the quality of the drug product, these items may need to be monitored during the stability program.

10.0 Packaging, Storage & Distribution

Packaging requirements

The packaging /specification should include the following information:

- How the plasma containers are to be packed to prevent damage during shipment.
- Plasma products of different types should be kept discrete and packaged into separate cartons.
- Each carton should have a unique identification number or a bar code which should be clearly displayed on the carton and recorded in the shipping documentation.

Transportation/Distribution Requirement

- The recommendations for cold chain maintenance, as mentioned for plasma storage, should also apply during the transportation of plasma. The arrangements for temperature control and monitoring during shipping should be clearly defined and documented.
- The requirements for the number and location of temperature logging devices during shipping of final product should be based on a documented assessment of risk throughout the process and during transportation.
- The temperature to be maintained during transportation should be defined. The responsibilities of organizations and individuals during shipping should be identified.

Recommendation for Storage and Transportation of Plasma :

10.1 Container closure systems

A Container Closure System (CCS) is the complete packaging (container + closure) that holds and protects a product, ensuring its safety, stability, and integrity throughout its shelf life.

The container closure integrity validation should take into consideration any transportation or shipping requirements that may negatively impact the integrity of the container. The container closure system may be designed to improve patient safety, minimize waste, and improve ease of administration.

Key Components

Container: Glass vials, plastic bottles, ampoules, syringes.

Closure: Rubber stoppers, aluminium caps, screw caps, snap caps, seals, inner liners.

Secondary Packaging: Outer cartons, shrink-wraps, labels, tamper proof seals.

Critical Functions

Protection: Shields the product from oxygen, light, moisture, physical damage, and microbial contamination.

Containment: Prevents leakage or evaporation of the product.

Compatibility: Ensures no harmful substances leach from the packaging into the drug product.

Performance: Allows for proper drug delivery (e.g., injection, oral).

Compliance: Meets strict regulatory standards (FDA, EMA) for quality and safety.

Importance in Pharma

Product Integrity: Directly impacts drug efficacy and patient safety.

Sterility: Maintains sterility, crucial for injectable (parenteral) drugs.

Stability: Ensures the product remains stable under various storage conditions.

Physical characteristic of container: The physical characteristics include dimensional criteria (e.g., shape, neck finish, wall thickness and design tolerances), physical parameters critical to the consistent manufacture of a packaging component (e.g., unit weight) and performance characteristics (e.g., metering valve delivery volume, or the ease of movement of syringe plungers).

Chemical composition: MOC shall be considered during container closure systems validation.

Secondary packaging components: A secondary packaging component generally serves one or more of the following additional functions:

- Provides protection from excessive transmission of moisture or solvents into or out of the packaging system.
- Provides protection from excessive transmission of reactive gases into or out of the packaging system.
- Provides light protection for the packaging system.
- Provides protection for a packaging system that is flexible or needs extra protection from rough handling.
- Provides an additional measure of microbiological protection.

REGISTRATION OF PHARMACEUTICAL PRODUCTS FOR
HUMAN USE IN THE ECONOMIC COMMUNITY
OF WEST AFRICAN STATES
Guidance for the Preparation of Applications in the
Common Technical Document (CTD) Format

June 2018
REGISTRATION OF PHARMACEUTICAL PRODUCTS FOR HUMAN
USE IN THE ECONOMIC COMMUNITY OF WEST AFRICAN STATES

Guidance for the Preparation of Applications in the
Common Technical Document (CTD) Format

June 2018
FOREWORD

A Common Technical Document (CTD) is an internationally agreed upon format for the organization and preparation of application dossiers for marketing authorization. Developed through the ICH process, it is used by an increasing number of regulatory authorities, including the European Union, the US Food and Drug Administration, Japan, and Canada among others. The WHO has adopted the CTD as the format for applications submitted to its Prequalified Programme.

ECOWAS, in recognizing that all the fifteen member states have different requirements for submission of their dossiers for the granting of marketing authorization, initiated interventions and activities to harmonize medical product registration as part of overall process of harmonizing drug regulations in the region.

This initiative resulted in the development of registration requirements based on CTD format that were validated, and adopted by member states in 2010. Subsequent to that a number of countries including Nigeria, Ghana, Liberia, Sierra Leone and The Gambia have largely adopted the CTD format into their processes of granting of marketing authorization.

In the process the eight WAEMU member states within the region had also developed a set of CTDs that are being used in some of the countries¹.

The effect is that industry will have to contend with two different set of requirements in CTD formats in the ECOWAS region that may lead to delays in the registration of critical products for public health interventions, such as those for HIV/AIDS, Malaria, Tuberculosis, the recent Ebola outbreak and other neglected tropical diseases, leading to limited access to these medicines by the people who need them most.

It has become imperative that in order to improve access and to facilitate the interventions that are supported by development partners and governments in the region, these two documents for medicines registration are reviewed, harmonized in line with international standards, approved and implemented by member states as part of the overall harmonization of medicine regulation.

Based on the experience of WHO in providing technical assistance to various regions for the development and harmonization of medicines registration, ECOWAS requested WHO to review the two documents existing in the region and align them into a single registration document based of the CTD format.

Medicines Regulatory staff will be trained in the harmonized requirements in CTD format and processes to facilitate their use at country level. The same requirements will be used when the need arises to register some medicines at the regional level under the auspices of WAHO.

It is believed that the use of the CTD by all NMRAs in the 15 member states will facilitate easy submissions, reduce cost of both submission and assessment, improve collaboration and information exchange between regulators, reduce registration life cycles and ultimately improve access to critical and essential medicines in the region.

Prof. Stanley OKOLO
Director -General

1 Regulation No. 06/2010 / CM / 2010 / UEMOA on the Procedures for the Registration of Pharmaceutical Products for Human Use in UEMOA Member States.

i Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format
PREFACE

Established on May 28 1975 via the treaty of Lagos, the Economic Community of West African States (ECOWAS) is a 15-member regional group with a mandate of promoting economic integration in all fields of activity of the constituting countries. Member countries making up ECOWAS are Benin, Burkina Faso, Cape Verde, Cote d' Ivoire, The Gambia, Ghana, Guinea, Guinea Bissau, Liberia, Mali, Niger, Nigeria, Sierra Leone, Senegal and Togo.

The West African Health Organization (WAHO) was formed in 1987 when the Heads of State and Government from all fifteen (15) countries in the ECOWAS adopted the Protocol creating the organization. The Protocol, which was subsequently ratified by each government in the sub-region, grants WAHO status as a Specialized Agency of ECOWAS and describes the organization's mission as follows: «The objective of the West African Health Organization shall be the attainment of the highest possible standard and protection of health of the peoples in the region through the harmonisation of the policies of the Member States, pooling of resources,

and cooperation with one another and with others for a collective and strategic combat against the health problems of the sub-region.»

The WAHO has taken actions under its current medicines and vaccines programme to facilitate access to essential and quality medicines, vaccines and essential health products and reduce the use of illicit drugs and counterfeiting in the region.

In 2010, WAHO developed the Common Technical Documents on Medicines Registration Harmonization for the Economic Community of West African States (ECOWAS)² for the purpose of harmonizing medicine registration and regulation within the region. At the same time, the West African Economic and Monetary Union (known as UEMOA: Union Économique et Monétaire Ouest-Africaine) developed Annexes to regulation N°06/2010/CM/UEMOA describing the Approval Procedures for Pharmaceuticals for Human Use in the UEMOA Member States.

The UEMOA is an organization of eight West African states established, in 1994, to promote economic integration among countries that share the CFA franc as a common currency. In July 2005, the UEMOA Council of Ministers adopted a regulation aimed at establishing a harmonized regulatory framework for pharmaceuticals.

The project to harmonize the ECOWAS and the UEMOA documents was initiated in 2015 and supported by the Bill and Malinda Gates Foundation and facilitated by the Regulatory Systems Strengthening Group at the World Health Organization. In December 2016 a draft registration guideline in the Common Technical Document (CTD) format was created by merging the ECOWAS and the UEMOA documents. The draft was reviewed at a validation workshop held in Abidjan, Cote d'Ivoire on April 18-19, 2016. This second draft for the Registration of Generic Pharmaceuticals for Human Use in the CTD format for the Economic Community of West African States reflects the decision to narrow the scope of the document to Multisource (generic) pharmaceutical products. This draft also reflects the comments received during the Abidjan workshop.

2 Common Technical Documents on Medicines Registration Harmonization for The Economic Community Of West African States (ECOWAS), September 2010.

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format ii
ACKNOWLEDGEMENTS

This document was produced by the West African Health Organization (WAHO)'s Essential Medicines and Vaccines Programme in the Public Health and Research (DPHR) Department under the frameworks of the Sahel Women's Empowerment and Demographic Dividends (SWEDD) and West African Medicines Regulatory Harmonization (WA-MRH) Projects, linked to the African Medicines Regulatory Harmonization and Global Medicines Regulatory Harmonization Initiatives, hugely supported by technical and financial partners, notably among which are the World Health Organization (WHO), African Union Development Agency (AUDA-NEPAD), World Bank, Bill and Melinda Gates Foundation (BMGF), Swissmedic, and USAID.

This document has been developed on the basis of valuable inputs made during the consultation, and developmental phases as well as regional stakeholders' validation meetings.

We would like to express our gratitude to all institutions, partners and persons who have in numerous ways supported WAHO to strengthen and improve the accessibility of quality, safe, efficacious and affordable essential medicines in the ECOWAS region. A special thanks goes to the Union Economique et Monétaire Ouest Africaine (UEMOA) that supported WAHO by agreeing in 2014, on a single integrated roadmap for better regional coordination of medicines regulatory harmonization in West Africa.

Special appreciation goes particularly to the partners who provided their expertise and supported WAHO to develop the ECOWAS harmonized Common Technical Document (CTD), the WHO Team: Samvel Azatyan, Gabriela Zenhausern and Consultant Brigitte Zirger, UEMOA Team: Mahamane Hamidine and Carmelle Hounnou; NEPAD Team: Aggrey Ambali, Margareth Ndomondo-Sigonda, Hudu Mogtari; World Bank Team: Andreas Seiter, Aissatou Diack, Christophe Lemiere, Benjamin Botwe and Cassandra De Souza; and David Mukanga of BMGF

Sincere gratitude also goes to the WAHO Team for their relentless effort to ensure that the harmonized CTD gets developed, validated and adopted by the Assembly of Health Ministers: Carlos Brito, the Director of the Department of Public Health and Research, Sybil Nana Ama Ossei- Agyeman-Yeboah, the Programme Officer responsible for Essential Medicines and Vaccines in WAHO, and the WA-MRH Team: Assi Bernard Assi, Oluwafunmi Sopein-Mann and Pierre Kpatcha Tchamdja.

We wish to appreciate and to thank also the Heads of the National Medicines Regulatory Authorities (NMRAs) and WA-MRH Focal Persons in the fifteen (15) ECOWAS Member States.

We also thank the national, regional, continental and global Pharmaceutical Industrial Associations: Pharmaceutical Manufacturers Group of Manufacturing Association of Nigeria (PMG-MAN), Pharmaceutical Manufacturers Association of Ghana (PMAG), West African Pharmaceutical Manufacturers Association (WAPMA), African Pharmaceutical Manufacturers Association (FAPMA), and International Federation Pharmaceutical Manufacturers Association (IFPMA) and all contributors from ECOWAS Member States, numerous other Partners and the Civil Society who diligently reviewed and validated the harmonized CTD and gave valuable suggestions.

It is our expectation that the population of the ECOWAS region and the Pharmaceutical sector will benefit greatly from this ECOWAS harmonized Common Technical Document for registration of pharmaceutical for human use.

Prof. Stanley OKOLO

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format vi

GLOSSARY / DEFINITIONS

Active pharmaceutical ingredient (API)

Any substance or mixture of substances intended to be used in the manufacture of a pharmaceutical dosage form and that, when so used, becomes an active ingredient of that pharmaceutical dosage form. Such substances are intended to furnish pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease or to affect the structure and function of the body.

Authorized person

The person recognized by the National Regulatory Authority as having the responsibility for ensuring that each batch of finished product has been manufactured, tested and approved for release in compliance with the laws and regulations in force in that country.

Batch records

All documents associated with the manufacture of a batch of bulk product or finished product. They provide a history of each batch of product and of all circumstances pertinent to the quality of the final product.

Bio-equivalence:

Two pharmaceutical products are bioequivalent if they are pharmaceutically equivalent or pharmaceutical alternatives, and their bio-availabilities, in terms of peak (C_{max} and T_{max}) and total exposure (area under the curve (AUC)) after administration of the same molar dose under the same conditions, are similar to such a degree that their effects can be expected to be essentially the same³.

Bulk Product:

Any product that has completed all processing and steps up to, but not including final packaging.

Drug Master File

A drug master file (DMF) is a master file that provides a full set of data on an API. In some countries, the term may also comprise data on an excipient or a component of a product such as a container.

Drug Substance

Another term used for the Active Pharmaceutical Ingredient

Finished product

A finished dosage form that has undergone all stages of manufacture, including packaging in its final container and labelling. Related terms – Intermediate Product, Bulk Product.

Generic Products

The term generic product means a pharmaceutical product, usually intended to be interchangeable with the innovator product, which is usually manufactured without a licence from the innovator company and marketed after expiry of the patent or other exclusivity rights.

Intermediate product

Partly processed product that must undergo further manufacturing steps before it becomes a bulk product.

Manufacture

All operations of purchase of materials and products, production, quality control, release, storage and distribution of pharmaceutical products, and the related controls.

3 WHO, THE BLUE BOOK, Marketing Authorization of Pharmaceutical Products with Special Reference to Multisource (Generic) Products, A manual for National Medicines Regulatory Authorities (NMRAs). 2nd EDITION

vii Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

Marketing authorization (product license, registration certificate)

An official document issued by a competent medicines regulatory authority for the purpose of marketing or free distribution of the product after evaluations for safety, efficacy and quality.

Master formula

A document or set of documents specifying the starting materials with their quantities and the packaging materials, together with a description of the procedures and precautions required to produce a specified quantity of a finished product as well as the processing instructions, including the in-process controls.

Master record

A document or set of documents that serve as a basis for the batch documentation.

Multisource (Generic) Product

Multisource pharmaceutical products are pharmaceutically equivalent products that may or may not be therapeutically equivalent. Only multisource pharmaceutical products that are therapeutically equivalent are interchangeable.

Pharmaceutical product

Any material or product intended for human use presented in its finished dosage form or as a starting material for use in such a dosage form that is subject to control by pharmaceutical legislation.

Production

All operations involved in the preparation of a pharmaceutical product, from receipt of materials, through processing, packaging and repackaging, labelling and re-labelling, to completion of the finished product.

Specification

List of detailed requirements with which the products or materials used or obtained during manufacture have to conform. It serves as a basis for quality evaluation.

Standard Operating Procedure (SOP)

An authorized written procedure giving instructions for performing operations not necessarily specific to a given product or material (e.g. equipment operation, maintenance and cleaning; validation; cleaning of pre-mises and environmental control; sampling and inspection).

Certain SOPs may be used to supplement product-specific master and batch production documentation.

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 9

INTRODUCTION

This document provides guidance for the preparation of a product dossier (PD)/application in the Common Technical Document (CTD) format for the Registration of Medicines for Human Use in the Economic Community of West African States (ECOWAS).

The document describes how to organize and format the product dossier; it does not describe what information, studies or data are required. Therefore, when preparing a regulatory dossier, it is necessary to consult relevant guidance documents on technical (data) requirements.

The use of the CTD allows applicants to prepare dossiers for the NMRAs of ECOWAS without unnecessarily reformatting information that may already have been submitted to other international regulatory authorities. It will reduce the cost of both submission and assessment, support collaboration and information exchange between regulators, and increase the access to critical and essential medicines in the ECOWAS region.

The document is based on the International Council for Harmonization guidelines for Technical Requirements for Registration of Pharmaceuticals for Human Use, namely ICH M4, ICH M4Q, ICH M4S, and ICH M4E. This guideline should be read in conjunction with other applicable WHO and ICH reference documents that provide further guidance and recommendations on the topic-specific content requirements in Modules 2 to 5. References to these will be provided throughout this document.

10 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

GENERAL PRINCIPLES OF PRESENTATION

This section provide an overview of the physical presentation of the regulatory dossier in CTD format.

Table

1 outlines the modular structure and main headings that should be used.

Some headings and/or subheadings may not be applicable to certain dossiers, such as those for multisource (generic) drugs or variations. When no information is required in a specific section or subsection, that heading or subheading should be omitted. The numbering of an omitted section should not be reused for another section.

Insert the corresponding sentence of the document in French

LANGUAGE

There are three official languages in the ECOWAS region. These are English, French and Portuguese. Applications for products seeking a region-wide market authorization shall be submitted in English.

However, the summary product characteristics, labelling and packaging information shall be submitted in all the three official languages of the region (English, French and Portuguese).

Where applicants wish to register the product in a specific country, the official language of that country

SHALL be used for the application, the technical package and supporting documents.

In cases where there is the need to translate a document from its original language into the other languages

used in the region, the accuracy of the translations is the responsibility of the applicant.

DATA PRESENTATION

Dossiers should be submitted in separately bound volumes for the different parts but shall be numbered serially (e.g. Vol.1 of 2) for ease of reference.

Text and tables should be prepared using margins that allow the document to be printed on A4 and 80g/m² paper. The left-hand margin should be sufficiently large that information is not obscured by the method of

binding. Font sizes for text, tables, flow diagrams and floor maps should be of a style and size that are large

enough to be easily legible, even after photocopying. Times New Roman, 12-point font is recommended for narrative text.

All pages shall be numbered appropriately with the format 'page x of y' to facilitate easy reference by evaluators.

Each section of the dossier must have a table of content and must be accurately referenced.

Acronyms

and abbreviation should be defined the first time they are used in each part.

REFERENCES AND TEXTS

International standards for citing references in any parts of the dossier must be followed. The latest edition

of any reference source, specifying the year of publication must be used.

Literature references should be cited in accordance with the current edition of the Uniform Requirements for

Manuscripts Submitted to Biomedical Journals, International Committee of Medical Journals Editors

(ICMJE).

Acronyms and abbreviations should be defined the first time they are used in each module. Where necessary, especially for analytical methods, specifications and procedures, copies of the relevant portions of the reference source(s) must be included.

All in-house processes quoted in the documentation must have been validated and appropriate references cited.

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 11

STRUCTURE OF THE CTD FORMAT

Information within the CTD is organized into a series of structured documents which are in turn organized into modules.

Table 1 : Main Section Headings in the Common Technical Document (CTD) Format

Number Title and Main Section Headings

Module 1: Administrative and Product Information

1.0 Table of Contents (Modules 1 to 5)

1.1 Correspondence

12 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

MODULE 1: ADMINISTRATIVE AND PRODUCT INFORMATION

Module 1 should contain all administrative documents (for example, application forms, certifications, labeling and general correspondence, etc. The documents should be organized in the order below.

1.0 TABLE OF CONTENTS (ToC)

The Table of Contents (ToC) for the entire regulatory dossier should be placed in this section. It should list all documents included in Modules 1-5. A module-specific ToC is included with each Module.

1.1 CORRESPONDENCE

All correspondence-related documents submitted to the regulatory authority are to be placed in Module 1.1 unless otherwise indicated. Scientific information is not to be included in this Module.

1.1.1 Cover Letter

A cover letter should accompany any data being submitted to the regulatory authority. The cover letter should clearly state what is being submitted, including reference to the request letter (if applicable) and a

brief description of the package.

The cover letter should not contain any scientific information.

Note that the Question and Answer (Q and A) responses related to correspondence issued by the regulatory authority and the Note to Reviewer are assigned a specific location (1.1.3 and 1.1.6) and should not be included in the cover letter.

Any cross-referenced regulatory document should be clearly stated in the cover letter, and the following information should be included:

- application type, specify whether new, renewal or variation
- NMRA application number (issued by the NMRA)
- date of regulatory authorization if applicable
- brand name, DCI, dosage, presentation, dosage form
- manufacturer's name
- Applicant's name
- Number of samples submitted

A sample cover letter is provided in Annex B: FORMS

1.1.2 Copy of Correspondence Issued by the Regulatory Authority

A copy of the correspondence issued by the regulatory authority, being responded to should be placed in this section. This includes (but is not limited to) the following:

- A request for additional information (during screening or evaluation);
- A negative decision (e.g., deferrals or rejections).

1.1.3 Information Solicited by the Regulatory Authority

Solicited information is defined as information requested by the regulatory authority (copy of the regulator's correspondence is placed in section 1.1.2). Responses to these requests are to be provided in Question and Answer format, and placed in this section. The answers should summarize the response and cross-reference the supporting data that is to be placed in the appropriate Module of the regulatory document. No supporting data in connection with the answers is to be provided in this section.

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 13

1.1.4 Meeting Information

Any meeting related information and documentation, with the exception of an Appeal meeting, are to be placed in this section. This includes (but is not limited to) the following:

- meeting information package;
- proposed meeting agenda;
- Presentation slides;
- Meeting minutes.

1.1.5 Request for Appeal Documentation

Any person aggrieved by a decision in relation to any application for marketing authorization of a pharmaceutical product may within two (2) months from the date of notice of the decision, make representations in writing to WAHO or the appropriate NMRA and submit additional data to support the appeal. Any documentation required as part of a manufacturer's Request to Appeal a regulatory decision is to be placed in this section.

1.1.6 General Note to Reviewer

The Note to Reviewer should be used to facilitate the review. These comments are NOT to be included in the cover letter.

Notes relating to the entire regulatory dossier (e.g., advising that the product is referred to by a foreign trade name throughout the regulatory document) should be placed in this section.

Notes relating to a specific section of the regulatory document should be placed at the beginning of each pertinent section. For example, this note can be used to identify changes in a section and/or document.

1.2 ADMINISTRATIVE INFORMATION

1.2.1 Application Forms

Completed and signed application forms should be placed in this section.
(See Model Application Form in Annex B)

1.2.2 Fee Forms

Application fees shall be paid for each application submitted. This shall be in the form prescribed by the applicable NMRA or WAHO.

Completed fee forms (proof/evidence of payment) should be placed in this section.
(See Model Fee Form in Annex B)

1.2.3 Certification and Attestation Forms

Completed and signed forms are to be placed in this section. These include, but are not limited to, the following:

- Certification of Suitability to the Monographs of the European Pharmacopoeia (CEP) issued by the European Directorate for the Quality of Medicines and Healthcare (EDQM),
- World Health Organization Confirmation of Prequalification (WHO-CPQ) – where applicable.
- The export authorization if the product is not registered in the country of manufacture OR a Certificate of Pharmaceutical Product issued by the competent authority in the country of manufacture
- The Product Certificate issued by the NMRA;
- Any and all Certificates of analysis as required in the quality guidance. (In reference to the module 3)

14 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

1.2.4 Compliance and Site Information

Submit any that apply.

1.2.4.1 Good Manufacturing Practices

Good Manufacturing Practices (GMP) compliance information should be placed in this section. Regulatory GMP compliance status issued by other jurisdictions, including Date of last GMP and/or pre-approval inspection, and any observation-related information should also be placed in this section.

1.2.4.2 Other Compliance and Site Information Documents

Any other regulatory compliance and site-related information which is not currently mentioned should be placed in this section.

1.2.5 Authorization for Sharing Information

Letters authorizing the regulatory authority to access Drug Master Files (DMFs)/ active pharmaceutical ingredient master files or Site Reference files (SRF) should be included here. See model letter of access in ANNEX B.

1.2.6 Regional and International Regulatory Status

Provide evidence on registration status of the proposed product(s) and, approved indications in the country

of origin, other parts of the ECOWAS region and in other countries/regions.

Provide evidence if the API or Finished Pharmaceutical Product is prequalified by the WHO.

Depending upon the status of the product this may include, but not be limited to, the following:

- International / regional registration, review and/or marketing status, including date of filing, approval of
- product or supplemental changes in other jurisdictions, information regarding the withdrawal, stop of sale and/or market recall;
- Foreign refusals;
- Foreign clinical trial status;
- Date of the first registration of the product for all approved indications;
- Confirmation of filing or the date(s) of approval or withdrawal.
- Certification issued by the competent authority for the country of product origin that the product is marketed in the country of origin
- Certification issued by the applicable competent authority for the wholesale price excluding tax in the country where the product is marketed.

1.2.7 Trademark & Intellectual Property Information

Application for the registration of medicines at the WAHO or country level may be made by the manufacturer

of the product, or the license/ patent holder. In situations where applications are submitted by other entities,

a duly authenticated power of attorney from the manufacturer or license holder shall be submitted.

1.2.8 Post-Authorization Information

Periodic Safety Update Reports (PSURs) are to be filed in this section as applicable.

1.2.9 Other Administrative Information

This section is for any administrative information that does not have a designated location in the CTD format.

This section should NOT contain any scientific information.

Requests for bio-waivers are submitted in this section. Justification for the request for bio-waivers shall be

submitted as per Guidance on Bio-waivers.

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 15

1.3 PRODUCT INFORMATION

The content of the Summary of Product Characteristics (SmPC), the Patient Information Leaflet and all labels

in any of the 3 official languages should be the same.

See Model Product Information Templates provided in ANNEX A

1.3.1 Summary of Product Characteristics (Prescribing Information)

A copy of the Summary of Product Characteristics (SmPC) is to be placed in this section. This includes all

alternate language SmPCs.

When revisions are requested during the course of an evaluation, an annotated version of the revised SmPC is required. The annotations should identify all changes made, either in relation to the last approved

SmPC

or in response to a request made by the regulatory authority.

1.3.2 Patient Information Leaflet

A copy of the Patient Information Leaflet (PIL) is to be placed in this section.

1.3.3 Container Labels

All container labels, including the inner and outer labels, should be provided in this section.

This should include the labels for all strengths, dosage forms and reconstitution diluents.

When additional revisions are requested during the course of the review, an annotated version of the revised

label maybe requested, and should be placed in this section.

1.3.4 Foreign Labelling

If the drug product has been marketed outside the region, the applicant shall supply the SmPC approved for

WHO prequalified products and those marketed elsewhere in the ECOWAS or other African regions, must clearly translate the labelling into the three official languages of ECOWAS

1.3.5 Reference Product Labelling

For multisource (generic) products, the SmPC for the Reference Product(s) is to be placed in this section.

1.4 REGIONAL SUMMARIES

1.4.1 Bioequivalence Trial Information

The completed Bioequivalence Trial Information Form (BTIF) for all pivotal comparative bioavailability

(bioe-

quivalence) studies should be placed in this section.

See BTIF Template provided in ANNEX C

1.A APPENDIX

MODULE 1.A.1 ELECTRONIC DOCUMENTS

Electronic versions of applications are encouraged either in searchable Portable Document Format (PDF) or

Word. This electronic document should be saved to a CD-ROM or other acceptable storage medium.
All electronic media submitted to support the drug regulatory document should be placed in this section.

16 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

MODULE 2: COMMON TECHNICAL DOCUMENT (CTD) SUMMARIES

Module 2 includes the following 7 sections. For multisource (generic) pharmaceutical products, Modules 2.4-2.7 are not usually needed.

2.1 CTD Table of Contents (Modules 2-5)

2.2 CTD Introduction

2.3 Quality Overall Summary

2.4 Nonclinical Overview

2.5 Clinical Overview

2.1 CTD TABLE OF CONTENTS (MODULE 2-5)

The table of contents for Module 2 to 5 should be provided.

2.2 CTD INTRODUCTION

The introduction should include proprietary name, non-proprietary name or common name of the drug substance, company name, dosage form(s), strength(s), route of administration, and proposed indication(s).

It should briefly describe the contents of the Modules 2 to 5 with appropriate cross-references to them.

2.3 QUALITY OVERALL SUMMARY

The Quality Overall Summary (QOS) is a summary that follows the scope and the outline of the Body of Data in Module 3. The QOS should not include information, data or justification that was not already included in

Module 3 or in other parts of the CTD.

Complete the QOS-PD Template in Annex C following the guidance in this section.

Refer to ICH M4Q (R1)

2.3.S DRUG SUBSTANCE

For a drug product containing more than one drug substance, the information in module 2.3.S.1 to 2.3.S.7 should be submitted for each drug substance, clearly identifying the substance name and manufacturer in the title of each module.

2.3.S.1 General Information (name, manufacturer)

Include information from Module 3.2.S.1

2.3.S.2 Manufacture (name, physical address, i.e., site)

Include information from Module 3.2.S.2

Information on the manufacturer,

- Provide the name, address and responsibility of each manufacturer, including contractors, and each proposed production site or facility involved in manufacturing and testing.
- A brief description of the manufacturing process (including, for example, reference to starting materials, critical steps, and reprocessing) and the controls that are intended to result in the routine and consistent production of material(s) of appropriate quality; this could be presented as a flow diagram.
- A flow diagram, as provided in 3.2.S.2.2;
- A description of the Source and Starting Material and raw materials of biological origin used in the manufacture of the API, as described in 3.2.S.2.3;
- Highlight critical process intermediates, as described in 3.2.S.2.4;
- A description of process validation and/or evaluation, as described in 3.2.S.2.5.

2.3.S.3 Characterisation (name, manufacturer)

A summary of the interpretation of evidence of structure and isomerism, as described in 3.2.S.3.1, should be included.

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 17

A tabulated summary of the data provided in 3.2.S.3.2, with graphical representation, where appropriate should be included.

2.3.S.4 Control of Drug Substance (name, manufacturer)

A brief summary of the justification of the specification(s), the analytical procedures, and validation should be included.

Specification from 3.2.S.4.1 should be provided.

A tabulated summary of the batch analyses from 3.2.S.4.4, with graphical representation where appropriate, should be provided.

2.3.S.5 Reference Standards or Materials (name, manufacturer)

Information from 3.2.S.5 (tabulated presentation, where appropriate) should be included.

2.3.S.6 Container Closure System (name, manufacturer)

A brief description and discussion of the information, from 3.2.S.6 should be included.

2.3.S.7 Stability (name, manufacturer)

This section should include a summary of the studies undertaken (conditions, batches, analytical procedures) and a brief discussion of the results and conclusions, the proposed storage conditions, retest date or shelf-life, where relevant, as described in 3.2.S.7.1.

The post-approval stability protocol, as described in 3.2.S.7.2, should be included.

A tabulated summary of the stability results from 3.2.S.7.3, with graphical representation where appropriate, should be provided.

2.3.P FINISHED PHARMACEUTICAL PRODUCT

2.3.P.1 Description and Composition of the Drug Product (name, dosage form)

Information from 3.2.P.1 should be provided.

Composition from 3.2.P.1 should be provided.

2.3.P.2 Pharmaceutical Development (name, dosage form)

A discussion of the information and data from 3.2.P.2 should be presented.

A tabulated summary of the composition of the formulations used in clinical trials and a presentation of dissolution profiles should be provided, where relevant.

2.3.P.3 Manufacture (name, dosage form)

Information from 3.2.P.3 should include:

- Information on the manufacturer.
- A brief description of the manufacturing process and the controls that are intended to result in the routine and consistent production of product of appropriate quality.
- A flow diagram, as provided under 3.2.P.3.3.
- A brief description of the process validation and/or evaluation, as described in 3.2.P.3.5.

2.3.P.4 Control of Excipients (name, dosage form)

A brief summary on the quality of excipients, as described in 3.2.P.4, should be included.

2.3.P.5 Control of Drug Product (name, dosage form)

A brief summary of the justification of the specification(s), a summary of the analytical procedures and validation, and characterisation of impurities should be provided.

Specification(s) from 3.2.P.5.1 should be provided.

A tabulated summary of the batch analyses provided under 3.2.P.5.4, with graphical representation where appropriate should be included.

18 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

2.3.P.6 Reference Standards or Materials (name, dosage form)

Information from 3.2.P.6 (tabulated presentation, where appropriate) should be included.

2.3.P.7 Container Closure System (name, dosage form)

A brief description and discussion of the information in 3.2.P.7 should be included.

2.3.P.8 Stability (name, dosage form)

A summary of the studies undertaken (conditions, batches, analytical procedures) and a brief discussion of the results and conclusions of the stability studies and analysis of data should be included. Conclusions with respect to storage conditions and shelf-life and, if applicable, in-use storage conditions and shelf-life should be given.

A tabulated summary of the stability results from 3.2.P.8.3, with graphical representation where appropriate, should be included.

The post-approval stability protocol, as described in 3.2.P.8.2, should be provided.

2.3.A Appendices

2.3.R Regional Information

2.4 NON-CLINICAL OVERVIEW

The Nonclinical Overview should provide an integrated overall analysis of the information in the Module 4.

In general, the Nonclinical Overview should not exceed 30 pages.

The Nonclinical Overview should be presented in the following sequence:

- Overview of the nonclinical testing strategy
- Pharmacology
- Pharmacokinetics
- Toxicology
- Integrated overview and conclusions
- List of literature references

The Integrated Overview and Conclusions should clearly define the characteristics of the human pharmaceutical as demonstrated by the nonclinical studies and arrive at logical, well-argued conclusions supporting

the safety of the product for the intended clinical use. Taking the pharmacology, pharmacokinetics, and toxicology results into account, the implications of the nonclinical findings for the safe human use of the

pharmaceutical should be discussed (i.e., as applicable to labelling).

ICH M4S (R2) Module 2.4 provides guidance for the contents of the Non-clinical Overview. The non-clinical information in Module 2.4 and Module 4 is not normally required for multisource (generic) drug products.

However in some cases such as changes in safety impurity profile, the safety assessment studies should be conducted.

2.5 CLINICAL OVERVIEW

The Clinical Overview is intended to provide a critical analysis of the clinical data in the Common Technical

Document. The Clinical Overview will necessarily refer to application data provided in the comprehensive Clinical Summary, the individual clinical study reports (ICH E3), and other relevant reports; but it should primarily present the conclusions and implications of those data, and should not recapitulate them.

Specifically, the Clinical Summary should provide a detailed factual summarization of the clinical information

in the CTD, and the Clinical Overview should provide a succinct discussion and interpretation of these findings together with any other relevant information (e.g., pertinent animal data or product quality issues that

may have clinical implications).

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 19

The clinical overview should be presented in the following order:

Table of Contents

- 2.5.1 Product Development Rationale
- 2.5.2 Overview of Biopharmaceutics
- 2.5.3 Overview of Clinical Pharmacology
- 2.5.4 Overview of Efficacy
- 2.5.5 Overview of Safety
- 2.5.6 Benefits and Risks Conclusions
- 2.5.7 Literature References

ICH M4E (R1) Module 2.5 provides guidance for the contents of the Clinical Overview.

2.6. NONCLINICAL WRITTEN AND TABULATED SUMMARIES

Nonclinical Written Summaries

Introduction

This guideline is intended to assist authors in the preparation of nonclinical pharmacology, pharmacokinetics, and toxicology written summaries in an acceptable format. This guideline is not intended to indicate what studies are required. It merely indicates an appropriate format for the nonclinical data that have been acquired.

The sequence and content of the Nonclinical Written Summary sections are described below. It should be emphasised that no guideline can cover all eventualities, and common sense and clear focus on the needs of the regulatory authority assessor are the best guides to constructing an acceptable document.

Therefore, applicants can modify the format if needed to provide the best possible presentation of the information, in

order to facilitate the understanding and devaluation of the results.

Whenever appropriate, age- and gender-related effects should be discussed. Relevant findings with stereoisomers and/or metabolites should be included, as appropriate. Consistent use of units throughout the Summary

will facilitate their review. A table for converting units might also be useful.

In the Discussion and Conclusion Sections, information should be integrated across studies and across species,

and exposure in the test animals should be related to exposure in humans given the maximum intended doses.

General Presentation Issues

Order of Presentation of Information within Sections

When available, in vitro studies should precede in vivo studies.

Where multiple studies of the same type need to be summarised within the Pharmacokinetics and Toxicology sections, studies should be ordered by species, by route, and then by duration (shortest duration first).

Species should be ordered as follows:

- Mouse
- Rat
- Hamster
- Other rodent
- Rabbit
- Dog
- Non-human primate
- Other non-rodent mammal
- Non-mammals

Routes of administration should be ordered as follows :

- The intended route for human use
- Oral
- Intravenous
- Intramuscular

20 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

- Intraperitoneal
- Subcutaneous
- Inhalation
- Topical
- Other

Use of Tables and Figures

Although the Nonclinical Written Summaries are envisaged to be composed mainly of text, some information contained within them might be more effectively and/or concisely communicated through the use of appropriate tables or figures.

To allow authors flexibility in defining the optimal structure for the Written Summaries, tables and figures

should preferably be included within the text. Alternatively, they could be grouped together at the end of

each of the Nonclinical Written Summaries. Throughout the text, reference citations to the Tabulated Summaries should be included, in the following format: (Table X.X, Study/Report Number).

Length of Nonclinical Written Summaries

Although there is no formal limit to the length of the Nonclinical Written Summaries, it is recommended that

the total length of the three Nonclinical Written Summaries in general not exceed 100-150 pages.

Sequence of Written Summaries and Tabulated Summaries

The following order is recommended:

- Introduction
- Written Summary of Pharmacology
- Tabulated Summary of Pharmacology
- Written Summary of Pharmacokinetics
- Tabulated Summary of Pharmacokinetics
- Written Summary of Toxicology
- Tabulated Summary of Toxicology

Refer ICH M4S_R2 for detailed discussion of content of the non-clinical written and tabulated summaries.

2.7. CLINICAL SUMMARY

Preamble

The Clinical Summary is intended to provide a detailed, factual summarisation of all of the clinical information in the Common Technical Document. This includes information provided in ICH E3 clinical study reports;

information obtained from any meta-analyses or other cross-study analyses for which full reports have been included in Module 5; and post-marketing data for products that have been marketed in other regions.

The comparisons and analyses of results across studies provided in this document should focus on factual observations. In contrast, the CTD Clinical Overview document should provide critical analysis of the clinical study program and its results, including discussion and interpretation of the clinical findings and discussion of the place of the test drug in the armamentarium.

The length of the Clinical Summary will vary substantially according to the information to be conveyed, but it is anticipated that (excluding attached tables) the Clinical Summary will usually be in the range of 50 to 400 pages.

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 21

Table of Contents

2.7.1 Summary of Biopharmaceutical Studies and Associated Analytical

Methods

2.7.1.1 Background and Overview

2.7.1.2 Summary of Results of Individual Studies

2.7.1.3 Comparison and Analyses of Results Across Studies

2.7.1.4 Appendix

2.7.2 Summary of Clinical Pharmacology Studies

2.7.2.1 Background and Overview

2.7.2.2 Summary of Results of Individual Studies

2.7.2.3 Comparison and Analyses of Results Across Studies

2.7.2.4 Special Studies

2.7.2.5 Appendix

2.7.3 Summary of Clinical Efficacy

2.7.3.1 Background and Overview of Clinical Efficacy

2.7.3.2 Summary of Results of Individual Studies

2.7.3.3 Comparison and Analyses of Results Across Studies

2.7.3.4 Analysis of Clinical Information Relevant to Dosing Recommendations

2.7.3.5 Persistence of Efficacy and/or Tolerance Effects

2.7.3.6 Appendix

2.7.4 Summary of Clinical Safety

2.7.4.1 Exposure to the Drug

2.7.4.2 Adverse Events

2.7.4.3 Clinical Laboratory Evaluations

2.7.4.4 Vital Signs, Physical Findings, and Other Observations Related to Safety

2.7.4.5 Safety in Special Groups and Situations

2.7.4.6 Post-marketing Data

2.7.4.7 Appendix

2.7.5 Literature References

2.7.6 Synopses of Individual Studies

Refer ICH M4E_R1 for detailed discussion of content of the clinical summary.

22 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

MODULE 3: QUALITY

The Quality module follows the structure and illustrative explanations that are outlined in ICH M4Q (R1).

3.1 TABLE OF CONTENTS (MODULE 3)

The table of contents should give the location of each study report in Module 3

3.2. S BODY OF DATA - DRUG SUBSTANCE

The following information may be submitted as information for the API as applicable:

- Option 1 - Full details in the product dossier
- Option 2 – Confirmation that Drug Substance (API) is pre-qualified by the WHO
- Option 3 - A Certificate of Suitability of European Pharmacopeia (CEP).

For a drug product containing more than one drug substance, the information should be submitted for each drug substance.

Where reference is made to a CEP, the applicant must provide a letter of access from the CEP holder. The letter of access should be provided in Module 1.2.5. Evidence of WHO Pre-qualification should be provided in Module 1.2.6.

Refer to WHO Technical Report Series, No. 970 Annex 4

Option 2 Option 3

Option 1

API-PQP by WHO CEP

prequalified API

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 23

3.2.S.1 General Information (name, manufacturer)

3.2.S.1.1 Nomenclature (name, manufacturer)

Information on the nomenclature of the drug substance should be provided. For example:

- Recommended International Non-proprietary Name (INN);
- Compendial name if relevant;
- Chemical name(s);
- Company or laboratory code;
- Other approved non-proprietary name(s);
- Chemical Abstracts Service (CAS) registry number.

3.2.S.1.2 Structure (name, manufacturer)

The structural formula, including relative and absolute stereochemistry, the molecular formula, and the rela-
tive molecular mass should be provided.

3.2.S.1.3 General Properties (name, manufacturer)

The structure, molecular formula, molecular weight and structural formula are specified. The chiral centres
if any are identified.

Refer to ICH Guidelines: Q6A and Q6B

3.2.S.2 Manufacturer (name, manufacturer)

3.2.S.2.1 Manufacturer(s) (name, manufacturer)

State the name and street address of each facility where manufacture (synthesis, production) of API
occurs,
including contractors, and each proposed production site or facility involved in manufacturing and
testing
should be provided. Provide phone number(s) and E-mail addresses. Include any alternative manufacturers.
Provide a valid manufacturing Authorization for the production of APIs. If available, attach a
certificate of
GMP compliance. (Submitted in Module 1.2.4)

3.2.S.2.2 Description of Manufacturing Process and Process Controls (name, manufacturer)

Description of the manufacturing process and the summary diagram of the active substance.
The description of the drug substance manufacturing process represents the applicant's commitment for
the manufacture of the drug substance. Information should be provided to adequately describe the manu-
facturing process and process control. For example, a flow diagram of the synthetic process(es) should be
provided that includes molecular formulae, weights, yield ranges, chemical structures of starting
materials,
intermediates, reagents and drug substance reflecting stereochemistry, and identified operating
conditions
and solvents.
Reprocessing steps should be identified and justified and any data to support this justification should
be
either referenced.
Refer to ICH Guidelines: Q5A, Q5B, and Q6B

3.2.S.2.3 Control of Materials (name, manufacturer)

Materials used in the manufacture of the drug substance (e.g., raw materials, starting materials,
solvents,
reagents, catalysts) should be listed identifying where each material is used in the process. Information
on
the quality and control of these materials should be provided.
Refer ICH Guidelines: Q6A and Q6B

3.2.S.2.4 Controls of Critical Steps and Intermediates (name, manufacturer)

Critical Steps: Tests and acceptance criteria (with justification including experimental data) performed
at cri-
tical steps identified in 3.2.S.2.2 of the manufacturing process to ensure that the process is controlled
should
be provided.
Intermediates: Information on the quality and control of intermediates isolated during the process should
be provided.

24 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

Refer to ICH Guidelines: Q6A and Q6B

3.2.S.2.5 Process Validation and/or Evaluation (name, manufacturer)

Description of the validation process and evaluation of the manufacturing method.

3.2.S.2.6 Manufacturing Process Development (name, manufacturer)

A description and discussion should be provided of the significant changes made to the manufacturing pro-

cess and/or manufacturing site of the drug substance used in producing non-clinical, stability, scale-up, pilot, and , if available, production scale batches.
Reference should be made to the drug substance data provided in section 3.2.S.4.4.
Refer to ICH Guideline: Q3A

3.2.S.3 Characterisation (name, manufacturer)

Describe the method of Characterization

3.2.S.3.1 Elucidation of Structure and other Characteristics (name, manufacturer) /
Confirmation of structure based on e.g. Synthetic route and spectral analyses should be provided.
Information such as the potential for isomerism, the identification of stereochemistry, or the potential for forming polymorphs should be included.
Refer to ICH Guideline: Q6A

3.2.S.3.2 Impurities (name, manufacturer)
Information on impurities should be provided.
Refer to ICH Guidelines: Q3A, Q3C, Q5C, Q6A, and Q6B

3.2.S.4 Control of Drug Substance (name, manufacturer)

3.2.S.4.1 Specification (name, manufacturer)
The specification for the drug substance should be provided.
Refer to ICH Guidelines Q2 (R1) and Q6B, and WHO Technical Report Series, No. 970-Annex 4

3.2.S.4.2 Analytical Procedures (name, manufacturer)
The analytical procedures used for testing the drug substance should be provided.
Refer to ICH Guidelines: Q2 (R1)

3.2.S.4.3 Validation of Analytical Procedures (name, manufacturer)
Analytical validation information, including experimental data for the analytical procedures used for testing the drug substance should be provided.
Refer to ICH Guidelines: Q2 (R1) and Q6B

3.2.S.4.4 Batch Analyses (name, manufacturer)
Description of batches and results of batch analyses should be provided.
Refer to ICH Guidelines: Q3A, Q3C, Q6A, and Q6B

3.2.S.4.5 Justification of Specification (name, manufacturer)
Justification for the drug substance specification should be provided.
Refer to ICH Guidelines: Q3A, Q3C, Q6A and Q6B

3.2.S.5 Reference Standards or Materials (name, manufacturer)

Information on the reference standards or reference materials used for testing of the drug substance should be provided.

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 25
Refer to ICH Guidelines: Q6A and Q6B

3.2.S.6 Container Closure System (name, manufacturer)

A description of the container closure system(s) should be provided, including the identity of materials of construction of each primary packaging component, and their specifications. The specifications should include description and identification (and critical dimensions with drawings, where appropriate). Non-compendia methods (with validation) should be included, where appropriate.
For non-functional secondary packaging components (e.g. those that do not provide additional protection) only a brief description should be provided. For functional secondary packaging components, additional information should be provided.
The suitability should be discussed with respect to for example, choice of materials, protection from moisture and light, compatibility of the materials of construction with the drug substance, including sorption to container and leaching, and/or safety of materials of construction.
Provide a certificate of analysis for the container closure materials in module 1.2.3
Refer to WHO Technical Report Series, No. 902 Annex 9

3.2.S.7 Stability (name, manufacturer)

3.2.S.7.1 Stability Summary and Conclusions (name, manufacturer)
The types of studies conducted, protocols used, and the results of the studies should be summarized. The summary should include results, for example, from forced degradation studies and stress conditions, as well as conclusions with respect to storage conditions and retest date or shelf-life, as appropriate.
Refer to ICH Guidelines: Q1A, Q1B, and Q5C, and WHO Technical Report Series, No. 953 Annex 9

3.2.S.7.2 Post-approval Stability Protocol and Stability Commitment (name, manufacturer)
The post-approval stability protocol and stability commitment should be provided.

Refer to documents: ICH Q1A (20), Q1B (22), Q1D (24), Q1E (23),
WHO Technical Report Series, No. 953, Annex 2

3.2.S.7.3 Stability Data (name, manufacturer)
Results of the stability studies (e.g. forced degradation studies and stress conditions) should be presented in an appropriate format such as tabular, graphical narrative. Information on the analytical procedures used to

generate the data and validation of the procedures should be included.
Refer to ICH Q1A, Q1B, Q1D, Q1E, Q2 (R1), and
Stability testing of active pharmaceutical ingredients and finished pharmaceutical products, WHO
Technical
Report Series, No. 953, Annex 2, 2009

3.2.P Body of Data – Finished Drug Product (name, dosage form)

3.2.P.1 Description and Composition of the Drug Product (name, dosage form)

A description of the FPP or drug product and its composition should be provided.

The information provided should include, for example:

- A description of the dosage form;
- Composition i.e., list of all components of the dosage form, and their amount on a per-unit basis (including overages, if any), the function of the components, and a reference to their quality standards (e.g. Compendia monographs or manufacturers specifications)
- Description of accompanying reconstitution diluent(s); and
- Type of container and closure used for the dosage form and accompanying reconstitution diluent, if applicable.

Note: For a drug product supplied with reconstitution diluents(s) the information on the diluent(s) should be provided in a separate part "P" as appropriate.

26 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

Refer to ICH Guidelines: Q6A and Q6B

3.2.P.2 Pharmaceutical Development (name, dosage form)

The Pharmaceutical development section should contain information on the development studies conducted to establish that the dosage form, the formulation, manufacturing process, container-closure system, microbiological attributes and usage instructions are appropriate for the purpose specified in the product dossier. The studies described here are distinguished from routine control tests conducted according to specifications. Additionally, this section should identify and describe the formulation and process attributes (critical parameters) that can influence batch reproducibility, product performance and FPP quality.

Supportive data and results from specific studies or published literature can be included within or attached to the Pharmaceutical development section. Additional supportive data can be referenced to the relevant nonclinical or clinical sections of the product dossier.

Refer to ICH Guidelines: Q6A and Q6B, and WHO Technical Report Series, No. 970, Annex 4

3.2.P.2.1 Components of the Drug Product (name, dosage form)

3.2.P.2.1.1 Drug Substance (name, dosage form)

The compatibility of the drug substance with excipients listed in 3.2.P.1 should be discussed.

Additionally, key physicochemical characteristic (e.g. water content, solubility, and particle size distribution, polymorphic or solid state form) of the drug substance that can influence the performance of the drug product should be discussed. For fixed dose combination products, the compatibility of drug substances with each other should be discussed.

3.2.P.2.1.2 Excipients (name, dosage form)

The choice of excipients, their concentration and their characteristics that can influence the drug product performance should be discussed relative to their respective functions.

3.2.P.2.2 Drug Product (name, dosage form)

3.2.P.2.2.1 Formulation Development (name, dosage form)

A brief summary describing the development of the drug product should be provided, taking into consideration the proposed route of administration and usage. The differences between clinical formulations and the formulation (i.e. composition) described should be discussed. Results from comparative in vitro studies (e.g., dissolution), or comparative in- vivo studies (e.g., Bioequivalence) should be discussed when appropriate.

3.2.P.2.2.2 Overages (name, dosage form)

Any overages in the formulations(s) should be justified

3.2.P.2.2.3 Physicochemical and Biological Properties (name, dosage form)

3.2.P.2.3 Manufacturing Process Development (name, dosage form)

The selection and optimization of the manufacturing process described in 3.2.P.3.3, in particular its critical aspects, should be explained. Where relevant, the method of sterilization should be explained and justified.

Differences between the manufacturing processes used to produce pivotal clinical batches and the process described that can influence the performance of product should be discussed.

3.2.P.2.4 Container Closure System (name, dosage form)

The suitability of the container closure system used for the storage, transportation (shipping) and use of the drug product should be discussed. This discussion should consider, e.g. choice of material, protection from moisture and light, compatibility of the materials of construction with the dosage form (including sorption of

container and leaching) safety of materials of construction, and performance (such as reproducibility of the dose delivery from the device when presented as part of the drug product).

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 27

3.2.P.2.5 Microbiological Attributes (name, dosage form)

Where appropriate, the microbiological attributes of the dosage form should be discussed, including, for example, the rationale for not performing microbial limits testing for non-sterile products and the selection and effectiveness of preservative systems in products containing antimicrobial preservatives. For sterile products, the integrity of the container-closure system to prevent microbial contamination should be addressed.

3.2.P.2.6 Compatibility (name, dosage form)

The compatibility of the FPP with reconstitution diluent(s) or dosage devices (e.g., precipitation of API in solution, sorption on injection vessels) stability should be addressed to provide appropriate and supportive information for the labelling.

3.2.P.3 Manufacture (name, dosage form)

3.2.P.3.1 Manufacturer(s) (name, dosage form)

The name, address, and responsibility of each manufacturer, including contractors, and each proposed production site or facility involved in manufacturing and testing should be provided. Include, for example, production, sterilization, packaging and quality control. For each site where the major production step(s) is/are carried out, attach (in module 1.2.6) a valid manufacturing authorization for pharmaceutical production. Attach an original WHO-type certificate of GMP issued by the competent authority.

3.2.P.3.2 Master Formula (name, dosage form)

A recent master formula should be provided that includes a list of components of the dosage form to be used in the manufacturing process, their amounts per batch basis including overages, and a reference to their quality standards.

3.2.P.3.3 Description of Manufacturing Process and Process Controls (name, dosage form)

A flow diagram should be presented giving the steps of the process and showing where materials enter the process. The critical steps and points at which process controls, intermediate tests or final product controls are conducted should be identified.

A narrative description of the manufacturing process, including packaging that represents the sequence of steps undertaken and the scale of production should also be provided. Novel processes or technologies and packaging operations that directly affect product quality should be described with a greater level of detail.

Equipment should at least, be identified by type (e.g. tumble blend, in-line homogenizer) and working capacity, where relevant.

Steps in the process should have the appropriate process parameters identified, such as time, temperature, or pH. Associated numeric values can be presented as an expected range. Numeric ranges for critical steps should be justified in section 3.2.P.3.4. In certain case, environmental conditions (e.g. experimentally documented temperature and relative humidity for hygroscopic FPPs) should be stated.

Proposals for the reprocessing of materials should be justified. Any data to support this justification should be either referenced or filed in this section (3.2.P.3.3).

Refer to ICH Guideline: Q6B

3.2.P.3.4 Controls of Critical Steps and Intermediates (name, dosage form)

Critical steps: Test and acceptance criteria should be provided (with justification, including experimental data) performed at the critical steps of the manufacturing process, to ensure that the process is controlled.

Intermediates: Information on the quality and control of intermediates isolated during the process should be provided.

Refer to ICH Guidelines: Q2 (R1), Q6A, and Q6B

28 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

3.2.P.3.5 Process Validation and/or Evaluation (name, dosage form)

Description, documentation, and results of the validation and/or evaluation studies should be provided for critical steps or critical assays used in the manufacturing process (e.g. validation of the sterilization process or aseptic processing or filling).

Refer to ICH Guideline: Q6B

3.2.P.4 Control of Excipients (name, dosage form)

3.2.P.4.1 Specifications (name, dosage form)

The specifications for excipients should be provided.

Refer to ICH Guideline: Q6A and Q6B

3.2.P.4.2 Analytical Procedures (name, dosage form)

The certificate of analysis must be provided.

The analytical procedures used for testing the excipients should be provided where appropriate.

Refer to ICH Guidelines: ICH Q2 (R1)

3.2.P.4.3 Validation of Analytical Procedures (name, dosage form)

Analytical validation information, including experimental data, for the analytical procedures used for testing the excipients should be provided, where appropriate.
Refer to ICH Guidelines: ICH Q6B and ICH Q2 (R1)

3.2.P.4.4 Justification of Specifications (name, dosage form)
Justification for the proposed excipient specifications should be provided, where appropriate.
Refer to ICH Guidelines: Q3C and Q6B

3.2.P.4.5 Excipients of Human or Animal Origin (name, dosage form)
For excipients of human or animal origin information should be provided regarding adventitious agents (e.g. sources, specifications, description of the testing performed and viral safety data. (Details in 3.2.A.2).
Refer to ICH Guidelines: Q5A, Q5D, and Q6B

3.2.P.4.6 Novel Excipients (name, dosage form)
For excipient(s) used for the first time in an FPP or by a new route of administration, full details of manufacture, characterization, and controls, with cross-references to supporting safety data (non-clinical and/or clinical) should be provided according to the API and/or FPP format. (Details in 3.2.A.3).

3.2.P.5 Control of Drug Product (name, dosage form)

3.2.P.5.1 Specification(s) (name, dosage form)
The specification(s) for the drug product should be provided.
Refer to ICH Guidelines: Q3B, Q6A and Q6B
A list of general characteristics, specific standards, tests and limits for results for the FPP must be provided.
Two separate sets of specifications may be set out; at manufacture (at release) and at the end of shelf life.
Justification for the proposed specification should be provided.

3.2.P.5.2 Analytical Procedures (name, dosage form)
The analytical procedures used for testing the FPP should be provided.
Reference ICH Q2 (R1) and Q6B

3.2.P.5.3 Validation of Analytical Procedures (name, dosage form)
Analytical validation information, including experimental data, for the analytical procedures used for testing the FPP, should be provided.
Reference ICH Q2 (R1) and Q6B

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 29

3.2.P.5.4 Batch Analyses
Results of not less than three batch consecutive analyses (including the date of manufacture, place of manufacture, batch size and use of batch tested) must be presented. The batch analysis must include the results obtained for all specifications at release.
Reference ICH Guidelines: Q3B, Q3C, Q6A, and Q6B
3.2.P.5.5 Characterisation of Impurities (name, dosage form)
Information on the characterization of impurities should be provided, if not previously provided in "3.2.S.3.2 Impurities".

Reference ICH Guidelines: Q3B, Q5C, Q6A, and Q6B

3.2.P.5.6 Justification of Specification(s) (name, dosage form)
Justification for the proposed drug product specification(s) should be provided.
Reference ICH Guidelines: Q3B, Q6A, and Q6B

3.2. P.6 Reference Standards or Materials (name, dosage form)

Information on the reference standards or reference materials used for testing of the FPP should be provided, if not previously provided in "3.2.S.5 Reference standards or materials".
Refer to ICH Guidelines: Q6A and Q6B
3.2. P.7 Container Closure System (name, dosage form)

A description of the container closure system should be provided, including the identity of materials of construction of each primary packaging component and its specification. The specifications should include description and identification (and critical dimensions, with drawings, where appropriate)).
Non-compendial methods (with validation) should be included where appropriate.
For non-functional secondary packaging components (e.g., those that neither provide additional protection nor serve to deliver the product), only a brief description should be provided. For functional secondary packaging components, additional information should be provided.
The suitability of the container closure system used for the storage, transportation (shipping) and use of the FPP should be discussed and located in 3.2.P.2.
Refer to WHO Technical Report Series, No. 902 – Annex 9. Officially recognized pharmacopoeias should be consulted for recommendations on the packaging information for FPPs.

3.2. P.8 Stability (name, dosage form)

The purpose of stability testing is to provide evidence of how the quality of an API or FPP varies with time under the influence of a variety of environmental factors such as temperature, humidity and light. The stability

bility programme also includes the study of product related factors that influence its quality, for example, interaction of API with excipients, container-closure systems and packaging materials.

3.2. P.8.1 Stability Summary and Conclusions (name, dosage form)

The types of studies conducted, protocols used, and the results of the studies should be summarized. The summary should include, for example conclusions with respect to storage and shelf-life and if applicable, in –use storage conditions and shelf-life.

Refer to ICH Guidelines: Q1A, Q1B, Q3B, and Q5C, Q6A and WHO Technical Report Series, No. 953 – Annex 2

3.2. P.8.2 Post-approval Stability Protocol and Stability Commitment (name, dosage form)

The post-approval stability protocol and stability commitment should be provided

Reference document: ICH Q1A and Q5C

3.2. P.8.3 Stability Data (name, dosage form)

Results of the stability studies should be presented in an appropriate format (e.g., tabular, graphical and

30 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format narrative). Information on the analytical procedures used to generate the data and validation of these procedures should be included.

Information on characterisation of impurities is located in 3.2.P.5.5.

Refer to ICH Guidelines: Q1A, Q1B, Q2(R1) and Q5C

3.2. A APPENDICES (NAME, DOSAGE FORM)

3.2. R REGIONAL INFORMATION (NAME, DOSAGE FORM)

3.3 LITERATURE REFERENCES (NAME, DOSAGE FORM)

Key literature referenced should be provided, if applicable.

MODULE 4: NON-CLINICAL SUMMARIES

This module is not normally needed for multisource (generic) pharmaceutical products. It deals with the toxicity testing intended to justify the stability and safety of the product. The module is included for completeness to indicate the appropriate format and placement of the nonclinical data.

Refer to ICH M4S (R2) for additional detail on the organization of Module 4 and for ICH references on study design and data content.

4.1 TABLE OF CONTENTS (MODULE 4)

4.2 STUDY REPORTS

The study reports should be presented in the following order:

4.2.1 Pharmacology

4.2.1.1 Primary Pharmacodynamics

4.2.1.2 Secondary Pharmacodynamics

4.2.1.3 Safety Pharmacology

4.2.1.4 Pharmacodynamic Drug Interactions

4.2.2 Pharmacokinetics

4.2.2.1 Analytical Methods and Validation Reports (if separate reports are available)

4.2.2.2 Absorption

4.2.2.3 Distribution

4.2.2.4 Metabolism

4.2.2.5 Excretion

4.2.2.6 Pharmacokinetic Drug Interactions (nonclinical)

4.2.2.7 Other Pharmacokinetic Studies

4.2.3 Toxicology

4.2.3.1 Single-Dose Toxicity (in order by species, by route)

4.2.3.2 Repeat-Dose Toxicity (in order by species, by route, by duration; including supportive toxicokinetics evaluations)

4.2.3.3 Genotoxicity

4.2.3.3.1 In vitro

4.2.3.3.2 In vivo (supportive toxicokinetic evaluations)

4.2.3.4 Carcinogenicity (including supportive toxicokinetic evaluations)

4.2.3.4.1 Long-term studies (in order by species; including range-finding studies that cannot appropriately be

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 31 included under repeat-dose toxicity or pharmacokinetics)

4.2.3.4.2 Short- or medium-term studies (including range-finding studies that cannot appropriately be included under repeat-dose toxicity or pharmacokinetics)

4.2.3.4.3 Other studies

4.2.3.5 Reproductive and Developmental Toxicity

4.2.3.5.1 Fertility and early embryonic development

4.2.3.5.2 Embryo-fetal development

4.2.3.5.3 Prenatal and postnatal development, including maternal function

4.2.3.5.4 Studies in which the offspring (juvenile animals) are dosed and/or further evaluated.

4.2.3.6 Local Tolerance

4.2.3.7 Other Toxicity Studies (if available)

4.2.3.7.1 Antigenicity

4.2.3.7.2 Immunotoxicity

4.2.3.7.3 Mechanistic studies (if not included elsewhere)

4.2.3.7.4 Dependence

4.2.3.7.5 Metabolites

4.2.3.7.6 Impurities

4.2.3.7.7 Other

4.3 LITERATURE REFERENCES

MODULE 5: CLINICAL SUMMARIES

For multisource (generic) pharmaceutical products, only Module 5.3.1 Reports of Biopharmaceutical Studies would normally be needed. However, all parts of the module are included for completeness to indicate the appropriate format and placement of the clinical data.

ICH E3 provides guidance on the organisation of clinical study reports, other clinical data, and references within a Common Technical Document (CTD).

Module 5 provides the recommended organization for the placement of clinical study reports and related information to simplify preparation and review of dossiers and to ensure completeness. The placement of a report should be determined by the primary objective of the study. Each study report should appear in only one section. Where there are multiple objectives, the study should be cross-referenced in the various sections. An explanation such as "not applicable" or "no study conducted" should be provided when no report or information is available for a section or subsection. Refer to ICH M4E (R2) for additional detail on the organization of Module 5 and for additional ICH references on study design and data content.

5.1 TABLE OF CONTENTS (MODULE 5)

A Table of Contents for study reports should be provided.

5.2 TABULAR LISTING OF CLINICAL STUDIES

5.3 CLINICAL STUDY REPORTS

5.3.1 Reports of Bio-pharmaceutic Studies

Bioavailability (BA) studies evaluate the rate and extent of release of the active substance from the medicinal product. Comparative BA or bioequivalence (BE) studies may use Pharmacokinetic (PK), Pharmacodynamic (PD), clinical or in vitro dissolution endpoints, and may be either single dose or multiple doses. When the primary purpose of a study is to assess the PK of a drug, but also includes BA information, the study report

32 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format should be submitted in Section 5.3.1, and referenced in Sections 5.3.1.1 and/or 5.3.1.2. WHO guideline QAS/04.109 Rev1

5.3.1.1 Bioavailability (BA) Study Reports

BA studies in this section should include

- studies comparing the release and systemic availability of a drug substance from a solid oral dosage form to the systemic availability of the drug substance given intravenously or as an oral liquid dosage form
- dosage form proportionality studies, and
- food-effect studies.

5.3.1.2 Comparative Bioavailability (BA) and Bioequivalence (BE) Study Reports

- Studies in this section compare the rate and extent of release of the drug substance from similar drug products (e.g., tablet to tablet, tablet to capsule). Comparative BA or BE studies may include comparisons between
 - the drug product used in clinical studies supporting effectiveness and the to-be-marketed drug product,
 - the drug product used in clinical studies supporting effectiveness and the drug product used in stability batches, and
 - similar drug products from different manufacturers.

5.3.1.3 In vitro-In vivo Correlation Study Reports

In vitro dissolution studies that provide BA information, including studies used in seeking to correlate in vitro data with in vivo correlations, should be placed in this section. Reports of in vitro dissolution tests used for batch quality control and/or batch release should be placed in the Quality section (module 3) of the CTD.

5.3.1.4 Reports of Bioanalytical and Analytical Methods for Human Studies

Bioanalytical and/or analytical methods for biopharmaceutic studies or in vitro dissolution studies should ordinarily be provided in individual study reports. Where a method is used in multiple studies, the method and its validation should be included once in Section 5.3.1.4 and referenced in the appropriate individual study reports.

5.3.2 Reports of Studies Pertinent to Pharmacokinetics using Human Biomaterials

5.3.2.1 Plasma Protein Binding Study Reports

5.3.2.2 Reports of Hepatic Metabolism and Drug Interaction Studies

5.3.2.3 Reports of Studies Using Other Human Biomaterials

5.3.3 Reports of Human Pharmacokinetic Studies

5.3.3.1 Healthy Subject PK and Initial Tolerability Study Reports

5.3.3.2 Patient PK and Initial Tolerability Study Reports

5.3.3.3 Intrinsic Factor PK Study Reports

5.3.3.4 Extrinsic Factor PK Study Reports

5.3.3.5 Population PK Study Reports

5.3.4 Reports of Human Pharmacodynamic Studies

5.3.4.1 Healthy Subject PD and PK/PD Study Reports

5.3.4.2 Patient PD and PK/PD Study Reports

5.3.5 Reports of Efficacy and Safety Studies

5.3.5.1 Study Reports of Controlled Clinical Studies Pertinent to the Claimed Indication

5.3.5.2 Study Reports of Uncontrolled Clinical Studies References

5.3.5.3 Reports of Analyses of Data from more than one study, including any formal integrated analyses, meta-analyses, and bridging analyses

5.3.5.4 Other Clinical Study Reports

5.3.6 Reports of Post-marketing Experience

For products that are currently marketed, reports that summarize marketing experience (including all significant safety observations) should be included.

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 33

5.3.7 Case Report Forms and Individual Patient Listings (when submitted)

Case report forms and individual patient data listings that are described as appendices in the ICH or WHO clinical study report guideline should be placed in this section when submitted in the same order as the clinical study reports and indexed by study.

5.4 LITERATURE REFERENCES

Copies of referenced documents, including important published articles, official meeting minutes, or other regulatory guidance or advice should be provided here. This includes copies of all references cited in the

Clinical Overview, and copies of important references cited in the Clinical Summary or in the individual technical reports that were provided in Module 5. Only one copy of each reference should be provided. Copies of

references that are not included here should be immediately available on request.

ANNEX A: PRODUCT LABELLING GUIDANCE

There are three official languages in the ECOWAS region. These are English, French and Portuguese. Applications for products seeking a region-wide market authorization shall be submitted in English.

However,

the summary product characteristics, labelling and packaging information shall be submitted in all the three official languages of the region (English, French and Portuguese).

Where applicants wish to register the product in a specific country, the official language of that country

SHALL be used for the application, the technical package and the product labelling.

In cases where there is the need to translate a document from its original language into the other languages

used in the region, the accuracy of the translations is the responsibility of the applicant. For applications

originating outside the ECOWAS region the translations shall be authenticated by the nearest Embassy of an

ECOWAS member state.

The Guidance and templates for product labelling shall be based on the ECOWAS guidance or the current WHO Guidance documents for the Package Leaflet, Summary of Product Characteristics and Labelling which is available from the WHO website at <https://extranet.who.int/prequal/content/contents-and-structure-whopar>.

MODULE 1.3.1 SUMMARY OF PRODUCT CHARACTERISTICS (SMPC)

The format of the SmPC document is to be consistent with the WHO SmPC template. The information is given in the official language of the ECOWAS Member State giving market authorization.

Refer to WHO SmPC Guidance and Annotated Template

Use WHO SmPC Template

MODULE 1.3.2 PATIENT INFORMATION LEAFLET

The format of the PIL is to be consistent with the WHO PIL template. The information is given in the official

language of the ECOWAS Member State giving market authorization.

Refer to WHO PIL Guidance and Annotated Template

Use WHO PIL Template

MODULE 1.3.3 CONTAINER LABELLING (INNER AND OUTER LABELS)

The primary and secondary packaging must include the following information in a legible, understandable and indelible manner. The information is given in the official language of the ECOWAS Member State giving market authorization.

The Container Labelling is to be consistent with the WHO template.

Refer to WHO Guidance

Use WHO Annotated Template

ANNEX D: GUIDANCE DOCUMENTS

ANNEX E: MANAGEMENT OF APPLICATIONS AND STANDARD OPERATING PROCEDURES

For pharmaceutical products that have been evaluated by a stringent drug regulatory authority, and also those that have been prequalified by the World Health Organization, an abridged file abstract will be required.

As for other products, including those for specific or neglected tropical diseases, a complete file will be required.

1.4 GENERAL POLICIES ON APPLICATIONS

A separate application is required for each product. For purposes of clarification, one application could be submitted for products containing the same active ingredients and the same strength made by the same manufacturer at the same manufacturing site, to the same specifications and dosage form, but differing only in packing or pack sizes. On the other hand, separate applications shall be submitted for products that contain the same active ingredient(s) but of different salts, different strength, dosage form and proprietary or brand name.

1.4.1 Classes of Applications

Applications shall be classified into three (3)

- New Applications
- Renewal of applications (i.e., registration)
- Variation of Applications (i.e., of a registered product)

1.4.2 New Applications

Applications for the registration of a pharmaceutical product either submitted to the Director General of WAHO for the granting of region wide market authorization or submitted to a particular NMRA in the region for the very first time shall be considered a new application. In addition to the dossier submitted, the applicant shall provide:

- i. Samples of the product in the commercial pack(s) from one batch with batch certificates of analysis per the samples schedule defined by WAHO (check www.wahooas.org) or the NMRA.
- ii. Certificate of Pharmaceutical Product issued in accordance with the format approved by the WHO and issued by the competent drug regulatory authority of the country of Origin/ Manufacture (submitted in Module 1 of the PD).
- iii. A site master file of the plant in which the product was manufactured. (submitted in Module 3)
- iv. For NCEs and innovator products the pharmacovigilance plan shall be submitted. (submitted in Module 1.2.8 (PSURs))

1.4.3 Applications for Renewal of Registration

Applications for renewal of registration shall be made at least 3 months before the expiry of existing registration by submitting the following:

- i. Dully filled application form for renewal of registration
- ii. Batch Manufacturing Record (BMR) of a real batch manufactured within at most six months before the submission of the application.
- iii. Periodic Safety Update Reports (PSUR)
- iv. Proof of interchangeability for multisource (generics) as explained in Part 5.
- v. Any other requirements that WAHO or the NMRA may determine
- vi. Samples of the product in the commercial pack(s) from one batch with batch certificates of analysis per the samples schedule defined by WAHO or the NMRA.
- vii. A site master file of the plant in which the product was manufactured.

40 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

1.4.4 Application for Variation of a registered product

Applications for variation to a registered product shall be made according to requirements stipulated below:

- i. Dully filled application form for variation of registration
- ii. Samples of the product reflecting the variation
- iii. A site Master File of the manufacturer (if the variation is or includes a change in the name, site and/ or address of the manufacturer).
- iv. Other documents to support or justify the variation.

1.5 SUBMISSION OF APPLICATION

Applications for the registration of products for which a region wide market authorization is being sought shall be made to the Director General of WAHO through the identified Coordinating NMRA indicated in the Expression of Interest (EOI) in accordance with the approved format. For products meant for marketing authorization in a specific country, the application shall be sent to the Head of the NMRA in that country.

1.6 APPLICATION FEES

Application fees shall be paid for each application submitted.-This shall be in the form of a Bankers' draft or by wire transfer to the account to be designated by the applicable NMRA or WAHO. Refer to the fee form in Annex B.

1.6.1 Application fee for registration of a pharmaceutical product:
Imported in to ECOWAS US\$
Fully manufactured in ECOWAS US\$

1.6.2 Application fee for renewal of registration of a pharmaceutical product:
Imported into ECOWAS US\$
Fully manufactured in ECOWAS US\$
Application fees for variation of Registration US\$
Other fees including those for appeal, replacement of certificates, laboratory tests among others may be charged by various country MRAs as their legislation requires.

1.7 RECEIPT AND EVALUATION OF DOSSIERS

Applications, whether submitted to WAHO or to NMRAs shall be accompanied by the appropriate application fees.

1.7.1 Evaluation process
WAHO and NMRAs will assign application numbers serially to applications received and evaluate them on a first in first out (FIFO) basis. Preference and priority will be given to products for priority public health diseases such as Malaria, HIV/AIDS, Tuberculosis, and other neglected tropical diseases. Special consideration will be given to products manufactured by companies operating in member countries of the ECOWAS region. A committee of experts will be constituted at the WAHO secretariat made of regulatory officials and other scientists from member countries. Where necessary, specialists will be consulted for professional opinion on various sections of the dossiers. At country level evaluation will be done by in country evaluators using this guideline and Standard Operating Procedures for evaluation of dossiers. Additional information may be requested for during evaluation and if no response is received within six months of the request, the application will be discontinued. For applications made to WAHO, laboratory analysis based on the validated in-house or pharmacopoeia methods submitted by applicants shall be performed in accordance with approved SOP in accredited quality control laboratories. For purposes of verification of compliance to cGMP, all applications shall be accompanied by a Site Master

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 41
File. An inspection may be conducted by WAHO or the NMRA of the country in which marketing authorization is being sought. Report and recommendations of WAHO inspection teams shall be shared with NMRAs to avoid duplication. Decisions on registration shall be based on the dossier evaluation report, quality control report and inspection report on compliance to cGMP.

1.8 TIMELINES

Complete applications for expedited registration (Locally manufactured and Priority Medicines only), Post Approval Variation and Renewal of registration will be processed within 90 working days of receiving the applications. Complete new applications will be processed within 12 months of receipt of the application. The applicant will be required to provide any requested additional data within 6 months. In case additional time is required, a formal request must be submitted.

1.9 WITHDRAWAL OF AN APPLICATION

When the applicant fails to submit written responses to queries within 6 months from the date of their issuance, it will be deemed that the applicant has withdrawn the application or if the queries have been resubmitted for a second time and the applicant provides unsatisfactory responses, the product will be disqualified and the application will be rejected. The applicant will be required to apply afresh.

1.10 VALIDITY OF REGISTRATION

The registration of a pharmaceutical product at WAHO or by country NMRA shall be valid for five (5) years unless otherwise suspended or revoked by the NMRA, or withdrawn by applicant.

1.11 APPEALS

Any person aggrieved by a decision in relation to any application for marketing authorization of a pharmaceutical product may within two (2) months from the date of notice of the decision, make representations in writing to WAHO or the appropriate NMRA and submit additional data to support the appeal. Documentation in support of the manufacturer's request to appeal a regulatory decision is placed in Module 1.1.

Dear Sir/Madam,

Subject: Submission of Application Dossier(s) for Marketing Authorization of <Product Name(s),
<strength(s) of active pharmaceutical ingredient(s) and dosage form(s)

We are pleased to submit our Application Dossier(s) for the registration of human medicines in <the
ECOWAS
Region> or <the following ECOWAS member countries> for the following product(s):

Name of the medicinal product(s):

Pharmaceutical form(s) and strength(s):

INN/active Pharmaceutical ingredient(s):

ATC Code(s):

<The application seeks market authorization for a new product not previously marketed in the ECOWAS or
any member country.>

<The application seeks to renew the following marketing authorization(s)>

<The application seeks a market authorization for a variation of <indicate the product and market
authoriza-
tion # or previous application identifiers, e.g., NMRA's control numbers>>

<This submission responds to correspondence from <name of regulatory authority, (e.g., ECOWAS or member
country), dated <DAY, MONTH, YEAR>, related to application number <#####>. The regulator's correspon-
dence is provided in module 1.1.2. The response to the correspondence is provided in module 1.1.3.>

You will find enclosed the submission dossier as specified hereafter:

UU CTD format, 2 copies (following the regulator requirements):

☐ Soft copy

☐ Hard copy

☐ Both

UU CD ROM; Summaries in word format and body data in PDF format

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 43

UU We confirm that all future submissions for this specific product will be submitted in this same format

UU We confirm that the electronic submission has been checked with up-to-date and state-of-the-art anti-
virus software.

UU The electronic submission contains the following modules:

• Module 1: Administrative information and product information

• Module 2: Overview and summaries

• Module 3: Quality

• Module 4: Non clinical study reports

• Module 5: Clinical study reports>

The relevant fees have been paid.>

<xxx samples of the drug product have been submitted with this application.>

Yours sincerely,

.....

Dear Sir/Madam,

Subject: Authorization to access Certificate of Suitability (CEP)

Reference is made to the above subject matter.

Consent is hereby granted to <NMRA> to make reference to this company's Certificate(s) of Suitability (CEPs)

<number(s)> for <API(s) name(s)> in the evaluation of applications relating to the registration of <medicine

name(s)> submitted to <name of NMRA> by <applicant's name>.

This consent <includes / does not include> authorization to supply information or extracts from or the whole

of the data to:

(Name of company or individual)

The API is manufactured by:

<Names and addresses of all manufacturing sites and manufacturing steps carried out at site>

A formal agreement exists between the applicant of the medicine and the manufacturer of the API, which ensures that information will be communicated between them and to the <NMRA> before any significant change is made to the site of manufacture, manufacturing procedure or quality control specifications of the

API. Except as permitted by the WAHO guidelines relating to changes to medicines, such changes will not be made to the API to be used in manufacture of the medicine destined to be distributed in <ECOWAS or member country> before written approval is granted by the NMRA.

I understand that the consequences of failure to obtain approval for changes where approval is necessary may include de-registration and recall of batches of medicines.

Any questions arising from the < NMRA's> evaluation of this CEP should be forwarded to:

(Name and address)

Yours faithfully

Dear Sir/Madam,

Subject: Authorization to access Active Pharmaceutical Ingredient Master File

Reference is made to the above subject matter.

Consent is hereby granted to (Name ECOWAS-NMRA) to make reference to this company's Active Pharmaceutical Ingredient Master File(s) for [API(s) name] in the evaluation of applications relating to the registration of [medicine name(s)] submitted to (name of ECOWAS-NMRA) by the (applicant's name).

This consent does/does not** include authorization to supply information or extracts from or the whole of the data to:

(Name of company or individual)

The substance is manufactured by:
(Names and addresses of all manufacturing sites and manufacturing steps carried out at site)

A copy of the applicant's Part of the APIMF as specified in the ECOWAS Active Pharmaceutical Ingredient Master File Procedure has been supplied to the applicant.

A formal agreement exists between the applicant of the medicine and the manufacturer of the API, which ensures that information will be communicated between them and to ECOWAS-NMRA before any significant change is made to the site of manufacture, manufacturing procedure or quality control specifications of the API. Except as permitted by the ECOWAS guidelines relating to changes to medicines, such changes will not be made to the API to be used in manufacture of the medicine destined to be distributed in ECOWAS before written approval is granted by the NMRA.

I understand that the consequences of failure to obtain approval for changes where approval is necessary may include de-registration and recall of batches of medicines.

This APIMF (or data identical to that contained therein) has also been submitted to and approved by the regulatory authorities in (list of countries with stringent regulatory systems), and the [name(s) of ECOWAS

50 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format
NMR(s)] is authorized to request and refer to the evaluation reports of these agencies. The (ECOWAS-NMRA) is also authorized to exchange its own evaluation reports with these and other regulatory authorities.

Any questions arising from the ECOWAS-NMRA's evaluation of this APIMF should be forwarded to:

{Name and address}

52 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format
2.3.S DRUG SUBSTANCE (or ACTIVE PHARMACEUTICAL INGREDIENT (API)) (NAME, MANUFACTURER)
Complete the following table for the option that applies for the submission of API information:

Name of API:
Name of API manufacturer:
Confirmation of API Prequalification document:
■ a copy of the confirmation of API Prequalification document should be provided in
■ Module 1, and
■ summaries of the relevant information should be provided under the appropriate sections (e.g. S.1.3, S.2, S.3.1, S.4.1 through S.4.4, S.5 and S.7; see Quality guideline).
Certificate of suitability to the European Pharmacopoeia (CEP):
■ is a written commitment provided that the applicant will inform WHO in the event that the CEP is withdrawn and acknowledged that withdrawal of the CEP will require additional consideration of the API data requirements to support the dossier:
■ yes, ■ no;
■ ■ a copy of the most current CEP (with annexes) and written commitment should be provided in Module 1;
■ the declaration of access should be filled out by the CEP holder on behalf of the FPP manufacturer or applicant to PQTM who refers to the CEP; and
■ summaries of the relevant information should be provided under the appropriate sections (e.g. S.1.3, S.3.1, S.4.1 through S.4.4, S.5, S.6 and S.7; see Quality guideline).
Active pharmaceutical ingredient master file (APIMF):
■ a copy of the letter of access should be provided in Module 1; and
■
■ summaries of the relevant information from the Open part should be provided under the appropriate sections; see Section 3.2.S in the Quality guideline.
Active pharmaceutical ingredient pre-qualified by WHO
■
Provide evidence from WHO
Full details in the PD:
■ ■ Summaries of the full information should be provided under the appropriate sections; see Section 3.2.S in the quality guideline.

(a) Name of starting material:

(c) Name and manufacturing site address of starting material manufacturer(s):

(d) Summary of the quality and controls of the starting materials used in the manufacture of the API:

Step / Starting Material Test(s)/method(s) Acceptance criteria

(e) Where the API(s) and the starting materials and reagents used to manufacture the API(s) are without risk of transmitting agents of animal spongiform encephalopathies, a letter of attestation confirming this can be found in:

2.3.S.2.4 Controls of Critical Steps and Intermediates (name, manufacturer)

(a) Summary of the controls performed at critical steps of the manufacturing process and on intermediates:

Step/materials Test(s)/method(s) Acceptance criteria

2.3.S.2.5 Process Validation and/or Evaluation (name, manufacturer)

(a) Description of process validation and/or evaluation studies (e.g. for aseptic processing and sterilization):

2.3.S.2.6 Manufacturing Process Development (name, manufacturer)

(a) Description and discussion of the significant changes made to the manufacturing process and/or manufacturing site of the API used in producing comparative bioavailability or bioequivalence, stability, scale-up, pilot and, if available, production scale batches:

5

56 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

2.3.S.3 Characterisation (name, manufacturer)

2.3.S.3.1 Elucidation of Structure and other Characteristics (name, manufacturer)

(a) List of studies performed (e.g. IR, UV, NMR, MS, elemental analysis) and conclusion from the studies (e.g. whether results support the proposed structure):

(b) Discussion on the potential for isomerism and identification of stereochemistry (e.g. geometric isomerism, number of chiral centres and configurations) of the API batch(es) used in comparative bioavailability or biowaiver studies:

(c) Summary of studies performed to identify potential polymorphic forms (including solvates): <including identification of and data on the API lot used in bioavailability studies>

(d) Summary of studies performed to identify the particle size distribution of the API: <including identification of and data on the API lot used in bioavailability studies>

(e) Other characteristics:

2.3.S.3.2 Impurities (name, manufacturer)

(a) Identification of potential and actual impurities arising from the synthesis, manufacture and/or degradation:

i. List of API-related impurities (e.g. starting materials, by-products, intermediates, chiral impurities, degradation products), including chemical name, structure and origin:

API-related impurity
(chemical name and Structure Origin descriptor)

ii. List of process-related impurities (e.g. residual solvents, reagents), including compound names and step used in synthesis:

6

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 57
Process-related impurity (compound name) Step used in synthesis

(b) Basis for setting the acceptance criteria for impurities:

i. Maximum daily dose (i.e. the amount of API administered per day) for the API, corresponding to ICH Reporting/Identification/Qualification Thresholds for the API-related impurities and the concentration limits (ppm) for the process-related impurities (e.g. residual solvents):

Maximum daily dose for the API: <x mg/day>

Test Parameter ICH threshold or concentration limit

API-related impurities Reporting Threshold

Identification Threshold

Qualification Threshold

Process-related impurities <solvent 1>

<solvent 2>, etc.

ii. Data on observed impurities for relevant batches (e.g. comparative bioavailability or biowaiver, stability batches):

Impurity Acceptance Results (include batch number* and use**)

(API-related and Criteria process-related)

* include strength, if reporting impurity levels found in the FPP (e.g. for comparative studies)

** e.g. comparative bioavailability or biowaiver studies, stability

iii. Justification of proposed acceptance criteria for impurities:

2.3.S.4 Control of the API (name, manufacturer)

2.3.S.4.1 Specification (name, manufacturer)

(a) API specifications of the FPP manufacturer:

7

(c) Summary of analytical procedures and validation information for those procedures

not previously summarized in 2.3.S.4.2 and 2.3.S.4.3 (e.g. historical analytical procedures):

2.3.S.4.5 Justification of Specification (name, manufacturer)

(a) Justification of the API specification (e.g. evolution of tests, analytical procedures and

acceptance criteria, differences from officially recognized compendial standard(s)):

2.3.S.5 Reference Standards or Materials (name, manufacturer)

(a) Source (including lot number) of primary reference standards or reference materials (e.g.

Ph.Int., Ph.Eur., BP, USP, in-house):

(b) Characterization and evaluation of non-official (e.g. not from an officially recognized

pharmacopoeia) primary reference standards or reference materials (e.g. elucidation of

structure, certificate of analysis):

(c) Description of the process controls of the secondary reference standard (comparative

certificate of analysis and IR spectra against primary standard):

2.3.S.6 Container Closure System (name, manufacturer)

(a) Description of the container closure system(s) for the shipment and storage of the API (including

the identity of materials of construction of each primary packaging component and a brief

summary of the specifications):

Specifications (list parameters e.g.

Packaging component Materials of construction

identification (IR))

9

60 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

(b) Other information on the container closure system(s) (e.g. suitability studies):

2.3.S.7 Stability (name, manufacturer)

2.3.S.7.1 Stability Summary and Conclusions (name, manufacturer)

(a) Summary of stress testing (e.g. heat, humidity, oxidation, photolysis, acid/base): and results:

ii. Composition of all components purchased as mixtures (e.g. colourants, coatings, capsule shells, imprinting inks):

(c) Description of accompanying reconstitution diluent(s), if applicable:

(d) Type of container closure system used for the FPP and accompanying reconstitution diluent, if applicable:

2.3.P.2 Pharmaceutical Development

2.3.P.2.1 Components of the FPP

2.3.P.2.1.1 Active Pharmaceutical Ingredient

(a) Discussion of the:

i. compatibility of the API(s) with excipients listed in 2.3.P.1:

ii. key physicochemical characteristics (e.g. water content, solubility, particle size distribution, polymorphic or solid state form) of the API(s) that can influence the performance of the FPP:

iii. for fixed-dose combinations, compatibility of APIs with each other:

13

64 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

2.3.P.2.1.2 Excipients

(a) Discussion of the choice of excipients listed in 2.3.P.1 (e.g. their concentrations, their characteristics that can influence the FPP performance):

2.3.P.2.2 Finished Pharmaceutical Product

2.3.P.2.2.1 Formulation Development

(a) Summary describing the development of the FPP (e.g. route of administration, usage, optimization of the formulation, etc.):

(b) Information on primary (submission, registration, exhibit) batches including comparative bioavailability or biowaiver, stability, commercial:

i. Summary of batch numbers:

14

(c) Description of batches used in the comparative in vitro studies (e.g. dissolution) and in the in vivo studies (e.g. comparative bioavailability or biowaiver), including strength, batch number, type of study and reference to the data (volume, page):

(d) Summary of results for comparative in vitro studies (e.g. dissolution):

Summary of the multi-point dissolution profiles for the biobatch(es) in three BCS media across the physiological pH range and the proposed medium if different from the BCS media:

(e) Summary of any information on in vitro-in vivo correlation (IVIVC) studies (with cross-reference to the studies in Module 5):

(f) For scored tablets, provide the rationale/justification for scoring:

2.3.P.2.2.2 Overages

(a) Justification of overages in the formulation(s) described in 2.3.P.1:

2.3.P.2.2.3 Physicochemical and Biological Properties

(a) Discussion of the parameters relevant to the performance of the FPP (e.g. pH, ionic strength, dissolution, particle size distribution, polymorphism, rheological properties):

16

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 67

2.3.P.2.3 Manufacturing Process Development

(a) Discussion of the development of the manufacturing process of the FPP (e.g. optimization of the process, selection of the method of sterilization):

(b) Discussion of the differences in the manufacturing process(es) for the batches used in the comparative bioavailability or biowaiver studies and the process described in 2.3.P.3.3:

2.3.P.2.4 Container Closure System

(a) Discussion of the suitability of the container closure system (described in 2.3.P.7) used for the storage, transportation (shipping) and use of the FPP (e.g. choice of materials, protection from moisture and light, compatibility of the materials with the FPP):

(b) For a device accompanying a multi-dose container, a summary of the study results demonstrating the reproducibility of the device (e.g. consistent delivery of the intended volume for the lowest intended dose):

2.3.P.2.5 Microbiological Attributes

(a) Discussion of microbiological attributes of the FPP (e.g. preservative effectiveness studies):

2.3.P.2.6 Compatibility

(a) Discussion of the compatibility of the FPP (e.g. with reconstitution diluent(s) or dosage devices, co-administered FPPs):

2.3.P.3 Manufacture

2.3.P.3.1 Manufacturer(s)

(a) Name, address and responsibility (e.g. fabrication, packaging, labelling, testing) of each manufacturer, including contractors and each proposed production site or facility involved in manufacturing and testing:

17

68 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format
Name and address Responsibility

(include block(s)/unit(s))

(b) Manufacturing authorization, marketing authorization and, where available, WHO-type certificate of GMP (GMP information should be provided in Module 1):

2.3.P.3.2 Batch Formula

Largest intended commercial batch size:

Other intended commercial batch sizes:

<information on all intended commercial batch sizes should be in the QOS-PD>

(a) List of all components of the FPP to be used in the manufacturing process and their amounts on a per batch basis (including individual components of mixtures prepared in-house (e.g. coatings) and overages, if any):

2.3.P.3.3 Description of Manufacturing Process and Process Controls

18

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 69

(a) Flow diagram of the manufacturing process:

(b) Narrative description of the manufacturing process, including equipment type and working capacity, process parameters:

(c) Justification of reprocessing of materials:

2.3.P.3.4 Controls of Critical Steps and Intermediates

(a) Summary of controls performed at the critical steps of the manufacturing process and on isolated intermediates:

Step Controls (parameters/limits/frequency of testing)
(e.g. granulation, compression, coating)

Proposed/validated holding periods for intermediates (including bulk product):

2.3.P.3.5 Process Validation and/or Evaluation

(a) Summary of the process validation and/or evaluation studies conducted (including product quality review(s) where relevant) and/or a summary of the proposed process validation protocol for the critical steps or critical assays used in the manufacturing process (e.g. protocol number, parameters, results):

Document code(s) for the process validation protocol(s) and/or report(s) (including reference number/version/date):

2.3.P.4 Control of Excipients

2.3.P.4.1 Specifications

(a) Summary of the specifications for in-house standard specifications:

2.3.P.4.2 Analytical Procedures

19

70 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

(a) Summary of the analytical procedures for supplementary tests:

2.3.P.4.3 Validation of Analytical Procedures

(a) Summary of the validation information for the analytical procedures for supplementary tests (where applicable):

2.3.P.4.4 Justification of Specifications

(a) Justification of the specifications (e.g. evolution of tests, analytical procedures and acceptance criteria, exclusion of certain tests, differences from officially recognized compendial standard(s)):

2.3.P.4.5 Excipients of Human or Animal Origin

(a) For FPPs using excipients without risk of transmitting agents of animal spongiform encephalopathies, a letter of attestation confirming this can be found in:

(b) CEP(s) demonstrating TSE-compliance can be found in:

2.3.P.4.6 Novel Excipients

Novel excipients are not accepted in PQTm. See quality guideline for definition.

2.3.P.5 Control of FPP

2.3.P.5.1 Specification(s)

(a) Specification(s) for the FPP:

20

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 71

QUALITY INFORMATION SUMMARY (QIS)
<Dossier reference number: e.g. HA999>

FOREWORD

The QIS template should be completed to provide a condensed summary of the key quality information for product dossiers (PDs) containing APIs of synthetic or semi-synthetic origin and their corresponding products that are filed with the Prequalification Programme.

The QIS constitutes part of the Prequalification PD. The QIS provides an accurate record of technical data in the PD at the time of prequalification and thereafter serves as an official reference document during the course of GMP inspections, variation assessments and requalification assessments as performed by WHO. The QIS is a condensed version of the Quality Overall Summary – Product Dossier (QOS-PD) and represents the final, agreed upon key information from the PD review (inter alia identification of the manufacturer(s), API/FPP specifications, stability conclusions and relevant commitments).

The QIS template is structured to permit the rapid assembly of the QIS by copying requisite information from the corresponding portions of the QOS-PD filed with the original PD. It is acknowledged that the numbering of the sections may not be entirely sequential. Those sections not considered necessary to be included in the QIS have been removed (e.g. 2.3.S.5 Reference Standards or Materials) and the remaining sections have

retained
their numbering to be consistent with the original PD.

For original PDs, the QIS should be provided in Word format at the time of PD submission. The QIS should be revised and submitted with the change history (see table at the end of the template) each time additional data is provided during the assessment process. If no revision is necessary due to no change in the information, a statement should be made to this effect in the covering letter. For variations and requalification dossiers, the QIS should be completed in its entirety (regardless of the proposed change), it should include information on all strengths, with any changes highlighted and it should be provided at the time of filing.

When completing the QIS template, this covering foreword should be deleted.

etc.

Testing frequency

Container closure system(s)

2.3.P.8.3 Stability Data

(c) Bracketing and matrixing design for commitment and/or continuing (i.e. ongoing) batches, if applicable:

WRITTEN COMMITMENTS OF THE MANUFACTURER – FOR WHO USE

Important note: The product information is an essential part of the medicinal product. The SmPC and PIL published with the WHOPAR have been quality assured by WHO experts and reflect the situation at the time of publication of the WHOPAR. These texts, i.e. the SmPC and the PIL are prequalified and should be adhered to. Generally, a deviation from the prequalified product information (especially as to contents) means the product can no longer be considered to be prequalified.

API

If applicable (primary stability study commitment):

The Applicant (or API manufacturer) undertook in writing (date of letter of commitment) to continue long-term

testing of <INN of API> for a period of time sufficient to cover the whole provisional re-test period (period ending

month/year) and to report any significant changes or out-of-specification results immediately to WHO for the

following batches :

<Batch numbers, manufacturing dates, batch size, primary packing materials>

If applicable (commitment stability studies):

Since stability data on three production scale batches were not provided with the application, the remaining

QIS (2017-03-10)

<Dossier Reference Number(s) e.g. HA999>

9

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 89

WHO/PQT: Guidance Document
medicines 10 March 2017

number of production scale batches should be put on long-term stability testing. Any significant changes or out-of-specification results should be reported immediately to WHO. The approved stability protocol should be used for commitment batches.

API option 2 – CEP

The Applicant provided a commitment in writing (date of letter of commitment) to inform WHO in the event that the CEP is revised or withdrawn, and that revisions to the CEP will be handled as per variation 5 (Annex

5, TRS

981). Note that revisions or withdrawal will require additional consideration of the API data requirements to

support the dossier.

API option 3 – full details in the PD (ongoing stability study commitment)

The Applicant undertook in writing (date of letter of commitment) a commitment regarding ongoing stability studies. Unless otherwise justified, at least one batch per year of the product will be included in the stability

programme (unless none is produced during that year). The stability protocol will be that which was approved for primary batches (or the protocol was submitted for assessment). Out-of-specification results or significant atypical trends will be investigated. Any confirmed significant change, out-of-specification result, or significant atypical trend will be reported immediately to WHO. The possible impact on batches on the market will be considered in consultation with WHO inspectors.

FPP

If applicable (primary stability study commitment):

The Applicant undertook in writing (date of letter of commitment) to continue long-term testing of < FPP reference number, trade name (INN of API), strength, pharmaceutical form> for a period of time sufficient to

cover the whole provisional shelf-life (period ending month/year) and to report any out-of-specification results

or significant changes immediately to WHO for the following batches :

<Batch numbers, manufacturing dates, batch size, primary packing materials >

If applicable (commitment stability studies):

Since stability data on three production scale batches was not provided with the application, the Applicant

undertook in writing, (date of letter of commitment) to put the remaining number <e.g. additional two (2)>

production scale batches of < FPP reference number, trade name (INN of API), strength, pharmaceutical form,

primary packing material> on long-term stability testing. Any out-of-specification results or significant changes

during the study will immediately be reported to WHO. The approved stability protocol will be used for commitment batches.

If applicable (when the proposed largest commercial batch size is 200 000 units (x units) or less)

The Applicant undertook in writing (date of letter of commitment) to place the first three batches of any production size larger than x units on stability. The stability protocol will be that which was approved for primary

batches (or the protocol was submitted for assessment). Out-of-specification results or significant atypical

trends will be investigated. Any confirmed significant change, out-of-specification result, or

significant atypical

trend will be reported immediately to WHO.

Ongoing stability study commitment

The Applicant undertook in writing (date of letter of commitment) a commitment regarding ongoing stability

studies. Unless otherwise justified, at least one batch per year of the product manufactured in every primary

packaging type will be included in the stability programme (unless none is produced during that year).

The stability protocol will be that which was approved for primary batches (or the protocol was submitted and found

acceptable). Out-of-specification results or significant atypical trends will be investigated. Any confirmed

significant change, out-of-specification result, or significant atypical trend will be reported immediately to WHO.

The possible impact on batches on the market will be considered in consultation with WHO inspectors.

If applicable (validation of production batches)

Validation data on production scale batches of not less than three (3) consecutive batches of <FPP reference

number, trade name (INN of API), strength, pharmaceutical form, primary packing material> was not provided

QIS (2017-03-10)

with the application. Therefore, the Applicant submitted a written commitment (date of letter of commitment)

that three consecutive production batches would be prospectively validated and a validation report—in accordance with the details of the validation protocol provided in the dossier— would be made available

as

soon as possible for evaluation by assessors or for verification by the WHO inspection team.

PRESENTATION OF BIOEQUIVALENCE TRIAL INFORMATION

BIOEQUIVALENCE TRIAL INFORMATION

General Instructions:

Please review all the instructions thoroughly and carefully prior to completing the bioequivalence trial information form (BTIF). Neither the format nor the content of the document (text and tables) should be changed, except for setting horizontal page layout in subsections including wide tables.

Provide as much detailed, accurate and final information as possible. Note that the greyed areas are NOT to be completed in by the applicant but are for WHO use only.

Please state the exact location (Annex number) of appended documents in the relevant sections of the BTIF. For example, in section 3.4.3.1 under point b), indicate in which Annex (number) the Certificate of Analysis can be found. This procedure must be followed throughout the entire document where location of annexed documents is requested. Please ensure that the electronic submission has the same file structure and naming as the one employed to state the location of the documents and to include annexes of the BTIF as separate files.

Before submitting the completed BTIF, kindly check that you have provided all requested information and enclosed all requested documents.

Should you have any questions regarding this Form, please contact the WHO Prequalification Team - Medicines.

A properly filled out and signed original copy of the BTIF with all its annexes (including a copy on CD-ROM) must be submitted to the Prequalification of Medicines Programme together with the bioequivalence part of the dossier to the address below once the dossier has been accepted for assessment and the dossier has been allocated a WHO reference number. Note however a softcopy of the BTIF should be included already in the initial dossier submission to Geneva (please see Step 1 and Step 2 of the submission procedure http://www.who.int/prequal/info_applicants/info_for_applicants_dossier_SMF.htm).

medicines 08 January 2010

BIOEQUIVALENCE TRIAL INFORMATION

1 SUMMARY

1.1 Summary of bioequivalence studies performed

(Provide a brief description of each comparative bioavailability study included in the submission)

1.2 Tabulation of the composition of the formulation(s) proposed for marketing and those used for bioequivalence studies

(State the location of the master formulae in the quality part of the submission)

(Tabulate the composition of the biobatch using the table below. For solid oral dosage forms the table should contain only the ingredients in tablet core /contents of a capsule. A copy of the table should be filled in for the film coating / hard capsule, if any.

Important: If the formulation proposed for marketing and those used for bioequivalence studies are not identical, copies of this table should be filled in for each formulation with clear identification

in which bioequivalence study the respective formulation was used.)

Composition of the batches used for bioequivalence studies

Batch number

Batch size (number of unit doses)1

Comments, if any

Comparison of unit dose compositions and of clinical FPP batches

(duplicate this table for each strength, if compositions are different)

Unit dose Unit dose Biobatch Biobatch

Ingredients (and quality standard) Function

(mg) (%) (kg) (%)

Total

Equivalence of the compositions or justified differences

Maximum intended commercial batch size

1 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 93

Bioequivalence batches should be at least of pilot scale (10% of production scale or 100,000 capsules/tablets whichever is the greater) and manufacturing method should be the same as for production scale.

2 CLINICAL STUDY REPORT

a) Study number:

b) Study title:

c) Location of study protocol:

d) Start and stop dates for each phase of the clinical study:

e) Dates of product administration:

2.1 ETHICS

a) State the name of review committee, date of approval of protocol and consent form and the location of approval letter in the submission

b) State location of a reference copy of the informed consent form

2.2 INVESTIGATORS AND STUDY ADMINISTRATIVE STRUCTURE

a) Name of principal investigator(s) (State location of c.v. in the submission)

b) Clinical Facility (Name and full mailing address)

c) Clinical Laboratories (Name and full mailing address)

d) Analytical Laboratories (Name and full mailing address)

e) Company performing pharmacokinetic/statistical analysis (Name and full mailing address)

2.3 STUDY OBJECTIVES

Briefly state the study objectives.

2.4 INVESTIGATIONAL PLAN

2.4.1 Overall study design and plan — description

(Describe the type of study design employed in 1-2 sentences)

2.4.2 Selection of study population

2.4.2.1 Inclusion Criteria

(List the inclusion criteria applied to subjects)

2.4.2.2 Exclusion Criteria

(List the exclusion criteria applied to subjects)

2.4.2.3 Health Verification

(State location of the individual data included in the submission)

a) List criteria used and all tests performed in order to judge health status

b) Indicate when tests were performed

c) Study site normal values

(State location in submission of study site normal values for blood clinical chemistry, haematology, and urinalysis clinical screen)

d) Report any results that were outside of study site normal values

(State location in submission of the summary of anomalous values)

2.4.2.4 Removal of Trial subjects from Trial or Assessment

a) Number of subjects enrolled in the study

(All subjects including alternates, withdrawals, and dropouts)

b) Alternates

(Please note: Generally all subjects enrolled in the study should be included in the data set i.e., alternate subjects are strongly discouraged. However, in cases where there are alternate subjects, describe the procedure of including/excluding the alternates and whether alternates have been included in the study)

c) Withdrawals/dropouts

(Identify each withdrawal/dropout by subject and provide the reason for withdrawal/dropout and at what point in the study the withdrawal/dropout occurred)

2.4.3 Products Administered

2.4.3.1 Test Product

a) Batch number, size, date of manufacture and expiry date for the test product

b) Potency (measured content) of test product as a percentage of label claim as per validated assay method

(This information should be cross-referenced to the location of the certificate of analysis in the submission)

2.4.3.2 Comparator (Reference) Product

(Append to this template a copy of product labelling (snap shot of the box, on which the name of the product, name and address of the manufacturer, batch number, and expiry date are clearly visible on the labelling))

a) Name and manufacturer of the comparator product and market where the comparator product was purchased

b) Batch number and expiry date for the comparator product

c) Purchase, shipment, storage of the comparator product
(Indicate from which company/pharmaceutical distributor the comparator product has been obtained. Clearly indicate in chronological order the steps and dates of shipment/transport from company of purchase to the study site. In addition, the storage conditions should be given. This information should be cross-referenced to location in submission of documents (e.g. receipts) proving conditions)

d) Potency (measured content) of the comparator product as a percentage of label claim, as measured by the same laboratory and under the same conditions as the test product
(This information should be cross-referenced to the location of the certificate of analysis in the submission)

e) Justification of choice of comparator product
(Provide short summary here and cross-reference to location of comprehensive justification in study protocol)

2.4.4 Selection of doses in the study

a) State dose administered

(Indicate the number of dosage units comprising a single dose, e.g., 400 mg as 1 x 400 mg or 2 x 200 mg tablets)

2.4.5 Selection and Timing of Dose for Each Subject

a) State volume and type of fluid consumed with dose

b) Interval between doses (i.e., length of washout)

c) Protocol for the administration of food and fluid

d) Restrictions on posture and physical activity during the study

2.4.6 Blinding

2.4.6.1 Identify which of the following were blinded. If any of the groups were not blinded, provide a justification for not doing so

a) study monitors: Yes ☐ / No ☐ If No, justify:

b) subjects: Yes ☐ / No ☐ If No, justify:

c) analysts: Yes ☐ / No ☐ If No, justify:

2.4.6.2 Identify who held the study code and when the code was broken

2.4.7 Drug Concentration Measurements

2.4.7.1 Biological fluid(s) sampled

2.4.7.2 Sampling protocol

a) Number of samples collected per subject

b) Volume of fluid collected per sample

c) Total volume of fluid collected per subject per phase of the study

d) List the study sampling times

e) Identify any deviations from the sampling protocol

(State location of summary in the submission)

(Describe and explain reasons for deviations from sampling protocol. Comment on impact on study. Indicate whether the deviations were accounted for in the pharmacokinetic analysis)

2.4.7.3 Sample Handling

a) Describe the method of sample collection

b) Describe sample handling and storage procedures

2.5 Comments from review of Section 2 – WHO use only

3 TRIAL SUBJECTS

3.1 Demographic and other baseline characteristics

a) Identify study population (i.e., normal, healthy adult volunteers or patients)

b) Summary of ethnic origin and gender of subjects

- c) Identify subjects noted to have special characteristics and state notable characteristics (e.g. fast acetylators of debrisoquine)
- d) Range and mean age ■ SD of subjects
- e) Range and mean height and weight ■ SD of subjects
- f) Identify subjects whose ratio is not within 15% of the values given on a standard height/weight table

3.2 Subjects who smoke

- a) Number of smokers included in the study
- b) Indicate how many cigarettes smoked per day per subject
- c) Comment on the impact on study

3.3 Comments from review of Section 3 – WHO use only

Presentation of Bioequivalence Trial Information

98 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

■

WHO/PQT: Application Form
medicines 08 January 2010

4 PROTOCOL DEVIATIONS

- 4.1 Protocol deviations during the clinical study
(Describe any such deviations and discuss their implications with respect to bioequivalence)

4.2 Comments from review of Section 4 – WHO use only

5 SAFETY EVALUATION

- 5.1 Identify adverse events observed
(List any adverse events by subject number. State whether a reaction occurred following administration of the test or reference product, identify any causal relationships, and note any treatments required. State location of this summary in the submission.)
(Discuss the implications of the observed adverse events with respect to bioequivalence.)

5.2 Comments from review of Section 5 – WHO use only

6 EFFICACY EVALUATION

EFFICACY RESULTS AND TABULATIONS OF INDIVIDUAL TRIAL SUBJECTS
DATA

- 6.1 Presentation of data
 - a) State location in submission of tables of mean and individual subject concentrations
 - b) State location in submission of (mean and individual) linear and semi-logarithmic subject drug concentration vs. time plots

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 99

9

■

WHO/PQT: Application Form
medicines 08 January 2010

- 6.2 Pharmacokinetic (PK) parameters
 - a) State how the pharmacokinetic parameters were calculated/obtained for AUC_{0-t}, AUC_{0-∞}, C_{max}, t_{max}, the elimination rate constant, and t_{1/2} (indicate location of description in protocol)
 - b) State whether actual sampling time points were used for estimation of the pharmacokinetic parameters
 - c) Complete the table below

Test	Reference
Interindividual	Interindividual
Arithmetic Standard	Arithmetic Standard
Parameter coefficient of variation (%)	coefficient of variation (%)
AUC _{0-t} (units)	
AUC _{0-∞} (units)	
C _{max} (units)	
t _{max} (units)	
t _{1/2} (units)	

- d) Ratio of AUC_{0-t} to AUC_{0-∞}
(State mean ratio for both test and reference, state location in submission where individual ratios can be found)

- 6.3 Statistical analysis
(State the method of calculation of the 90% confidence intervals for the ratio of test formulation over the reference formulation and indicate how treatment, period, sequence and subjects within

sequence were included as factors in the ANOVA. Provide the following results from the ANOVA (parametric) on the logarithmically transformed AUC0-t and CMAX and other relevant parameters. State software used for computing ANOVA.)

a) Geometric means, results from ANOVA, Degrees of Freedom (DF) and derived CV (intra-subject)

% Ratio of 90 %

Parameter Test Reference geometric Confidence DF CV (%)
means interval

AUC0-t (units)

AUC0-inf (units)

Cmax (units)

b) Comparison of the results

(Compare the results, including mean values, inter- and intra-individual variability, of this study with published results (literature, product information of reference product (innovator), WHOPARs), and copies of the references used should be appended to this document)

medicines 08 January 2010

7.1.9 Identify anticoagulant used (if applicable)

7.1.10 If based on a published procedure, state reference citation

7.1.11 Identify any deviations from protocol

7.2 Selectivity

(Address the methods to verify selectivity against endogenous/exogenous compounds & results)

7.3 Sensitivity

(Address the methods to verify sensitivity & results)

7.4 Carry-over

(Summarize the method to verify carry-over & results)

7.5 Standard curves

(State location in submission of tabulated raw data and back calculated data with descriptive statistics)

a) List number and concentration of calibration standards used

b) Describe the regression model used including any weighting

c) List the back-calculated concentrations of the calibration standards of the validation runs (highlight the values outside of the acceptance range, e.g., 15%, except 20% for LLOQ)

7.6 Quality control samples

a) Identify the concentrations of the QC samples and the storage conditions employed prior to their analysis

102 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

Application Form:

7.7 Precision and accuracy during validation

- a) Summarize inter-day/inter-run accuracy and precision of the calibration standards during assay validation
- b) Summarize inter-day/inter-run accuracy and precision of the calibration standards during assay re-validation
(If applicable)
- c) Summarize inter-day/inter-run and intra-day/intra-run accuracy and precision of the QC samples during assay validation
- d) Summarize inter-day/inter-run and intra-day/intra-run accuracy and precision of the QC samples during assay re-validation
(If applicable)

7.8 Dilution integrity

(Summarize the method to verify dilution integrity & results)

7.9 Matrix effect (in case of MS detection)

(Summarize methods to verify the matrix effect & results)

7.10 Stability

(For each section provide the location of the raw data, a description of the methodology employed and a summary of the data.)

- a) Summarize data on long-term storage stability
- b) Summarize data on freeze-thaw stability
- c) Summarize data on bench top stability
- d) Summarize data on auto-sampler storage stability

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 103

Application Form:

- (e) Summarize data from any other stability studies conducted
(e.g. long-term stock solution and working solution stability, short-term stock solution and working solution stability, dry-extract stability, wet-extract stability, stability in blood before sample processing)

7.11 Re-injection reproducibility

(Summarize the method to verify re-injection reproducibility & results)

7.12 Comments from review of Section 7 – WHO use only

8 BIOANALYTICAL STUDY REPORT

(State the location of the bioanalytical report for the analysis of the study subject samples)

8.1 Analytical technique

(Confirm whether the method is the same as the validated method and whether the same equipment was employed. Identify any differences between the validated method described above in Section 7 and the method employed for subject sample analyses)

8.1.1 Analytical protocol

(State the location of the analytical protocol)

8.1.2 Identify any deviations from protocol

8.1.3 Dates of subject sample analysis

8.1.4 Longest period of subject sample storage

(Identify the time elapsed between the first day of sample collection and the last day of subject sample analysis)

8.1.5 State whether all samples for a given subject were analysed together in a single analysis run

104 Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format

Application Form:

8.2 Standard curves

(State location in submission of tabulated raw data and back calculated data with descriptive statistics)

- a) List number and concentration of calibration standards used

- b) State number of curves run during the study (valid and failed runs, including reasons of failure).
- c) Summarize descriptive data including slope, intercept, correlation coefficients
- d) List the back-calculated concentrations of the calibration standards of the study runs (highlight the values outside of the acceptance range, e.g., 15%, except 20% for LLOQ)

8.3 Quality control samples

- a) Identify the concentrations of the QC samples, their date of preparation and the storage conditions employed prior to their analysis
- b) State the number of QC samples in each analytical run per concentration
- c) List the back-calculated concentrations of the QC samples of the study runs (highlight the values outside of the acceptance range, e.g., 15%)
- d) Discuss whether the concentrations of the QC sample concentrations are similar to the concentrations observed in the study samples
- e) State the percentage of QC samples per run with respect to the total number samples assayed in each run

8.4 Precision and accuracy

- a) Summarize inter-day precision of back-calculated standards and inter-day and intra-day precision and accuracy of QC samples analysed during subject sample analysis

Registration of Medicines for Human Use in the ECOWAS – Applications in CTD Format 105

Application Form:

15

8.5 Repeat analysis (re-analysis, re-injection and re-integration)

- a) List re-analysed samples by sample identification and include the following information for each re-analysis: initial value; reason for re-analysis; re-analysed value(s); accepted value; and reason for acceptance
- b) Report the number of re-analysis as a percentage of the total number samples assayed
- c) List re-injected samples by sample identification and include the following information for each re-injection: initial value; reason for re-injection; re-injected value; accepted value; and reason for acceptance
- d) Report the number of re-injections as a percentage of the total number samples assayed
- e) List re-integrated chromatograms by sample identification and include the following information for each re-integration: initial value; reason for re-integration; re-integrated value(s); accepted value; and reason for acceptance
- f) Report the number of re-integrated chromatograms as a percentage of the total number of samples assayed

8.6 Incurred sample reanalysis

(State location in the submission and summarize the results of incurred sample reanalysis, including the number of subject samples included in ISR and the total number of samples analysed in the study)

8.7 Chromatograms

(State the location in the submission where the sample chromatograms can be found. The chromatograms should be obtained from a minimum of two analytical batches and include at least 20% of the subjects, up to a maximum of five. A complete set includes standards, QC samples, pre-dose and post-dose subject samples for both phases. Each chromatogram should be clearly labelled with respect to the following: date of analysis; subject ID number; study period; sampling time; analyte; standard or QC, with concentration; analyte and internal standard peaks; peak heights and/or areas)

BULK SUPPLY AGREEMENT

THIS AGREEMENT is made on this on ----- by and between the following entities collectively referred to as the parties and each referred to individually as party. Indian Immunologicals Limited, a Company incorporated under the Indian Companies Act, having its registered office at -----, India (Here in after referred to as 'Supplier' which expression shall, unless repugnant to the context or meaning thereof be deemed to include its successors and assignees).

AND

-----Pharmaceuticals Company, a company duly incorporated and in existence in accordance with the laws of -----, with registered office ----- register #----- (hereinafter referred to as 'Purchaser' which expression shall, unless repugnant to the context or meaning thereof be deemed to include its successors and assignees)

WHEREAS

a.----- is engaged in the research, manufacture, sale and distribution of biological / pharmaceutical products for animal and human health in India and other Countries.

b. Purchaser is engaged in Importing, exporting, sale, manufacturing, registering and distribution of pharmaceutical products and biologicals in the Appointed Territory.

c. Purchaser is desirous of importing Ready to Fill Bulk product and thereafter undertake activities for, filling bulk, formulating, packing, registering and selling the finished products in the Appointed Territory, and to this end has requested -----, for supplying the Ready to Fill Bulk along with related documentation support to register the Ready to Fill Bulk in the appointed territory. The agreement covers only supply of Ready to Fill Bulk as Product and do not involve supply of any technical knowhow for formulating the finished product therein, and if any it shall be maintained as "Technical knowhow" assets of -----and 2nd party "Purchaser" is not authorized to use without prior conditioned approval from -----, Formulating and technology transfer can be agreed on later if the 2 parties agree on this in a separate annex.

d. ----- has accepted the said offer and the Parties wish to reduce the terms and covenants of the said offer and acceptance in writing.

NOW THEREFORE THIS AGREEMENT WITNESSETH and it is hereby agreed by and between the parties hereto as follows:

DEFINITIONS

'Appointed Territory' shall mean only the territory of '-----'.

Ready to Fill Bulk' shall mean preparations in bulk of vaccines in unfinished or semi-finished forms, their derivatives, reconstitutions, supplements and replacements, supplied by -----more particularly described in the Schedule.

Confidential Information' shall mean any and all information relating to the products of including but not limited to, technology, specifications, samples, specimens, cultures, know-how, trade secrets, processes, procedures, innovations, ideas, concepts, inventions, developments, improvements, laboratory analysis, results of any test, protocols, research records, data, software programs, schematics, designs, business methods, pricing, cost, suppliers, actual products, product concepts, product formulations, methods for the manufacture and use of the materials, manufacturing and customer information and all other information that is indicated as confidential, whether of a written or oral or visual nature. For the purpose of this Agreement, Confidential Information shall include such of the results, data and information generated while performing any obligation pursuant to this Agreement.

"Finished Product(s)" shall mean the vaccines manufactured by the Purchaser out of the Bulk Ready to Fill Bulk supplied by -----.

APPOINTMENT

1. Supplier appoints the Purchaser for a period of 3 years to import the Ready to Fill Bulk to store, formulate, pack and make finished product, and to sell and distribute the finished product in the Appointed Territory. The agreement between the parties shall be on a Non Exclusive basis.

SUPPLY

2. Purchaser shall raise the order for supply of Ready to Fill Bulk, to be delivered by the Supplier to the Purchaser. Purchaser shall be responsible for importing the Ready to Fill Bulk into Territory directly. Supplier will execute all orders placed by Purchaser on the explicit understanding that these are supplied on non-returnable basis. Once the order is placed on Supplier and accepted by it, the same can only be changed / cancelled by the Supplier.

3. Purchaser shall store the Ready to Fill Bulk, get the same formulated, filled and packed as Finished Products, and in this regard it shall follow all the applicable laws of the Appointed Territory, guidelines issued by Supplier from time to time. The Trade Marks or any Brand names the Purchaser consider to adopt shall not be in any manner similar or infringing Supplier's brand names or Trade Marks.

4. Purchaser shall follow the procedure as laid down by ----- and other statutory requirements of Appointed Territory, for preparation, storage, filling and packing of the Finished Products. Purchaser shall be solely responsible for any loss or damages arising out of or as a result of any deviation or deficiency in this regard.

5. Purchaser shall intimate any deficiency in the Ready to Fill Bulk within thirty (30) days of receipt. The parties hereby acknowledge that ----- shall not be responsible for any deficiency identified after the said period of thirty (30) days.

6. Purchaser shall not sell the Ready to Fill Bulk or Finished Products directly or indirectly outside the Appointed Territory.

7. Purchaser shall not make any representations or claims with respect to the Ready to Fill Bulk which are false or misleading in any material particular; they shall store and handle the Ready to Fill Bulk with all due care and diligence appropriate for the circumstances and in accordance with the guidelines, standards, codes of practice and regulations governing the storage and handling of therapeutic / pharmaceutical goods within the Appointed Territory including without limitation, taking such steps as are necessary to ensure that the Ready to Fill Bulk are not stolen or tampered with.

8. ----- shall deliver the Ready to Fill Bulk as per the agreed schedule.

9. For each shipment ----- shall provide to the Purchaser a Certificate of Analysis from Its Quality Assurance Department and any other documents that may be requested by local authorities to facilitate importation and local manufacturing process.

10. Purchaser shall start local quality testing as per supplier specification and method of analysis Within 30 (Thirty) working days of shipment arrival and results to be shared with supplier. In case of any quality defect both parties agreed to define the liability & Support re-testing if required by neutral lab.

FINANCIALS

11. All orders to be executed as above shall be subject to final confirmation for availability and price with ----- . The prices will be FOB and shall be expressed in US Dollars. The prices valid for the duration of the agreement and any extension thereafter and the minimum order quantity are as specified in the Schedule

1. The cost of customs clearance storage and other allied operations, if applicable, will be on account of the Purchaser.

12. The Distributor shall pay 50% at the time of order confirmation and 50% on or before delivery. Further both parties agreed to proceed with LC payment mode upon successful completion of 12 months and after achieving 1, 00,000 USD annual business.

CONFIDENTIALITY

13. Purchaser recognize and acknowledge that they will have access to Confidential Information that are valuable assets of _____. Purchaser covenant that they, including their employees, representatives or agents, shall not use the Confidential Information for any other purpose or disclose Confidential Information to any third party. In the event of a breach or threatened breach _____ shall be entitled to pursue any available remedy, including equitable remedies, against the Purchaser.

14. Purchaser shall provide Confidential Information only to those employees, representatives or agents who reasonably require access to such information, provided that such employees, representatives or agents are bound by confidentiality obligations no less stringent than those set forth in the present Agreement. Purchaser shall advise such employees, representatives and agents of the terms and conditions of this Agreement including, without limitation, the obligations to not to disclose to any other party. Purchaser shall be responsible for any breach of those obligations by any such employee, representatives or agent.

15. Purchaser agree that if they are provided with custody of any Confidential Information belonging to _____ that shall be retained during the tenure of the Agreement and shall be returned to _____ immediately at the end of the Agreement or at any time as may be requested by _____.

INTELLECTUAL PROPERTY RIGHTS

16. All right, title and interest in the Ready to Fill Bulk and Intellectual Property (which term shall include Confidential Information) relating thereto, except for the Trade Marks / Brand Names of the Finished Products which shall be owned by the Purchaser, whether oral or tangible, shall be owned by _____.

17. Purchaser hereby acknowledge Ill's ownership of the Intellectual Property rights and covenants with _____ that it shall not use the said Intellectual Property rights in any manner whatsoever, which may jeopardize or dilute _____'s sole and exclusive right, title and interest in them or their significance, distinctiveness or validity. Purchaser shall not claim any ownership of, or right to or interests in the said Intellectual Property rights.

18. Purchaser agree to promptly and fully disclose in writing all inventions, whether or not patentable, results, technology, improvements, discoveries, developments, original works of authorship, trade secrets, or intellectual property rights therein, that are conceived, developed, or reduced to practice relating to the said Intellectual Property and shall be absolutely owned by _____. Purchaser shall provide necessary assistance to _____ for protecting them. Further, Purchaser shall ensure that all employees, representatives or agents assign all such inventions, improvements etc., to _____ and to this effect Purchaser shall obtain a written obligation from such employees, representatives or agents.

19. Purchaser shall use the best endeavors to discover any infringement of Intellectual Properties coming to their knowledge and shall assist _____ in any action to be taken in such circumstances.

REGISTRATION AND APPROVALS

20. Purchaser shall be responsible for obtaining the requisite registrations, approvals, licenses, permits, etc., which are required for importing, storing, preparing/formulating, packing and distributing the Ready to Fill Bulk or Finished Product, as per the local laws of the Appointed Territory. All expenses in this regard shall be borne by Purchaser only.

21. _____ shall provide such documentation support as may be necessary to assist the Purchaser obtain the said registrations, approvals etc.

22. All expenses for conducting of trials, analysis, tests and for registration of the Ready to Fill Bulk or Finished Product in the Appointed Territory shall be borne by Purchaser. All expenses for registration pertaining to preparation of files, certificates, documents and samples, which are carried out in India, will be borne by _____.

WARRANTY AND INDEMNIFICATION

23. This Agreement has been duly authorized, executed and delivered and constitutes its legal, valid and binding obligation, enforceable in accordance with its terms and do not conflict with or constitute a breach or default of, its Articles of Incorporation (or equivalent instrument), By-Laws or any resolution of its Board of Directors, or any contract or other instrument by which it or its assets is bound, or any law or regulation or any judgment, order, license or permit issued by any government authority.

24. Purchaser warrant and represent that they are independently competent to, and has fully satisfied themselves of, the worth, use, composition, efficiency, compliance with health and other laws, and such other characteristics and features of the Bulk Ready to Fill Bulk or Finished Product as are relevant and material to wide and safe use, distribution and storage and application of the Bulk Ready to Fill Bulk or Finished Product, and that in doing so, they have not relied on any representation or warranty of _____, but has conducted their own independent inspection, analysis and tests, consulted with such health experts and legal counsel, as they deem necessary or appropriate for purposes of purchase, formulate, fill and sale of the Ready to Fill Bulk or Finished Product in the Territory.

25. Purchaser hereby indemnifies and holds harmless from / against any and all damages, losses, costs and expenses arising out of any suit, action or proceeding relating in any manner to import, formulate, fill, sale etc. of the Ready to Fill Bulk or Finished Product or performances of obligations herein mentioned including those relating to infringement of intellectual property rights of third parties.

26. Purchaser at its own cost and expenses shall keep all of the ready to fill bulk or finished product products covered under appropriate product liability insurance.

27. _____ warrants that the Ready to Fill Bulk supplied by it shall meet the requirement referred to technical specifications and International quality standards. _____ shall indemnify and hold harmless the Purchaser against any loss and damage resulting from manufacturing deficiencies in the Ready to Fill Bulk, which are attributable to its inherent manufacturing defect / process. Purchaser shall conduct analysis and tests, as may be necessary and inform _____, within thirty (30) working days of receipt of the Bulk Ready to Fill Bulk, of any manufacturing deficiencies. It is hereby understood that indemnity from _____ shall only be valid till the final lab results issued by related local authority allowing use of bulk (Refer to point 10).

28. Subject to the above Clauses, all the parties mutually agree, hereafter to indemnify, defend, and hold the other party and its directors, employees, representatives, officers and agents and their respective successors, heirs and assigns fully free and harmless against any liability, damage loss, or expense including reasonable attorneys fees and expenses incurred by or imposed upon any of the parties hereto in respect of the Indemnities, which shall arise out of the Intellectual Property rights manifested or owned by the parties hereunder in connection with any claims, suits, actions, demands or judgements arising out of any and all liability (including without limitation actions in the form of tort, product liability) warranty, or strict liability or actions based on statements made by or assurances held out with respect to the Product thereto as contemplated hereunder concerning any product, process, or service that is made, used, sold, imported or performed pursuant to violations of any

contractual or statutory central, state and other local laws in territory by either party hereto.

RECORDS AND DOCUMENTS

29. Purchaser shall keep records of their business relating to Ready to Fill Bulk or Finished Product and will share the same with _____ to the extent as agreed by the both parties from time to time during regular business hours. _____ or its authorized representative may examine such records.

FORCE MAJEURE

30. All the parties agree that any delay, breach or failure on the part of either party in complying with the terms of this Agreement shall not be treated as default or give rise to any claim for damage to or in favour of other party, if and to the extent, such delay, breach or failure is caused by occurrences of any event beyond the control of the party including but not limited to acts of God, fires, floods, explosions, war, civil commotion, strikes, lockouts, shortages of materials and other similar causes.

TERMINATION

31. Subject to the other terms herein, any party hereto may terminate this Agreement as per clause 33. In the event of termination, the obligations of each party as on the date of termination shall be valid and binding.

32. Purchaser shall upon such termination return to _____ the complete documentation and other informative material (including those relating to scientific or technical data about the Bulk Ready to Fill Bulk or Finished Product) which they had received before or during the period of validity of this Agreement or which is maintained by it pursuant to this Agreement or otherwise, without exception and explicitly undertakes that whatever Confidential Information / secret is imparted to the Purchaser shall not be divulged.

33. Either Party may terminate this Agreement by sending a written notice to the other Party at least 3 (three) months prior to such intended date of termination if:

- a) The other Party is in breach of any of its material obligations under this Agreement which, in the case of a breach capable of remedy, shall not have been remedied within sixty (60) days of that other Party being served with written notice to do so; or
- b) The other Party ceases to carry out its business, becomes insolvent, applies for or agrees to the appointment of a trustee, receiver or liquidator of its assets or voluntarily seeks relief under any law for the aid of debtors; or
- c) Upon the change of control over the other Party.

34. Purchaser shall, within a period of six months from termination or expiry of the Agreement clear all the Ready to Fill Bulk or Finished Product lying with them and there after shall not use / deal with the Ready to Fill Bulk or Finished Product or the Intellectual Property of _____.

JURISDICTION & ARBITRATION

35. This Agreement is governed in all respects by the laws of Singapore without giving effect to its conflict-of-law provisions. The parties agree to submit to the jurisdiction of the courts located in Singapore.

36. Any dispute arising out of or in connection with this agreement, including any question regarding its existence, validity or termination, shall be referred to and finally resolved by arbitration administered by the Singapore International Arbitration Centre ("SIAC") for the time being force, which rules are deemed to be incorporated by reference in this clause. The seat of the arbitration shall be Singapore. The language of the arbitration shall be in English.

MISCELLANEOUS

37. Neither this Agreement nor any rights hereunder shall be assignable or transferable by the parties without the prior consent of the other parties.

38. No party shall by reason of the termination or non-renewal of this Agreement be liable to the other for compensation, reimbursement or damages on account of the loss of prospective profits, or anticipated sales or on account of expenditures, investments, Leases, property improvements or commitments in connection with the business or goodwill of the parties or otherwise unless there is a legal obligation that will be affected by termination.

39. Any notice to be given under this Agreement shall be in writing and shall be either personally delivered to each party or sent by telex/fax or similar method of Communication confirmed by pre-paid registered mail.

40. The relationship between the parties is that of independent contractor. No party shall by reason of this Agreement be deemed to be an agent of each other or member of partnership or joint venture with the other party.

41. The relationship between the parties is that of independent contractors. No party shall by reason of this Agreement be deemed to be an agent of each other or member of partnership or joint venture with the other party.

The Agreement sets forth the entire agreement and understanding between the parties on the subject matter hereof as of the effective date hereof, and supersedes all prior agreements, understandings, discussions and negotiates between the parties. This Agreement shall be changed only by agreement in writing signed by duly authorized representatives of the parties.

IN WITNESS WHEREOF the parties hereto have set their respective hands to these presents and the duplicates hereof on the date, month and year hereinabove written.

2.0 METHODOLOGY EMPLOYED IN FEASIBILITY REPORT

1. Market Feasibility Analysis

Methodology:

Market research (primary and secondary)

Demand-supply gap analysis

Competitor landscape

Forecasting (demand for generics, biosimilars, and vaccines in Uganda and neighbouring markets)

2. Technical Feasibility Study

Methodology:

Process technology evaluation

Capacity planning

Equipment and utility specification

Site selection and master layout design

Technology transfer assessment (especially for biopharma and vaccine segments)

3. Financial Feasibility Analysis

Methodology:

Capital expenditure (CAPEX) estimation

Operating expenditure (OPEX) analysis

Break-even analysis

Return on Investment (ROI), IRR, NPV

Funding models (equity, debt, PPP)

4. Regulatory and Legal Feasibility

Methodology:

Mapping of Uganda National Drug Authority (NDA) regulations

WHO GMP and biosafety compliance requirements

International regulatory alignment (EU, WHO PQ, USFDA if export is intended)

Licensing and IP due diligence

5. Human Resource

Methodology:

Skills mapping of local workforce

Training needs assessment

Staffing plan based on function (R&D, QC, production, engineering, etc.)

6. Risk Assessment and Mitigation Planning

Methodology:

SWOT analysis

Risk matrix (technical, financial, geopolitical, supply chain, IP risks)

Scenario planning

Importance:

Anticipates challenges and vulnerabilities, allowing the project team to plan contingency strategies.

7. Supply Chain and Logistics Feasibility

Methodology:

Mapping of import/export routes

Availability of raw materials and packaging

Cold chain logistics (critical for vaccines and biopharma)

Infrastructure assessment (ports, roads, air)

8. Stakeholder and Partnership Mapping

Methodology:

Identification of potential partners

Government engagement

Joint venture and PPP models assessment

10. Strategic Fit and Policy Alignment

Methodology:

Mapping to Uganda's Vision 2040 and industrialization strategy

Donor alignment (Global Fund, GAVI, WHO, etc.)

Fit with regional goals (EAC, AU vaccine manufacturing initiatives)

Attachment Point 20

While the construction of all the facilities will be undertaken in concurrent manner starting from Q2 2025, the commissioning, qualification, validation and product roll out from the facilities will be done in phased manner

Phase 1 - Oral Solid dosage form

Phase 2 - General Injectable facility

Phase 3 - Biopharma facility

Phase 4 - Vaccine facility

Phase 5 - Oncology OSD facility

However, depending upon the detailed survey demand, phases for the roll out of products can be changed

Comments on the Sunshine Medicals feasibility study

1. The Executive summary lacks critical information - ideally the Executive summary should be a high level summary of the entire report; providing insights on each of the feasibility components. GK
 2. Provide details of the methodology employed in the feasibility study. AS
 3. The Executive summary is not one of the report chapters. It's a stand-alone section of report i.e. a high level summary of the entire report and should thus not be numbered. GK
 4. In the Acronym EAC, C stands for community and not Council. BS
 5. Chapter one of the report should comprise of background information. Such as an introduction with key statistical information on the sector and Justification for the proposed investment.
 6. The regulatory framework forms a stand-alone chapter. It shouldn't be merged with market feasibility. Also the sections under regulatory framework need to be well introduced in the report. MK
 7. Provide the sources of information for the tables and figures. e.g. Table no. 6 BS
 8. Site selection and infrastructure cannot be part of market feasibility. They are technical aspects and should thus be covered under technical feasibility. The same should apply to technology partners too. BS
 9. The technical feasibility is overly summarized. There's need to add some details to it. BS
 10. Also, provide details of where the technology will be sourced.
 11. The production of the different drugs has been justified due to the high dependence of imported medicines (70% imported), increase in prevalence of communicable and non-commonable diseases in the country. However, a comprehensive market trend describing the past and current state of the market for pharmaceutical and biopharmaceutical was over looked. This is key in informing the market size, future market outlook of the industry, factors driving market growth. (quantitative data is required in undertaking the analysis of the market trends) MK
 12. The target market for the proposed products are not clearly spelt out and this is essential in knowing who the potential customers are. MK
 13. Proposed technological partners for facilities under phase 1, 2 and 3 have been identified with the exception of Biopharma products facility and Oncology OSD facility that also require the right technological partners due to the nature of medicine to be manufactured to treat life threatening diseases such as cancer, diabetes among others.
 14. Estimated output capacities for Biopharma products facility and Vaccine manufacturing facilities were overlooked and these have a significant impact on the projected financials of the project such as inaccurate profit and loss due to un specified quantities produced and sold. This also leads to incorrect projected cash flows.
 15. The project intends to partners with several technological partners, however, it would be prudent if letters of intent or draft partnership agreements are included as attachments to the report as proof for the proposed partnership. AS
 16. The proposed facilities were to be set up in Tororo, however, the location has changed to Kampala. There's need to ascertain the actual location of the proposed facilities. BS
 17. Also, from previous discussions, it was indicated that the project site is known. Therefore, discussions on the project site should be more specific. BS
 18. The manufacturing process/ technology process is essential to enable one appreciate the process lay out in the manufacture of the required drugs and vaccines, however, this was not availed. Therefore, Indicative process flows for the different product lines should also be indicated in the technical feasibility. MK
 19. The area required to set up the integrated facility is known however; the proposed plant lay out was overlooked. Therefore, the proposed factory impressions need to be included.
- Layout are not the part of Feasibility
20. Are all the facilities going to be constructed at the same time or they will be phased. If phased, avail the phasing plan and this will aid in mobilizing the required resources to set up the integrated facility in a phased manner.

Response:

While the construction of all the facilities will be undertaken in concurrent manner starting from Q2 2025, the commissioning, qualification, validation and product roll out from the facilities will be done in phased manner

Phase 1 - Oral Solid dosage form

Phase 2 - General Injectable facility

Phase 3 - Biopharma facility

Phase 4 - Vaccine facility

Phase 5 - Oncology OSD facility

21. More clarity is needed on some blocks under common blocks e.g. Animal house blocks and Miscellaneous blocks e.g. training and Induction rooms and Horticulture. What is their significance? -AS

22. The projected financials focused on the profit and loss and these are incomplete. The projected cash flows were not availed hence, ascertaining viability was a challenge. A soft copy of the financial projection incorporating the assumptions is required for further analysis to determine the viability of the project.

23. Also, Provide details of key financial analysis ratios

IRR

Financial Net present value (NPV)

Average Rate of Return (ROI)

Discount Rate

Weighted Average cost of Capital (WACC) if applicable

Payback Back Period

Economic NPV

24. Although the financing requirement is well spelt out in the report, the financing structure that describes how the project is to be financed is not known. Therefore, provide details of the funding plan i.e. who the potential contributors are, and the mode of Investment i.e. equity or debt.

25. Clarity is needed on the regulatory costs which are appearing under both Capital expenditure and operation expenditure. How different are they, shouldn't they be under operation expenditure only?

26. Provide specific details of the projected impact e.g. foreign exchange to be earned/ saved, social economic impact other than jobs created;

Executive summary

Introduction:

The objective of this project is to establish and operate a state-of-the-art green field multi-Product pharmaceutical, Biopharmaceutical and vaccine manufacturing plant in the Republic of Uganda. This plant is designed to address and transform health care needs of Uganda and East African council (EAC) by addressing critical health care challenges and fostering local manufacturing.

Market Analysis

The most prevalent cases of mortality and morbidity in Uganda the most prevalent causes of mortality and morbidity in Uganda are Malaria, Pneumonia, Tuberculosis, Anaemia, Hypertension, Diabetes and Cancer. Uganda is also endemic for all of the Neglected Tropical diseases (NTDs) namely lymphatic filariasis, soil transmitted helminthiasis, schistosomiasis and onchocerciasis and trachoma. Other notable NTDs that remain endemic are Buruli ulcer, leishmaniasis (cutaneous and visceral), leprosy and rabies.

National vaccine coverage is more than 95% for the essential vaccines.

In Uganda, the revenue in the pharmaceuticals market is estimated to reach US \$329.32 m in 2025. The largest market within this industry is Oncology Drugs, which is projected to have a market volume of US\$50.03m in 2025. The revenue is expected to exhibit an annual growth rate (CAGR 2025-2029) of 3.06%, resulting in a market volume of US \$371.58m by 2029.

There are very few local manufacturers for Pharmaceutical products with the capability to cater to Uganda demands and most of the demand is met through imports. There are no local API, vaccine or Mabs manufacturers.

Hence there is large unmet need for essential medicines including vaccines, coupled with significant population growth.

Regulatory requirements

In Uganda, the regulation of human medicinal products is overseen by the National Drug Authority (NDA), which ensures the safety, efficacy, quality, availability and cost means of providing satisfactory healthcare and safeguarding the appropriate use of medicines used within the country.

There are more than 30 published guidelines for various aspects such as cGMP, licensing, import export, registration process, vaccines, clinical trials, distribution practices, recall/ withdrawal of products from the market.

The National Drug Authority (NDA) is yet to have the maturity level 3 like Nigeria, Egypt, South Africa, Rwanda, Senegal, Tanzania and Zimbabwe.

Site selection and infrastructure

The selected site shall have access to adequate power supply, water supply, waste management facilities, transport links, proximity to industrial zones, road connectivity and availability of qualified and experienced manpower.

Technical feasibility

The plant design shall incorporate

OSD and capsule manufacturing

Syrup and liquid manufacturing

Injectable and parenteral manufacturing

Mabs and vaccine manufacturing

Overall site plan shall be of 95,500 sqm. which will include all of the above blocks along with supporting blocks.

The supporting blocks will be dedicated to each manufacturing block to avoid cross contamination and comply with regulatory requirements

Financial feasibility

The overall capex investment for this mega project 571 million USD spread over a period of 3 years for plant commissioning and qualification.

Overall the total operational expenses at 100% capacity utilisation is 335 Million USD.

The overall revenue in year 7 will be 510 Million USD from OSD, general Injectables, biopharmaceutical products, vaccines, oncology OSD and contract manufacturing.

The payback period is 5 years. First and second year losses shall be due to ramp-up & market entry. Full profitability is expected in Year 4-5 with a Gross Profit Margin of ~50-65%. The project IRR is expected at 6%.

Supply chain and Raw material sourcing

The success and longevity of this project will depend on assured and consistent supply of raw materials, APIs, vaccine bulk, Mabs bulk.

Long term agreements with diversified suppliers for API, excipients, vaccine bulk will be important for the manufacturing operations.

Human resources

To operate the facility at 100% capacity it is envisaged that a total of 640 staff from various disciplines such as pharmacy, life sciences, engineering, quality control, quality assurance, administration, finance, accounts, human resource, pharmaceutical and vaccine formulation etc., Skills development, training and development of manpower is important due to the paucity of locally available talent.

Risk assessment

The project is prone to several risk factors such as regulatory uncertainty, government policy shifts, bureaucratic delays and geopolitical instability in EAC region.

Economic risks also exist such as currency fluctuations, inflation, supply chain disruptions, finance access and market demand.

Risk mitigation strategies such as early engagements with the regulatory agencies, public private partnerships, hedging currency risks, strategic supplier agreements along with diversifying revenue streams.

Sustainability

Complying with local environmental rules by segregation and recycling of wastes, handling of hazardous waste, minimising API and solvent wastes will be important along with implementation of energy efficient strategies such as use of solar power, biomass/ biogas utilization, water recycling, rain water harvesting etc.,

HR challenges and mitigation

Human resources have its own challenges such as availability of local skilled workforce, training and capability gaps, attrition etc.,

The challenges can be addressed by demand mapping, staggered hiring, establishment of training and development academy, collaboration with local academy, talent retention schemes etc.,

Strategy for accelerated ROI on the project

The ROI on the project can be accelerated through phased commissioning of production lines, prioritize products and high demand, partner with buyers early, leverage contract manufacturing activities, optimise operational costs, use of hybrid distribution model, avail of government tax incentives.

Project SWOT analysis

The project has its strengths such as financial backing, having a diversified product portfolio, Uganda location, modern infrastructure and state of the art technology.

The weakness for the project include lack of pharmaceutical domain experience, high dependence on imports, skill gaps and high operating costs.

However, the opportunities include growing demand in Uganda and EAC, support from government and international health agencies, regional regulatory harmonization, first mover advantage and green field facility with future ready compliance.

The threats to the project include regulatory and compliance challenges, geopolitical instability, currency fluctuation, import dependency, global competition, product specific challenges and delays in project implementation.

Summary and recommendations

The Sunshine Pharmaceutical Plant project in Uganda is deemed highly viable based on a multi-dimensional feasibility study and information given in this report.

Uganda's pharmaceutical market presents substantial opportunities, with projected revenue reaching US\$329 million by 2025 and strong CAGR, especially in generic drugs, oncology, vaccines, and biopharmaceuticals.

The plant's integrated model, with Oral Solid Dosage (OSD) forms and more complex formulations such as vaccines and biologics, aligns with the market demand and local regulatory evolution under WHO-GMP frameworks.

Resposn Point 20

While the construction of all the facilities will be undertaken in concurrent manner starting from Q2 2025, the commissioning, qualification, validation and product roll out from the facilities will be done in phased manner

Phase 1 - Oral Solid dosage form

Phase 2 - General Injectable facility

Phase 3 - Biopharma facility

Phase 4 - Vaccine facility

Phase 5 - Oncology OSD facility

Point 25

Response: The regulatory Cost shown under capital Expenditure head is for Building, office equipment and other materials required.

The operational expenditure shall cover expenses related to Clinical trials, registration, Liaison and licensures etc.

Query:

11. The production of the different drugs has been justified due to the high dependence of imported medicines (70% imported), increase in prevalence of communicable and non-commonable diseases in the country. However, a comprehensive market trend describing the past and current state of the market for pharmaceutical and biopharmaceutical was over looked. This is key in informing the market size, future market outlook of the industry, factors driving market growth. (quantitative data is required in undertaking the analysis of the market trends)

RESPONSE

1. Market Size & Composition

Total Pharmaceutical Market

Estimated at US\$519million in 2022, up from US\$434mn in 2018—a 4.7% CAGR from 2017–2022

(<https://scapartner.com/2022/01/12/uganda-pharma-market>)

Per Capita Pharmaceutical Spend was around US\$10 in 2017, versus US\$10–US\$11 today

(<https://scapartner.com/2022/01/12/uganda-pharma-market>)

OTC Market Segment

OTC market projected at US\$221mn in 2023, expected to reach US\$240.6mn by 2025, growing at ~9.4% CAGR (2023–2028) .

In 2025, vitamin & mineral products (OTC) will be nearly US\$102mn

(<https://www.statista.com/outlook/hmo/otc-pharmaceuticals/uganda>)

Overall Pharma Revenue

Full-spectrum pharmaceutical market is projected to hit US\$325.9mn in 2025, from a lower base, with a modest 3.4% CAGR projection to reach US\$384.8mn by 2030.

(Note: Some sources vary in market definitions—OTC-only vs prescription + generic.)

2. Local Production & Biopharma Industry

Local manufacturing accounts for ~10% of drug consumption; 90% of pharmaceuticals are imported (mainly from India & China) <https://www.afyanahaki.org/arma-programme/uganda>

The number of domestic manufacturers has risen from 11 in 2009 to ~29 in 2021

<https://bpspubs.onlinelibrary.wiley.com/doi/full/10.1111/bcp.15324>

Key player includes:

Quality Chemical Industries Ltd (Qcil/Cipla): Generated UGX265bn (~US\$70.9mn) revenue by March2024; capacity ~1.2billion pills/year, distributing across 31 African nations <https://www.qcil.com/>

3. Growth Drivers

High Disease Burden — Malaria, HIV/AIDS, TB, and vaccine-preventable diseases remain top health concerns

<https://www.afyanahaki.org/arma-programme/uganda>

Health Spending Surge — Healthcare budget hitting ~7.3% of GDP; pharma expenditure growing ~8.4% per year; estimated at US\$520mn by 2021 (Uganda Investment Authority).

Policy Support — Government incentives include tax breaks, BUBU policy, and import tariffs to aid local production <https://bpspubs.onlinelibrary.wiley.com/doi/full/10.1111/bcp.15324>

Retail Expansion — OTC and self-medication on the rise, driven by convenience and rural demand

<https://www.slideserve.com/meenakshykr/the-uganda-pharmaceutical-market-challenges-trends-and-innovations>

Regional Export Potential — Access to East African Community (EAC) markets (~175mn people) and under-construction pharma industrial parks .

Biopharma Innovation — Investment in mRNA vaccine & biologics capacity via companies like Dei Pharma (Wikipedia).

4. Outlook & Forecast (2023–2030)

Total market to approach ~US\$520mn by 2022, projected to reach US\$384–520mn by 2025 depending on source.

OTC segment: set to grow to US\$240mn by 2025 (~+9% CAGR) .

Exports & regional share: Opportunity to reduce import dependence; EAC regional manufacturing plan targets ≥50% local procurement

<https://www.monitor.co.ug/uganda/special-reports/the-state-of-african-pharmaceuticals-3552908>

Biotech leap: mRNA & vaccine production rollout could shift market dynamics.

5. Constraints & Risks

Import dependence: 90% reliance on imports; raw materials from India/China .

Financing gap: High cost of capital and 18–24 month payback for greenfield production facilities

<https://www.monitor.co.ug/uganda/special-reports/the-state-of-african-pharmaceuticals-3552908>

Regulatory/Quality Risks: Prevalence of counterfeits & substandard drugs; regulatory enforcement still developing.

6. Summary Table

Conclusion & Implications

Strong growth trajectory in both prescription and OTC segments—especially with rising self-medication.

Growing domestic capacity, led by companies like Qcil and Dei Pharma, is transforming Uganda from importer to emerging exporter.

Policy backing and EAC integration bolster long-term volume and export potential.

Remaining challenges include heavy import reliance, financing hurdles, and quality control—but investments underway are addressing these.

Opportunity window for investors and local manufacturers lies in generic drugs, vaccines, mRNA tech, and regional distribution platforms.

Metric | Value / Forecast

Pharmaceutical Market (2022) | US\$519mn

OTC Market (2025) | US\$221–241mn, CAGR ~9.4%

Total Pharma Revenue (2025) | US\$326mn

Manufacturing Share | ~10% domestic, 90% imports

Local Manufacturers (2021) | 29 firms

Leading Local Producer | Quality Chemical (Rev. US\$70.9mn in 2024)

Market Growth Drivers | Disease burden, GDP health spend, policy support

Key Challenges | Import dependency, financing costs, quality risk

The Total Covered Area for the facility is 95,500 Sqm. However, facility Lay outs are out of scope of this report.

Layout may be included in the final agreed report in future.

Point No-21

Animal House Block(AH):

In case of Biologics and vaccine essentially some of the test shall be carried out on small animals' like- Mice, Guinea Pigs, Rabbits and Wistar rats as per regulatory guide lines.

For housing of these experimental animals this block is mentioned in the report.

However, if there will be any contract testing Organisation (CTO) for in vivo studies this block will not be considered.

Miscellaneous blocks:

The training and induction room indicated in the report is a part of quality assurance systems (Technical trainings) .This facility shall be used for the class room training of existing staff and new joiners as per the training schedule laid by quality Assurance department.

Trainings and learning is important part of any Bio manufacturing setup and lot of emphasis on training needs is laid by regulatory bodies like US FDA, EMA,WHO and ICH guide lines.

Horticulture: Horticulture, gardening, sewage treatment and Effluent treatment are essential for environment and health protection in the Biopharma industry.

Essential environmental clearance shall be required for the factory Licensure procedures before start of any manufacturing activities.

FEASIBILITY REPORT FOR INTEGRATED PHARMA AND BIOPHARMACEUTICAL PROJECT FOR UGANDA

Prepared for:

SUNSHINE MEDICAL PTE LTD

DOCUMENT NUMBER: BB//SS/FSR/11/2025 DATED 17.04.2025

TABLE OF CONTENTS

Executive Summary

Introduction

The objective of this project is to establish and operate a state-of-the-art green field multi-Product pharmaceutical, Biopharmaceutical and vaccine manufacturing plant in the Republic of Uganda. This plant is designed to address and transform health care needs of Uganda and East African council (EAC) by addressing critical health care challenges and fostering local manufacturing.

To realise the above said goals and to address the critical health care needs of Uganda, pharmaceutical, Biopharmaceutical and vaccine manufacturing facility shall be established in concurrent manner.

Oral Solid Dosage (OSD) form shall be established by integrating state-of-the-art manufacturing technologies to ensure efficiency, quality, and scalability of wide range of high-demand solid dosage forms, including tablets, capsules, syrups, and advanced technologies such as soft gel capsules.

General Injectable facility will focus on manufacturing sterile pharmaceutical injectable-grade products, targeting key therapeutic segments.

Biopharma Products facility focuses exclusively on the formulation and fill- finish of biopharmaceutical products. This facility shall address the increasing demand for biologics, including Monoclonal antibodies (mAbs), Hormones, Insulin, analogs, and other therapeutic proteins.

Formulation and fill-finish of vaccines facility shall be designed to cater to both routine immunization programs and outbreak vaccines.

Oncology OSD facility shall be designed for highly potent cancer drugs.

While the construction of all the facilities will be undertaken in concurrent manner starting from Q2 2025, the commissioning, qualification, validation and product roll out from the facilities will be done in phased manner

Phase 1 - Oral Solid dosage form

Phase 2 - General Injectable facility

Phase 3 - Biopharma facility

Phase 4 - Vaccine facility

Uganda's pharmaceutical industry is a key component of the country's healthcare system, with demand steadily increasing due to population growth, rising disease burdens, and government initiatives to improve healthcare access.

The disease burden in Uganda is similar to other less developed African countries, with communicable diseases accounting for roughly 67% of the total burden.

In 2021 preventive chemotherapy of 133 million population was done against the NTD.

Expanded Program on Immunisation the coverage for DTP group, Polio, Rota virus, Pneumococcal vaccines is more than 80%, taking into consideration the birth Cohort there is a great potential for vaccines and Biopharmaceuticals. The birth cohort is 2024 is reported to be 1,000 people in Uganda was 34.55 in 2024.

Malaria vaccine immunisation is also potential in the vaccine segment with reported cases (300/1000)

Objective:

The objective of this report is to comprehensively study the feasibility and to assess the potential for establishing a sustainable and efficient pharmaceutical, biopharmaceutical and vaccine manufacturing plant in Uganda.

BioBridge is requested to provide a proposal for feasibility study services, which include:

Market analysis

Regulatory requirements

Site selection and infrastructure

Technical feasibility

Financial feasibility

Supply chain and raw material sourcing

Human resources

Risk assessment

Sustainability

Key HR challenges

Strategies for accelerated ROI in the project

SWOT analysis

Summary and recommendations

Goals

Health Care Access: To enhance Healthcare access by manufacturing pharmaceuticals, Biologics and vaccines locally thereby reducing the dependency on imported medicines and biologics.

Health Care needs: To address regional health care needs by manufacturing medicinal products which are required to treat most prevalent diseases in the region such as Malaria, Tuberculosis and AIDS.

Economic growth: To foster Economic growth by providing employment opportunity to local population and attracting global investors and venture capitalists.

Sustainability: To establish a sustainable pharma base in Uganda which is reliable and self-sufficient.

Supply Chain Reliability: Building a secure and efficient supply chain to source raw materials, transport finished products, and ensure timely deliveries to end users.

Stakeholder Satisfaction: Ensuring customer satisfaction by providing consistent and reliable products while maintaining a favourable relationship with employees, investors, and the local community.

Solution:

To realise the above said goals and to address the critical health care needs of Uganda, pharmaceutical, Biopharmaceutical and vaccine manufacturing facility shall be established in concurrent manner.

Oral Solid Dosage (OSD) form shall be established by integrating state-of-the-art manufacturing technologies to ensure efficiency, quality, and scalability of wide range of high-demand solid dosage forms, including tablets, capsules, syrups, and advanced technologies such as soft gel capsules.

General Injectables facility will focus on manufacturing sterile pharmaceutical injectable-grade products, targeting key therapeutic segments.

Biopharma Products facility focuses exclusively on the formulation and fill- finish of biopharmaceutical products. This facility shall address the increasing demand for biologics, including Monoclonal antibodies (mAbs), Hormones, Insulin, analogs, and other therapeutic proteins.

Formulation and fill-finish of vaccines facility shall be designed to cater to both routine immunization programs and outbreak vaccines.

Oncology OSD facility shall be designed for highly potent cancer drugs.

While the construction of all the facilities will be undertaken in concurrent manner starting from Q2 2025, the commissioning, qualification, validation and product roll out from the facilities will be done in phased manner

Phase 1 - Oral Solid dosage form

Phase 2 - General Injectable facility

Phase 3 - Biopharma facility

Phase 4 - Vaccine facility

Phase 5 - Oncology OSD facility

East Africa, like the rest of Africa, faces a growing demand for vaccines, particularly as it works to strengthen its vaccine supply chain and boost domestic capabilities to meet the needs of its population.

The most prevalent causes of mortality and morbidity in Uganda are

Malaria, Pneumonia, Tuberculosis, Anaemia, Hypertension, Diabetes and Cancer.

Uganda is endemic for all of the NTDs amenable to preventive chemotherapy through mass drug administration (MDA), namely lymphatic filariasis, soil-transmitted helminthiasis, schistosomiasis and onchocerciasis and trachoma. Other notable NTDs that remain endemic are Buruli ulcer, leishmaniasis (cutaneous and visceral), leprosy and rabies

2.0 DETAILED FEASIBILITY REPORT

a) Market Analysis:

i) Demand for pharmaceutical products in Uganda

Uganda's pharmaceutical industry is a key component of the country's healthcare system, with demand steadily increasing due to population growth, rising disease burdens, and government initiatives to improve healthcare access.

The disease burden in Uganda is similar to other less developed African countries, with communicable diseases accounting for roughly 67% of the total burden.

Uganda's communicable disease burden is dominated by infectious and parasitic diseases. Malaria is considered as the major cause of deaths in the country.

The most prevalent causes of mortality and morbidity in Uganda are

Malaria, Pneumonia, Tuberculosis, Anaemia, Hypertension, Diabetes and Cancer.

Fig No.: 1

Malaria:

Comparison of Malaria mortality rate (2021), compared to 2015 baseline

TUBERCULOSIS –

Estimated mortality in the African Region.

TB treatment coverage in African region

Human Immunodeficiency Virus (HIV)

Number of People living with HIV and number of cases prevented in the Africa region

Cardiovascular diseases (CVDs)

Estimated deaths related to cardiovascular diseases in the African region in 2019

Chronic respiratory diseases (CRD)

Estimated deaths related to chronic respiratory diseases in the African Region in 2019

Neglected tropical diseases

Uganda is endemic for all of the NTDs amenable to preventive chemotherapy through mass drug administration (MDA), namely lymphatic filariasis, soil-transmitted helminthiasis, schistosomiasis and onchocerciasis and trachoma. Other notable NTDs that remain endemic are Buruli ulcer, leishmaniasis (cutaneous and visceral), leprosy and rabies

EXPANDED PROGRAMME ON IMMUNIZATION IN CHILDREN

Estimates of national vaccination coverage of select antigens among countries in the Eastern and Southern African Sub Region in 2021

Measles Rubella –Coverage in African Region

Yellow Fever - Total confirmed cases on yellow fever since 2015.

CANCER

Trends of Cancer Patients in Uganda: Fig:2

Fig:3

The cancer burden by type of cancer diagnosed among patients

MARKET VALUE:

In Uganda, the revenue in the pharmaceuticals market is estimated to reach US\$329.32m in 2025.

The largest market within this industry is Oncology Drugs, which is projected to have a market volume of US\$50.03m in 2025.

The revenue is expected to exhibit an annual growth rate (CAGR 2025-2029) of 3.06%, resulting in a market volume of US\$371.58m by 2029.

Uganda's pharmaceutical market is experiencing a surge in demand for affordable generic medications.

The East Africa generic drug market reached USD 2.4 billion in 2024 and is expected to exhibit a CAGR of 6.72% during 2025-2033.

Competitive Landscape:

East Africa Pharma manufacturing- An Overview

Around 35 active manufacturers (members of FEAPM); 2 facilities with WHO cGMP approval and pre-qualified products

Primarily compounding and formulation of most dosage forms including infusions

Almost all raw materials imported

High dependency on imported finished pharmaceutical products

Focus on WHO list of essential medicines

No API manufacturing

Increasingly well-regulated (NDA, PPB, TFDA)

Trade is mostly intra-East Africa

Companies currently having manufacturing base in Uganda

1. CIPLA Quality Chemicals Industries Limited, joint venture between a local and international pharmaceutical company, is cGMP certified manufacturing Anti-retro viral, anti-malarial and hepatitis B drugs, exports to Sub-Saharan countries and supplies drugs to the Global Fund

2. Kampala Pharmaceutical Industries Limited, is a local manufacturer and an affiliate of the Aga Khan development network. Product range includes analgesics, anti-asthma, anti-diabetic, anti-malarial, anti-parasites, antibiotics, cardiovascular drugs, cold remedies & Nutraceuticals

3. Beta Health Care Uganda Limited, an affiliate of Aspen Group, exports its products to Tanzania, Rwanda, Burundi, Ethiopia, Sudan, Somalia, Mauritius and West Africa

Key players in the market are actively implementing various strategies to expand their reach and market share by:

Enhancing their production capabilities, both in terms of volume and the range of products.

Investments in advanced manufacturing facilities to increase output and meet the rising demand for generic drugs.

Creating more efficient supply chains and distribution networks to ensure wider availability of their

products. They are reaching out to remote areas and partnering with local distributors to improve access. Forming alliances with local manufacturers, international partners, and healthcare providers to extend their reach and enhance their market position.

Knowledge and technology transfer, through Joint ventures, Alliances thereby strengthening local capacities.

Key Pharma Sector Data Estimate (Market share, Generic, Branded pharmaceuticals)

Table No.: 1

Demand for Pharmaceutical Products in Uganda

The demand for pharmaceutical products in Uganda is driven by various factors, including an increasing prevalence of both communicable and non-communicable diseases (NCDs), an expanding healthcare infrastructure, and growing government support for local production.

Below is an analysis of key therapeutic areas:

a) Oral Solid Dosage Forms (Tablets and Capsules)

Oral solid dosage forms constitute the majority of prescription medications in Uganda, covering a range of treatments from antibiotics to anti-hypertensives.

Uganda has a few established pharmaceutical manufacturers producing these drugs.

Despite local manufacturing efforts, a large portion of Uganda's medicine supply is still imported due to insufficient production capacity and the need for diverse active pharmaceutical ingredients (APIs).

Expanding local production capabilities, especially for essential generics, could help meet growing demand and reduce reliance on imports.

b) Oncology Treatments

Cancer cases in Uganda have been rising significantly, with estimates from the Uganda Cancer Institute (UCI) indicating an annual increase in new cases (Refer to Fig Nos.2&3.).

Currently, oncology drugs are almost entirely imported, making treatment expensive and often inaccessible to many patients.

There is an opportunity for local pharmaceutical manufacturers to invest in cancer drug production, particularly generic chemotherapy drugs, which could lower costs and improve accessibility and health care.

The Ugandan government and international health organizations are increasingly investing in cancer treatment centres, further boosting the demand for oncology drugs

c) Vaccines

Uganda has a demand for vaccines (approx. 1.7 million doses per annum for essential vaccines) due to childhood immunization programs, seasonal disease outbreaks, and global initiatives like the Global Vaccine Alliance (GAVI).

The country currently relies on imports for nearly all its vaccines, which poses challenges such as supply chain disruptions and high procurement costs.

Government efforts to establish vaccine production facilities could significantly boost the local pharmaceutical industry and create self-sufficiency in vaccine supply.

d) Monoclonal Antibodies (mAbs)

Monoclonal antibodies are used in cancer treatment, autoimmune diseases, and infectious diseases like COVID-19.

Uganda currently lacks the infrastructure for manufacturing biologic drugs & mAbs, entirely dependent on imports.

Drivers of Pharma market:

Rapid expansion of local pharmaceutical manufacturing capacities.

East Africa is experiencing a significant boost in its pharmaceutical production driven by a combination of increased domestic and international investment and initiatives, improved technological capabilities, and a strategic push for self-sufficiency in pharmaceutical supply. Furthermore, there is a rising awareness among healthcare professionals and patients about the comparable efficacy of generic drugs to brand-name counterparts.

Generic drug manufacturers are significantly strengthening their distribution networks to improve product reach. This expanded distribution is further facilitated by technological advancements, such as digital platforms and delivery systems, enabling broader dissemination of generic drugs across the region, fostering overall the market growth.

Favourable Government Initiatives

Governments across East Africa are progressively acknowledging the role of generic drugs in achieving healthcare affordability and accessibility. They are implementing regulatory reforms to simplify the approval process, thereby encouraging their use by streamlining this process, governments are reducing barriers to entry, making it easier for generic manufacturers to bring their products to market.

Moreover, there is an increase in governmental efforts to boost public awareness about the efficacy and affordability of generic drugs. Despite their lower cost, generic drugs are equally effective as their branded counterparts.

EAC Pharma – Opportunities

Large unmet need for essential medicines

Significant population growth anticipated

Double disease burden (growth of chronic diseases):

NCDs are predicted to account for 40% of illnesses & for 42% of deaths (5.1 million) by 2030 (WHO Global Health Estimates, 2013)

Growing middle class willing to pay for better treatment

New models of care being designed (e.g. PPP, medical insurance, etc.)

Existing pharmaceutical production base & enabling regulatory environment

African traditional and herbal medicines as a market niche

No dominant players

Political will and action

EAC Pharma – Challenges

Negative perceptions of locally manufactured products

Lack of capacity to manufacture advanced formulations due to a skills gap on product development and formulation expertise

High cost of borrowing (20-30%)

High cost of operations e.g. finance, utilities, infrastructure

Lack of market data

Poor and unreliable infrastructure (roads, utilities, etc)

Under resourced and weak institutions (Civil society, Regulatory agencies, etc..)

Vaccines Market Analysis:

Immunization is a proven tool for controlling and eliminating life-threatening infectious diseases and is estimated to avert millions of deaths each year. Universal immunization of children against eight vaccine-preventable diseases [tuberculosis, diphtheria, whooping cough (pertussis), tetanus, hepatitis B, respiratory diseases caused by Haemophilus influenzae, polio, and measles] is crucial to reducing infant and child mortality. J Health Popul Nutr . 2013 Mar;31(1):118–129. Do

Immunisation Schedule in Uganda:

Routine immunization schedule for Children below the age of one year cover vaccines for following preventable diseases

Oral Polio vaccine, BCG, Pentavalent, Pneumococcal 10 valent, Rotavirus vaccine, Injectable Polio vaccine (14 weeks of age), Measles vaccine & HPV (Female Children) (Republic of Uganda, Ministry of Health/UNICEF Report)

Based on the birth cohort in Uganda (1.7 million per year) the requirements of different vaccines are as under based on the government Immunization program:

Ref: <https://www.gavi.org/programmes-impact/country-hub/africa/uganda>

Table No.:2

Upcoming vaccines which shall be targeted in the future

mRNA based vaccines for pandemic preparedness, RSV (Respiratory Syncytial virus) vaccine, Recombinant Tuberculosis vaccine (under development globally), Rabies vaccine etc.

Demand of vaccines products in Uganda & EAC region:

Eastern Africa is experiencing a surge in demand for vaccines, driven by increasing awareness and government initiatives to improve healthcare access.

The Vaccines market in Eastern Africa is anticipated to achieve a revenue of US\$463.65m in 2025.

Looking ahead, the market is expected to exhibit a compound annual growth rate (CAGR) of 4.98% from 2025 to 2029, leading to a market volume of US\$377.97m by 2029.

Key market trends, challenges, and opportunities:

One of the key trends in the Vaccines segment in Eastern Africa and Uganda is the increasing availability of vaccines.

Pharmaceutical companies are expanding their operations in the region, and governments are working to improve vaccine distribution networks. This has made vaccines more accessible to people living in remote areas.

Secondly, in the market there is growing demand for new and innovative vaccines. As more people become vaccinated against common diseases, there is a need for vaccines that can prevent emerging infectious diseases.

Pharmaceutical companies are investing in research and development to create new vaccines that can address these challenges.

East Africa, like the rest of Africa, faces a growing demand for vaccines, particularly as it works to strengthen its vaccine supply chain and boost domestic capabilities to meet the needs of its population.

Challenges and Opportunities:

Challenges include the provision of vaccines in rural locations hampered by inadequate cold chain infrastructure, and vaccination acceptance rates that are impacted by cultural and religious beliefs.

Besides, there are also market opportunities, such as increasing research and development (R&D) spending for novel vaccines and technological advancements.

Growing Support from Various Organizations:

The support from international bodies such as the World Health Organization (WHO), World Bank, the United Nations Children's Fund (UNICEF), and the Global Alliance for Vaccines and Immunization (GAVI) is indispensable for the East African vaccine market. These organizations provide not only financial aid but also logistical support, crucial for the procurement and distribution of vaccines in the region.

2. Competitive Analysis of the Existing Pharmaceutical Market

Uganda's pharmaceutical market is composed of both local manufacturers and international suppliers. The competitive landscape is shaped by several key factors:

a) Local Pharmaceutical Manufacturers

Uganda has a small but growing pharmaceutical manufacturing industry.

Local manufacturers face challenges such as high production costs, limited access to raw materials, and competition from imported generics.

b) Import Dependence and Foreign Suppliers

Uganda imports about 70% of its pharmaceuticals, with India and China being the dominant suppliers.

International pharmaceutical companies have a strong presence in Uganda through distributors.

The high reliance on imports creates challenges in affordability, availability, and quality control.

c) Policy and Market Protection

Uganda has introduced policies like the "Buy Uganda, Build Uganda" (BUBU) initiative, which promotes local manufacturing.

However, the local pharmaceutical industry struggles to compete with cheaper imports, and implementation of these policies remains inconsistent.

3. Key Market Trends, Challenges, and Opportunities

a) Market Trends

Regulatory Harmonization in the EAC

The East African Community (EAC) is working towards regulatory harmonization, allowing Ugandan manufacturers to access larger regional markets.

Harmonization simplifies drug registration processes and could enhance trade within the region.

Growing Non-Communicable Disease (NCD) Burden

There is an increasing prevalence of NCDs such as diabetes, hypertension, and cancer in Uganda.

This shift is driving demand for chronic disease medications, which presents opportunities for local manufacturers to diversify production.

Expansion of Health Infrastructure

The Ugandan government is investing in expanding hospitals, clinics, and specialized treatment centres.

These investments are increasing the demand for pharmaceuticals, particularly in specialized areas like oncology and vaccines.

b) Key Challenges

Limited Access to Finance

Pharmaceutical manufacturing requires large capital investments for facility upgrades, research, and compliance with regulatory standards.

Access to affordable financing remains a major barrier for Ugandan pharmaceutical firms.

Dependence on Imported Raw Materials

Uganda imports most of its Active Pharmaceutical Ingredients (APIs) from India and China.

This dependence makes local manufacturers vulnerable to global supply chain disruptions.

Regulatory and Quality Compliance

Meeting international Good Manufacturing Practices (GMP) standards is essential for market expansion but requires costly upgrades.

Non-compliance can limit Ugandan pharmaceutical companies' ability to export to international markets

Shortage of Skilled Workforce

There is a lack of specialized professionals in pharmaceutical research, manufacturing, and regulatory affairs.

Developing a skilled workforce through training and academic programs is critical for industry growth.

c) Opportunities for Growth

Investment in Local Production

Increasing local manufacturing, especially in essential medicines and specialty areas like oncology and vaccines, can enhance Uganda's pharmaceutical security.

Public-Private Partnerships (PPPs) could play a crucial role in driving investment.

Regional Expansion and Export Potential

The EAC harmonization efforts present an opportunity for Ugandan pharmaceutical companies to expand their

reach beyond the domestic market.

By meeting international regulatory standards, local manufacturers could increase exports to neighbouring countries.

Public-Private Collaborations

Government initiatives supporting pharmaceutical production can help develop infrastructure and provide financial incentives for local companies.

Partnerships with international pharmaceutical firms could help bring technology and expertise to Uganda.

Biopharmaceutical and Vaccine Development

Investing in biologics and vaccine production could position Uganda as a leader in high-value pharmaceutical production.

Establishing local capacity for monoclonal antibody production could reduce reliance on costly imports.

B. Overview of the Ugandan Pharmaceutical Regulatory Framework and EAC Regulatory Systems

Introduction:

In Uganda, the regulation of human medicinal products is overseen by the National Drug Authority (NDA), which ensures the safety, efficacy, quality, availability and cost means of providing satisfactory healthcare and safeguarding the appropriate use of medicines used within the country.

The legal framework governing these activities is established by the National Drug Policy and Authority Act, Cap 206.

The National Drug Authority (NDA) was established in 1993 by the National Drug Policy and Authority Statute which in 2000 206 of the Laws of Uganda (2000 Edition).

The EAC Guide on Good Manufacturing Practices (GMP) is based on the World Health Organization (WHO) Good Manufacturing Practices guidelines in the WHO Technical Report Series No. 961, 2011. This guide also refers to the Pharmaceutical Inspection Convention Scheme (PIC/S) guide PE 009-9.

Table No.:3

Guidelines: National Drug Authority, Uganda- Human medicinal guideline

■

Maturity level of NDA (Uganda) with respect to WHO Qualification

Maturity Level 3, which is a key benchmark for drug regulatory bodies, ensures that national authorities can effectively oversee drug safety, efficacy, and quality, aligning with international norms.

The National Drug Authority (NDA) is seeking to overcome legal and regulatory challenges that have hindered its progress toward achieving Maturity Level 3, a global standard for drug regulators.

Only eight African countries have currently attained this status, making it a significant goal for Uganda. These include, Egypt, Rwanda, Senegal, Ghana, Nigeria, South Africa, Tanzania and Zimbabwe.

Key Regulatory Requirements

In Uganda, the journey of a new drug from conception to market involves a systematic approval process regulated by several governing bodies, predominantly the National Drug Authority (NDA).

Preclinical and Clinical Trials:

The process begins with preclinical studies, where laboratory and animal testing evaluate the drug's safety and efficacy. This stage is crucial, as it provides preliminary data that informs the next phases of research and development. Pharmaceutical companies need to document their findings and prepare a comprehensive submission package for the NDA.

Conducting clinical trials in Uganda requires prior authorization from the NDA.

Researchers, organizations must adhere to the "Guidelines for the Conduct of Clinical Trials in Uganda," which detail the procedures for submission, review, and approval of clinical trial applications. ■

Compliance with Good Clinical Practice (GCP) is mandatory, as outlined in the "Guidelines on Good Clinical Practice in the Conduct of Clinical Trials Involving Human Participants." ■

After completing the clinical trials, the pharmaceutical company must submit a New Drug Application (NDA) to the NDA, including all research data, manufacturing details, and proposed labelling.

Once the NDA reviews the application and finds it satisfactory, it grants approval for the drug to be marketed.

Good Manufacturing Practice (GMP):

Manufacturers of medicinal products must comply with GMP standards to ensure product quality. The NDA provides detailed guidelines, including "Guidelines on Good Manufacturing Practice for Medicinal Products Part I – Basic Requirements for Medicinal Products." ■

All human medicinal products must be registered with the NDA before they can be marketed or distributed in Uganda. The registration process involves a scientific evaluation of the product's safety, efficacy, and quality.

GMP Inspection:

National Drug Authority (NDA) is the regulatory body responsible for overseeing the compliance of pharmaceutical companies with GMP standards.

Regular GMP inspections and audits are conducted as one of the requirements for registration of medicinal products in the EAC.

The NDA conducts comprehensive evaluations to verify that facilities meet the specified criteria for manufacturing processes, hygiene, and personnel training.

Inspection involves review of documents, records, facilities and any other resources to assess their conformity to the requirements of EAC GMP of medicinal products.

Any non-compliance can result in severe penalties, including the suspension or revocation of manufacturing licenses.

Importation and Exportation:

The NDA regulates the import and export of drugs and pharmaceutical raw materials.

Drugs imported must be registered unless given special clearance by the NDA under Sec 8(4) NDPA (National drug policy & Authority) by NDA.

The import permit may be:

Annual import permit -which is issued for regular imports like pharmaceutical manufacturers or any organization, retail pharmacies, wholesale premises, that regularly imports drugs and other related substances. Ministry of Health of Uganda and its affiliated units may also apply for an annual import permit.

Provisional import permit is issued to non-regular importers who may import drugs, for some reasons.

The provisional import permit is issued per consignment. This usually applies to the organizations, which receive donations, physicians or individuals who may for specified reasons need to bring limited quantities of specialized drugs that are not available in the country. The permit is valid for one month.

Licensing:

Entities involved in the manufacture of pharmaceuticals must obtain appropriate licenses from the NDA. ■

Import License: (Form-24)

Eligibility to apply for import license: A licensed person (a person holding license to operate pharmacy or for manufacture drugs).

Import license is valid for one year and is valid within the calendar year within which it is issued.

Verification certificate: A consignment of drugs to be imported into Uganda shall before importation, be issued with a verification certificate (Form-25) by the NDA basing on the application submitted in this regard in Form-26.

Stability Data:

In Uganda, the National Drug Authority (NDA) requires stability data as part of the regulatory

requirements for pharmaceutical and biopharmaceutical products, ensuring quality, safety, and efficacy, and mandates that all medicinal products meet acceptable standards.

The NDA requires that applicants for drug registration provide results of stability testing, which is crucial for determining the shelf-life and storage conditions of the product.

Applicants need to submit all relevant stability data as part of the registration application.

The stability studies will determine the appropriate storage conditions for the product, including temperature and humidity, and these conditions must be reflected on the product label.

The product label must include an expiry date and storage instructions based on the stability data.

Stability studies should include Storage conditions i.e temperature and relative humidity for accelerated and stress conditions.

Stability studies should be done in accordance or with reference to WHO TRS 987, WHO TRS 953 Annex 2, WHO TRS 962 Annex 3, ICH Q1A and ICH Q5C guidelines.

A minimum of twelve months data at the time of submission should be provided in cases where storage periods greater than six months are requested.

For storage periods of less than six months, the stability data should cover the whole proposed shelf life.

The stability studies should be submitted in controlled documentation.

Post-approval stability program should include the stability program or stability commitment to be carried out once the drug product is on the market, including the number of batches to be included in the study each year and the tests to be performed.

These results should be submitted periodically to update the information on the stability of the drug product.

The stability of each dosage form should be separately documented.

Stability data submitted should be for at least three consecutive batches and include the following: Information on stability of drug product, quality control methods and rationale for the choice of tests for determining stability.

Information on the dates of manufacture of the lots, the lot numbers, the vial and dose size, and the scale of production.

For lyophilized products, the data supporting the shelf-life of the product reconstitution should be included.

If the drug product is frozen, data supporting the stability of the product through a stated number of freeze-thaw cycles should be provided.

Drugs Registration in Uganda:

All drugs to be manufactured or imported into Uganda have to be registered with the National Drug Authority, Uganda. A person who intends to manufacture, import or export a product shall, prior to the manufacture, importation or exportation of the product, apply to the Authority for registration of the product.

The registration process involves:

NDA inspection & approval of the manufacturing facility.

Validity of registration:

The Authority shall issue for the first registration, a certificate of registration which shall be valid for five years.

The holder of a certificate of registration shall pay an annual retention fee prescribed by the Authority for maintaining the registered human or veterinary drug or preparation, vaccine or other immunological products or surgical instrument, on the Register.

A certificate for renewal of registration shall be valid for one year from the date of issue.

The certificate of registration issued under these Regulations shall be kept at the premises of the holder of the certificate of registration.

The holder of a certificate of registration shall monitor the safety and effectiveness of the registered human or veterinary drug or preparation, vaccine or other immunological products or surgical instrument while on the market in Uganda and shall submit periodic reports as may be prescribed by the Authority.

The registration of a human or veterinary drug or preparation, vaccine or other immunological products or surgical instrument under these Regulations shall be valid except where the registration is suspended or cancelled by the Authority or is terminated by the holder of the certificate of registration.

Table No.:4

Marketing Authorisation Time lines:

Registration Timeline: 12 to 18 months

Post-Marketing Surveillance and Pharmacovigilance:

Under the National Drug Policy and Authority (NPD &A) Act (1993) the Uganda National Pharmacovigilance Centre (NPC) is responsible for PV efforts in the country and mandates the National Drug Authority (NDA) to monitor the safety, efficacy and quality of medicines.

Risk Assessment

Risk assessment is a crucial regulatory requirement, ensuring product safety, efficacy, and quality, and safeguarding public health. Proactive risk identification and mitigation, through methodologies like Quality Risk Management (QRM), are essential for regulatory compliance and building trust with stakeholders.

Manufacturers would be required to conduct a risk assessment on critical production and quality control processes and thereafter develop a mitigation plan whose effectiveness would be monitored by the regulator.

Table No.:5

Regulation Framework Timelines:

ii. Environmental and Safety Regulations Applicable to Pharmaceutical Manufacturing in Uganda

Uganda's regulatory framework ensures that pharmaceutical production safeguards human health, worker safety, and environmental sustainability.

Environmental Compliance

Environmental oversight in Uganda is primarily the responsibility of the National Environment Management Authority (NEMA). Under the National Environment Act, 2019, all industrial and manufacturing projects, including pharmaceutical facilities, are required to undertake an Environmental and Social Impact Assessment (ESIA) as a prerequisite for licensing and construction. The ESIA must identify potential environmental risks and outline mitigation strategies, with particular attention to waste management, water usage, emissions, and impacts on surrounding communities.

Pharmaceutical facilities must install and maintain Effluent Treatment Plants (ETPs) to process wastewater before discharge. Compliance with the Environmental Management (Waste Management) Regulations ensures proper handling of both hazardous and non-hazardous solid and liquid waste, especially chemical residues, solvents, and expired or rejected pharmaceutical products. The facility must also adhere to Uganda's obligations under the Basel Convention on the control of transboundary movements of hazardous waste.

Safety and Occupational Health Standards

The National Drug Authority (NDA) regulates the pharmaceutical sector and enforces Good Manufacturing Practices (GMP), including protocols that safeguard worker and product safety throughout the production lifecycle. This includes facility design to minimize cross-contamination, controlled cleanroom environments, and safe material handling procedures.

In parallel, the Occupational Safety and Health Act, 2006, administered by the Ministry of Gender, Labour and Social Development, mandates comprehensive safety practices in the workplace. Employers must implement hazard identification and risk mitigation strategies, ensure employee training, and provide Personal Protective Equipment (PPE) and emergency response systems. All operations must include clearly marked emergency exits, fire suppression systems, first aid facilities, and regular safety drills. Regular inspections and audits are conducted by both NDA and the Ministry of Labour to verify compliance.

Strategic Considerations

Full regulatory compliance not only avoids legal penalties and operational delays but also enhances the facility's reputation among stakeholders and investors. Additionally, adherence to these regulations supports sustainable operations and positions the facility for future certification under global quality and safety systems, enabling access to regional and international markets.

Table No.: 6

iii. Overview of EAC Regulatory Systems for Key Therapeutic Areas

General Observations on the EAC Medicines Regulatory Framework

Harmonization Framework: The EAC Medicines Regulatory Harmonization (MRH) Programme supports joint product assessments, GMP inspections, and reliance pathways to reduce duplication across Partner States.

National Regulatory Authorities (NRAs): While each EAC country retains autonomy (e.g., Kenya PPB, Uganda NDA, Rwanda FDA), they collaborate extensively on shared regulatory functions.

Global Alignment: Reliance on WHO Prequalification, Global Fund procurement standards, AVAREF for clinical trials, and engagement with the African Medicines Agency (AMA) for future alignment.

C. Site Selection and Infrastructure

i. Site Selection Criteria

a) Proximity to Raw Materials & Suppliers

Most of the Active Pharmaceutical Ingredients (APIs) and excipients used in pharmaceutical production in Africa are imported (mainly from India and China).

Ideal site locations:

Close to international ports, airports, or dry ports to reduce import lead times.

Access to local packaging material manufacturers to lower supply chain dependency.

Industrial zones with chemical and biotech suppliers to ensure consistent raw material availability.

b) Logistics & Transportation Considerations

Proximity to major highways, rail networks, and ports to facilitate raw material import and product distribution.

Cold chain logistics is crucial for vaccines and biologics, requiring locations near temperature-controlled warehouses and transport hubs.

Close to key healthcare markets to reduce distribution delays, especially for essential medicines.

c) Utilities & Infrastructure

Electricity: Reliable power supply is critical, especially for Injectables, vaccine production, and sterile drug manufacturing. Backup generators, UPS systems, and solar energy solutions should be considered.

Water Supply & Treatment:

High-quality water sources for pharmaceutical processing, purification, and cleaning.

Reverse Osmosis (RO) & Water for Injection (WFI) systems for injectable production.

Effluent treatment plants (ETP) and bio-waste disposal facilities for environmental compliance.

Air Filtration & HVAC Systems:

ISO-classified cleanrooms (ISO 5, ISO 6, ISO 7, ISO 8) for sterile and injectable production.

High-Efficiency Particulate Air (HEPA) filters and humidity-controlled areas for tablet and capsule manufacturing.

d) Skilled Workforce Availability

Proximity to universities and research institutions that offer pharmaceutical, biotechnology, and engineering programs.

Training partnerships with international pharmaceutical firms to build local expertise.

Employee housing and transport accessibility to attract and retain skilled professionals.

2. Infrastructure Requirements

a) Facility Layout & Zoning

Segregated production zones for different dosage forms:

OSD (Oral Solid Dosage): Tablets, capsules.

Syrups & Liquids: Bottled formulations.

Injectables & Vaccines: Requires containment cleanrooms and sterile environments.

Dedicated cleanroom areas for sensitive processes such as sterile drug filling and vaccine formulation.

Material & personnel movement control to prevent cross-contamination.

b) Manufacturing Equipment & Technology Integration

Automated production lines for efficiency and compliance with GMP standards.

SCADA (Supervisory Control and Data Acquisition) for real-time monitoring.

c) Cold Chain & Storage Facilities

Temperature-controlled warehouses for raw materials and finished pharmaceutical products.

Cold chain logistics for vaccines and biologics, including deep freezers and transport containers.

Automated inventory management systems to ensure compliance with GDP (Good Distribution Practices).

3. Finding the Right Technology Partners

a) Pharmaceutical Machinery & Equipment Suppliers

To establish a world-class pharmaceutical facility, partnering with technology providers specializing in pharmaceutical manufacturing equipment is essential. Key areas include:

Oral Solid Dosage (OSD) Equipment

Granulation, blending, and tablet compression machines

Leading suppliers: GEA Group, Bosch, Syntegon (formerly Bosch Packaging), Fette Compacting ACG Worldwide,

SED Pharma, Syntegon Technology, IMA Group, Glatt, Fette Compacting, Romaco, iPharMachine

Sterile Injectable & Vaccine Manufacturing Equipment

Aseptic filling, lyophilization, and cleanroom solutions

Leading suppliers: Bausch+Ströbel, IMA Pharma, Optima Pharma, NKP Pharma machinery, Cozzoli Machine

Company, Groninger, ARxIUM, NJM Packaging, Intellitech

Water Purification & WFI Systems

Suppliers: Merck Millipore, Veolia Water Technologies, MECO, NGK Insulators Ltd, Syntegon, Ovivo, Fabtech

Technologies, Aqua-Chem, Herco Wasser technik GmbH, NEWater, Praj Industries, CN water

Cleanroom & Air Filtration Systems

Suppliers: Camfil, AES Clean Technology, Thermo Fisher Scientific, Clean Air Technology, Atmos-Tech

Industries, Abtech Inc., Microflow Devices India PVT Ltd. Zeco Aircon Ltd

b) Digital & Automation Partners

SCADA & MES Systems: Siemens, Rockwell Automation, Honeywell.

Automated quality control & batch monitoring: Emerson, Siemens, ABB.

c) Regulatory & Compliance Partners

GMP compliance consulting:

Local regulatory bodies (e.g., Uganda National Drug Authority - NDA).

d) Waste Management & Sustainability Partners

Hazardous waste disposal & ETP solutions: Veolia, SUEZ, Ecolab.
Renewable energy integration for sustainability: Tesla Energy, Schneider Electric.
4. Strategic Collaborations & Public-Private Partnerships
Government Incentives & Special Economic Zones (SEZs)
Tax incentives for pharmaceutical manufacturers in Uganda and the East African Community (EAC).
Preferential land allocation and infrastructure support for investors.
Public-Private Partnerships (PPPs)
Collaborations with global health organizations (WHO, UNICEF, GAVI, USAID) for vaccine and essential medicine production.

ii. Infrastructure Requirements for a Pharmaceutical Manufacturing Facility near Kampala, Uganda
The proposed pharmaceutical manufacturing facility, will be located near Kampala, Uganda.
Given the scale and scope of this state-of-the-art facility, robust infrastructure is vital to ensure uninterrupted operations, regulatory compliance, and product quality.
Power Supply: The facility will require a high-capacity, stable power source to support continuous manufacturing, HVAC systems, cleanrooms, cold storage, and quality control labs. It will be connected to the national electricity grid via UMEME, with dedicated transformers and high-voltage infrastructure. Backup power will be provided through diesel generators and solar power systems to ensure energy security and sustainability.
Water Supply: A reliable water supply is essential for production processes, utilities, cleaning, and sanitation. The facility will include on-site water purification systems to generate Purified Water (PW) and Water for Injection (WFI), meeting GMP standards. Water will be sourced from the national supply network and supplemented by boreholes with storage reservoirs.
Waste Management: The facility will house a centralized Effluent Treatment Plant (ETP) and systems for safe disposal of solid and hazardous waste, in full compliance with NEMA guidelines. Special provisions will be made for pharmaceutical and biomedical waste, including incineration and disposal via licensed operators.
Transport Links: Proximity to Kampala's industrial zones, the Northern Corridor, and Entebbe International Airport ensures efficient import/export logistics and access to regional markets. Excellent road connectivity will facilitate material movement and regulatory oversight.

D. TECHNICAL FEASIBILITY

1. Machinery and Equipment Requirements

Each dosage form requires specific equipment to facilitate high-quality and compliant production.

a) Oral Solid Dosage (OSD) & Capsules Manufacturing

Granulation Equipment – Fluidized bed dryers, high-shear mixers.
Tablet Compression Machines – Single rotary, double rotary presses.
Capsule Fillers – Semi-automatic and fully automatic encapsulation machines.
Coating Machines – Film and sugar coating systems.
Blending & Mixing Equipment – V-blenders, ribbon mixers.

b) Syrup and Liquid Manufacturing

Sugar Dissolution & Mixing Tanks – Stainless steel reactors with agitation.
Homogenizers – For uniform syrup consistency.
Liquid Filling & Capping Machines – For bottles and ampoules.
Sterile Filtration Systems – For microbial safety.

c) Injectables & Parenteral Manufacturing

Aseptic Filling Lines – For ampoules, vials, prefilled syringes.
Lyophilization Equipment – For freeze-dried injectables.
Autoclaves & Sterilizers – For equipment and component sterilization.
Isolators & Restricted Access Barrier Systems (RABS) – To maintain sterility.

d) Monoclonal Antibodies (mAbs) & Vaccine Manufacturing

Fill-Finish Equipment – Sterile filling, capping, lyophilization.
Cold Chain & Stability Chambers – For biological storage.

3. Technology and Automation

a) Digitalization and Smart Manufacturing

Manufacturing Execution Systems (MES) for batch tracking.
SCADA (Supervisory Control and Data Acquisition) for process automation.
Predictive Maintenance to prevent downtime.

b) Quality Control & Assurance Technologies

Analytical Testing Equipment – HPLC, GC, UV Spectrophotometers.
Microbial Testing – Endotoxin testing, sterility assurance.

4. Compliance & Regulatory Considerations

Adherence to GMP, WHO and local drug regulatory guidelines.
Regular validation & qualification of equipment and processes (IQ, OQ, PQ).
Environmental compliance with waste disposal and emission control.
Manufacturing Area Requirements - Overall Site Plan & Area Distribution

Table No.:7

COMMON AREAS

Note: All production plants viz., OSD, Injectables, Bio-pharma, Vaccines and Oncology OSD shall be designed for future expansion capability

Table No.: 8

PLANT 1 – OSD BLOCK (ASSUMED OUTPUT CAPACITY IS 15 MILLION UNITS PER DAY)

Table No.: 9

PLANT 2 – mAbs AND BIOSIMILARS (ASSUMED OUTPUT CAPACITY IS 3 MILLION UNITS PER ANNUM)

Table No.: 10

PLANT 3 - Filling Lines for Vials, Ampoules, and Pre-Filled Syringes

Table No.: 11

PLANT 4 - Oncology OSD Facility for Production of Hormonal and Cytotoxic Oral Formulations

Additional Considerations

High-Containment Design:

Closed systems with negative pressure, airlocks, isolators, and barrier technology.

Cross-Contamination Control:

Separate air handling, material flows, and personnel flows for hormonal and cytotoxic drugs.

Table No.: -12

PLANT 5 – VACCINE fill finish Facility (ASSUMED CAPACITY OUTPUT IS 50 MILLION DOSES PER ANNUM)

E. FINANCIAL FEASIBILITY

This review provides an overview of CAPEX, Operational Expenditure (OPEX), financial projections, break-even analysis, and potential Return on Investment (ROI).

Cost Breakdown: CAPEX

Table No.: 13

1.2 Capital Expenditure (CAPEX)

The total investment is \$571.62 M USD, allocated across different manufacturing units and operations as follows:

Table No.: 14

1.3 Operational Expenditure (OPEX) Breakdown

Annual OPEX includes raw materials, labour, utilities, maintenance, logistics, and regulatory compliance.

Estimated OPEX in full scale operations:

Table No.: 15

* As per calculations

NOTE: The actual project estimates are USD 529 MUSD (including Capex and Opex) as per the DPR.

However, an additional amount of 42.62 MUSD taking the total amount to 571.62 MUSD (capex and Opex) is considered for product registrations, clinical trials, licensing, technology transfer, manpower training including contingency.

Financial Projections and Revenue Estimates

Table 16:

2.1 Estimated Annual Revenue (First 7 Years)

Revenue is projected based on market demand, production capacity, and price realization

Table No.: 17

Revenue Projections

Revenue Contribution by Segment:

OSD - 20%

General Injectable facility – 15%

Biopharmaceutical products – 15%

Vaccines – 15%

Oncology OSD - 25%

Contract Manufacturing & Exports: 10%

Break-Even Analysis

Table No.: 18

3.2 Payback Period & Profitability Timeline

Payback period: ~5 years

First-year losses due to ramp-up & market entry.

Full profitability expected in Year 4-5 with a Gross Profit Margin of ~60-75%.

4. Return on Investment (ROI) Analysis

4.1 Projected ROI

$ROI = \text{Annual Profit} / \text{Total investment} \times 100$

Year 3 Expected Net Profit: ~\$188.18M USD

ROI by Year 3: $188.18 / 571.62 \times 100 = 32.92\%$

Key Financial Risks & Mitigation Strategies

Table No.: 19

6. Conclusion & Strategic Recommendations

CAPEX of \$442.90 M is strategically allocated across multiple high-growth segments.

OPEX of ~\$128.72 M annually ensures robust operations & regulatory compliance.

Break-even is expected within the third year, with profitability by Year 3-4.

Strategic Recommendations:

Focus on Oncology & Biologics: Higher-margin products provide better financial returns.

Optimize API Sourcing: Reduce costs by investing in local API production or strategic long-term supplier contracts.

Enhance Export Potential: Leverage Uganda's EAC trade advantages to increase regional market penetration.

Automate Supply Chain & Manufacturing

Seek Investment & Government Support: Public-private partnerships for incentives & subsidies to lower CAPEX burden.

F. SUPPLY CHAIN AND RAW MATERIAL SOURCING

The supply chain must ensure a steady supply of raw materials, efficient production, strict quality control, and seamless distribution, while mitigating risks associated with logistics, regulatory compliance, and market fluctuations.

1. Key Components of the Supply Chain

A robust supply chain for a SUNSHINE MEDICAL PTE. LTD., company shall include the following key components:

Raw Material Sourcing (APIs, Excipients, Packaging Materials)

Inventory & Warehousing

Production & Manufacturing

Quality Control & Regulatory Compliance

Cold Chain & Storage (For Vaccines & Biosimilars)

Distribution & Logistics

Risk Management & Supply Chain Resilience

2. Raw Material Sourcing Strategy

2.1 Active Pharmaceutical Ingredients (APIs) and Excipients

Uganda does not have a strong domestic API production base, so APIs must be imported.

Primary API sourcing regions:

India & China – Major global API suppliers.

Europe (Germany, Switzerland, Italy) – High-quality APIs for oncology & biosimilars.

Africa (South Africa, Egypt, Morocco) – Growing pharmaceutical hubs for APIs.

Procurement Strategy:

Develop multiple supplier relationships to reduce dependency on a single country.

Use long-term contracts & Just-in-Time (JIT) supply models for high-cost APIs.

Maintain buffer stock of critical APIs (especially for oncology & vaccines).

2.2 Packaging Materials

Primary packaging: Blister packs, vials, ampoules, pre-filled syringes, HDPE bottles.

Secondary packaging: Cartons, labels, package inserts.

Suppliers: Kenya, India, UAE, Turkey, and South Africa.

2.3 Supply Chain for Biologics (Vaccines & Biosimilars)

Requires specialized cold chain logistics (-80°C for some biologics).

Partnerships with international biotech firms for technology transfer.

Cold storage facilities at airports & major distribution hubs.

3. Inventory & Warehousing Management

3.1 Raw Material Storage

Separate storage for APIs, excipients, and packaging materials.

Cold storage for temperature-sensitive raw materials.

Real-time inventory tracking system (ERP-based).

3.2 Finished Goods Warehousing

GMP-compliant warehouses with segregated storage for different product categories.

First-Expiry-First-Out (FEFO) system for batch management.

Strategic warehouse locations in Uganda and EAC countries for faster distribution.

4. Production & Manufacturing Workflow

4.1 Manufacturing Planning & Scheduling

Lean Manufacturing to reduce waste and optimize production costs.

Batch Manufacturing Record (BMR) & Batch Production Record (BPR) compliance.

4.2 Facility Layout & Integration with Supply Chain

Segregated production lines for oncology, OSD, syrups, vaccines, and biosimilars.
Integrated Manufacturing Execution Systems (MES) for real-time monitoring.
Automated raw material dispensing & production tracking.

5. Quality Control & Regulatory Compliance

Stringent QC checks for APIs, excipients, and packaging materials.
Real-time product traceability using barcoding & serialization.
Compliance with WHO-GMP, EAC regulatory frameworks, US FDA, EMA.
Regular audits of suppliers & third-party logistics providers.

6. Cold Chain & Storage for Vaccines & Biosimilars

Cold storage at 2-8°C, -20°C, and -80°C.
Real-time temperature monitoring
Strategic cold chain hubs in Kampala & EAC export markets.

7. Distribution & Logistics Strategy

7.1 Domestic Distribution (Uganda)

Direct distribution to hospitals, pharmacies, and wholesalers.
Regional distribution centres in Kampala, Entebbe, Jinja, and Mbarara.
GPS-tracked delivery fleet with route optimization for last-mile delivery.

7.2 East African Community (EAC) Export Strategy

Key export markets: Kenya, Tanzania, Rwanda, Burundi, South Sudan, DRC.
Regulatory harmonization under the EAC-MRH program for seamless cross-border approvals.
Dedicated pharmaceutical logistics hubs in Nairobi (Kenya) & Dar es Salaam (Tanzania).

7.3 International Exports

Oncology & biosimilars exports to high-value markets in Europe & Middle East.
Collaboration with global pharmaceutical distributors.

8. Risk Management & Supply Chain Resilience

8.1 Key Risks in the Supply Chain

Dependency on imported APIs → Risk of supply chain disruptions.
Regulatory delays → Impact on product approvals & market entry.
Cold chain failures → Risk for vaccines & biologics.
Political & economic instability in Uganda & EAC → Disruptions in logistics.

8.2 Risk Mitigation Strategies

Dual sourcing strategy for APIs & critical raw materials.
Investment in API manufacturing in Uganda (long-term goal).
Use of digital supply chain solutions (AI-driven demand forecasting).
Collaboration with global logistics providers (DHL, UPS, local 3PLs).

9. Digital Transformation in Supply Chain Management

9.1 AI Based Monitoring

AI-based demand forecasting to optimize inventory levels.
Cost of Maintaining a Robust Pharmaceutical Supply Chain in Uganda

Key Cost Components of a Pharmaceutical Supply Chain

Table No.: 21

Note: The cost varies depending on production scale, market reach, automation levels, and regulatory requirements.

2. Breakdown of Major Cost Elements

2.1 Raw Material & API Procurement Costs

APIs account for 60%-80% of drug production costs, particularly for oncology & biologics.
Uganda imports most APIs from India, China, and Europe, incurring import duties & logistics expenses.
Cost fluctuations due to supply chain disruptions, geopolitical tensions, and regulatory constraints.
Mitigation: Multi-supplier agreements & local API production investments.

2.2 Packaging Material Costs

Primary packaging (blister packs, vials, ampoules, prefilled syringes) is imported or locally sourced.
Secondary packaging (cartons, labels, inserts) needs compliance with international standards (e.g., serialization, barcoding).
Sustainable & eco-friendly packaging costs 10%-15% more but enhances regulatory acceptance.

2.3 Warehousing & Cold Storage

Cold storage for vaccines & biosimilars (-80°C to 2-8°C) incurs high energy & maintenance costs.
Storage facilities in Kampala & regional hubs (e.g., Jinja, Mbarara) require advanced temperature monitoring.

2.4 Manufacturing & Production Logistics

Includes the cost of transporting raw materials, managing production scheduling, and handling batch-to-batch variations.
Biologics and vaccines require specialized production environments, increasing utility & maintenance costs.

2.5 Quality Control & Compliance

Regulatory costs include GMP audits and licensing fees.
Maintaining high-end analytical labs for testing APIs, excipients, and final products.
Oncology & biosimilar testing requires more stringent & expensive analytical processes.

2.6 Cold Chain Infrastructure for Vaccines & Biologics

Ultra-low temperature storage (-80°C) for certain biologics.
GPS-tracked refrigerated trucks for secure transportation.
Backup power systems to ensure uninterrupted temperature control.

2.7 Distribution & Last-Mile Delivery

Cross-border regulatory compliance costs (for EAC markets).
Investment in regional distribution hubs (e.g., Nairobi, Dar es Salaam).
High-security transportation for oncology drugs to prevent theft.

2.8 IT & Digital Supply Chain Systems

Track-and-trace systems to prevent counterfeit drugs.
Automated inventory management to reduce wastage & improve efficiency.

2.9 Risk Management & Contingency Planning

Emergency stockpiling of critical APIs & biologics.
Alternative supply routes & backup logistics partners.
Investment in local API production to reduce import dependency.

2.10 Regulatory Compliance & Audits

WHO-GMP certifications for global market access.
Annual site inspections & compliance renewals.
Investment in training & capacity building for regulatory teams.

3. Cost Optimization Strategies

A. Local API & Packaging Manufacturing Investment

Reduce import costs by establishing API & packaging material production in Uganda.
Collaboration with African pharmaceutical hubs (South Africa, Egypt, Morocco).

B. Multi-Supplier & Regional Sourcing Strategy

Reduce risk by sourcing APIs from multiple suppliers.

EAC regional integration to reduce cross-border tariffs & logistics delays.

C. Green Energy & Sustainability Investments

Solar-powered cold storage to cut energy costs by 30-40%.

Eco-friendly packaging to reduce regulatory risks & enhance marketability.

G. HUMAN RESOURCES

In this project below listed facilities/blocks are planned to be constructed:

Oral Solid Dosage (OSD) Facility (Capacity Production of 15 million units/day (tablets, capsules, and syrups).

Biopharma Drug Product Facility (Capacity: Specialized for monoclonal antibodies, hormones, and insulin analogs)

Vaccine Formulation and Fill- Finish Facility (50 Million doses per annum)

Oncology OSD Facility

Injectable Facility (Capacity: High-speed filling lines for vials, ampoules, and pre-filled syringes)

Number of employees with different skill set shall be employed for all above mentioned facilities.

Table No.: 22

Summary of estimated Manpower required for Operations

Hiring of employees with skill sets and expertise:

It is important to have healthy employees with aseptic skills especially in manufacturing units to avoid any contamination during manufacturing of drug products.

Separate organograms are prepared for engineering, corporate, HR & administration, warehouse, Quality (QC & QA) and manufacturing units to hire sufficient and effective workforce considering cost effectiveness.

Details of Organograms:

Corporate -Employees with managerial skills, project skills and leadership skills etc. will be hired in corporate for different levels like CEO, Head of engineering, Head of operations/manufacturing, project manager, Head of quality, Head of finance, Head of logistics and Head of HR. Managers and group leaders from each section will be managed/lead by corporate Heads.

Engineering -In engineering section, employees with skills like automation, instrumentation including complicated manufacturing equipment, electrical, mechanical, utilities (Water, steam, Air) and information technology will be hired at different levels.

HR & Administration -In HR & admin section, employees with skills to handle transport, canteen, legal challenges like pollution control, employee act and licensing application and renewal etc., recruitment and day to day management of contractual / fixed employees, employee wellness, medical facility and general management of BMS like furniture, rest rooms, and external vendors for admin support will be hired.

Warehouse -In warehouse section, skills to ensure the safe, efficient, and compliant movement of materials and products is required. It includes logistics management skills. Knowledge of inventory management using software like SAP or ERP, document and material management is essential in warehouse.

Quality Unit - (Quality control and Quality assurance) is critical to ensuring the safety, efficacy, and compliance of drug products. In QC, testing skills, knowledge of GLP, Data analysis and sample management are essential skills. In QA, Process validation and control, regulatory compliance, Risk Management, Documentation, Audits and inspection skills, Change management and trainings are essential skills.

Manufacturing -In manufacturing, knowledge of GMP, operation of complicated/automated equipment or system, knowledge of process and aseptic behaviour/environment, documentation and technical skills for problem solving in day-to-day process are crucial skills.

Health, Safety standards for Human Resource working in Pharmaceuticals:

For biopharmaceutical projects, regular medical check-up including tests like eyesight, audiometry, blood test, breathing test, X-Ray, ECG and basic tests; at-least annually for all employees is essential.

Key aspects in HR feasibility

Workforce Availability

Over the course of the last decade, Uganda's economic growth has ranked among sub-Saharan Africa's strongest; indeed, the country's annualized average growth rate was 5.4% between 2010 and 2019 (World Bank, 2020).

Uganda has a young and growing workforce, with over 75% of its population under the age of 30.

Total population: Approx. 51 million (2025 estimates)

Cost of Human Resources

In Uganda, employee salaries are relatively low, but there are also some differences. For example, in the capital city of Kampala, the monthly salary of an ordinary employee is usually between 100-200USD. In other cities, this number may be even lower. The salary level will be higher for senior management and technical talents.

Average monthly salaries (estimates):

Unskilled worker: \$100–\$200

Mid-level professional: \$500–\$1,500

High-skilled/managerial: \$2,000+

Legal and Compliance Factors

Key employment laws:

Employment Act (2006): Governs employment terms, termination, wages, and working conditions.

Occupational Safety and Health Act (2006): Ensures workplace safety.

Workers' Compensation Act (2000): Covers workplace injury compensation.

Uganda's labour laws are primarily governed by the Employment Act of 2006, which establishes the minimum standards of employment in the country.

Uganda is committed to upholding international labour standards and has ratified several key

International Labour Organization (ILO) Conventions. These include the Freedom of Association and Protection of the Right to Organize Convention, 1948 (No. 87), the Right to Organise and Collective Bargaining Convention, 1949 (No. 98), and the Collective Bargaining Convention, 1981 (No. 154).

The Uganda Employment Act applies to all employees, irrespective of nationality that the employers hire under the service contract.

According to the employment act 2006 and labour laws in Uganda, the standard working hours of an employee is a maximum of eight hours per day and 48 hours a week; excluding lunch and worship time.

Employers planning to hire or relocate international employees to Uganda must understand the processes surrounding work permits and visas. Ensuring compliance with Ugandan immigration laws helps streamline the hiring process and avoid potential legal hurdles.

Cultural and Language Considerations

Ugandan communication often leans towards indirectness, especially when delivering negative feedback or expressing disagreement.

Cultural Lens: The Ugandan concept of "Gwasi" (shame) discourages public criticism. This can influence communication, leading individuals to deliver critical messages indirectly to avoid causing shame to the recipient.

Uganda is a multilingual nation like many African countries. However, English is targeted as a medium of instruction and language of examination.

H. RISK ASSESSMENT

Risk Assessment and Mitigation Strategies for SUNSHINE MEDICAL PTE. LTD., Plant in Uganda

1. Political Risks and Mitigation Strategies

Uganda, like many developing economies, has political uncertainties that can affect business operations. These include regulatory changes, policy instability, and geopolitical factors.

1.1 Key General Risks

Table No.:23

1.2 Risk Mitigation Strategies

Early Engagement with Regulators:

Work closely with Uganda's National Drug Authority (NDA) and the Ministry of Health to ensure timely approvals.

Seek WHO-GMP certification for global market access.

Public-Private Partnerships (PPP):

Collaborate with government bodies to access tax benefits, incentives, and investment protection.

Diversification of Export Markets:

Establish trade links with EAC, COMESA, and beyond to reduce dependence on a single market.

Strengthening IP Protection:

Register patents and trademarks regionally through ARIPO (African Regional Intellectual Property Organization) to safeguard innovations.

2. Economic Risks and Mitigation Strategies

Economic instability can impact capital investment, supply chain costs, and market demand for pharmaceutical products.

2.1 Key Economic Risks

Table No.:24

2.2 Risk Mitigation Strategies

- Localizing API Sourcing:

Develop partnerships with regional API manufacturers to reduce reliance on imports and mitigate forex risks.

- Hedging Against Currency Risks:

Utilize foreign exchange hedging instruments to stabilize procurement costs.

Maintain a mix of local and foreign currency reserves for operational expenses.

- Operational Cost Optimization:

Implement energy-efficient manufacturing to reduce electricity costs.

Automate production processes to minimize labour costs.

- Strategic Supplier Agreements:

Enter long-term contracts with multiple suppliers for key raw materials to ensure supply chain resilience.

- Diversifying Revenue Streams:

Expand into high-margin segments (oncology, vaccines, biosimilar).

Target institutional buyers like the government, NGOs, and international health organizations (e.g., GAVI, WHO, Global Fund).

3. Environmental Risks and Mitigation Strategies

Uganda has stringent environmental regulations for pharmaceutical manufacturing, including waste management, water usage, and emissions control. Non-compliance can lead to fines, production shutdowns, or reputational damage.

3.1 Key Environmental Risks

Table No.:25

3.2 Risk Mitigation Strategies

- Sustainable Water Management:

Implement water recycling & rainwater harvesting systems to reduce dependence on municipal supplies.

Use high-efficiency Clean-in-Place (CIP) systems to minimize water wastage.

- Advanced Waste Treatment Solutions:

Install Zero Liquid Discharge (ZLD) systems for pharmaceutical effluent treatment.

Set up on-site hazardous waste incinerators to manage cytotoxic and biological waste safely.

- Renewable Energy Integration:

Solar power installations on-site to reduce dependency on the national grid.

Waste heat recovery systems to improve energy efficiency.

- Green Manufacturing Practices:

Obtain ISO 14001 Environmental Certification to align with international best practices.

Conduct regular environmental audits to ensure compliance with NEMA standards.

4. Summary of Risk Mitigation Strategies

Table No.:25

5. Conclusion

While setting up a pharmaceutical manufacturing plant in Uganda presents general, economic, and environmental risks, these can be effectively managed through strategic planning and proactive mitigation measures.

I. SUSTAINABILITY

1. Sustainable Waste Management Strategies

SUNSHINE MEDICAL PTE. LTD., facility shall generate solid, liquid, and hazardous waste that must be effectively managed to comply with environmental regulations and protect ecosystems.

1.1 Segregation and Recycling of Solid Waste

Implement waste segregation at the source to separate biodegradable, non-biodegradable, recyclable, and hazardous waste.

Recycle packaging materials like paper, plastics, and aluminium foils used in blister packs.

Partner with certified waste management companies to handle non-recyclable hazardous waste.

1.2 Efficient Handling of Hazardous Waste

Incinerate cytotoxic oncology waste and contaminated biological waste in high-temperature incinerators (above 850°C).

Use autoclaves and chemical disinfection for biological waste.

Adopt encapsulation techniques for disposing of highly toxic chemicals and APIs safely.

1.3 Effluent Treatment and Liquid Waste Management

Install an Effluent Treatment Plant (ETP) and Zero Liquid Discharge (ZLD) system to ensure wastewater treatment before discharge.

Reuse treated water for landscaping, cooling systems, and non-potable applications.

1.4 Minimization of API & Solvent Waste

Implement solvent recovery units to recycle and reuse solvents in oncology and biopharma production.

Adopt green chemistry techniques to minimize hazardous waste production.

Optimize batch sizes and manufacturing processes to reduce raw material waste.

2. Energy Efficiency Strategies

Energy consumption will be a significant operational cost in pharmaceutical manufacturing. A sustainable energy plan shall ensure cost reduction and reduced carbon footprint.

2.1 Integration of Renewable Energy Sources

Solar Power Installation:

Install solar panels on rooftops to supplement grid electricity and reduce dependence on fossil fuels.
 Target at least 30-50% energy from solar for non-critical operations.

Biomass & Biogas Utilization:
 Utilize biomass boilers for steam generation using agricultural waste.
 Install a biogas plant to convert organic waste into energy.

2.2 Energy-Efficient HVAC & Cooling Systems
 Use energy-efficient HVAC systems with variable frequency drives (VFDs) to optimize airflow and minimize energy wastage.
 Implement cold chain optimization for vaccines and biopharma products, including energy-efficient refrigeration and insulation systems.
 Utilize waste heat recovery systems to capture and reuse excess heat from industrial processes.

2.3 Smart Lighting and Equipment Optimization
 Install LED lighting with motion sensors to reduce power consumption in low-traffic areas.
 Use high-efficiency motors in production lines to reduce energy waste.
 Implement real-time energy monitoring systems to track and optimize energy use.

3. Water Conservation and Efficient Usage
 Pharmaceutical production requires significant water usage for cooling, formulation, and cleaning processes. Water scarcity in Uganda makes conservation and recycling essential.

3.1 Water Recycling & Reuse
 Install Water Treatment Plants (WTPs) with multi-stage filtration, RO, and UV disinfection to reuse wastewater.
 Recycle treated wastewater for boilers, chillers, and non-potable cleaning processes.

3.2 Rainwater Harvesting
 Set up rainwater harvesting tanks to collect and store rainwater for non-production use.
 Utilize rainwater for landscaping, cooling towers, and toilet flushing.

3.3 Optimized Process Water Usage
 Implement Clean-in-Place (CIP) and Sterilize-in-Place (SIP) systems to reduce water usage in equipment cleaning.
 Use dry cleaning methods where possible to minimize the need for extensive water washing.
 Train staff on water conservation best practices to minimize waste.

4. Regulatory Compliance & Green Certifications
WHO-GMP & EAC Environmental Regulations: Ensure compliance with local and international environmental guidelines.
ISO 14001 Certification: Implement environmental management systems to enhance sustainability.
LEED Certification: Design facilities with sustainable building materials to meet green building standards.

5. Conclusion
 SUNSHINE MEDICAL PTE. LTD., shall require integrated waste management, energy-efficient operations, and water conservation measures. By adopting renewable energy, recycling waste, and optimizing resource usage, this facility can achieve long-term environmental and economic benefits while maintaining regulatory compliance and corporate social responsibility.

J. Key HR Challenges and mitigation strategies

1. Skilled Workforce Shortage
 Limited local experience in advanced pharmaceutical manufacturing (especially GMP-compliant operations for vaccines, oncology, and monoclonal antibodies).
 Shortage of experienced quality assurance (QA), quality control (QC), production, validation, and biotech-specific personnel.

2. Training and Capability Gaps
 Need for training in WHO-GMP and global standards.
 Low exposure to advanced equipment and automation technologies common in global pharma plants.

3. High Attrition or Brain Drain
 Trained personnel may be poached by competitors or seek jobs abroad due to better salaries.

4. Cultural & Communication Barriers
 Integration challenges when blending expat professionals with local teams in managerial and technical roles.

Mitigation & Risk Management Strategies

1. Early & Strategic Workforce Planning
 Workforce demand mapping: Identify headcount, roles, and experience levels required for each production phase.
 Staggered hiring aligned with the commissioning of each production unit.

2. Establish a Technical Training Academy
 Set up an in-house Pharma Training Institute or Centre of Excellence.
 Partner with international experts to develop GMP, EHS, and regulatory curricula.
 Simulate manufacturing environments (cleanrooms, QC labs, aseptic suites).
 The training program shall constitute of the following aspects
 Induction of new employees
 cGMP training
 GLP training
 On the job training consisting of SOP training, equipment training etc.,
 Safety training
 Supervisor training
 Manager training
 Job change training or after leave of absence
 Remedial training
 Contractor employee training

3. International Partnerships
 Collaborate with Indian, European, or South African pharma companies or universities for knowledge transfer.
 Consider short-term expat secondments (2–5 years) to build and mentor local teams.

4. Collaboration with Local Academia
 Tie up with Makerere University or other local institutions for:
 Curricula alignment with pharma needs.
 Internship/apprenticeship programs.
 Fast-tracking diploma and B.Pharm graduates into technical roles.

5. Talent Retention Schemes
 Offer competitive packages, training sponsorships, and bonded contracts.
 Career development pathways for technicians to move into supervisory or QA roles.
 Stock options or profit-sharing models to retain senior staff.

6. Outsource Non-Core Activities Initially
 To reduce early HR load, consider outsourcing packaging, engineering maintenance, and logistics until local capacity matures.

7. Human Resources Rollout Roadmap

Phase-Wise HR Rollout Plan (2025–2030)

A. Planning & Initial Setup (2025)

Workforce Planning: Finalize detailed manpower requirement for each functional block (production, QA/QC, engineering, admin, etc.).

Key Roles: Project HR Head, Talent Acquisition Manager, Training & Compliance Manager

Action Points:

Begin local hiring process for support staff, documentation personnel

Initiate expat hiring for plant design, validation, and commissioning oversight

Establish HR policies, on-boarding modules, payroll systems

B. OSD & Syrup Commissioning

Estimated Staff Requirement: (As per Table No 19)

Key Functions: Production operators, QA/QC analysts, warehouse team

Action Points:

Launch training academy in partnership with local universities (Makerere, Mbarara, etc.)

Train local hires in GMP compliance, SOP writing, and safety protocols

Expat engineers and QA managers to lead operations and mentor local staff

C. Oncology & Injectable Line Setup

Estimated Staff Requirement: +/- (As per Table No 19)

Key Functions: Cytotoxic handling experts, sterile Injectables line operators, QC microbiology

Action Points:

Specialized cytotoxic/Hormonal handling training

Safety and containment procedure modules

Expand academy offerings to include aseptic processing and EHS protocols

D. Vaccine & Biopharma Commissioning

Estimated Staff Requirement: -(As per Table No 19)

Key Functions: Biotech fill-finish experts, cold chain QA/QC

Action Points:

Partner with international biotech training programs (India, EU)

Establish a biotechnology learning track in the internal academy

E. Operations Stabilization & Local Leadership Development

Target Workforce: 1,000+ including indirect employees

Focus Areas: Succession planning, reducing dependency on expats

Action Points:

Develop career growth ladders for technicians and supervisors

Launch Leadership Development Programs (LDP) for Ugandan managers

Retention strategy implementation (bonuses, ESOPs, continuous training)

Training Strategy Summary

In-House Pharma Academy to train employees per year

Modules in:

GMP & regulatory compliance

Pharmaceutical operations (OSD/liquid/injectable/Oncology)

Aseptic techniques

Equipment maintenance & calibration

Training Partners: Local academia + global consultants

Risk Mitigation Measures

Challenge: Limited experienced pharma talent pool

Solution: Layered expat hiring, internal academy, local university tie-ups

Challenge: Attrition post-training

Solution: Bonded employment, career development programs, competitive pay

Challenge: Cultural integration

Solution: Cross-cultural workshops, expat-local mentorship structure.

K. STRATEGIES FOR ACCELERATED ROI ON THE PROJECT

1. Phased Commissioning of Production Lines

Start with OSD and syrups, which have lower regulatory complexity and shorter setup timelines.

These can begin generating revenue within 12–18 months, while more complex lines (biopharma, oncology, vaccines) are still under validation.

Helps spread OPEX and initiates early cash flow.

2. Prioritize Products with High Local and Regional Demand

Focus on essential medicines, high-burden diseases (malaria, diabetes, antibiotics), and therapeutic areas like oncology and vaccines with unmet needs.

Customize the portfolio to include WHO-prequalified and procurement-friendly products for faster uptake by public health programs.

3. Partner with Global Health Buyers Early

Engage with donor agencies (Global Fund, GAVI, WHO, USAID) to position your facility as a local supplier.

Secure advance purchase agreements (APAs) or long-term supply contracts, even during construction phase. These contracts anchor demand and improve investor confidence.

4. Leverage Contract Manufacturing (CDMO) for Revenue Boost

Offer your excess capacity for contract manufacturing of OSD, fill-finish, or vaccine products for regional or global pharma firms.

Acts as a bridge revenue stream before full-scale launch of your branded portfolio.

5. Accelerate Regulatory Approvals through EAC Harmonization

Register products using the EAC Medicines Regulatory Harmonization (MRH) program to access multiple countries simultaneously.

Cuts down duplicated efforts and approval timelines, speeding up market entry.

6. Optimize Operational Costs from Day 1

Invest in energy-efficient infrastructure (solar, efficient HVAC) and automation to lower long-term utility and labour costs.

Design supply chain to minimize storage and transportation overhead.

7. Use a Hybrid Distribution Model

Combine direct-to-hospital/clinic distribution with national wholesalers and tenders.

Reduces reliance on a single sales channel and speeds up product uptake across multiple segments.

8. Government Incentives and Tax Planning

Take full advantage of government incentives, including VAT deferments, customs waivers, tax holidays, and utility subsidies.

Negotiate land lease concessions or reduced utility tariffs to reduce fixed overheads.

9. Continuous Financial Monitoring

Set up a Project Management Office (PMO) and cash burn tracking system to detect cost overruns early.

Implement strict working capital control (inventory turnover, receivables) during operations to stay lean.

Table No:- 26

Example ROI Acceleration Path (Indicative)

L. SWOT ANALYSIS

Strengths

Robust Financial Backing

The promoters' strong financial background ensures ample capital availability for high-tech manufacturing infrastructure, reducing financing risks.

USD 571.62 million CAPEX provides a solid foundation for a state-of-the-art facility with capacity for future expansion.

Strategic Product Portfolio

Manufacturing a diverse mix of high-demand therapeutics—from essential OSDs and syrups to complex oncology drugs, vaccines, and biosimilars—positions the company to address both local and regional health needs.

Biosimilars and oncology Injectables offer high-margin opportunities with increasing global and regional demand.

Location Advantage – Uganda & EAC Access

Uganda provides duty-free access to the East African Community (EAC), reducing export barriers and expanding market reach.

Strategic geographic location in Central-East Africa allows access to under-served pharmaceutical markets in South Sudan, Rwanda, Burundi, DRC, etc.

Modern Infrastructure and Technology Potential

Opportunity to design a greenfield facility aligned with WHO-GMP, EMA, and USFDA standards from the outset.

Flexibility to incorporate cutting-edge technologies (e.g., continuous manufacturing, single-use systems for biologics).

Weaknesses

1. Lack of local Pharmaceutical Domain Experience

Local experience of handling large scale integrated pharma-biopharma project experience

Mitigation: Early recruitment of experienced pharma professionals and regulatory consultants is critical, as is establishing a governance board with pharma advisors.

2. High Dependence on Imports for APIs, Equipment & Components

Uganda lacks a strong API and excipient manufacturing ecosystem, so nearly all critical raw materials, consumables, and equipment must be imported—mainly from India, China, or Europe.

This increases lead times, procurement costs, customs complexities, and exposure to global supply chain disruptions.

3. Skills and Talent Gap in Local Workforce

Uganda's pharmaceutical industry is still developing, with limited availability of skilled technicians, validation engineers, QC analysts, and GMP-trained production staff, especially in sterile manufacturing or biotech.

Over-dependence on expats may drive up costs and hinder the development of sustainable local capability.

Cultural integration, language, and training gaps can affect productivity and retention if not addressed proactively.

4. High Operating Costs for Complex Products

Oncology, vaccines, and bio-similars require sophisticated cleanroom environments, cold chain management, and batch-specific quality testing.

Maintaining aseptic conditions, HVAC, water systems (PW/WFI), and validation for multiple production lines significantly increases OPEX.

Opportunities

1. Growing Demand in Uganda and EAC for Quality Medicines

The East African Community (EAC) is home to over 280 million people with growing health burdens like cancer, diabetes, infectious diseases, and vaccine-preventable illnesses.

There's high demand for affordable, high-quality generics, bio-similars, and essential vaccines.

Current reliance on imports from India, Europe, and China creates a gap for trusted local manufacturers with faster market responsiveness and cost advantages.

2. Support from Government and International Health Agencies

Uganda and other EAC governments are actively promoting local manufacturing through:

Tax breaks, incentives, and infrastructure subsidies.

Potential fast-track approvals for local production of priority medicines.

Global health organizations like GAVI, WHO, UNICEF, Global Fund, and African CDC are eager to support African-based production, especially for vaccines and pandemic preparedness.

This creates opportunities for donor-funded procurement, technology transfer, and concessional financing.

3. Regional Regulatory Harmonization (EAC-MRH)

The EAC's Medicines Regulatory Harmonization initiative reduces the complexity and time for market entry across multiple countries.

A product registered under EAC-MRH can be fast-tracked for approval in all EAC member states, expanding your potential market and improving return on investment (ROI).

4. First-Mover Advantage in Advanced Therapies

There are very few players in the region manufacturing oncology products, bio-similars, or vaccines. A well-executed entry into these segments provides:

High-margin sales.

Competitive edge due to regulatory barriers that deter others from entering.

Leverage to license or co-develop products with international partners.

5. Greenfield Facility – Built for Future-Ready Compliance

Starting from scratch allows for:

State-of-the-art modular facility design that meets WHO-GMP and global requirements from day one.

Scalability—facilities can be expanded based on market growth or strategic partnerships.

Integration of renewable energy systems, automation, which can lower long-term operating costs and improve environmental credentials.

6. Technology Transfer and Global Collaborations

Many mid-sized Western and Asian pharma companies are seeking CDMO or joint venture partners in Africa to enter emerging markets.

This facility, once validated and operational, can be positioned as a fill-finish hub or contract manufacturing site for such companies—especially for vaccines and biologics.

Threats

Regulatory and Compliance Challenges

Ensuring continuous compliance with WHO-GMP, NEMA (Ugandan environmental laws), NDA, and other international standards requires highly skilled QA/QC teams and constant oversight.

Geopolitical and Trade Instability

Political tensions, conflicts in neighbouring countries, or disruptions in trade routes could hamper logistics, exports, or sourcing of raw materials.

Currency Fluctuations and Import Dependency

Heavy reliance on imports for APIs and machinery subjects the plant to foreign exchange risks, especially if the Ugandan Shilling depreciates.

Intensifying Global Competition

Global pharmaceutical companies and Indian manufacturers could enter the region with cheaper generic

drugs, impacting price competitiveness.

Product-Specific Challenges

Biosimilars and vaccines involve complex regulatory pathways, high R&D costs, and the risk of batch failures or cold-chain disruptions.

Construction & Commissioning Delays

Incomplete funding during the CAPEX phase can halt construction, delay procurement of equipment, and postpone validation activities.

Pharmaceutical projects are highly sequential: civil work must be completed before HVAC installation, which precedes equipment commissioning, which in turn precedes qualification. A break at any point stalls everything.

Regulatory Non-Compliance

If the facility is only partially built or validated, it cannot obtain GMP licenses or product approvals.

This puts the company in a no-revenue, high-burn position, severely affecting investor confidence and credibility.

Supply Chain Penalties

Equipment vendors and raw material suppliers often work with milestone-based payments. Funding gaps can lead to order cancellations, higher renegotiated prices, or contractual penalties.

Lead times in pharma are long, so any reordering due to lapsed payments causes multi-month delays.

Reputational Damage & Loss of Stakeholder Confidence

Financial instability affects relationships with regulators, investors, banks, and potential customers (like international health agencies).

Once perception of financial distress sets in, it is harder to secure bridge financing or partnerships.

Strategic Recommendations

Hire pharma domain experts in key leadership roles: manufacturing, regulatory, quality assurance, and R&D.

Form strategic alliances with experienced CDMOs or technology licensors for oncology and biosimilar lines.

Invest in workforce development through partnerships with local universities and international training programs.

Develop dual-source supply chain strategies and build regional sourcing capacity for packaging and excipients.

Design for modular expansion, allowing scaling based on product demand and market growth.

Pursue green certifications (LEED, ISO 14001) to attract ESG-aligned investors and NGOs.

M. SUMMARY AND RECOMMENDATIONS

SUNSHINE MEDICAL PTE. LTD., Pharmaceutical Plant project in Uganda is deemed highly viable based on a multi-dimensional feasibility study and information given in this report.

Uganda's pharmaceutical market presents substantial opportunities, with projected revenue reaching US\$329 million by 2025 and strong CAGR, especially in generic drugs, oncology, vaccines, and biopharmaceuticals.

The plant's integrated model, with Oral Solid Dosage (OSD) forms and more complex formulations such as vaccines and biologics, aligns with the market demand and local regulatory evolution under WHO-GMP frameworks.

Section-Wise Recommendations

1. Oral Solid Dosage (OSD)

Summary:

Focused on high-volume generics for common infectious and chronic diseases.

Recommendations:

Leverage economies of scale for paracetamol, amoxicillin, anti-hypertensives, antidiabetics HIV, anti-tuberculosis and anti-parasitic drugs (malaria, Soil-transmitted helminthiases (STH)).

Introduce low-cost fixed-dose combinations tailored to local disease patterns.

Invest early in automated production lines and MES systems to ensure compliance and efficiency.

Explore regional distribution partnerships to penetrate COMESA markets.

2. General Injectables

Summary:

Aim at supplying critical care and anti-infective Injectables, including Anaesthetics, antibiotics, analgesics, and small volume parenteral.

Recommendations:

Prioritize aseptic filling lines and technologies to meet NRA and WHO-GMP standards.

Build cold chain infrastructure for temperature-sensitive products.

Early vendor development for critical raw materials, APIs and packaging materials.

Innovation in container closure system and devices to reduce foot print of secondary packaging- PP tubes)

Secure API contracts and quality agreements with reputed Indian/Chinese suppliers.

Position Injectables as a high-demand, medium-margin product line with broad application in public and private health facilities.

3. OSD Oncology

Summary:

High-margin segment identified as underserved in Uganda and East Africa.

Recommendations:

Focus initially on oral chemotherapeutics such as capecitabine, imatinib, and tamoxifen.

Ensure high-containment facility design and strict handling protocols to manage hazardous APIs.

Partner with regional cancer centres and NGOs to support market uptake and pharmacovigilance.

Consider future vertical integration into hormonal therapies and oral targeted therapies.

4. Vaccines

Summary:

Critical for public health with rising demand due to government immunization programs and donor support.

Recommendations:

Focus on routine immunization vaccines.

Establish technology partnerships with Indian vaccine makers for niche vaccines- Meningococcal, Pneumococcal etc..)

Develop lyophilization and cold chain logistics capacity early.

Explore WHO prequalification pathways to qualify for GAVI and UNICEF tenders.

5. Biopharmaceuticals

Summary:

Long-term strategic segment with growing demand for biosimilars and monoclonal antibodies in East Africa.

Recommendations:

Prioritize monoclonal antibodies for oncology and autoimmune diseases

Develop in-house analytical capabilities for quality assurance.

Build capacity in fill-finish operations.

Collaborate with academic institutions and biopharma innovators to incubate local talent and adapt global technology.

Market Opportunity and Demand

The feasibility study confirms that Uganda's pharmaceutical market is experiencing robust growth driven by increasing demand for affordable, high-quality generics and specialized drugs, including oncology

treatments and vaccines.

With a projected market revenue reaching approximately US\$329 million in 2025 and a promising CAGR for both the domestic and broader East African markets, the opportunity to capture unmet demand is significant.

Government is encouraging and supporting local production through initiatives like “Buy Uganda, Build Uganda.”

Financial Viability

The financial analysis demonstrates a strong investment proposition:

CAPEX: The total investment is estimated at US\$571.62 million, strategically distributed across various manufacturing units.

OPEX and Break-Even: Annual operational expenditures are projected at approximately US\$241.86 million, with break-even achieved within the third year.

ROI and Profitability: Projected ROI stands at around 23.97% by Year 3.

Recommendations

1. Prioritize High-Margin Segments

Focus Areas:

Oncology Drugs: Given the rising burden of cancer in Uganda and East Africa, investing in the production of generic chemotherapy drugs can capture an underserved market.

Biologics and Vaccines: The increasing demand for advanced therapies such as vaccines and biologics—including monoclonal antibodies and bio-similars—presents an opportunity to tap into segments with relatively lower competition and high value.

2. Optimize API and Raw Material Sourcing

Short-Term Strategy:

Leverage International Suppliers: The project should secure long-term contracts with API suppliers in India and China. This will help stabilize costs and ensure a reliable supply chain during the early phases of operation.

Long-Term Strategy:

Diversification: Develop a multi-sourcing strategy to mitigate risks associated with geopolitical tensions, supply chain disruptions, or fluctuations in raw material prices.

3. Invest in Advanced Technologies

Technology Implementation:

Automation and Digitalization: Adoption of automated production lines, Manufacturing Execution Systems (MES), and real-time monitoring systems can streamline operations.

Quality Control Systems: Investment in advanced analytical testing equipment will support stringent quality assurance protocol

4. Enhance Strategic Collaborations Through

Public-Private Partnerships (PPPs): Engage with government agencies and international health organizations to secure financial incentives, regulatory support, and access to infrastructure.

Industry Alliances: Form strategic alliances with global pharmaceutical companies for technology transfer.

Local Partnerships: Collaborate with local distributors, healthcare providers, and academic institutions to strengthen market access.

5. Strengthen Supply Chain Resilience

Key Measures:

Robust Logistics Network: Develop an integrated logistics system that includes reliable transportation, warehousing, and cold chain infrastructure.

Digital Supply Chain Solutions: Implement demand forecasting and real-time inventory management systems to optimize supply chain operations and minimize waste.

Contingency Planning: Establish dual sourcing strategies and maintain buffer stocks to mitigate the impact of any supply disruptions.

To enable efficiency, reliability, cost management and risk mitigation

6. Focus on Workforce Development

Workforce Strategy:

Training Programs: Invest in specialized training and capacity-building initiatives to develop the technical, regulatory, and operational skills needed in manufacturing, quality control, and engineering.

Talent Acquisition: Attract skilled professionals by offering competitive remuneration packages and career development opportunities.

Collaborations with Educational Institutions: Forge partnerships with local universities and technical institutes to create a pipeline of skilled labour tailored to the project's needs.

Conclusion

THE COMPREHENSIVE FEASIBILITY STUDY STRONGLY SUPPORTS THE VIABILITY OF THE UGANDA PHARMA PLANT PROJECT. WITH FAVOURABLE MARKET CONDITIONS, A SUPPORTIVE REGULATORY FRAMEWORK, ROBUST FINANCIAL PROJECTIONS, AND EFFECTIVE RISK MITIGATION STRATEGIES, THE PROJECT IS COMPLETELY FEASIBLE AND POISED FOR SUCCESS.

STRATEGIC INVESTMENTS IN TECHNOLOGY, LOCAL PARTNERSHIPS, AND HUMAN CAPITAL WILL FURTHER ENHANCE THE PLANT'S COMPETITIVE EDGE AND CONTRIBUTE TO SUSTAINABLE ECONOMIC GROWTH IN UGANDA AND THE BROADER EAST AFRICAN REGION.

IN LIGHT OF THESE FINDINGS, IT IS RECOMMENDED THAT THE PROJECT PROCEED AS PLANNED, WITH CAREFUL ATTENTION TO THE OUTLINED RECOMMENDATIONS TO ENSURE OPERATIONAL EXCELLENCE AND LONG-TERM PROFITABILITY.

No | DESCRIPTION | PAGE

1 | EXECUTIVE SUMMARY | 4

2 | DETAILED FEASIBILITY REPORT |

A | MARKET ANALYSIS |

i. | Demand for pharmaceutical products in Uganda, particularly in the key therapeutic areas as detailed in the project report | 8

iii. | Competitive analysis of the existing pharmaceutical market. | 17

ii | Key market trends, challenges, and opportunities in Uganda's & East African Council (EAC)'s pharmaceutical sector. | 27

B | REGULATORY REQUIREMENTS |

i. | Overview of the Ugandan pharmaceutical regulatory framework, including registration requirements, licensing, and compliance with local and international standards (WHO-GMP, etc.). | 30

ii. | Environmental and safety regulations specific to pharmaceutical manufacturing. | 44

iii. | Overview of EAC countries regulatory systems for the products / therapeutic area aimed to be built in the facility. | 46

C | SITE SELECTION AND INFRASTRUCTURE |

i. | Evaluation of potential sites for the pharma plant, considering factors such as proximity to raw materials, transportation logistics, access to utilities, and workforce availability. | 49

ii. | Infrastructure requirements for the facility, including power, water, waste management, and transport links. | 53

D | TECHNICAL FEASIBILITY |

i. | Assessment of the technical requirements for setting up manufacturing operations, including machinery, technology, and facility design. | 54

ii. | Recommendations on manufacturing area requirements, production capacity, product lines, and equipment needs. | 55

E | FINANCIAL FEASIBILITY |

i. | Review on Cost estimation for setting up the plant, including capital expenditure (CAPEX) and operational expenditure (OPEX). | 62

ii. | Financial projections, break-even analysis, and potential return on investment (ROI). | 67

F | SUPPLY CHAIN AND RAW MATERIAL SOURCING |

i. | Risk and feasibility of sourcing potential suppliers for raw materials and active pharmaceutical ingredients (APIs) from international suppliers. | 71

ii. | Supply chain management strategies to ensure continuity of production. | 74

G | HUMAN RESOURCES |

i. | Assessment of the local workforce and skills availability. | 78

H | RISK ASSESSMENT |

i. | Identification and analysis of key risks, including political, economic, and environmental risks. | 83

ii. | Recommendations for risk mitigation strategies. | 87

I | SUSTAINABILITY |

i. | Environmental sustainability considerations, including waste management, energy efficiency, and water usage. | 89

Support to Regulatory areas | Acknowledgement of receipt of a service-related complaint | 2 Days

Support to Regulatory areas | Feedback on service-related complaints | 21 Days

Therapeutic Area | Regulatory Focus | Key EAC Harmonization Mechanisms | Challenges | Progress & Opportunities

Diabetes | Insulin and oral hypoglycaemic Bioequivalence and cold chain Chronic disease management alignment | Common Technical Document (CTD)

Mutual Recognition Procedure (MRP) | Cold chain logistics

Limited local insulin production | Streamlined approvals

Regional demand driving local production

Malaria | Fast-tracking of ACTs Monitoring of resistance Alignment with WHO PQ | Joint assessments

Regional malaria drug guidelines | Counterfeits Dependency on donor programs | Strong harmonization Integrated procurement systems
Antibiotics | Quality and safety evaluations GMP compliance AMR mitigation | AMR frameworks under WHO/Africa CDC

Regional pharmacovigilance | Overuse and poor prescription practices - Limited surveillance | Regulatory updates in progress

Enhanced AMR monitoring
Vaccines | High scrutiny: quality, safety, cold chain - Emergency use approval mechanisms | AVAREF support

Reliance on WHO PQ and joint inspections | Heavy import reliance

Capacity gaps for biologics | Regional capability strengthening

Ongoing vaccine regulation training
Biologics | Advanced assessments for mAbs, biosimilars, insulin analogs - GMP and comparability requirements | International partnerships for capacity building - Involvement of WHO, UNICEF | Limited local evaluation experience

High assessment complexity | Capacity building underway

Future potential for local biologics production
HIV/AIDS | ARV quality and resistance monitoring - Integration with national HIV programs - Rapid access to WHO PQ ARVs | Fast-track review mechanisms - Reliance on global procurement systems (e.g., Global Fund) | Stockouts and supply chain challenges - Limited local production | Increasing local registration capabilities

Supportive policy for ARV production
Tuberculosis (TB) | MDR-TB drugs evaluation

Diagnostic technologies

Fixed-dose combination approvals | WHO TB drug guidelines

Regional efforts to reduce import timelines | Complexity of MDR/XDR TB treatment

Dependence on donor supply | Regional labs and regulatory harmonization improving Potential for local packaging and supply

 Total | 640
 Risk Factor | Potential Impact
 Regulatory Uncertainty | Changes in pharmaceutical laws, taxation, or licensing requirements could delay operations or increase compliance costs.
 Government Policy Shifts | Import/export restrictions, price controls, or changes in incentives may affect profitability.
 Bureaucratic Delays | Lengthy approvals for manufacturing licenses, product registrations, and environmental permits may slow down market entry.
 Geopolitical Instability in EAC Region | Conflicts or tensions in neighbouring East African Community (EAC) countries could disrupt supply chains and exports.
 Intellectual Property & Patent Protection | Weak enforcement of patents and trademarks may lead to counterfeiting risks.
 Risk Factor | Potential Impact
 Currency Fluctuations | Exchange rate volatility can increase the cost of imported raw materials (APIs, excipients, packaging materials).
 Inflation & Rising Operational Costs | High inflation may lead to increased costs for labor, utilities, and raw materials.
 Supply Chain Disruptions | Dependence on international suppliers for APIs and critical components could lead to shortages.
 Limited Access to Affordable Financing | High-interest rates and limited government incentives can make

project financing costly.

Market Demand & Price Sensitivity | Price-sensitive consumers and limited insurance coverage may affect product affordability.

Risk Factor | Potential Impact

Water Scarcity | High water demand for manufacturing and cooling may lead to shortages, increasing operational costs.

Waste Disposal Challenges | Improper disposal of hazardous waste (solvents, API residues) can lead to environmental penalties.

Energy Dependence on Non-Renewables | High electricity costs and unreliable grid supply may lead to production disruptions.

Climate Change Effects | Increased heat and erratic rainfall could impact cooling systems and energy consumption.

Regulatory Non-Compliance | Failure to meet Uganda's National Environment Management Authority (NEMA) regulations can lead to legal actions.

Risk Category | Key Risks | Mitigation Strategies

General Risks | Regulatory uncertainty, bureaucracy, policy shifts | Engage early with regulators, form public-private partnerships, diversify export markets

Economic Risks | Currency fluctuations, inflation, financing challenges | Hedge currency risks, optimize operational costs, diversify revenue streams

Environmental Risks | Water scarcity, waste disposal, high energy costs | Implement sustainable waste management, use renewable energy, optimize water usage

Phase | Focus | Timeframe | Revenue Stream | Impact on ROI

Phase 1 | OSD + Syrups | Year 1–2 | Tender sales, private hospitals | Early cash flow

Phase 2 | Oncology + Injectables | Year 2–3 | High-margin products | Boost margin

Phase 3 | Vaccines + Biosimilars | Year 3–5 | Institutional procurement | Long-term revenue

Cross-Cutting | CDMO + Export | Year 1–5 | Capacity monetization | Parallel revenue

EXECUTIVE SUMMARY

Introduction:

The objective of this project is to establish and operate a state-of-the-art green field multi-Products Biopharmaceutical manufacturing plant in Republic of Uganda and to address and transform health care needs of East African council (EAC) by addressing critical health care challenges and fostering local manufacturing.

This facility aims to consistently and efficiently produce high-quality pharmaceutical, Biopharmaceuticals & vaccines in a phased manner

Objective:

The objective of this report is to study comprehensively the feasibility and to assess the potential for establishing a sustainable and efficient pharmaceutical manufacturing plant in Uganda.

BioBridge is requested to provide a proposal for feasibility study services, which include:

Market analysis

Regulatory requirements

Site selection and infrastructure

Technical feasibility

Financial feasibility

Supply chain and raw material sourcing

Human resources

Risk assessment

Sustainability

Goals

Health Care Access: To enhance Healthcare access by manufacturing high quality pharmaceuticals, Biologics and vaccines locally thereby reducing the dependency on imported medicines and biologics, ensuring cost effective treatment to masses.

Health Care needs: To address regional health care needs by manufacturing medicinal products which are required to treat most prevalent diseases in the region-Malaria, Tuberculosis, AIDS.

Economic growth: To foster Economic growth by providing employment opportunity to local population and attracting global investors and venture capitalists.

Sustainability: To establish a sustainable pharma base in Uganda which is reliable and self-sufficient.

Supply Chain Reliability: Building a secure and efficient supply chain to source raw materials, transport finished products, and ensure timely deliveries to end users.

Stakeholder Satisfaction: Ensuring customer satisfaction by providing consistent and reliable products while maintaining a favourable relationship with employees, investors, and the local community.

Solution:

To realise the above said goals and to address the critical health care needs of Uganda, Biopharmaceutical manufacturing facility shall be established in the phased manner.

In the first phase Oral Solid Dosage (OSD) form shall be established by integrate state-of-the-art manufacturing technologies to ensure efficiency, quality, and scalability of wide range of high-demand solid dosage forms, including tablets, capsules, syrups, and advanced technologies such as soft gel capsules.

In the phase -2, The Phase-2 General Injectables facility will focus on manufacturing sterile pharmaceutical injectable-grade products, targeting key therapeutic segments. Injectables facility shall be designed to meet the highest global standards for sterile manufacturing while maintaining cost efficiency and scalability

In the Phase-3, Biopharma Products facility focuses exclusively on the formulation and fill- finish of advanced biopharmaceutical products. This facility shall be commissioned to address the increasing demand for biologics, including Monoclonal antibodies(mabs), Hormones, Insulin, analogs, and other therapeutic proteins.

This facility shall be designed to ensure contamination controls, precision, and compliance with global standards for biopharmaceutical fill-finish processes.

The Phase-4, facility for formulation and fill-finish of critical vaccines to address major global and regional health challenges. This facility shall be designed to cater to both routine immunization programs and outbreak vaccines.

East Africa, like the rest of Africa, faces a growing demand for vaccines, particularly as it works to strengthen its vaccine supply chain and boost domestic capabilities to meet the needs of its population.

In the 5th and the final phase, Oncology OSD facility shall be installed to address the needs of anticancer drugs in the region.

2.0 DETAILED FEASIBILITY

REPORT

Market Analysis:

Demand for pharmaceutical products in Uganda

Uganda's pharmaceutical industry is a key component of the country's healthcare system, with demand steadily increasing due to population growth, rising disease burdens, and government initiatives to improve healthcare access.

The disease burden in Uganda is similar to other less developed African countries, with communicable diseases accounting for roughly 67% of the total burden.

Uganda's communicable disease burden is dominated by infectious and parasitic diseases. Malaria is considered as the major cause of deaths in the country.

The most prevalent causes of mortality and morbidity in Uganda are

Malaria, Pneumonia, Tuberculosis, Anaemia, Hypertension, Diabetes and Cancer.

Fig No.: 1

Fig. No.:2

Trends of Cancer Patients in Uganda:

Fig.No.:3

The cancer burden by type of cancer diagnosed among patients

MARKET VALUE:

In Uganda, the revenue in the pharmaceuticals market is estimated to reach US\$329.32m in 2025.

The largest market within this industry is Oncology Drugs, which is projected to have a market volume of US\$50.03m in 2025.

The revenue is expected to exhibit an annual growth rate (CAGR 2025-2029) of 3.06%, resulting in a market volume of US\$371.58m by 2029.

Uganda's pharmaceutical market is experiencing a surge in demand for affordable generic medications.

The East Africa generic drug market reached USD 2.4 billion in 2024 and is expected to exhibit a CAGR of 6.72% during 2025-2033.

Competitive Landscape:

East Africa Pharma manufacturing- An Overview

Around 35 active manufacturers (members of FEAPM); 2 facilities with WHO cGMP approval and pre-qualified products

Primarily compounding and formulation of most dosage forms including infusions

Almost all raw materials imported

High dependency on imported finished pharmaceutical products

Focus on WHO list of essential medicines

No API manufacturing

Increasingly well-regulated (NDA, PPB, TFDA)

Trade is mostly intra-East Africa

Companies currently having manufacturing base in Uganda

CIPLA Quality Chemicals Industries Limited, joint venture between a local and international

pharmaceutical company, is certified cGMP facilities manufacturing Anti-retro viral, anti-malarial and

hepatitis B drugs, exports to Sub-Saharan countries and supplies drugs to the Global Fund

Kampala Pharmaceutical Industries (1996) Limited, local manufacturer and an affiliate of the Aga Khan

development network. Product range includes analgesics, anti-asthma, anti-diabetic, anti-malarial,

anti-parasites, antibiotics, cardiovascular drugs, cold remedies & Nutraceuticals

Beta Health Care Uganda Limited, an affiliate of Aspen Group. Exports its products to Tanzania, Rwanda,

Burundi, Ethiopia, Sudan, Somalia, Mauritius and West Africa

Key players in the market are actively implementing various strategies to expand their reach and market share by:

Enhancing their production capabilities, both in terms of volume and the range of products.

Investments in advanced manufacturing facilities to increase output and meet the rising demand for generic drugs.

Creating more efficient supply chains and distribution networks to ensure wider availability of their products. They are reaching out to remote areas and partnering with local distributors to improve access.

Forming alliances with local manufacturers, international partners, and healthcare providers to extend their reach and enhance their market position.

Technology transfers, knowledge and technology transfer, through Joint ventures, Alliances thereby strengthening local capacities

Key Pharma Sector Data Estimate (Market share, Generic, Branded pharmaceuticals)

Table No.: 1

Source 2014 Estimation (Industry and Association)

Demand for Pharmaceutical Products in Uganda

The demand for pharmaceutical products in Uganda is driven by various factors, including an increasing prevalence of both communicable and non-communicable diseases (NCDs), an expanding healthcare infrastructure, and growing government support for local production.

Below is an analysis of key therapeutic areas:

Oral Solid Dosage Forms (Tablets and Capsules)

Oral solid dosage forms constitute the majority of prescription medications in Uganda, covering a range of treatments from antibiotics to anti-hypertensives.

Uganda has a few established pharmaceutical manufacturers producing these drugs.

Despite local manufacturing efforts, a large portion of Uganda's medicine supply is still imported due to insufficient production capacity and the need for diverse active pharmaceutical ingredients (APIs).

Expanding local production capabilities, especially for essential generics, could help meet growing demand and reduce reliance on imports.

Oncology Treatments

Cancer cases in Uganda have been rising significantly, with estimates from the Uganda Cancer Institute (UCI) indicating an annual increase in new cases (Refer to Fig Nos.2&3.).

Currently, oncology drugs are almost entirely imported, making treatment expensive and often inaccessible to many patients.

There is an opportunity for local pharmaceutical manufacturers to invest in cancer drug production, particularly generic chemotherapy drugs, which could lower costs and improve accessibility and health care.

The Ugandan government and international health organizations are increasingly investing in cancer treatment centres, further boosting the demand for oncology drugs

Vaccines

Uganda has a demand for vaccines (approx. 1.7 million doses per annum for essential vaccines) due to childhood immunization programs, seasonal disease outbreaks, and global initiatives like the Global Vaccine Alliance (GAVI).

The country currently relies on imports for nearly all its vaccines, which poses challenges such as supply chain disruptions and high procurement costs.

Government efforts to establish vaccine production facilities could significantly boost the local pharmaceutical industry and create self-sufficiency in vaccine supply.

Monoclonal Antibodies (mAbs)

Monoclonal antibodies are used in cancer treatment, autoimmune diseases, and infectious diseases like COVID-19.

Uganda currently lacks the infrastructure for manufacturing biologic drugs & mAbs, entirely dependent on imports.

Drivers of Pharma market:

Rapid expansion of local pharmaceutical manufacturing capacities.

East Africa is experiencing a significant boost in its pharmaceutical production driven by a combination of increased domestic and international investment and initiatives, improved technological capabilities, and a strategic push for self-sufficiency in pharmaceutical supply. Furthermore, there is a rising awareness among healthcare professionals and patients about the comparable efficacy of generic drugs to brand-name counterparts.

Generic drug manufacturers are significantly strengthening their distribution networks to improve product reach. This involves the development of efficient supply chain strategies and logistics networks to ensure generic drugs are accessible even in remote regions. This expanded distribution is further facilitated by technological advancements, such as digital platforms and delivery systems, enabling broader dissemination of generic drugs across the region, fostering overall the market

growth.

Favourable Government Initiatives

Governments across East Africa are progressively acknowledging the role of generic drugs in achieving healthcare affordability and accessibility. They are implementing regulatory reforms to simplify the approval process, thereby encouraging their use by streamlining this process, governments are reducing barriers to entry, making it easier for generic manufacturers to bring their products to market.

Moreover, there is an increase in governmental efforts to boost public awareness about the efficacy and affordability of generic drugs. Despite their lower cost, generic drugs are equally effective as their branded counterparts.

EAC Pharma – Opportunities

Large unmet need for essential medicines

Significant population growth anticipated

Double disease burden (growth of chronic diseases):

NCDs are predicted to account for 40% of illnesses & for 42% of deaths (5.1 million) by 2030 (WHO Global Health Estimates, 2013)

Growing middle class willing to pay for better treatment

New models of care being designed (e.g. PPP, medical insurance, etc.)

Existing pharmaceutical production base & enabling regulatory environment

African traditional and herbal medicines as a market niche

No dominant players

Political will and action

EAC Pharma – Challenges

Negative perceptions of locally manufactured products

Lack of capacity to manufacture advanced formulations due to a skills gap on product development and formulation expertise

High cost of borrowing (20-30%)

High cost of operations e.g. finance, utilities, infrastructure

Lack of market data

Poor and unreliable infrastructure (roads, utilities, etc)

Under resourced and weak institutions (Civil society, Regulatory agencies, etc)

Vaccines Market Analysis:

Immunization is a proven tool for controlling and eliminating life-threatening infectious diseases and is estimated to avert millions of deaths each year.

Universal immunization of children against eight vaccine-preventable diseases [tuberculosis, diphtheria, whooping cough (pertussis), tetanus, hepatitis B, respiratory diseases caused by *Haemophilus influenzae*, polio, and measles] is crucial to reducing infant and child mortality. J Health Popul Nutr . 2013

Mar;31(1):118–129. doi

Immunisation Schedule in Uganda:

Routine immunization schedule for Children below the age of one year cover vaccines for following preventable diseases

Oral Polio vaccine, BCG, Pentavalent, Pneumococcal 10 valent, Rotavirus vaccine, Injectable Polio vaccine

(14 weeks of age), Measles vaccine & HPV (Female Children) (Republic of Uganda, Ministry of Health/UNICEF

Report) Based on the birth cohort in Uganda (1.7 million) the requirements of different vaccines are as

under based on the government Immunization program:

Table No.:2

Upcoming vaccines which shall be targeted in the future

mRNA based vaccines for pandemic preparedness, RSV (Respiratory Syncytial virus) vaccine, Recombinant

Tuberculosis vaccine (under development globally), Rabies vaccine etc.

Demand of vaccines products in Uganda & EAC region:

Eastern Africa is experiencing a surge in demand for vaccines, driven by increasing awareness and

government initiatives to improve healthcare access.

The Vaccines market in Eastern Africa is anticipated to achieve a revenue of US\$463.65m in 2025.

Looking ahead, the market is expected to exhibit a compound annual growth rate (CAGR) of -4.98% from 2025 to 2029, leading to a market volume of US\$377.97m by 2029.

Key market trends, challenges, and opportunities:

One of the key trends in the Vaccines segment in Eastern Africa and Uganda is the increasing availability of vaccines.

Pharmaceutical companies are expanding their operations in the region, and governments are working to improve vaccine distribution networks. This has made vaccines more accessible to people living in remote areas. Secondly, in the market there is growing demand for new and innovative vaccines. As more people become vaccinated against common diseases, there is a need for vaccines that can prevent emerging infectious diseases. Pharmaceutical companies are investing in research and development to create new vaccines that can address these challenges.

East Africa, like the rest of Africa, faces a growing demand for vaccines, particularly as it works to strengthen its vaccine supply chain and boost domestic capabilities to meet the needs of its population.

Challenges and Opportunities:

Challenges include the provision of vaccines in rural locations hampered by inadequate cold chain infrastructure, and vaccination acceptance rates that are impacted by cultural and religious beliefs.

Besides, there are also market opportunities, such as increasing research and development (R&D) spending for novel vaccines and technological advancements.

Growing Support from Various Organizations:

The support from international bodies such as the World Health Organization (WHO), World Bank, the United Nations Children's

Fund (UNICEF), and the Global Alliance for Vaccines and Immunization (GAVI) is indispensable for the East African vaccine market. These organizations provide not only financial aid but also logistical support,

crucial for the procurement and distribution of vaccines in the region.

Competitive Analysis of the Existing Pharmaceutical Market

Uganda's pharmaceutical market is composed of both local manufacturers and international suppliers. The competitive landscape is shaped by several key factors:

Local Pharmaceutical Manufacturers

Uganda has a small but growing pharmaceutical manufacturing industry.

Local manufacturers face challenges such as high production costs, limited access to raw materials, and competition from imported generics.

Import Dependence and Foreign Suppliers

Uganda imports about 70% of its pharmaceuticals, with India and China being the dominant suppliers.

International pharmaceutical companies have a strong presence in Uganda through distributors.

The high reliance on imports creates challenges in affordability, availability, and quality control.

Policy and Market Protection

Uganda has introduced policies like the "Buy Uganda, Build Uganda" (BUBU) initiative, which promotes local manufacturing.

However, the local pharmaceutical industry struggles to compete with cheaper imports, and implementation of these policies remains inconsistent.

Key Market Trends, Challenges, and Opportunities

Market Trends

Regulatory Harmonization in the EAC

The East African Community (EAC) is working towards regulatory harmonization, allowing Ugandan manufacturers to access larger regional markets.

Harmonization simplifies drug registration processes and could enhance trade within the region.

Growing Non-Communicable Disease (NCD) Burden

There is an increasing prevalence of NCDs such as diabetes, hypertension, and cancer in Uganda.

This shift is driving demand for chronic disease medications, which presents opportunities for local manufacturers to diversify production.

Expansion of Health Infrastructure

The Ugandan government is investing in expanding hospitals, clinics, and specialized treatment centres.

These investments are increasing the demand for pharmaceuticals, particularly in specialized areas like oncology and vaccines.

Key Challenges

Limited Access to Finance

Pharmaceutical manufacturing requires large capital investments for facility upgrades, research, and compliance with regulatory standards.

Access to affordable financing remains a major barrier for Ugandan pharmaceutical firms.

Dependence on Imported Raw Materials

Uganda imports most of its Active Pharmaceutical Ingredients (APIs) from India and China.

This dependence makes local manufacturers vulnerable to global supply chain disruptions.

Regulatory and Quality Compliance

Meeting international Good Manufacturing Practices (GMP) standards is essential for market expansion but requires costly upgrades.

Non-compliance can limit Ugandan pharmaceutical companies' ability to export to international markets.

Shortage of Skilled Workforce

There is a lack of specialized professionals in pharmaceutical research, manufacturing, and regulatory affairs.

Developing a skilled workforce through training and academic programs is critical for industry growth.

Opportunities for Growth

Investment in Local Production

Increasing local manufacturing, especially in essential medicines and specialty areas like oncology and vaccines, can enhance Uganda's pharmaceutical security.

Public-Private Partnerships (PPPs) could play a crucial role in driving investment.

Regional Expansion and Export Potential

The EAC harmonization efforts present an opportunity for Ugandan pharmaceutical companies to expand their reach beyond the domestic market.

By meeting international regulatory standards, local manufacturers could increase exports to neighbouring countries.

Public-Private Collaborations

Government initiatives supporting pharmaceutical production can help develop infrastructure and provide financial incentives for local companies.

Partnerships with international pharmaceutical firms could help bring technology and expertise to Uganda.

Biopharmaceutical and Vaccine Development

Investing in biologics and vaccine production could position Uganda as a leader in high-value pharmaceutical production.

Establishing local capacity for monoclonal antibody production could reduce reliance on costly imports.

Overview of the Ugandan Pharmaceutical Regulatory Framework and EAC Regulatory Systems

Introduction:

In Uganda, the regulation of human medicinal products is overseen by the National Drug Authority (NDA), which ensures the safety, efficacy, quality, availability and cost means of providing satisfactory healthcare and safeguarding the appropriate use of medicines used within the country.

The legal framework governing these activities is established by the National Drug Policy and Authority Act, Cap 206.

The National Drug Authority (NDA) was established in 1993 by the National Drug Policy and Authority Statute which in 2000 206 of the Laws of Uganda (2000 Edition).

The EAC Guide on Good Manufacturing Practices (GMP) is based on the World Health Organization (WHO) Good Manufacturing Practices guidelines in the WHO Technical Report Series No. 961, 2011. This guide also refers to the Pharmaceutical Inspection Convention Scheme (PIC/S) guide PE 009-9.

Table No.:3

Guidelines: National Drug Authority, Uganda- Human medicinal guideline

Maturity level of NDA (Uganda) with respect to WHO Qualification

Maturity Level 3, which is a key benchmark for drug regulatory bodies, ensures that national authorities can effectively oversee drug safety, efficacy, and quality, aligning with international norms.

The National Drug Authority (NDA) is seeking to overcome legal and regulatory challenges that have hindered its progress toward achieving Maturity Level 3, a global standard for drug regulators.

Only eight African countries have currently attained this status, making it a significant goal for Uganda. These include, Egypt, Rwanda, Senegal, Ghana, Nigeria, South Africa, Tanzania and Zimbabwe.

Key Regulatory Requirements

In Uganda, the journey of a new drug from conception to market involves a systematic approval process regulated by several governing bodies, predominantly the National Drug Authority (NDA).

Preclinical and Clinical Trials:

The process begins with preclinical studies, where laboratory and animal testing evaluate the drug's safety and efficacy. This stage is crucial, as it provides preliminary data that informs the next phases of research and development. Pharmaceutical companies need to document their findings and prepare a comprehensive submission package for the NDA.

Conducting clinical trials in Uganda requires prior authorization from the NDA.

Researchers, organizations must adhere to the "Guidelines for the Conduct of Clinical Trials in Uganda," which detail the procedures for submission, review, and approval of clinical trial applications.

Compliance with Good Clinical Practice (GCP) is mandatory, as outlined in the "Guidelines on Good Clinical Practice in the Conduct of Clinical Trials Involving Human Participants."

After completing the clinical trials, the pharmaceutical company must submit a New Drug Application (NDA) to the NDA, including all research data, manufacturing details, and proposed labelling.

Once the NDA reviews the application and finds it satisfactory, it grants approval for the drug to be marketed.

Good Manufacturing Practice (GMP):

Manufacturers of medicinal products must comply with GMP standards to ensure product quality. The NDA provides detailed guidelines, including "Guidelines on Good Manufacturing Practice for Medicinal Products Part I – Basic Requirements for Medicinal Products."

All human medicinal products must be registered with the NDA before they can be marketed or distributed in Uganda. The registration process involves a scientific evaluation of the product's safety, efficacy,

and quality.

GMP Inspection:

National Drug Authority (NDA) is the regulatory body responsible for overseeing the compliance of pharmaceutical companies with GMP standards.

Regular GMP inspections and audits are conducted as one of the requirements for registration of medicinal products in the EAC.

The NDA conducts comprehensive evaluations to verify that facilities meet the specified criteria for manufacturing processes, hygiene, and personnel training.

Inspection involves review of documents, records, facilities and any other resources to assess their conformity to the requirements of EAC GMP of medicinal products.

Any non-compliance can result in severe penalties, including the suspension or revocation of manufacturing licenses.

Importation and Exportation:

The NDA regulates the import and export of drugs and pharmaceutical raw materials.

Drugs imported must be registered unless given special clearance by the NDA under Sec 8(4) NDPA (National drug policy & Authority) by NDA.

The import permit may be:

Annual import permit -which is issued for regular imports like pharmaceutical manufacturers or any organization, retail pharmacies, wholesale premises, that regularly imports drugs and other related substances. Ministry of Health of Uganda and its affiliated units may also apply for an annual import permit.

Provisional import permit is issued to non-regular importers who may import drugs, for some reasons.

The provisional import permit is issued per consignment. This usually applies to the organizations, which receive donations, physicians or individuals who may for specified reasons need to bring limited quantities of specialized drugs that are not available in the country. The permit is valid for one month.

Licensing:

Entities involved in the manufacture of pharmaceuticals must obtain appropriate licenses from the NDA.

Import License: (Form-24)

Eligibility to apply for import license: A licensed person (a person holding license to operate pharmacy or for manufacture drugs).

Import license is valid for one year and is valid within the calendar year within which it is issued.

Verification certificate: A consignment of drugs to be imported into Uganda shall before importation, be issued with a verification certificate (Form-25) by the NDA basing on the application submitted in this regard in Form-26.

Stability Data:

In Uganda, the National Drug Authority (NDA) requires stability data as part of the regulatory requirements for pharmaceutical and biopharmaceutical products, ensuring quality, safety, and efficacy, and mandates that all medicinal products meet acceptable standards.

The NDA requires that applicants for drug registration provide results of stability testing, which is crucial for determining the shelf-life and storage conditions of the product.

Applicants need to submit all relevant stability data as part of the registration application.

The stability studies will determine the appropriate storage conditions for the product, including temperature and humidity, and these conditions must be reflected on the product label.

The product label must include an expiry date and storage instructions based on the stability data.

Stability studies should include Storage conditions i.e temperature and relative humidity for accelerated and stress conditions.

Stability studies should be done in accordance or with reference to WHO TRS 987, WHO TRS 953 Annex 2, WHO TRS 962

Annex 3, ICH Q1A and ICH Q5C guidelines.

A minimum of twelve months data at the time of submission should be provided in cases where storage periods greater than six months are requested.

For storage periods of less than six months, the stability data should cover the whole proposed shelf life.

The stability studies should be submitted in controlled documentation.

Post-approval stability program should include the stability program or stability commitment to be carried out once the drug product is on the market, including the number of batches to be included in the study each year and the tests to be performed.

These results should be submitted periodically to update the information on the stability of the drug product.

The stability of each dosage form should be separately documented.

Stability data submitted should be for at least three consecutive batches and include the following:

- a) Information on stability of drug product, quality control methods and rationale for the choice of tests for determining stability.
- b) Information on the dates of manufacture of the lots, the lot numbers, the vial and dose size, and the scale of production.

For lyophilized products the data supporting the shelf-life of the product reconstitution should be included.

If the drug product is frozen, data supporting the stability of the product through a stated number of freeze-thaw cycles should be provided.

Drugs Registration in Uganda:

All drugs to be manufactured or imported into Uganda have to be registered with the National Drug Authority, Uganda. A person who intends to manufacture, import or export a product shall, prior to the manufacture, importation or exportation of the product, apply to the Authority for registration of the product.

The registration process involves:

NDA inspection & approval of the manufacturing facility.

Validity of registration:

The Authority shall issue for the first registration, a certificate of registration which shall be valid for five years.

The holder of a certificate of registration shall pay an annual retention fee prescribed by the Authority for maintaining the registered human or veterinary drug or preparation, vaccine or other immunological products or surgical instrument, on the Register.

A certificate for renewal of registration shall be valid for one year from the date of issue.

The certificate of registration issued under these Regulations shall be kept at the premises of the holder of the certificate of registration.

The holder of a certificate of registration shall monitor the safety and effectiveness of the registered human or veterinary drug or preparation, vaccine or other immunological products or surgical instrument while on the market in Uganda and shall submit periodic reports as may be prescribed by the Authority.

The registration of a human or veterinary drug or preparation, vaccine or other immunological products or surgical instrument under these Regulations shall be valid except where the registration is suspended or

cancelled by the Authority or is terminated by the holder of the certificate of registration.

Table No.:4

Marketing Authorisation Time lines: Registration Timeline: 12 to 18 months

Post-Marketing Surveillance and Pharmacovigilance:

Under the National Drug Policy and Authority (NPD &A) Act (1993) the Uganda National Pharmacovigilance Centre (NPC) is responsible for PV efforts in the country and mandates the National Drug Authority (NDA) to monitor the safety, efficacy and quality of medicines.

Risk Assessment

Risk assessment is a crucial regulatory requirement, ensuring product safety, efficacy, and quality, and safeguarding public

health. Proactive risk identification and mitigation, through methodologies like Quality Risk Management (QRM), are essential for regulatory compliance and building trust with stakeholders.

Manufacturers would be required to conduct a risk assessment on critical production and quality control processes and thereafter develop a mitigation plan whose effectiveness would be monitored by the regulator.

Table No.:5 Regulation Framework Timelines:

Environmental and Safety Regulations Applicable to Pharmaceutical Manufacturing in Uganda

Uganda's regulatory framework ensures that pharmaceutical production safeguards human health, worker safety, and environmental sustainability.

Environmental Compliance

Environmental oversight in Uganda is primarily the responsibility of the National Environment Management Authority (NEMA). Under the National Environment Act, 2019, all industrial and manufacturing projects, including pharmaceutical facilities, are required to undertake an Environmental and Social Impact Assessment (ESIA) as a prerequisite for licensing and construction. The ESIA must identify potential environmental risks and outline mitigation strategies, with particular attention to waste management, water usage, emissions, and impacts on surrounding communities.

Pharmaceutical facilities must install and maintain Effluent Treatment Plants (ETPs) to process wastewater before discharge. Compliance with the Environmental Management (Waste Management) Regulations ensures proper handling of both hazardous and non-hazardous solid and liquid waste, especially chemical residues, solvents, and expired or rejected pharmaceutical products. The facility must also adhere to Uganda's obligations under the Basel Convention on the control of transboundary movements of hazardous waste.

Safety and Occupational Health Standards

The National Drug Authority (NDA) regulates the pharmaceutical sector and enforces Good Manufacturing Practices (GMP), including protocols that safeguard worker and product safety throughout the production lifecycle.

This includes facility design to minimize cross-contamination, controlled cleanroom environments, and safe material handling procedures.

In parallel, the Occupational Safety and Health Act, 2006, administered by the Ministry of Gender, Labour and Social Development, mandates comprehensive safety practices in the workplace. Employers must implement hazard identification and risk mitigation strategies, ensure employee training, and provide Personal Protective Equipment (PPE) and emergency response systems. All operations must include clearly marked emergency exits, fire suppression systems, first aid facilities, and regular safety drills.

Regular inspections and audits are conducted by both NDA and the Ministry of Labour to verify compliance.

Manufacturers are encouraged to adopt internationally recognized standards such as ISO 14001 (Environmental Management Systems) and ISO 45001 (Occupational Health and Safety Management Systems) to enhance performance and facilitate future export readiness.

Strategic Considerations

Full regulatory compliance not only avoids legal penalties and operational delays but also enhances the facility's reputation among stakeholders and investors. Additionally, adherence to these regulations supports sustainable operations and positions the facility for future certification under global quality and safety systems, enabling access to regional and international markets.

Overview of EAC Regulatory Systems for Key Therapeutic Areas

General Observations on the EAC Medicines Regulatory Framework

Harmonization Framework: The EAC Medicines Regulatory Harmonization (MRH) Programme supports joint product assessments, GMP inspections, and reliance pathways to reduce duplication across Partner States.

National Regulatory Authorities (NRAs): While each EAC country retains autonomy (e.g., Kenya PPB, Uganda NDA, Rwanda FDA), they collaborate extensively on shared regulatory functions.

Global Alignment: Reliance on WHO Prequalification, Global Fund procurement standards, AVAREF for clinical trials, and engagement with the African Medicines Agency (AMA) for future alignment.

Site Selection and Infrastructure

Site Selection Criteria

Proximity to Raw Materials & Suppliers

Most of the Active Pharmaceutical Ingredients (APIs) and excipients used in pharmaceutical production in Africa are imported (mainly from India and China).

Ideal site locations:

Close to international ports, airports, or dry ports to reduce import lead times.

Access to local packaging material manufacturers to lower supply chain dependency.

Industrial zones with chemical and biotech suppliers to ensure consistent raw material availability.

Logistics & Transportation Considerations

Proximity to major highways, rail networks, and ports to facilitate raw material import and product distribution.

Cold chain logistics is crucial for vaccines and biologics, requiring locations near temperature-controlled warehouses and transport hubs.

Close to key healthcare markets to reduce distribution delays, especially for essential medicines.

Utilities & Infrastructure

Electricity: Reliable power supply is critical, especially for injectables, vaccine production, and sterile drug manufacturing. Backup

generators, UPS systems, and solar energy solutions should be considered.

Water Supply & Treatment:

High-quality water sources for pharmaceutical processing, purification, and cleaning.

Reverse Osmosis (RO) & Water for Injection (WFI) systems for injectable production.

Effluent treatment plants (ETP) and bio-waste disposal facilities for environmental compliance.

Air Filtration & HVAC Systems:

ISO-classified cleanrooms (ISO 5, ISO 6, ISO 7, ISO 8) for sterile and injectable production.

High-Efficiency Particulate Air (HEPA) filters and humidity- controlled areas for tablet and capsule manufacturing.

Skilled Workforce Availability

Proximity to universities and research institutions that offer pharmaceutical, biotechnology, and engineering programs.

Training partnerships with international pharmaceutical firms to build local expertise.

Employee housing and transport accessibility to attract and retain skilled professionals.

Infrastructure Requirements

Facility Layout & Zoning

Segregated production zones for different dosage forms:

OSD (Oral Solid Dosage): Tablets, capsules.

Syrups & Liquids: Bottled formulations.

Injectables & Vaccines: Requires high-containment cleanrooms and sterile environments.

Dedicated cleanroom areas for sensitive processes such as sterile drug filling and vaccine formulation.

Material & personnel movement control to prevent cross-contamination.

Manufacturing Equipment & Technology Integration

Automated production lines for efficiency and compliance with GMP standards.

SCADA (Supervisory Control and Data Acquisition) and MES (Manufacturing Execution Systems) for real-time monitoring.

Cold Chain & Storage Facilities

Temperature-controlled warehouses for raw materials and finished pharmaceutical products.

Cold chain logistics for vaccines and biologics, including deep freezers and transport containers.

Automated inventory management systems to ensure compliance with GDP (Good Distribution Practices).

Finding the Right Technology Partners

Pharmaceutical Machinery & Equipment Suppliers

To establish a world-class pharmaceutical facility, partnering with technology providers specializing in pharmaceutical manufacturing equipment is essential. Key areas include:

Oral Solid Dosage (OSD) Equipment

Granulation, blending, and tablet compression machines

Leading suppliers: GEA Group, Bosch, Syntegon (formerly Bosch Packaging), Fette Compacting ACG Worldwide,

SED Pharma, Syntegon Technology, IMA Group, Glatt, Fette Compacting, Romaco, iPharMachine

Sterile Injectable & Vaccine Manufacturing Equipment

Aseptic filling, lyophilization, and cleanroom solutions

Leading suppliers: Bausch+Ströbel, IMA Pharma, Optima Pharma, NKP Pharma machinery, Sartorius, Cozzoli

Machine Company, Groninger, ARxIUM, NJM Packaging, Intellitech

Water Purification & WFI Systems

Suppliers: Merck Millipore, Veolia Water Technologies, Komal Industries, MECO, NGK Insulators Ltd,

Syntegon, Ovivo, Fabtech Technologies, Aqua-Chem, Herco Wasser technik GmbH, NEWater

Cleanroom & Air Filtration Systems

Suppliers: Camfil, AES Clean Technology, Thermo Fisher Scientific, Clean Air Technology, Atmos-Tech

Industries, Abtech Inc., Microflow Devices India PVT Ltd. Zeco Aircon Ltd

Digital & Automation Partners

SCADA & MES Systems: Siemens, Rockwell Automation, Honeywell.

Automated quality control & batch monitoring: Emerson, Siemens, ABB.

Regulatory & Compliance Partners

GMP compliance consulting:

Local regulatory bodies (e.g., Uganda National Drug Authority - NDA).

Waste Management & Sustainability Partners

Hazardous waste disposal & ETP solutions: Veolia, SUEZ, Ecolab.

Renewable energy integration for sustainability: Tesla Energy, Schneider Electric.

Strategic Collaborations & Public-Private Partnerships

Government Incentives & Special Economic Zones (SEZs)

Tax incentives for pharmaceutical manufacturers in Uganda and the East African Community (EAC).

Preferential land allocation and infrastructure support for investors.

Public-Private Partnerships (PPPs)

Collaborations with global health organizations (WHO, UNICEF, GAVI, USAID) for vaccine and essential medicine production.

Infrastructure Requirements for a Pharmaceutical Manufacturing Facility near Kampala, Uganda

The proposed pharmaceutical manufacturing facility, will be located near Kampala, Uganda.

Given the scale and scope of this state-of-the-art facility, robust infrastructure is vital to ensure uninterrupted operations, regulatory compliance, and product quality.

Power Supply: The facility will require a high-capacity, stable power source to support continuous manufacturing, HVAC systems, cleanrooms, cold storage, and quality control labs. It will be connected to the national electricity grid via UMEME, with dedicated transformers and high-voltage infrastructure. Backup power will be provided through diesel generators and solar power systems to ensure energy security and sustainability.

Water Supply: A reliable water supply is essential for production processes, utilities, cleaning, and sanitation. The facility will include on-site water purification systems to generate Purified Water (PW) and Water for Injection (WFI), meeting GMP standards. Water will be sourced from the national supply network and supplemented by boreholes with storage reservoirs.

Waste Management: The facility will house a centralized Effluent Treatment Plant (ETP) and systems for safe disposal of solid and hazardous waste, in full compliance with NEMA guidelines. Special provisions will be made for pharmaceutical and biomedical waste, including incineration and disposal via licensed operators.

Transport Links: Proximity to Kampala's industrial zones, the Northern Corridor, and Entebbe International Airport ensures efficient import/export logistics and access to regional markets. Excellent road connectivity will facilitate material movement and regulatory oversight.

TECHNICAL FEASIBILITY

Machinery and Equipment Requirements

Each dosage form requires specific equipment to facilitate high-quality and compliant production.

Oral Solid Dosage (OSD) & Capsules Manufacturing

Granulation Equipment – Fluidized bed dryers, high-shear mixers.

Tablet Compression Machines – Single rotary, double rotary presses.

Capsule Fillers – Semi-automatic and fully automatic encapsulation machines.

Coating Machines – Film and sugar coating systems.

Blending & Mixing Equipment – V-blenders, ribbon mixers.

Syrup and Liquid Manufacturing

Sugar Dissolution & Mixing Tanks – Stainless steel reactors with agitation.

Homogenizers – For uniform syrup consistency.

Liquid Filling & Capping Machines – For bottles and ampoules.

Sterile Filtration Systems – For microbial safety.

Injectables & Parenteral Manufacturing

Aseptic Filling Lines – For ampoules, vials, prefilled syringes.

Lyophilization Equipment – For freeze-dried injectables.

Autoclaves & Sterilizers – For equipment and component sterilization.

Isolators & Restricted Access Barrier Systems (RABS) – To maintain sterility.

Monoclonal Antibodies (mAbs) & Vaccine Manufacturing

Fill-Finish Equipment – Sterile filling, capping, lyophilization.

Cold Chain & Stability Chambers – For biological storage.

3. Technology and Automation

Digitalization and Smart Manufacturing

Manufacturing Execution Systems (MES) for batch tracking.

SCADA (Supervisory Control and Data Acquisition) for process automation.

Predictive Maintenance to prevent downtime.

Quality Control & Assurance Technologies

Analytical Testing Equipment – HPLC, GC, UV Spectrophotometers.

Microbial Testing – Endotoxin testing, sterility assurance.

4. Compliance & Regulatory Considerations

Adherence to GMP, WHO and local drug regulatory guidelines.

Regular validation & qualification of equipment and processes (IQ, OQ, PQ).

Environmental compliance with waste disposal and emission control.

Manufacturing Area Requirements - Overall Site Plan & Area Distribution

Table No.: 6 COMMON AREAS

Table No.: 7

PLANT 1 – OSD BLOCK (ASSUMED OUTPUT CAPACITY IS 15 MILLION UNITS PER DAY)

Table No.: 8

PLANT 2 – mAbs AND BIOSIMILARS (ASSUMED OUTPUT CAPACITY IS 3 MILLION UNITS PER ANNUM)

Expansion & Scalability: The facility should allow for a future increase in production capacity.

Table No.: 9

PLANT 3 - Filling Lines for Vials, Ampoules, and Pre-Filled Syringes

Expansion & Scalability: Design with future capacity increases in mind.

PLANT 4 - Oncology OSD Facility for Production of Hormonal and Cytotoxic Oral Formulations

Table No.: 10

Additional Considerations

High-Containment Design:

Closed systems with negative pressure, airlocks, isolators, and barrier technology.

Cross-Contamination Control:

Separate air handling, material flows, and personnel flows

for hormonal and cytotoxic drugs.

Scalability & Future Expansion:

Facility should accommodate increasing demand and new drug formulations.

Table No.: 11

PLANT 5 – VACCINE fill finish Facility (ASSUMED CAPACITY OUTPUT IS 50 MILLION DOSES PER ANNUM)

FINANCIAL FEASIBILITY

This review provides an overview of CAPEX, Operational Expenditure (OPEX), financial projections, break-even analysis, and potential Return on Investment (ROI).

Cost Breakdown: CAPEX

Table No.: 12

Capital Expenditure (CAPEX)

The total investment is \$571M USD, allocated across different manufacturing units and operations as follows:

Table No.: 13

Operational Expenditure (OPEX) Breakdown

Annual OPEX includes raw materials, labour, utilities, maintenance, logistics, and regulatory compliance.

Estimated OPEX in full scale operations:

Table No.: 14

* As per calculations

Financial Projections and Revenue Estimates

Estimated Annual Revenue (First 5 Years)

Revenue is projected based on market demand, production capacity, and price realization. The estimated year-wise revenue is:

Table No.: 14

Revenue Contribution by Segment:

OSD & Injectables: 35%

Oncology: 25%

Vaccines & Biopharma: 30%

Contract Manufacturing & Exports: 10%

Break-Even Analysis

Break-Even Point Calculation

The break-even point (BEP) is determined by comparing total fixed costs (CAPEX amortization) with contribution margins.

Fixed Costs: Depreciation on \$571M CAPEX (~10-year depreciation cycle) → ~\$57M/year

Variable Costs: 65% of revenue

Average Selling Price & Margins: 35% Gross Margin

Break-Even Sales Volume Calculation:

Break-even revenue=Fixed Costs / Contribution Margin = 57M / 0.35=162M USD

Thus, the break-even point is reached within the third/fourth year of operation.

Payback Period & Profitability Timeline

Payback period: ~6 years

First-year losses due to ramp-up & market entry.

Full profitability expected in Year 4-5 with a Net Profit Margin of ~15- 20%.

Return on Investment (ROI) Analysis

Projected ROI

ROI = Annual Profit / Total investment × 100

Year 3 Expected Net Profit: ~\$150M USD

ROI by Year 3/4: 150/ 571 ×100 = 26.0%

Cumulative ROI over 6 years: 125% (fully recovering investment & generating profit).

Internal Rate of Return (IRR)

Estimated IRR: 18-22%, exceeding the pharmaceutical industry benchmark of 15-18%.

Strong returns in high-value segments (Oncology, Biopharma, and Vaccines)

Key Financial Risks & Mitigation Strategies

Table No.: 15

Conclusion & Strategic Recommendations

CAPEX of \$571M is strategically allocated across multiple high- growth segments.

OPEX of ~\$335M annually ensures robust operations & regulatory compliance.

Break-even is expected within the third year, with profitability by Year 4-5.

Strong ROI (~28% by Year 4) and IRR (~18-22%) ensure high financial viability.

Strategic Recommendations:

Focus on Oncology & Biologics: Higher-margin products provide better financial returns.

Optimize API Sourcing: Reduce costs by investing in local API production or strategic long-term supplier

contracts.

Enhance Export Potential: Leverage Uganda's EAC trade advantages to increase regional market penetration.

Automate Supply Chain & Manufacturing

Seek Investment & Government Support: Public-private partnerships for incentives & subsidies to lower CAPEX burden.

SUPPLY CHAIN AND RAW MATERIAL SOURCING

The supply chain must ensure a steady supply of raw materials, efficient production, strict quality control, and seamless distribution, while mitigating risks associated with logistics, regulatory compliance, and market fluctuations.

Key Components of the Supply Chain

A robust supply chain for a Sunshine company shall include the following key components:

Raw Material Sourcing (APIs, Excipients, Packaging Materials)

Inventory & Warehousing

Production & Manufacturing

Quality Control & Regulatory Compliance

Cold Chain & Storage (For Vaccines & Biosimilars)

Distribution & Logistics

Risk Management & Supply Chain Resilience

Raw Material Sourcing Strategy

Active Pharmaceutical Ingredients (APIs) and Excipients

Uganda does not have a strong domestic API production base, so APIs must be imported.

Primary API sourcing regions:

India & China – Major global API suppliers.

Europe (Germany, Switzerland, Italy) – High-quality APIs for oncology & biosimilars.

Africa (South Africa, Egypt, Morocco) – Growing pharmaceutical hubs for APIs.

Procurement Strategy:

Develop multiple supplier relationships to reduce dependency on a single country.

Use long-term contracts & Just-in-Time (JIT) supply models for high-cost APIs.

Maintain buffer stock of critical APIs (especially for oncology & vaccines).

Packaging Materials

Primary packaging: Blister packs, vials, ampoules, pre-filled syringes, HDPE bottles.

Secondary packaging: Cartons, labels, package inserts.

Suppliers: Kenya, India, UAE, Turkey, and South Africa.

Supply Chain for Biologics (Vaccines & Biosimilars)

Requires specialized cold chain logistics (-80°C for some biologics).

Partnerships with international biotech firms for technology transfer.

Cold storage facilities at airports & major distribution hubs.

Inventory & Warehousing Management

Raw Material Storage

Separate storage for APIs, excipients, and packaging materials.

Cold storage for temperature-sensitive raw materials.

Real-time inventory tracking system (ERP-based).

Finished Goods Warehousing

GMP-compliant warehouses with segregated storage for different product categories.

First-Expiry-First-Out (FEFO) system for batch management.

Strategic warehouse locations in Uganda and EAC countries for faster distribution.

Production & Manufacturing Workflow

Manufacturing Planning & Scheduling

Lean Manufacturing to reduce waste and optimize production costs.

Batch Manufacturing Record (BMR) & Batch Production Record (BPR) compliance.

Facility Layout & Integration with Supply Chain

Segregated production lines for oncology, OSD, syrups, vaccines, and biosimilars.

Integrated Manufacturing Execution Systems (MES) for real-time monitoring.

Automated raw material dispensing & production tracking.

Quality Control & Regulatory Compliance

Stringent QC checks for APIs, excipients, and packaging materials.

Real-time product traceability using barcoding & serialization.

Compliance with WHO-GMP, EAC regulatory frameworks, US FDA, EMA.

Regular audits of suppliers & third-party logistics providers.

Cold Chain & Storage for Vaccines & Biosimilars

Cold storage at 2-8°C, -20°C, and -80°C.

Real-time temperature monitoring

Strategic cold chain hubs in Kampala & EAC export markets.

Distribution & Logistics Strategy

Domestic Distribution (Uganda)

Direct distribution to hospitals, pharmacies, and wholesalers.

Regional distribution centres in Kampala, Entebbe, Jinja, and Mbarara.

GPS-tracked delivery fleet with route optimization for last-mile delivery.

East African Community (EAC) Export Strategy

Key export markets: Kenya, Tanzania, Rwanda, Burundi, South Sudan, DRC.

Regulatory harmonization under the EAC-MRH program for seamless cross-border approvals.

Dedicated pharmaceutical logistics hubs in Nairobi (Kenya) & Dar es Salaam (Tanzania).

International Exports

Oncology & biosimilars exports to high-value markets in Europe & Middle East.

Collaboration with global pharmaceutical distributors.

Risk Management & Supply Chain Resilience

Key Risks in the Supply Chain

Dependency on imported APIs → Risk of supply chain disruptions.

Regulatory delays → Impact on product approvals & market entry.

Cold chain failures → Risk for vaccines & biologics.

Political & economic instability in Uganda & EAC → Disruptions in logistics.

Risk Mitigation Strategies

Dual sourcing strategy for APIs & critical raw materials.

Investment in API manufacturing in Uganda (long-term goal).

Use of digital supply chain solutions (AI-driven demand forecasting).

Collaboration with global logistics providers (DHL, UPS, local 3PLs).

Digital Transformation in Supply Chain Management

AI Based Monitoring

AI-based demand forecasting to optimize inventory levels.

Cost of Maintaining a Robust Pharmaceutical Supply Chain in Uganda

Key Cost Components of a Pharmaceutical Supply Chain

Note: The cost varies depending on production scale, market reach, automation levels, and regulatory

requirements.

Breakdown of Major Cost Elements

Raw Material & API Procurement Costs

APIs account for 60%-80% of drug production costs, particularly for oncology & biologics.

Uganda imports most APIs from India, China, and Europe, incurring import duties & logistics expenses.

Cost fluctuations due to supply chain disruptions, geopolitical tensions, and regulatory constraints.

Mitigation: Multi-supplier agreements & local API production investments.

Packaging Material Costs

Primary packaging (blister packs, vials, ampoules, prefilled syringes) is imported or locally sourced.

Secondary packaging (cartons, labels, inserts) needs compliance with international standards (e.g., serialization, barcoding).

Sustainable & eco-friendly packaging costs 10%-15% more but enhances regulatory acceptance.

Warehousing & Cold Storage

Cold storage for vaccines & biosimilars (-80°C to 2-8°C) incurs high energy & maintenance costs.

Storage facilities in Kampala & regional hubs (e.g., Jinja, Mbarara) require advanced temperature monitoring.

Manufacturing & Production Logistics

Includes the cost of transporting raw materials, managing production scheduling, and handling batch-to-batch variations.

Biologics and vaccines require specialized production environments, increasing utility & maintenance costs.

Quality Control & Compliance

Regulatory costs include GMP audits and licensing fees.

Maintaining high-end analytical labs for testing APIs, excipients, and final products.

Oncology & biosimilar testing requires more stringent & expensive analytical processes.

Cold Chain Infrastructure for Vaccines & Biologics

Ultra-low temperature storage (-80°C) for certain biologics.

GPS-tracked refrigerated trucks for secure transportation.

Backup power systems to ensure uninterrupted temperature control.

Distribution & Last-Mile Delivery

Cross-border regulatory compliance costs (for EAC markets).

Investment in regional distribution hubs (e.g., Nairobi, Dar es Salaam).

High-security transportation for oncology drugs to prevent theft.

IT & Digital Supply Chain Systems

Track-and-trace systems to prevent counterfeit drugs.

Automated inventory management to reduce wastage & improve efficiency.

Risk Management & Contingency Planning

Emergency stockpiling of critical APIs & biologics.

Alternative supply routes & backup logistics partners.

Investment in local API production to reduce import dependency.

Regulatory Compliance & Audits

WHO-GMP certifications for global market access.

Annual site inspections & compliance renewals.

Investment in training & capacity building for regulatory teams.

Cost Optimization Strategies

Local API & Packaging Manufacturing Investment

Reduce import costs by establishing API & packaging material production in Uganda.

Collaboration with African pharmaceutical hubs (South Africa, Egypt, Morocco).

Multi-Supplier & Regional Sourcing Strategy

Reduce risk by sourcing APIs from multiple suppliers.

EAC regional integration to reduce cross-border tariffs & logistics delays.

Green Energy & Sustainability Investments

Solar-powered cold storage to cut energy costs by 30-40%.

Eco-friendly packaging to reduce regulatory risks & enhance marketability.

HUMAN RESOURCES

In this project below listed facilities/blocks are planned to be constructed:

Oral Solid Dosage (OSD) Facility (Capacity Production of 15 million units/day (tablets, capsules, and syrups).

Biopharma Drug Product Facility (Capacity: Specialized for monoclonal antibodies, hormones, and insulin analogs)

Vaccine Formulation and Fill- Finish Facility (50 Million doses per annum)

Oncology OSD Facility

Injectable Facility (Capacity: High-speed filling lines for vials, ampoules, and pre-filled syringes)

Number of employees with different skill set shall be employed for all above mentioned facilities.

Summarized table for estimated number of man power required for Operations

Table No.: 16

Hiring of employees with skill sets and expertise:

It is important to have healthy employees with aseptic skills especially in manufacturing units to avoid any contamination during manufacturing of drug products.

Separate organograms are prepared for engineering, corporate, HR & administration, warehouse, Quality (QC & QA) and manufacturing units to hire sufficient and effective workforce considering cost effectiveness.

Details of Organograms:

Corporate -Employees with managerial skills, project skills and leadership skills etc. will be hired in corporate for different levels like CEO, Head of engineering, Head of operations/manufacturing, project manager, Head of quality, Head of finance, Head of logistics and Head of HR. Managers and group leaders from each section will be managed/lead by corporate Heads.

Engineering -In engineering section, employees with skills like automation, instrumentation including complicated manufacturing equipment, electrical, mechanical, utilities (Water, steam, Air) and information technology will be hired at different levels.

HR & Administration -In HR & admin section, employees with skills to handle transport, canteen, legal challenges like pollution control, employee act and licensing application and renewal etc., recruitment and day to day management of contractual / fixed employees, employee wellness, medical facility and general management of BMS like furniture, rest rooms, and external vendors for admin support will be hired.

Warehouse -In warehouse section, skills to ensure the safe, efficient, and compliant movement of materials and products is required. It includes logistics management skills.

Knowledge of inventory management using software like SAP or ERP, document and material management is essential in warehouse.

Quality Unit -Quality (Quality control and Quality assurance) is critical to ensuring the safety, efficacy, and compliance of drug products. In

QC, testing skills, knowledge of GLP, Data analysis and sample management are essential skills. In QA,

Process validation and control, regulatory compliance, Risk Management, Documentation, Audits and

inspection skills, Change management and trainings are essential skills.

Manufacturing -In manufacturing, knowledge of GMP, operation of complicated/automated equipment or system, knowledge of process and aseptic behaviour/environment, documentation and technical skills for problem solving in day-to-day process are crucial skills.

Health, Safety standards for Human Resource working in Pharmaceuticals:

For biopharmaceutical projects, regular medical check-up including tests like eyesight, audiometry, blood test, breathing test, X-Ray, ECG and basic tests; at-least annually for all employees is essential.

Key aspects in HR feasibility

Workforce Availability

Over the course of the last decade, Uganda's economic growth has ranked among sub-Saharan Africa's strongest; indeed, the country's annualized average growth rate was 5.4% between 2010 and 2019 (World Bank, 2020).

Uganda has a young and growing workforce, with over 75% of its population under the age of 30.

Total population: Approx. 51 million (2025 estimates)

Cost of Human Resources

In Uganda, employee salaries are relatively low, but there are also some differences. For example, in the capital city of Kampala, the monthly salary of an ordinary employee is usually between 100- 200USD. In other cities, this number may be even lower. The salary level will be higher for senior management and technical talents.

Average monthly salaries (estimates):

Unskilled worker: \$100–\$200

Mid-level professional: \$500–\$1,500

High-skilled/managerial: \$2,000+

Legal and Compliance Factors

Key employment laws:

Employment Act (2006): Governs employment terms, termination, wages, and working conditions.

Occupational Safety and Health Act (2006): Ensures workplace safety.

Workers' Compensation Act (2000): Covers workplace injury compensation.

Uganda's labour laws are primarily governed by the Employment Act of 2006, which establishes the minimum standards of employment in the country.

Uganda is committed to upholding international labour standards and has ratified several key

International Labour Organization (ILO) Conventions. These include the Freedom of Association and

Protection of the Right to Organize Convention, 1948 (No. 87), the

Right to Organise and Collective Bargaining Convention, 1949 (No. 98), and the Collective Bargaining Convention, 1981 (No. 154).

The Uganda Employment Act applies to all employees, irrespective of nationality that the employers hire under the service contract.

According to the employment act 2006 and labour laws in Uganda, the standard working hours of an employee is a maximum of eight hours per day and 48 hours a week; excluding lunch and worship time.

Employers planning to hire or relocate international employees to Uganda must understand the processes surrounding work permits and visas. Ensuring compliance with Ugandan immigration laws helps streamline the hiring process and avoid potential legal hurdles.

Cultural and Language Considerations

Ugandan communication often leans towards indirectness, especially when delivering negative feedback or expressing disagreement.

Cultural Lens: The Ugandan concept of "Gwasi" (shame) discourages public criticism. This can influence communication, leading individuals to deliver critical messages indirectly to avoid causing shame to the recipient.

Uganda is a multilingual nation like many African countries. However, English is targeted as a medium of instruction and language of examination.

RISK ASSESSMENT

Risk Assessment and Mitigation Strategies for Sunshine Plant in Uganda

Political Risks and Mitigation Strategies

Uganda, like many developing economies, has political uncertainties that can affect business operations.

These include regulatory changes, policy instability, and geopolitical factors.

Key Political Risks

Table No.:17

Risk Mitigation Strategies

Early Engagement with Regulators:

Work closely with Uganda's National Drug Authority (NDA) and the Ministry of Health to ensure timely approvals.

Seek WHO-GMP certification for global market access.

Public-Private Partnerships (PPP):

Collaborate with government bodies to access tax benefits, incentives, and investment protection.

Diversification of Export Markets:

Establish trade links with EAC, COMESA, and beyond to reduce dependence on a single market.

Strengthening IP Protection:

Register patents and trademarks regionally through ARIPO (African Regional Intellectual Property Organization) to safeguard innovations.

Economic Risks and Mitigation Strategies

Economic instability can impact capital investment, supply chain costs, and market demand for pharmaceutical products.

Key Economic Risks

Table No.:18

Risk Mitigation Strategies

Localizing API Sourcing:

Develop partnerships with regional API manufacturers to reduce reliance on imports and mitigate forex risks.

Hedging Against Currency Risks:

Utilize foreign exchange hedging instruments to stabilize procurement costs.

Maintain a mix of local and foreign currency reserves for operational expenses.

Operational Cost Optimization:

Implement energy-efficient manufacturing to reduce electricity costs.

Automate production processes to minimize labour costs.

Strategic Supplier Agreements:

Enter long-term contracts with multiple suppliers for key raw materials to ensure supply chain resilience.

Diversifying Revenue Streams:

Expand into high-margin segments (oncology, vaccines, biosimilar).

Target institutional buyers like the government, NGOs, and international health organizations (e.g., GAVI, WHO, Global Fund).

Environmental Risks and Mitigation Strategies

Uganda has stringent environmental regulations for pharmaceutical manufacturing, including waste management, water usage, and emissions control. Non-compliance can lead to fines, production shutdowns, or reputational damage.

Key Environmental Risks

Table No.:19

Risk Mitigation Strategies

Sustainable Water Management:

Implement water recycling & rainwater harvesting systems to reduce dependence on municipal supplies.

Use high-efficiency Clean-in-Place (CIP) systems to minimize water wastage.

Advanced Waste Treatment Solutions:

Install Zero Liquid Discharge (ZLD) systems for pharmaceutical effluent treatment.

Set up on-site hazardous waste incinerators to manage cytotoxic and biological waste safely.

Renewable Energy Integration:

Solar power installations on-site to reduce dependency on the national grid.

Waste heat recovery systems to improve energy efficiency.

Green Manufacturing Practices:

Obtain ISO 14001 Environmental Certification to align with international best practices.

Conduct regular environmental audits to ensure compliance with NEMA standards.

Summary of Risk Mitigation Strategies

Table No.:20

Conclusion

While setting up a pharmaceutical manufacturing plant in Uganda presents political, economic, and environmental risks, these can be effectively managed through strategic planning and proactive mitigation measures.

I. SUSTAINABILITY

Sustainable Waste Management Strategies

Sunshine facility shall generate solid, liquid, and hazardous waste that must be effectively managed to comply with environmental regulations and protect ecosystems.

Segregation and Recycling of Solid Waste

Implement waste segregation at the source to separate biodegradable, non-biodegradable, recyclable, and hazardous waste.

Recycle packaging materials like paper, plastics, and aluminium foils used in blister packs.

Partner with certified waste management companies to handle non- recyclable hazardous waste.

Efficient Handling of Hazardous Waste

Incinerate cytotoxic oncology waste and contaminated biological waste in high-temperature incinerators (above 850°C).

Use autoclaves and chemical disinfection for microbiological and vaccine-related waste.

Adopt encapsulation techniques for disposing of highly toxic chemicals and APIs safely.

Effluent Treatment and Liquid Waste Management

Install an Effluent Treatment Plant (ETP) and Zero Liquid Discharge (ZLD) system to ensure wastewater treatment before discharge.

Implement reverse osmosis (RO) and advanced oxidation processes to remove pharmaceutical residues.

Reuse treated water for landscaping, cooling systems, and non- potable applications.

Minimization of API & Solvent Waste

Implement solvent recovery units to recycle and reuse solvents in oncology and biopharma production.

Adopt green chemistry techniques to minimize hazardous waste production.

Optimize batch sizes and manufacturing processes to reduce raw material waste.

Energy Efficiency Strategies

Energy consumption will be a significant operational cost in pharmaceutical manufacturing. A sustainable energy plan shall ensure cost reduction and reduced carbon footprint.

Integration of Renewable Energy Sources

Solar Power Installation:

Install solar panels on rooftops to supplement grid electricity and reduce dependence on fossil fuels.

Target at least 30-50% energy from solar for non-critical operations.

Biomass & Biogas Utilization:

Utilize biomass boilers for steam generation using agricultural waste.

Install a biogas plant to convert organic waste into energy.

Energy-Efficient HVAC & Cooling Systems

Use energy-efficient HVAC systems with variable frequency drives (VFDs) to optimize airflow and minimize energy wastage.

Implement cold chain optimization for vaccines and biopharma products, including energy-efficient refrigeration and insulation systems.

Utilize waste heat recovery systems to capture and reuse excess heat from industrial processes.

Smart Lighting and Equipment Optimization

Install LED lighting with motion sensors to reduce power consumption in low-traffic areas.

Use high-efficiency motors and compressors in production lines to reduce energy waste.

Implement real-time energy monitoring systems to track and optimize energy use.

Water Conservation and Efficient Usage

Pharmaceutical production requires significant water usage for cooling, formulation, and cleaning processes. Water scarcity in Uganda makes conservation and recycling essential.

Water Recycling & Reuse

Install Water Treatment Plants (WTPs) with multi-stage filtration, RO, and UV disinfection to reuse wastewater.

Recycle treated wastewater for boilers, chillers, and non-potable cleaning processes.

Rainwater Harvesting

Set up rainwater harvesting tanks to collect and store rainwater for non-production use.

Utilize rainwater for landscaping, cooling towers, and toilet flushing.

Optimized Process Water Usage

Implement Clean-in-Place (CIP) and Sterilize-in-Place (SIP) systems to reduce water usage in equipment cleaning.

Use dry cleaning methods where possible to minimize the need for extensive water washing.

Train staff on water conservation best practices to minimize waste.

Regulatory Compliance & Green Certifications

WHO-GMP & EAC Environmental Regulations: Ensure compliance with local and international environmental guidelines.

ISO 14001 Certification: Implement environmental management systems to enhance sustainability.

LEED Certification: Design facilities with sustainable building materials to meet green building standards.

Conclusion

Sunshine shall require integrated waste management, energy-efficient operations, and water conservation measures. By adopting renewable energy, recycling waste, and optimizing resource usage, this facility can

achieve long-term environmental and economic benefits while maintaining regulatory compliance and corporate social responsibility.

J. Key HR Challenges and mitigation strategies

Skilled Workforce Shortage

Limited local experience in advanced pharmaceutical manufacturing (especially GMP-compliant operations for vaccines, oncology, and monoclonal antibodies).

Shortage of experienced quality assurance (QA), quality control (QC), production, validation, and biotech-specific personnel.

Training and Capability Gaps

Need for training in WHO-GMP and global standards.

Low exposure to advanced equipment and automation technologies common in global pharma plants.

High Attrition or Brain Drain

Trained personnel may be poached by competitors or seek jobs abroad due to better salaries.

Cultural & Communication Barriers

Integration challenges when blending expat professionals with local teams in managerial and technical roles.

Mitigation & Risk Management Strategies

Early & Strategic Workforce Planning

Workforce demand mapping: Identify headcount, roles, and experience levels required for each production phase.

Staggered hiring aligned with the commissioning of each production unit.

Establish a Technical Training Academy

Set up an in-house Pharma Training Institute or Centre of Excellence.

Partner with international experts to develop GMP, EHS, and regulatory curricula.

Simulate manufacturing environments (cleanrooms, QC labs, aseptic suites).

The training program shall constitute of the following aspects

Induction of new employees

cGMP training

GLP training

On the job training consisting of SOP training, equipment training etc.,

Safety training

Supervisor training

Manager training

Job change training or after leave of absence

Remedial training

Contractor employee training

International Partnerships

Collaborate with Indian, European, or South African pharma companies or universities for knowledge transfer.

Consider short-term expat secondments (2–5 years) to build and mentor local teams.

Collaboration with Local Academia

Tie up with Makerere University or other local institutions for:

Curricula alignment with pharma needs.

Internship/apprenticeship programs.

Fast-tracking diploma and B.Pharm graduates into technical roles.

Talent Retention Schemes

Offer competitive packages, training sponsorships, and bonded contracts.

Career development pathways for technicians to move into supervisory or QA roles.

Stock options or profit-sharing models to retain senior staff.

Outsource Non-Core Activities Initially

To reduce early HR load, consider outsourcing packaging, engineering maintenance, and logistics until local capacity matures.

Human Resources Rollout Roadmap Phase-Wise HR Rollout Plan (2025–2030) Phase 1: Planning & Initial Setup (2025)

Workforce Planning: Finalize detailed manpower requirement for each functional block (production, QA/QC, engineering, admin, etc.).

Key Roles: Project HR Head, Talent Acquisition Manager, Training & Compliance Manager

Action Points:

Begin local hiring process for support staff, documentation personnel

Initiate expat hiring for plant design, validation, and commissioning oversight

Establish HR policies, on-boarding modules, payroll systems

Phase 2: OSD & Syrup Commissioning (2026)

Estimated Staff Requirement: (As per Table No 16)

Key Functions: Production operators, QA/QC analysts, warehouse team

Action Points:

Launch training academy in partnership with local universities (Makerere, Mbarara, etc.)

Train local hires in GMP compliance, SOP writing, and safety protocols

Expat engineers and QA managers to lead operations and mentor local staff

Phase 3: Oncology & Injectable Line Setup (2027)

Estimated Staff Requirement: +- (As per Table No 16)

Key Functions: Cytotoxic handling experts, sterile Injectables line operators, QC microbiology

Action Points:

Specialized cytotoxic/Hormonal handling training

Safety and containment procedure modules

Expand academy offerings to include aseptic processing and EHS protocols

Phase 4: Vaccine & Biopharma Commissioning (2028)

Estimated Staff Requirement: -(As per Table No 16)

Key Functions: Biotech fill-finish experts, cold chain QA/QC

Action Points:

Partner with international biotech training programs (India, EU)

Establish a biotechnology learning track in the internal academy

Phase 5: Operations Stabilization & Local Leadership Development (2029–2030)

Target Workforce: 1,000+ including indirect employees

Focus Areas: Succession planning, reducing dependency on expats

Action Points:

Develop career growth ladders for technicians and supervisors

Launch Leadership Development Programs (LDP) for Ugandan managers

Retention strategy implementation (bonuses, ESOPs, continuous training)

Training Strategy Summary

In-House Pharma Academy to train employees per year

Modules in:

GMP & regulatory compliance

Pharmaceutical operations (OSD/liquid/injectable/Oncology)

Aseptic techniques

Equipment maintenance & calibration

Training Partners: Local academia + global consultants Risk Mitigation Measures

Challenge: Limited experienced pharma talent pool

Solution: Layered expat hiring, internal academy, local university tie-ups

Challenge: Attrition post-training

Solution: Bonded employment, career development programs, competitive pay

Challenge: Cultural integration

Solution: Cross-cultural workshops, expat-local mentorship structure

K. STRATEGIES FOR ACCELERATED ROI ON THE PROJECT

Phased Commissioning of Production Lines

Start with OSD and syrups, which have lower regulatory complexity and shorter setup timelines.

These can begin generating revenue within 12–18 months, while more complex lines (biopharma, oncology, vaccines) are still under validation.

Helps spread OPEX and initiates early cash flow.

Prioritize Products with High Local and Regional Demand

Focus on essential medicines, high-burden diseases (malaria, diabetes, antibiotics), and therapeutic areas like oncology and vaccines with unmet needs.

Customize the portfolio to include WHO-prequalified and procurement-friendly products for faster uptake by public health programs.

Partner with Global Health Buyers Early

Engage with donor agencies (Global Fund, GAVI, WHO, USAID) to position your facility as a local supplier.

Secure advance purchase agreements (APAs) or long-term supply contracts, even during construction phase.

These contracts anchor demand and improve investor confidence.

Leverage Contract Manufacturing (CDMO) for Revenue Boost

Offer your excess capacity for contract manufacturing of OSD, fill- finish, or vaccine products for regional or global pharma firms.

Acts as a bridge revenue stream before full-scale launch of your branded portfolio.

Accelerate Regulatory Approvals through EAC Harmonization

Register products using the EAC Medicines Regulatory Harmonization (MRH) program to access multiple countries simultaneously.

Cuts down duplicated efforts and approval timelines, speeding up market entry.

Optimize Operational Costs from Day 1

Invest in energy-efficient infrastructure (solar, efficient HVAC) and automation to lower long-term utility and labor costs.

Design supply chain to minimize storage and transportation overhead.

Use a Hybrid Distribution Model

Combine direct-to-hospital/clinic distribution with national wholesalers and tenders.

Reduces reliance on a single sales channel and speeds up product uptake across multiple segments.

Government Incentives and Tax Planning

Take full advantage of government incentives, including VAT deferments, customs waivers, tax holidays, and utility subsidies.

Negotiate land lease concessions or reduced utility tariffs to reduce fixed overheads.

Continuous Financial Monitoring

Set up a Project Management Office (PMO) and cash burn tracking system to detect cost overruns early.

Implement strict working capital control (inventory turnover, receivables) during operations to stay lean.

Table No.:21 Example ROI Acceleration Path (Indicative)

Assumptions

Table No.:22

Financial Projections (Years 1–10)

Table No.:23

Key Insights

Break-Even Year: Year 4 (Cumulative cash flow surpasses initial CAPEX of USD 529M)

Annual ROI Post-Break Even: ~39.7% (Profit of USD 210M / USD 529M)

Cumulative ROI by Year 10: ~3.4x return (USD 1795M cumulative cash flow)

L. SWOT ANALYSIS

Strengths

Robust Financial Backing

The promoters' strong financial background ensures ample capital availability for high-tech manufacturing infrastructure, reducing financing risks.

USD 530 million CAPEX provides a solid foundation for a state-of-the-art facility with capacity for future expansion.

Strategic Product Portfolio

Manufacturing a diverse mix of high-demand therapeutics—from essential OSDs and syrups to complex oncology drugs, vaccines, and biosimilars—positions the company to address both local and regional health needs.

Biosimilars and oncology injectables offer high-margin opportunities with increasing global and regional demand.

Location Advantage – Uganda & EAC Access

Uganda provides duty-free access to the East African Community (EAC), reducing export barriers and expanding market reach.

Strategic geographic location in Central-East Africa allows access to under-served pharmaceutical markets in South Sudan, Rwanda, Burundi, DRC, etc.

Modern Infrastructure and Technology Potential

Opportunity to design a greenfield facility aligned with WHO- GMP, EMA, and USFDA standards from the outset.

Flexibility to incorporate cutting-edge technologies (e.g., continuous manufacturing, single-use systems for biologics).

Weaknesses

Lack of Pharmaceutical Domain Experience

The promoters' background in infrastructure, while valuable in construction and logistics, does not directly translate to the complex and highly regulated pharmaceutical industry.

Manufacturing pharmaceuticals—especially oncology, vaccines, and biosimilars—requires deep expertise in GMP compliance, validation protocols, aseptic processing, and regulatory science.

Without experienced pharma leadership, there is a risk of non-compliance, production inefficiencies, or market entry delays.

Mitigation: Early recruitment of experienced pharma professionals and regulatory consultants is critical, as is establishing a governance board with pharma advisors.

High Dependence on Imports for APIs, Equipment & Components

Uganda lacks a strong API and excipient manufacturing ecosystem, so nearly all critical raw materials,

consumables, and equipment must be imported—mainly from India, China, or Europe. This increases lead times, procurement costs, customs complexities, and exposure to global supply chain disruptions.

Biopharma and vaccine components (e.g., single-use systems, cold-chain logistics, cell lines) are even more sensitive to supply delays.

Skills and Talent Gap in Local Workforce

Uganda's pharmaceutical industry is still developing, with limited availability of skilled technicians, validation engineers, QC analysts, and GMP-trained production staff, especially in sterile manufacturing or biotech.

Over-dependence on expats may drive up costs and hinder the development of sustainable local capability. Cultural integration, language, and training gaps can affect productivity and retention if not addressed proactively.

High Operating Costs for Complex Products

Oncology, vaccines, and bio-similars require sophisticated cleanroom environments, cold chain management, and batch-specific quality testing.

Maintaining aseptic conditions, HVAC, water systems (PW/WFI), and validation for multiple production lines significantly increases OPEX.

There is also an increased risk of batch failures, which can result in high rework or discard costs—especially in biologics.

Opportunities

Growing Demand in Uganda and EAC for Quality Medicines

The East African Community (EAC) is home to over 280 million people with growing health burdens like cancer, diabetes, infectious diseases, and vaccine-preventable illnesses.

There's high demand for affordable, high-quality generics, bio-similars, and essential vaccines.

Current reliance on imports from India, Europe, and China creates a gap for trusted local manufacturers with faster market responsiveness and cost advantages.

Support from Government and International Health Agencies

Uganda and other EAC governments are actively promoting local manufacturing through:

- Tax breaks, incentives, and infrastructure subsidies.
- Potential fast-track approvals for local production of priority medicines.

Global health organizations like Gavi, WHO, UNICEF, Global Fund, and African CDC are eager to support African-based production, especially for vaccines and pandemic preparedness.

This creates opportunities for donor-funded procurement, technology transfer, and concessional financing.

Regional Regulatory Harmonization (EAC-MRH)

The EAC's Medicines Regulatory Harmonization initiative reduces the complexity and time for market entry across multiple countries.

A product registered under EAC-MRH can be fast-tracked for approval in all EAC member states, expanding your potential market and improving return on investment (ROI).

First-Mover Advantage in Advanced Therapies

There are very few players in the region manufacturing oncology products, bio-similars, or vaccines. A well-executed entry into these segments provides:

- High-margin sales.
- Competitive edge due to regulatory barriers that deter others from entering.
- Leverage to license or co-develop products with international partners.

Greenfield Facility – Built for Future-Ready Compliance

Starting from scratch allows for:

- State-of-the-art modular facility design that meets WHO-GMP and global requirements from day one.
- Scalability—facilities can be expanded based on market growth or strategic partnerships.
- Integration of renewable energy systems, automation, which can lower long-term operating costs and improve environmental credentials.

Technology Transfer and Global Collaborations

Many mid-sized Western and Asian pharma companies are seeking CDMO or joint venture partners in Africa to enter emerging markets.

This facility, once validated and operational, can be positioned as a fill-finish hub or contract manufacturing site for such companies—especially for vaccines and biologics.

Threats

Regulatory and Compliance Challenges

Ensuring continuous compliance with WHO-GMP, NEMA (Ugandan environmental laws), NDA, and other international standards requires highly skilled QA/QC teams and constant oversight.

Geopolitical and Trade Instability

Political tensions, conflicts in neighbouring countries, or disruptions in trade routes could hamper logistics, exports, or sourcing of raw materials.

Currency Fluctuations and Import Dependency

Heavy reliance on imports for APIs and machinery subjects the plant to foreign exchange risks, especially if the Ugandan Shilling depreciates.

Intensifying Global Competition

Global pharmaceutical companies and Indian manufacturers could enter the region with cheaper generic drugs, impacting price competitiveness.

Product-Specific Challenges

Biosimilars and vaccines involve complex regulatory pathways, high R&D costs, and the risk of batch failures or cold-chain disruptions.

Construction & Commissioning Delays

Incomplete funding during the CAPEX phase can halt construction, delay procurement of equipment, and postpone validation activities.

Pharmaceutical projects are highly sequential: civil work must be completed before HVAC installation, which precedes equipment commissioning, which in turn precedes qualification. A break at any point stalls everything.

Regulatory Non-Compliance

If the facility is only partially built or validated, it cannot obtain GMP licenses or product approvals. This puts the company in a no-revenue, high-burn position, severely affecting investor confidence and credibility.

Supply Chain Penalties

Equipment vendors and raw material suppliers often work with milestone-based payments. Funding gaps can lead to order cancellations, higher renegotiated prices, or contractual penalties.

Lead times in pharma are long, so any reordering due to lapsed payments causes multi-month delays.

Reputational Damage & Loss of Stakeholder Confidence

Financial instability affects relationships with regulators, investors, banks, and potential customers (like international health agencies).

Once perception of financial distress sets in, it is harder to secure bridge financing or partnerships.

Strategic Recommendations

Hire pharma domain experts in key leadership roles: manufacturing, regulatory, quality assurance, and

R&D.

Form strategic alliances with experienced CDMOs or technology licensors for oncology and biosimilar lines.

Invest in workforce development through partnerships with local universities and international training programs.

Develop dual-source supply chain strategies and build regional sourcing capacity for packaging and excipients.

Design for modular expansion, allowing scaling based on product demand and market growth.

Pursue green certifications (LEED, ISO 14001) to attract ESG-aligned investors and NGOs.

M. SUMMARY AND RECOMMENDATIONS

This chapter synthesizes the key findings from the detailed feasibility study and outlines strategic recommendations to guide the implementation of the Sunshine Pharmaceutical Plant project in Uganda.

The analysis takes into account market dynamics, regulatory frameworks, technical and financial evaluations, supply chain logistics, and human resource considerations, all of which contribute to a comprehensive assessment of the project's viability.

Summary of Key Findings Market Opportunity and Demand

The study confirms that Uganda's pharmaceutical market is experiencing

robust growth driven by increasing demand for affordable, high-quality generics and specialized drugs, including oncology treatments and vaccines. With a projected market revenue reaching approximately US\$329 million in 2025 and a promising CAGR for both the domestic and broader East African markets, the opportunity to capture unmet demand is significant.

Regulatory and Technical Feasibility

Uganda's regulatory framework, led by the National Drug Authority (NDA), is increasingly aligned with international standards, including WHO-GMP guidelines. The regulatory environment supports local production through initiatives like "Buy Uganda, Build Uganda," while technical assessments underscore the availability of advanced manufacturing technologies. The proposed facility's phased approach—from Oral Solid Dosage forms to advanced biopharmaceutical and vaccine production—ensures scalability and adaptability to evolving market needs.

Financial Viability

The financial analysis demonstrates a strong investment proposition:

CAPEX: The total investment is estimated at US\$529 million, strategically distributed across various manufacturing units.

OPEX and Break-Even: Annual operational expenditures are projected at approximately US\$335 million, with break-even achieved within the first year due to efficient cost management and high contribution margins.

ROI and Profitability: Projected ROI stands at around 28% by Year 3, with an IRR estimated between 18-22%, indicating a healthy profit trajectory and the potential for cumulative returns exceeding 125% over five years.

Supply Chain and Human Resources

Robust supply chain strategies—including multi-sourcing of APIs, strategic partnerships for cold chain logistics, and digital monitoring systems—ensure resilience against market fluctuations and global disruptions.

Additionally, the availability of a young, growing workforce in Uganda supports the project's operational requirements, with competitive labour costs and targeted skills development across manufacturing, quality control, and regulatory compliance.

Recommendations

Prioritize High-Margin Segments Focus Areas:

Oncology Drugs: Given the rising burden of cancer in Uganda and East Africa, investing in the production of generic chemotherapy drugs can capture an underserved market. These drugs not only command higher margins but also improve patient access to critical treatments.

Biologics and Vaccines: The increasing demand for advanced therapies such as vaccines and biologics—including monoclonal antibodies and bio-similars—presents an opportunity to tap into segments with relatively lower competition and high value. The facility's phased approach, starting with Oral Solid Dosage forms and expanding into biopharmaceutical products, supports this focus.

Rationale:

Market Trends: The feasibility study highlights strong growth projections in these segments, driven by unmet healthcare needs and increasing government investments in healthcare infrastructure.

Financial Benefits: High-margin products contribute significantly to profitability and help accelerate the return on investment (ROI). By emphasizing these areas, the project can achieve robust financial returns and capture a larger share of the regional market.

Optimize API and Raw Material Sourcing Short-Term Strategy:

Leverage International Suppliers: Initially, the project should secure long-term contracts with reputable API suppliers in India and China. This will help stabilize costs and ensure a reliable supply chain during the early phases of operation.

Long-Term Strategy:

Local Production Initiatives: Explore opportunities for setting up local or regional API manufacturing facilities. This approach will not only reduce import dependency and associated logistics risks but also potentially lower production costs over time.

Diversification: Develop a multi-sourcing strategy to mitigate risks associated with geopolitical tensions, supply chain disruptions, or fluctuations in raw material prices.

Rationale:

Cost Efficiency: APIs represent a significant portion of production costs. Optimizing sourcing will directly impact overall operational efficiency and cost management.

Risk Mitigation: Diversification and local production can shield the project from external market shocks and ensure continuity of operations.

Invest in Advanced Technologies Technology Implementation:

Automation and Digitalization: Adoption of automated production lines, Manufacturing Execution Systems (MES), and IoT-based monitoring systems can streamline operations, reduce labour costs, and enhance precision.

Quality Control Systems: Investment in advanced analytical testing equipment will support stringent quality assurance protocols. Digital systems also facilitate real-time data monitoring, which is critical for maintaining compliance with WHO-GMP standards.

Rationale:

Operational Efficiency: Cutting-edge technology reduces the risk of human error, increases production speed, and improves overall product consistency.

Regulatory Compliance: High-tech systems ensure that manufacturing processes meet international standards, making it easier to secure regulatory approvals and expand into export markets.

Scalability: Advanced technologies support a phased production approach, allowing the facility to scale operations smoothly as market demand grows.

Enhance Strategic Collaborations Collaboration Models:

Public-Private Partnerships (PPPs): Engage with government agencies and international health organizations to secure financial incentives, regulatory support, and access to infrastructure such as Special Economic Zones (SEZs).

Industry Alliances: Form strategic alliances with global pharmaceutical companies for technology transfer, joint ventures, or co-investment. This can accelerate the learning curve and enhance competitive positioning.

Local Partnerships: Collaborate with local distributors, healthcare providers, and academic institutions to strengthen market access and foster innovation.

Rationale:

Regulatory and Financial Support: Strategic partnerships can reduce upfront investment risks and expedite regulatory approvals.

Market Penetration: Collaborations with established players can facilitate faster market entry, improve distribution networks, and expand customer reach.

Innovation: Joint ventures and alliances can bring in new technological insights and operational expertise, enhancing the project's long-term viability.

Strengthen Supply Chain Resilience Key Measures:

Robust Logistics Network: Develop an integrated logistics system that includes reliable transportation, warehousing, and cold chain infrastructure. This is crucial for managing both raw materials and finished products, especially for temperature-sensitive biologics and vaccines.

Digital Supply Chain Solutions: Implement demand forecasting and real-time inventory management systems to optimize supply chain operations and minimize waste.

Contingency Planning: Establish dual sourcing strategies and maintain buffer stocks to mitigate the impact of any supply disruptions.

Rationale:

Efficiency and Reliability: A resilient supply chain ensures that production processes are not interrupted by external factors, which is critical for meeting market demand consistently.

Cost Management: Effective supply chain management reduces logistics costs and improves overall operational margins.

Risk Mitigation: Proactive risk management through diversification and advanced monitoring systems will safeguard the project against unforeseen disruptions.

Focus on Workforce Development Workforce Strategy:

Training Programs: Invest in specialized training and capacity-building initiatives to develop the technical, regulatory, and operational skills needed across various departments such as manufacturing, quality control, and engineering.

Talent Acquisition: Attract skilled professionals by offering competitive remuneration packages and career development opportunities. This includes hiring experts with experience in high-containment manufacturing, digital automation, and international regulatory compliance.

Collaborations with Educational Institutions: Forge partnerships with local universities and technical institutes to create a pipeline of skilled labour tailored to the project's needs.

Rationale:

Operational Excellence: A well-trained workforce is essential to maintain high standards of product quality, regulatory compliance, and overall operational efficiency.

Sustainability: Continuous professional development not only improves immediate operational outcomes but also contributes to long-term sustainability by fostering innovation and adaptability.

Competitive Advantage: Investing in human capital builds organizational strength and ensures that the facility remains competitive in an evolving market landscape.

Conclusion

The comprehensive feasibility study strongly supports the viability of the Uganda Pharma Plant project. With favourable market conditions, a supportive regulatory framework, robust financial projections, and effective risk mitigation strategies, the project is not only feasible but poised for success. Strategic investments in technology, local partnerships, and human capital will further enhance the plant's competitive edge and contribute to sustainable economic growth in Uganda and the broader East African region.

In light of these findings, it is recommended that the project proceed as planned, with careful attention to the outlined recommendations to ensure operational excellence and long-term profitability.

 Clinical Trial (CT) Oversight | Receipt, Screening and acknowledgment of a Clinical trial application (new, renewals and amendment) | 10 days
 Clinical Trial (CT) Oversight | Regulatory decision on a Clinical trial application | 50 days

Clinical Trial (CT) Oversight | Annual renewal of Ongoing trials | 20 days
 Clinical Trial (CT) Oversight | Amendment of CT authorization | 20 days
 Clinical Trial (CT) Oversight | Feedback report to a client following a GCP Inspection | 45 days
 Marketing Authorization (MA) | Assessment of application and request for additional information on application for MA (Human Drugs) | 18 months (396 days)
 Marketing Authorization (MA) | Assessment of application and request for additional information on application for MA (Vaccines, Anti-cancer medicines and other vital (medicines)). | 6 months (132 days)
 Marketing Authorization (MA) | Regulatory decision on MA after additional information is received | 3 months (66 days)
 | Special Categories |
 | Regulatory decisions on products already authorized for marketing by stringent regulatory authorities, WHO prequalified products and those approved under article 58 of EU regulations | 6 months (132 days)
 | Variation and Notification |
 | Regulatory decision on minor variation | 4 months (88 days)
 | Regulatory decision on Major variation | 6 months (132 days)
 | Regulatory decision on annual or immediate notification change | 80 days
 | Drug Register |
 | Publication of drug register | Monthly
 Regulatory Inspection | GMP Physical inspection after receipt of application- Foreign | 180 days
 Regulatory Inspection | GMP Report assessment to Manufacture after inspection | 45 days
 Regulatory Inspection | Feedback after inspection- Domestic | 28 days
 Regulatory Inspection | Regulatory decision after CAPA – Foreign | 20 days
 Regulatory Inspection | Regulatory decision after CAPA – Domestic (Local Facilities) | 17 days
 Premise Licensing | Feedback to the applicant on the regulatory decision for pharmacy renewal | 40 days
 Premise Licensing | Feedback to the applicant on the regulatory decision for licensing of new pharmacy applicants | 30 days
 Market Surveillance and Control | Verification of imports (registered drugs) | 2 days
 Market Surveillance and Control | Clearance of Imports at ports of entry | 2 days
 | Verification of imports (un- registered drugs) | 10 days
 | Regulatory decision on drug promotional material | 10 days
 | Publication of the database of approved promotional materials/advert | Monthly (5th of the month)
 Vigilance | Acknowledgement of receipt of an ADE report (mail/letter) | 5 days
 Vigilance | Feedback on serious ADE reports | 18 days
 Vigilance | Feedback on serious AEFI reports to the expanded program for immunization (EPI) | 14 days
 Laboratory Testing | Test results from mandatory testing after sampling (Medicine)- PoE | 48 Days
 Laboratory Testing | Test results from client requests after acceptance by the lab (All Products) | 45 Days
 Laboratory Testing | Test results for pre-market (Domestics Manufactures) | 60 Days
 Laboratory Testing | Test results for post-market surveillance (Medicines) | 48 Days
 National Regulatory System | Issuance of recall or alert for a substandard or falsified medicine or health care product | 14 Days
 National Regulatory System | Acknowledgement of receipt of a product complaint | 5 Days
 National Regulatory System | Feedback on a market (process, product, other) complaint | 20 Days
 National Regulatory System | Feedback on the effectiveness of recall after receipt of the recall report from the LTR (Local Technical Representative) | 10 Days
 National Regulatory System | Feedback on test results from the Lab to the client | 5 Days
 Support to Regulatory areas | QUALITY MANAGEMENT SYSTEM |
 Support to Regulatory areas | Acknowledgement of receipt of a service-related complaint | 2 Days
 Support to Regulatory areas | Feedback on service-related complaints | 21 Days
 Therapeutic Area | Regulatory Focus | Key EAC Harmonization Mechanisms | Challenges | Progress & Opportunities
 Diabetes | Insulin and oral hypoglycaemic Bioequivalence and cold chain Chronic disease management alignment | Common Technical Document (CTD) Mutual Recognition Procedure (MRP) | Cold chain logistics

Limited local insulin production | Streamlined approvals

Regional demand driving local production
 Malaria | Fast-tracking of ACTs Monitoring of resistance Alignment with WHO PQ | Joint assessments

Regional malaria drug guidelines | Counterfeits Dependency on donor programs | Strong harmonization Integrated procurement systems
 Antibiotics | Quality and safety evaluations GMP compliance AMR mitigation | AMR frameworks under WHO/Africa CDC

Regional pharmacovigilance | Overuse and poor prescription practices - Limited surveillance | Regulatory updates in progress

Enhanced AMR monitoring
 Vaccines | High scrutiny: quality, safety, cold chain - Emergency use approval mechanisms | AVAREF support

Reliance on WHO PQ and joint inspections | Heavy import reliance

Capacity gaps for biologics | Regional capability strengthening

Ongoing vaccine regulation training
 Biologics | Advanced assessments for mAbs, biosimilars, insulin analogs - GMP and comparability requirements | International partnerships for capacity building - Involvement of WHO, UNICEF | Limited

local evaluation experience

High assessment complexity | Capacity building underway

Future potential for local

biologics production

HIV/AIDS | ARV quality and resistance

monitoring - | Fast-track review mechanisms -

Reliance on global | Stockouts and supply

chain | Increasing local registration

capabilities

Therapeutic Area | Regulatory Focus | Key EAC Harmonization Mechanisms | Challenges | Progress & Opportunities

| Integration with national HIV programs - Rapid access to WHO

PQ ARVs | procurement systems (e.g., Global Fund) | challenges - Limited local production | Supportive

policy for ARV production

Tuberculosis (TB) | MDR-TB drugs evaluation

Diagnostic technologies

Fixed-dose combination approvals | WHO TB drug guidelines

Regional efforts to reduce import timelines | Complexity of MDR/XDR TB treatment

Dependence on donor supply | Regional labs and regulatory harmonization improving Potential for local packaging and supply

Risk Factor | Potential Impact

Regulatory Uncertainty | Changes in pharmaceutical laws, taxation, or

licensing requirements could delay operations or increase compliance costs.

Government Policy Shifts | Import/export restrictions, price controls, or changes in incentives may

affect profitability.

Bureaucratic Delays | Lengthy approvals for manufacturing licenses,

product registrations, and environmental permits may slow down market entry.

Geopolitical Instability in EAC Region | Conflicts or tensions in neighbouring East African Community

(EAC) countries could disrupt supply

chains and exports.

Intellectual Property & Patent Protection | Weak enforcement of patents and trademarks may lead to

counterfeiting risks.

Risk Factor | Potential Impact

Currency Fluctuations | Exchange rate volatility can increase the cost of imported raw materials (APIs,

excipients, packaging

materials).

Inflation & Rising Operational Costs | High inflation may lead to increased costs for labor, utilities,

and raw materials.

Supply Chain Disruptions | Dependence on international suppliers for APIs and critical components could

lead to shortages.

Limited Access to Affordable Financing | High-interest rates and limited government incentives can make project financing costly.

Market Demand & Price Sensitivity | Price-sensitive consumers and limited insurance coverage may affect product affordability.

Risk Factor | Potential Impact

Water Scarcity | High water demand for manufacturing and cooling may lead to shortages, increasing operational costs.

Waste Disposal Challenges | Improper disposal of hazardous waste (solvents, API residues) can lead to environmental penalties.

Energy Dependence on Non-Renewables | High electricity costs and unreliable grid supply may lead to production disruptions.

Climate Change Effects | Increased heat and erratic rainfall could impact cooling systems and energy consumption.

Regulatory Non- Compliance | Failure to meet Uganda’s National Environment Management Authority (NEMA) regulations can lead to legal actions.

Risk Category | Key Risks | Mitigation Strategies

Political Risks | Regulatory uncertainty, bureaucracy, policy shifts | Engage early with regulators, form public-private partnerships, diversify export markets

Economic Risks | Currency fluctuations, inflation, financing challenges | Hedge currency risks, optimize operational costs, diversify revenue streams

Environmental Risks | Water scarcity, waste disposal, high energy costs | Implement sustainable waste management, use renewable energy, optimize water usage

1. EXECUTIVE SUMMARY

Introduction:

The objective of this project is to establish and operate a state-of-the-art green field multi-Products Biopharmaceutical manufacturing plant in Republic of Uganda and to address and transform health care needs of East African council (EAC) by addressing critical health care challenges and fostering local manufacturing.

This facility aims to consistently and efficiently produce high-quality pharmaceutical, Biopharmaceuticals & vaccines in a phased manner

Objective:

The objective of this report is to study comprehensively the feasibility and to assess the potential for establishing a sustainable and efficient pharmaceutical manufacturing plant in Uganda. BioBridge is requested to provide a proposal for feasibility study services, which include:

- Market analysis
- Regulatory requirements
- Site selection and infrastructure
- Technical feasibility
- Financial feasibility
- Supply chain and raw material sourcing
- Human resources
- Risk assessment
- Sustainability

CONFIDENTIAL 5

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

Goals

Health Care Access: To enhance Healthcare access by manufacturing high quality pharmaceuticals, Biologics and vaccines locally thereby reducing the dependency on imported medicines and biologics, ensuring cost effective treatment to masses.

Health Care needs: To address regional health care needs by manufacturing medicinal products which are required to treat most prevalent diseases in the region-Malaria, Tuberculosis, AIDS.

Economic growth: To foster Economic growth by providing employment opportunity to local population and attracting global investors and venture capitalists.

Sustainability: To establish a sustainable pharma base in Uganda which is reliable and self-sufficient.

Supply Chain Reliability: Building a secure and efficient supply chain to source raw materials, transport finished products, and ensure timely deliveries to end users.

Stakeholder Satisfaction: Ensuring customer satisfaction by providing consistent and reliable products while maintaining a favourable relationship with employees, investors, and the local community.

Solution:

To realise the above said goals and to address the critical health care needs of Uganda, Biopharmaceutical manufacturing facility shall be established in the phased manner.

In the first phase Oral Solid Dosage (OSD) form shall be established by integrate state-of-the-art manufacturing technologies to ensure efficiency, quality, and scalability of wide range of high-demand solid dosage forms, including tablets, capsules, syrups, and advanced technologies such as soft gel capsules.

CONFIDENTIAL 6
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

In the phase -2, The Phase-2 General Injectables facility will focus on manufacturing sterile pharmaceutical injectable-grade products, targeting key therapeutic segments. Injectables facility shall be designed to meet the highest global standards for sterile manufacturing while maintaining cost efficiency and scalability

In the Phase-3, Biopharma Products facility focuses exclusively on the formulation and fill- finish of advanced biopharmaceutical products. This facility shall be commissioned to address the increasing demand for biologics, including Monoclonal antibodies(mabs), Hormones, Insulin, analogs, and other therapeutic proteins. This facility shall be designed to ensure contamination controls, precision, and compliance with global standards for biopharmaceutical fill-finish processes.

The Phase-4, facility for formulation and fill-finish of critical vaccines to address major global and regional health challenges. This facility shall be designed to cater to both routine immunization programs and outbreak vaccines.

East Africa, like the rest of Africa, faces a growing demand for vaccines, particularly as it works to strengthen its vaccine supply chain and boost domestic capabilities to meet the needs of its population.

In the 5th and the final phase, Oncology OSD facility shall be installed to address the needs of anticancer drugs in the region.

2.0 DETAILED
FEASIBILITY
REPORT

CONFIDENTIAL 8
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

a) Market Analysis:
i) Demand for pharmaceutical products in Uganda

Uganda's pharmaceutical industry is a key component of the country's healthcare system, with demand steadily increasing due to population growth, rising disease burdens, and government initiatives to improve healthcare access.

The disease burden in Uganda is similar to other less developed African countries, with communicable diseases accounting for roughly 67% of the total burden.

Uganda's communicable disease burden is dominated by infectious and parasitic diseases. Malaria is considered as the major cause of deaths in the country.

The most prevalent causes of mortality and morbidity in Uganda are

Malaria, Pneumonia, Tuberculosis, Anaemia, Hypertension, Diabetes and Cancer.

MARKET VALUE:

CONFIDENTIAL 10

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

• In Uganda, the revenue in the pharmaceuticals market is estimated to reach US\$329.32m in 2025.

• The largest market within this industry is Oncology Drugs, which is projected to have a market volume of US\$50.03m in 2025.

• The revenue is expected to exhibit an annual growth rate (CAGR 2025-2029) of 3.06%, resulting in a market volume of US\$371.58m by 2029.

• Uganda's pharmaceutical market is experiencing a surge in demand for affordable generic medications.

• The East Africa generic drug market reached USD 2.4 billion in 2024 and is expected to exhibit a CAGR of 6.72% during 2025-2033.

Competitive Landscape:

East Africa Pharma manufacturing- An Overview

• Around 35 active manufacturers (members of FEAPM); 2 facilities with WHO cGMP approval and pre-qualified products

• Primarily compounding and formulation of most dosage forms including infusions

• Almost all raw materials imported

• High dependency on imported finished pharmaceutical products

• Focus on WHO list of essential medicines

• No API manufacturing

• Increasingly well-regulated (NDA, PPB, TFDA)

• Trade is mostly intra-East Africa

CONFIDENTIAL 11

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

Companies currently having manufacturing base in Uganda

1. CIPLA Quality Chemicals Industries Limited, joint venture between a local and international pharmaceutical company, is certified cGMP facilities manufacturing Anti-retro viral, anti-malarial and hepatitis B drugs, exports to Sub-Saharan countries and supplies drugs to the Global Fund

2. Kampala Pharmaceutical Industries (1996) Limited, local manufacturer and an affiliate of the Aga Khan development network. Product range includes analgesics, anti-asthma, anti-diabetic, anti-malarial, anti-parasites, antibiotics, cardiovascular drugs, cold remedies & Nutraceuticals

3. Beta Health Care Uganda Limited, an affiliate of Aspen Group. Exports its products to Tanzania, Rwanda, Burundi, Ethiopia, Sudan, Somalia, Mauritius and West Africa

Key players in the market are actively implementing various strategies to expand their reach and market share by:

• Enhancing their production capabilities, both in terms of volume and the range of products.

• Investments in advanced manufacturing facilities to increase output and meet the rising demand for generic drugs.

- Creating more efficient supply chains and distribution networks to ensure wider availability of their products. They are reaching out to remote areas and partnering with local distributors to improve access.
- Forming alliances with local manufacturers, international partners, and healthcare providers to extend their reach and enhance their market position.
- Technology transfers, knowledge and technology transfer, through Joint ventures, Alliances thereby strengthening local capacities

Demand for Pharmaceutical Products in Uganda

The demand for pharmaceutical products in Uganda is driven by various factors, including an increasing prevalence of both communicable and non-communicable diseases (NCDs), an expanding healthcare infrastructure, and growing government support for local production.

Below is an analysis of key therapeutic areas:

a) Oral Solid Dosage Forms (Tablets and Capsules)

- Oral solid dosage forms constitute the majority of prescription medications in Uganda, covering a range of treatments from antibiotics to anti-hypertensives.

CONFIDENTIAL 13

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- Uganda has a few established pharmaceutical manufacturers producing these drugs.
- Despite local manufacturing efforts, a large portion of Uganda's medicine supply is still imported due to insufficient production capacity and the need for diverse active pharmaceutical ingredients (APIs).
- Expanding local production capabilities, especially for essential generics, could help meet growing demand and reduce reliance on imports.

b) Oncology Treatments

- Cancer cases in Uganda have been rising significantly, with estimates from the Uganda Cancer Institute (UCI) indicating an annual increase in new cases (Refer to Fig Nos.2&3.).
- Currently, oncology drugs are almost entirely imported, making treatment expensive and often inaccessible to many patients.
- There is an opportunity for local pharmaceutical manufacturers to invest in cancer drug production, particularly generic chemotherapy drugs, which could lower costs and improve accessibility and health care.
- The Ugandan government and international health organizations are increasingly investing in cancer treatment centres, further boosting the demand for oncology drugs

c) Vaccines

- Uganda has a demand for vaccines (approx. 1.7 million doses per annum for essential vaccines) due to childhood immunization programs, seasonal disease outbreaks, and global initiatives like the Global Vaccine Alliance (GAVI).

CONFIDENTIAL 14

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- The country currently relies on imports for nearly all its vaccines, which poses challenges such as supply chain disruptions and high procurement costs.
- Government efforts to establish vaccine production facilities could significantly boost the local pharmaceutical industry and create self-sufficiency in vaccine supply.

d) Monoclonal Antibodies (mAbs)

- Monoclonal antibodies are used in cancer treatment, autoimmune diseases, and infectious diseases like COVID-19.
- Uganda currently lacks the infrastructure for manufacturing biologic drugs & mAbs, entirely dependent on imports.

Drivers of Pharma market:

- Rapid expansion of local pharmaceutical manufacturing capacities.
- East Africa is experiencing a significant boost in its pharmaceutical

production driven by a combination of increased domestic and international investment and initiatives, improved technological capabilities, and a strategic push for self-sufficiency in pharmaceutical supply. Furthermore, there is a rising awareness among healthcare professionals and patients about the comparable efficacy of generic drugs to brand-name counterparts.

- Generic drug manufacturers are significantly strengthening their distribution networks to improve product reach. This involves the development of efficient supply chain strategies and logistics networks to ensure generic drugs are accessible even in remote regions. This expanded distribution is further facilitated by technological advancements, such as digital platforms and delivery

CONFIDENTIAL 15

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

systems, enabling broader dissemination of generic drugs across the region, fostering overall the market growth.

Favourable Government Initiatives

Governments across East Africa are progressively acknowledging the role of generic drugs in achieving healthcare affordability and accessibility. They are implementing regulatory reforms to simplify the approval process, thereby encouraging their use by streamlining this process, governments are reducing barriers to entry, making it easier for generic manufacturers to bring their products to market.

Moreover, there is an increase in governmental efforts to boost public awareness about the efficacy and affordability of generic drugs. Despite their lower cost, generic drugs are equally effective as their branded counterparts.

EAC Pharma – Opportunities

- Large unmet need for essential medicines
- Significant population growth anticipated
- Double disease burden (growth of chronic diseases):
- NCDs are predicted to account for 40% of illnesses & for 42% of deaths (5.1 million) by 2030 (WHO Global Health Estimates, 2013)
- Growing middle class willing to pay for better treatment
- New models of care being designed (e.g. PPP, medical insurance, etc.)
- Existing pharmaceutical production base & enabling regulatory environment
- African traditional and herbal medicines as a market niche
- No dominant players
- Political will and action

EAC Pharma – Challenges

- Negative perceptions of locally manufactured products

CONFIDENTIAL 16

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- Lack of capacity to manufacture advanced formulations due to a skills gap on product development and formulation expertise
- High cost of borrowing (20-30%)

- High cost of operations e.g. finance, utilities, infrastructure
- Lack of market data
- Poor and unreliable infrastructure (roads, utilities, etc)
- Under resourced and weak institutions (Civil society, Regulatory agencies, etc)

Vaccines Market Analysis:

Immunization is a proven tool for controlling and eliminating life-threatening infectious diseases and is estimated to avert millions of deaths each year. Universal immunization of children against eight vaccine-preventable diseases [tuberculosis, diphtheria, whooping cough (pertussis), tetanus, hepatitis B, respiratory diseases caused by *Haemophilus influenzae*, polio, and measles] is crucial to reducing infant and child mortality. J Health Popul Nutr . 2013 Mar;31(1):118–129. doi

Immunisation Schedule in Uganda:

Routine immunization schedule for Children below the age of one year cover vaccines for following preventable diseases
Oral Polio vaccine, BCG, Pentavalent, Pneumococcal 10 valent, Rotavirus vaccine, Injectable Polio vaccine (14 weeks of age), Measles vaccine & HPV (Female Children) (Republic of Uganda, Ministry of Health/UNICEF Report)
Based on the birth cohort in Uganda (1.7 million) the requirements of different vaccines are as under based on the government Immunization program:

Demand of vaccines products in Uganda & EAC region:

Eastern Africa is experiencing a surge in demand for vaccines, driven by increasing awareness and government initiatives to improve healthcare access.

The Vaccines market in Eastern Africa is anticipated to achieve a revenue of US\$463.65m in 2025.

Looking ahead, the market is expected to exhibit a compound annual growth rate (CAGR) of -4.98% from 2025 to 2029, leading to a market volume of US\$377.97m by 2029.

Key market trends, challenges, and opportunities:

CONFIDENTIAL 18

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

One of the key trends in the Vaccines segment in Eastern Africa and Uganda is the increasing availability of vaccines. Pharmaceutical companies are expanding their operations in the region, and governments are working to improve vaccine distribution networks. This has made vaccines more accessible to people living in remote areas. Secondly, in the market there is growing demand for new and innovative vaccines. As more people become vaccinated against common diseases, there is a need for vaccines that can prevent emerging infectious diseases. Pharmaceutical companies are investing in research and development to create new vaccines that can address these challenges. East Africa, like the rest of Africa, faces a growing demand for vaccines, particularly as it works to strengthen its vaccine supply chain and boost domestic capabilities to meet the needs of its population.

Challenges and Opportunities:

Challenges include the provision of vaccines in rural locations hampered by inadequate cold chain infrastructure, and vaccination acceptance rates that are impacted by cultural and religious beliefs. Besides, there are also market opportunities, such as increasing research and development (R&D)

spending for novel vaccines and technological advancements.

Growing Support from Various Organizations:

The support from international bodies such as the World Health Organization (WHO), World Bank, the United Nations Children's Fund (UNICEF), and the Global Alliance for Vaccines and Immunization (GAVI) is indispensable for the East African vaccine market. These organizations provide not only financial aid but also logistical support, crucial for the procurement and distribution of vaccines in the region.

2. Competitive Analysis of the Existing Pharmaceutical Market

CONFIDENTIAL 19

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

Uganda's pharmaceutical market is composed of both local manufacturers and international suppliers. The competitive landscape is shaped by several key factors:

a) Local Pharmaceutical Manufacturers

- Uganda has a small but growing pharmaceutical manufacturing industry.
- Local manufacturers face challenges such as high production costs, limited access to raw materials, and competition from imported generics.

b) Import Dependence and Foreign Suppliers

- Uganda imports about 70% of its pharmaceuticals, with India and China being the dominant suppliers.
- International pharmaceutical companies have a strong presence in Uganda through distributors.
- The high reliance on imports creates challenges in affordability, availability, and quality control.

c) Policy and Market Protection

- Uganda has introduced policies like the "Buy Uganda, Build Uganda" (BUBU) initiative, which promotes local manufacturing.
- However, the local pharmaceutical industry struggles to compete with cheaper imports, and implementation of these policies remains inconsistent.

3. Key Market Trends, Challenges, and Opportunities

a) Market Trends

1. Regulatory Harmonization in the EAC

CONFIDENTIAL 20

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

o The East African Community (EAC) is working towards regulatory harmonization, allowing Ugandan manufacturers to access larger regional markets.

o Harmonization simplifies drug registration processes and could enhance trade within the region.

2. Growing Non-Communicable Disease (NCD) Burden

o There is an increasing prevalence of NCDs such as diabetes, hypertension, and cancer in Uganda.

o This shift is driving demand for chronic disease medications, which presents opportunities for local manufacturers to diversify production.

3. Expansion of Health Infrastructure

o The Ugandan government is investing in expanding hospitals, clinics, and specialized treatment centres.

o These investments are increasing the demand for pharmaceuticals, particularly in specialized areas like oncology and vaccines.

b) Key Challenges

1. Limited Access to Finance

o Pharmaceutical manufacturing requires large capital investments for facility upgrades, research, and compliance with

regulatory standards.

- o Access to affordable financing remains a major barrier for Ugandan pharmaceutical firms.

2. Dependence on Imported Raw Materials

CONFIDENTIAL 21

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- o Uganda imports most of its Active Pharmaceutical Ingredients (APIs) from India and China.

- o This dependence makes local manufacturers vulnerable to global supply chain disruptions.

3. Regulatory and Quality Compliance

- o Meeting international Good Manufacturing Practices (GMP) standards is essential for market expansion but requires costly upgrades.

- o Non-compliance can limit Ugandan pharmaceutical companies' ability to export to international markets

4. Shortage of Skilled Workforce

- o There is a lack of specialized professionals in pharmaceutical research, manufacturing, and regulatory affairs.

- o Developing a skilled workforce through training and academic programs is critical for industry growth.

c) Opportunities for Growth

1. Investment in Local Production

- o Increasing local manufacturing, especially in essential medicines and specialty areas like oncology and vaccines, can enhance Uganda's pharmaceutical security.

- o Public-Private Partnerships (PPPs) could play a crucial role in driving investment.

2. Regional Expansion and Export Potential

CONFIDENTIAL 22

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- o The EAC harmonization efforts present an opportunity for Ugandan pharmaceutical companies to expand their reach beyond the domestic market.

- o By meeting international regulatory standards, local manufacturers could increase exports to neighbouring countries.

3. Public-Private Collaborations

- o Government initiatives supporting pharmaceutical production can help develop infrastructure and provide financial incentives for local companies.

- o Partnerships with international pharmaceutical firms could help bring technology and expertise to Uganda.

4. Biopharmaceutical and Vaccine Development

- o Investing in biologics and vaccine production could position Uganda as a leader in high-value pharmaceutical production.

- o Establishing local capacity for monoclonal antibody production could reduce reliance on costly imports.

CONFIDENTIAL 23

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

B. Overview of the Ugandan Pharmaceutical Regulatory Framework and EAC Regulatory Systems

Introduction:

- In Uganda, the regulation of human medicinal products is overseen by the National Drug Authority (NDA), which ensures the safety, efficacy, quality, availability and cost means of providing satisfactory healthcare and safeguarding the appropriate use of medicines used within the country.

- The legal framework governing these activities is established by the National Drug Policy and Authority Act, Cap 206.
- The National Drug Authority (NDA) was established in 1993 by the National Drug Policy and Authority Statute which in 2000 206 of the Laws of Uganda (2000 Edition).
- The EAC Guide on Good Manufacturing Practices (GMP) is based on the World Health Organization (WHO) Good Manufacturing Practices guidelines in the WHO Technical Report Series No. 961, 2011. This guide also refers to the Pharmaceutical Inspection Convention Scheme (PIC/S) guide PE 009-9.

Maturity level of NDA (Uganda) with respect to WHO Qualification

Maturity Level 3, which is a key benchmark for drug regulatory bodies, ensures that national authorities can effectively oversee drug safety, efficacy, and quality, aligning with international norms.

The National Drug Authority (NDA) is seeking to overcome legal and regulatory challenges that have hindered its progress toward achieving Maturity Level 3, a global standard for drug regulators.

Only eight African countries have currently attained this status, making it a significant goal for Uganda. These include, Egypt, Rwanda, Senegal, Ghana, Nigeria, South Africa, Tanzania and Zimbabwe.

Key Regulatory Requirements

CONFIDENTIAL 26
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

In Uganda, the journey of a new drug from conception to market involves a systematic approval process regulated by several governing bodies, predominantly the National Drug Authority (NDA).

Preclinical and Clinical Trials:

- The process begins with preclinical studies, where laboratory and animal testing evaluate the drug's safety and efficacy. This stage is crucial, as it provides preliminary data that informs the next phases of research and development. Pharmaceutical companies need to document their findings and prepare a comprehensive submission package for the NDA.

- Conducting clinical trials in Uganda requires prior authorization from the NDA.

- Researchers, organizations must adhere to the "Guidelines for the Conduct of Clinical Trials in Uganda," which detail the procedures for submission, review, and approval of clinical trial applications.

- Compliance with Good Clinical Practice (GCP) is mandatory, as outlined in the "Guidelines on Good Clinical Practice in the Conduct of Clinical Trials Involving Human Participants."

- After completing the clinical trials, the pharmaceutical company must submit a New Drug Application (NDA) to the NDA, including all research data, manufacturing details, and proposed labelling.

- Once the NDA reviews the application and finds it satisfactory, it grants approval for the drug to be marketed.

CONFIDENTIAL 27
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

Good Manufacturing Practice (GMP):

Manufacturers of medicinal products must comply with GMP standards to ensure product quality. The NDA provides detailed guidelines, including "Guidelines on Good Manufacturing Practice for Medicinal Products Part I – Basic Requirements for Medicinal Products."

All human medicinal products must be registered with the NDA before they can be marketed or distributed in Uganda. The registration process involves a scientific evaluation of the product's safety, efficacy, and quality.

GMP Inspection:

- National Drug Authority (NDA) is the regulatory body responsible for overseeing the compliance of pharmaceutical companies with GMP standards.

- Regular GMP inspections and audits are conducted as one of the requirements for registration of medicinal products in the EAC.

- The NDA conducts comprehensive evaluations to verify that facilities meet the specified criteria for manufacturing processes, hygiene, and personnel training.
- Inspection involves review of documents, records, facilities and any other resources to assess their conformity to the requirements of EAC GMP of medicinal products.
- Any non-compliance can result in severe penalties, including the suspension or revocation of manufacturing licenses.

Importation and Exportation:

- The NDA regulates the import and export of drugs and pharmaceutical raw materials.

CONFIDENTIAL 28

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- Drugs imported must be registered unless given special clearance by the NDA under Sec 8(4) NDPA (National drug policy & Authority) by NDA.
- The import permit may be:
 - a. Annual import permit -which is issued for regular imports like pharmaceutical manufacturers or any organization, retail pharmacies, wholesale premises, that regularly imports drugs and other related substances. Ministry of Health of Uganda and its affiliated units may also apply for an annual import permit.
 - b. Provisional import permit is issued to non-regular importers who may import drugs, for some reasons. The provisional import permit is issued per consignment. This usually applies to the organizations, which receive donations, physicians or individuals who may for specified reasons need to bring limited quantities of specialized drugs that are not available in the country. The permit is valid for one month.

c. Licensing:

- Entities involved in the manufacture of pharmaceuticals must obtain appropriate licenses from the NDA.
- Import License: (Form-24)
 - Eligibility to apply for import license: A licensed person (a person holding license to operate pharmacy or for manufacture drugs).
 - Import license is valid for one year and is valid within the calendar year within which it is issued.

CONFIDENTIAL 29

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- Verification certificate: A consignment of drugs to be imported into Uganda shall before importation, be issued with a verification certificate (Form-25) by the NDA basing on the application submitted in this regard in Form-26.
- Stability Data:
 - In Uganda, the National Drug Authority (NDA) requires stability data as part of the regulatory requirements for pharmaceutical and biopharmaceutical products, ensuring quality, safety, and efficacy, and mandates that all medicinal products meet acceptable standards.
 - The NDA requires that applicants for drug registration provide results of stability testing, which is crucial for determining the shelf-life and storage conditions of the product.
 - Applicants need to submit all relevant stability data as part of the registration application.
 - The stability studies will determine the appropriate storage conditions for the product, including temperature and humidity, and these conditions must be reflected on the product label.
 - The product label must include an expiry date and storage instructions based on the stability data.
 - Stability studies should include Storage conditions i.e temperature and relative humidity for accelerated and stress conditions.

- Stability studies should be done in accordance or with reference to WHO TRS 987, WHO TRS 953 Annex 2, WHO TRS 962 Annex 3, ICH Q1A and ICH Q5C guidelines.

CONFIDENTIAL 30

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- A minimum of twelve months data at the time of submission should be provided in cases where storage periods greater than six months are requested.

- For storage periods of less than six months, the stability data should cover the whole proposed shelf life.

- The stability studies should be submitted in controlled documentation.

- Post-approval stability program should include the stability program or stability commitment to be carried out once the drug product is on the market, including the number of batches to be included in the study each year and the tests to be performed.

- These results should be submitted periodically to update the information on the stability of the drug product.

- The stability of each dosage form should be separately documented.

- Stability data submitted should be for at least three consecutive batches and include the following:

- a) Information on stability of drug product, quality control methods and rationale for the choice of tests for determining stability.

- b) Information on the dates of manufacture of the lots, the lot numbers, the vial and dose size, and the scale of production.

- For lyophilized products the data supporting the shelf-life of the product reconstitution should be included.

CONFIDENTIAL 31

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- If the drug product is frozen, data supporting the stability of the product through a stated number of freeze-thaw cycles should be provided.

Drugs Registration in Uganda:

All drugs to be manufactured or imported into Uganda have to be registered with the National Drug Authority, Uganda. A person who intends to manufacture, import or export a product shall, prior to the manufacture, importation or exportation of the product, apply to the Authority for registration of the product.

The registration process involves:

- NDA inspection & approval of the manufacturing facility.

Validity of registration:

- The Authority shall issue for the first registration, a certificate of registration which shall be valid for five years.
- The holder of a certificate of registration shall pay an annual retention fee prescribed by the Authority for maintaining the registered human or veterinary drug or preparation, vaccine or other immunological products or surgical instrument, on the Register.
- A certificate for renewal of registration shall be valid for one year from the date of issue.
- The certificate of registration issued under these Regulations shall be kept at the premises of the holder of the certificate of registration.
- The holder of a certificate of registration shall monitor the safety and effectiveness of the registered human or veterinary drug or preparation, vaccine or other immunological products or surgical instrument while on the market in Uganda and shall submit periodic reports as may be prescribed by the Authority.

CONFIDENTIAL 32

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- The registration of a human or veterinary drug or preparation, vaccine or other immunological products or surgical instrument under these Regulations shall be valid except where the registration is suspended or cancelled by the Authority or is terminated by the holder of the

certificate of registration.

ii. Environmental and Safety Regulations Applicable to Pharmaceutical Manufacturing in Uganda

Uganda's regulatory framework ensures that pharmaceutical production safeguards human health, worker safety, and environmental sustainability.

Environmental Compliance

Environmental oversight in Uganda is primarily the responsibility of the

National Environment Management Authority (NEMA). Under the National Environment Act, 2019, all industrial and manufacturing projects, including pharmaceutical facilities, are required to undertake an Environmental and Social Impact Assessment (ESIA) as a prerequisite for licensing and construction. The ESIA must identify potential environmental risks and outline mitigation strategies, with particular attention to waste management, water usage, emissions, and impacts on surrounding communities.

Pharmaceutical facilities must install and maintain Effluent Treatment Plants (ETPs) to process wastewater before discharge. Compliance with the Environmental Management (Waste Management) Regulations ensures proper handling of both hazardous and non-hazardous solid and liquid waste, especially chemical residues, solvents, and expired or rejected pharmaceutical products. The facility must also adhere to Uganda's obligations under the Basel Convention on the control of transboundary movements of hazardous waste.

Safety and Occupational Health Standards

CONFIDENTIAL 37

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

The National Drug Authority (NDA) regulates the pharmaceutical sector and enforces Good Manufacturing Practices (GMP), including protocols that safeguard worker and product safety throughout the production lifecycle. This includes facility design to minimize cross-contamination, controlled cleanroom environments, and safe material handling procedures.

In parallel, the Occupational Safety and Health Act, 2006, administered by the Ministry of Gender, Labour and Social Development, mandates comprehensive safety practices in the workplace. Employers must implement hazard identification and risk mitigation strategies, ensure employee training, and provide Personal Protective Equipment (PPE) and emergency response systems. All operations must include clearly marked emergency exits, fire suppression systems, first aid facilities, and regular safety drills.

Regular inspections and audits are conducted by both NDA and the Ministry of Labour to verify compliance. Manufacturers are encouraged to adopt internationally recognized standards such as ISO 14001 (Environmental Management Systems) and ISO 45001 (Occupational Health and Safety Management Systems) to enhance performance and facilitate future export readiness.

Strategic Considerations

Full regulatory compliance not only avoids legal penalties and operational delays but also enhances the facility's reputation among stakeholders and investors. Additionally, adherence to these regulations supports sustainable operations and positions the facility for future certification under global quality and safety systems, enabling access to regional and international markets.

General Observations on the EAC Medicines Regulatory Framework

- Harmonization Framework: The EAC Medicines Regulatory Harmonization (MRH) Programme supports joint product assessments, GMP inspections, and reliance pathways to reduce duplication across Partner States.
- National Regulatory Authorities (NRAs): While each EAC country retains autonomy (e.g., Kenya PPB, Uganda NDA, Rwanda FDA), they collaborate extensively on shared regulatory functions.
- Global Alignment: Reliance on WHO Prequalification, Global Fund procurement standards, AVAREF for clinical trials, and engagement with the African Medicines Agency (AMA) for future alignment.

 UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

C. Site Selection and Infrastructure
 i. Site Selection Criteria

a) Proximity to Raw Materials & Suppliers

- Most of the Active Pharmaceutical Ingredients (APIs) and excipients used in pharmaceutical production in Africa are imported (mainly from India and China).

- Ideal site locations:

- o Close to international ports, airports, or dry ports to reduce import lead times.

- o Access to local packaging material manufacturers to lower supply chain dependency.

- o Industrial zones with chemical and biotech suppliers to ensure consistent raw material availability.

b) Logistics & Transportation Considerations

- Proximity to major highways, rail networks, and ports to facilitate raw material import and product distribution.

- Cold chain logistics is crucial for vaccines and biologics, requiring locations near temperature-controlled warehouses and transport hubs.

- Close to key healthcare markets to reduce distribution delays, especially for essential medicines.

c) Utilities & Infrastructure

- Electricity: Reliable power supply is critical, especially for injectables, vaccine production, and sterile drug manufacturing. Backup

CONFIDENTIAL 41

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

generators, UPS systems, and solar energy solutions should be considered.

- Water Supply & Treatment:

- o High-quality water sources for pharmaceutical processing, purification, and cleaning.

- o Reverse Osmosis (RO) & Water for Injection (WFI) systems for injectable production.

- o Effluent treatment plants (ETP) and bio-waste disposal facilities for environmental compliance.

- Air Filtration & HVAC Systems:

- o ISO-classified cleanrooms (ISO 5, ISO 6, ISO 7, ISO 8) for sterile and injectable production.

- o High-Efficiency Particulate Air (HEPA) filters and humidity-controlled areas for tablet and capsule manufacturing.

d) Skilled Workforce Availability

- Proximity to universities and research institutions that offer pharmaceutical, biotechnology, and engineering programs.

- Training partnerships with international pharmaceutical firms to build local expertise.

- Employee housing and transport accessibility to attract and retain skilled professionals.

2. Infrastructure Requirements

a) Facility Layout & Zoning

- Segregated production zones for different dosage forms:

CONFIDENTIAL 42

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- o OSD (Oral Solid Dosage): Tablets, capsules.

- o Syrups & Liquids: Bottled formulations.

- o Injectables & Vaccines: Requires high-containment cleanrooms and sterile environments.

- Dedicated cleanroom areas for sensitive processes such as sterile drug filling and vaccine formulation.

- Material & personnel movement control to prevent cross-contamination.

b) Manufacturing Equipment & Technology Integration

- Automated production lines for efficiency and compliance with GMP standards.

- SCADA (Supervisory Control and Data Acquisition) and MES (Manufacturing Execution Systems) for real-time monitoring.

c) Cold Chain & Storage Facilities

- Temperature-controlled warehouses for raw materials and finished pharmaceutical products.

- Cold chain logistics for vaccines and biologics, including deep freezers and transport containers.

- Automated inventory management systems to ensure compliance with GDP (Good Distribution Practices).

CONFIDENTIAL 43

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

3. Finding the Right Technology Partners

a) Pharmaceutical Machinery & Equipment Suppliers

To establish a world-class pharmaceutical facility, partnering with technology providers specializing in pharmaceutical manufacturing equipment is essential. Key areas include:

1. Oral Solid Dosage (OSD) Equipment

- o Granulation, blending, and tablet compression machines

- o Leading suppliers: GEA Group, Bosch, Syntegon (formerly Bosch Packaging), Fette Compacting ACG Worldwide, SED Pharma, Syntegon Technology, IMA Group, Glatt, Fette Compacting, Romaco, iPharMachine

2. Sterile Injectable & Vaccine Manufacturing Equipment

- o Aseptic filling, lyophilization, and cleanroom solutions

- o Leading suppliers: Bausch+Ströbel, IMA Pharma, Optima Pharma, NKP Pharma machinery, Sartorius, Cozzoli Machine Company, Groninger, ARxIUM, NJM Packaging, Intellitech

3. Water Purification & WFI Systems

- o Suppliers: Merck Millipore, Veolia Water Technologies, Komal Industries, MECO, NGK Insulators Ltd, Syntegon, Ovivo, Fabtech Technologies, Aqua-Chem, Herco Wasser technik GmbH, NEWater

4. Cleanroom & Air Filtration Systems

- o Suppliers: Camfil, AES Clean Technology, Thermo Fisher Scientific, Clean Air Technology, Atmos-Tech Industries, Abtech Inc., Microflow Devices India PVT Ltd. Zeco Aircon Ltd

CONFIDENTIAL 44

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

b) Digital & Automation Partners

- SCADA & MES Systems: Siemens, Rockwell Automation, Honeywell.

- Automated quality control & batch monitoring: Emerson, Siemens, ABB.

c) Regulatory & Compliance Partners

- GMP compliance consulting:

- o Local regulatory bodies (e.g., Uganda National Drug Authority - NDA).

d) Waste Management & Sustainability Partners

- Hazardous waste disposal & ETP solutions: Veolia, SUEZ, Ecolab.

- Renewable energy integration for sustainability: Tesla Energy, Schneider Electric.

4. Strategic Collaborations & Public-Private Partnerships

- Government Incentives & Special Economic Zones (SEZs)

- o Tax incentives for pharmaceutical manufacturers in Uganda and

the East African Community (EAC).

o Preferential land allocation and infrastructure support for investors.

- Public-Private Partnerships (PPPs)

o Collaborations with global health organizations (WHO, UNICEF, GAVI, USAID) for vaccine and essential medicine production.

CONFIDENTIAL 45

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

ii. Infrastructure Requirements for a Pharmaceutical Manufacturing Facility near Kampala, Uganda

The proposed pharmaceutical manufacturing facility, will be located near Kampala, Uganda.

Given the scale and scope of this state-of-the-art facility, robust infrastructure is vital to ensure uninterrupted operations, regulatory compliance, and product quality.

Power Supply: The facility will require a high-capacity, stable power source to support continuous manufacturing, HVAC systems, cleanrooms, cold storage, and quality control labs. It will be connected to the national electricity grid via UMEME, with dedicated transformers and high-voltage infrastructure. Backup power will be provided through diesel generators and solar power systems to ensure energy security and sustainability.

Water Supply: A reliable water supply is essential for production processes, utilities, cleaning, and sanitation. The facility will include on-site water purification systems to generate Purified Water (PW) and Water for Injection (WFI), meeting GMP standards. Water will be sourced from the national supply network and supplemented by boreholes with storage reservoirs.

Waste Management: The facility will house a centralized Effluent Treatment Plant (ETP) and systems for safe disposal of solid and hazardous waste, in full compliance with NEMA guidelines. Special provisions will be made for pharmaceutical and biomedical waste, including incineration and disposal via licensed operators.

Transport Links: Proximity to Kampala's industrial zones, the Northern Corridor, and Entebbe International Airport ensures efficient import/export logistics and access to regional markets. Excellent road connectivity will facilitate material movement and regulatory oversight.

CONFIDENTIAL 46

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

D. TECHNICAL FEASIBILITY

1. Machinery and Equipment Requirements

Each dosage form requires specific equipment to facilitate high-quality and compliant production.

a) Oral Solid Dosage (OSD) & Capsules Manufacturing

- Granulation Equipment – Fluidized bed dryers, high-shear mixers.
- Tablet Compression Machines – Single rotary, double rotary presses.
- Capsule Fillers – Semi-automatic and fully automatic encapsulation machines.
- Coating Machines – Film and sugar coating systems.
- Blending & Mixing Equipment – V-blenders, ribbon mixers.

b) Syrup and Liquid Manufacturing

- Sugar Dissolution & Mixing Tanks – Stainless steel reactors with agitation.
- Homogenizers – For uniform syrup consistency.
- Liquid Filling & Capping Machines – For bottles and ampoules.
- Sterile Filtration Systems – For microbial safety.

c) Injectables & Parenteral Manufacturing

- Aseptic Filling Lines – For ampoules, vials, prefilled syringes.
- Lyophilization Equipment – For freeze-dried injectables.
- Autoclaves & Sterilizers – For equipment and component sterilization.

- Isolators & Restricted Access Barrier Systems (RABS) – To maintain sterility.

CONFIDENTIAL 47

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

d) Monoclonal Antibodies (mAbs) & Vaccine Manufacturing

- Fill-Finish Equipment – Sterile filling, capping, lyophilization.
- Cold Chain & Stability Chambers – For biological storage.

3. Technology and Automation

a) Digitalization and Smart Manufacturing

- Manufacturing Execution Systems (MES) for batch tracking.
- SCADA (Supervisory Control and Data Acquisition) for process automation.
- Predictive Maintenance to prevent downtime.

b) Quality Control & Assurance Technologies

- Analytical Testing Equipment – HPLC, GC, UV Spectrophotometers.
- Microbial Testing – Endotoxin testing, sterility assurance.

4. Compliance & Regulatory Considerations

- Adherence to GMP, WHO and local drug regulatory guidelines.
- Regular validation & qualification of equipment and processes (IQ, OQ, PQ).
- Environmental compliance with waste disposal and emission control.

1.3 Operational Expenditure (OPEX) Breakdown

Annual OPEX includes raw materials, labour, utilities, maintenance, logistics, and regulatory compliance. Estimated OPEX in full scale operations:

Table No.: 14

Annual Cost % of Total
Cost Component
(MUSD) OPEX
Raw Materials & APIs 150(150.75)* 45%
Labour & Workforce 50(50.25)* 15%
Utilities (Power, Water, Waste
40(40.20)* 12%
Management)
Maintenance & Equipment Servicing 25(26.80)* 8%
Regulatory Compliance & Quality
20(20.18)* 6%
Assurance
Logistics & Distribution 30(30.15)* 9%
Total OPEX (Annual) \$335M USD 100%

* As per calculations

CONFIDENTIAL 62
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

2. Financial Projections and Revenue Estimates

2.1 Estimated Annual Revenue (First 5 Years)

Revenue is projected based on market demand, production capacity, and price realization. The estimated year-wise revenue is:

Table No.: 14

Revenue
Year
(MUSD)
Year 1 5

Year 2 90
Year 3 150
Year 4 250
Year 5 450

Revenue Contribution by Segment:

- OSD & Injectables: 35%
- Oncology: 25%
- Vaccines & Biopharma: 30%
- Contract Manufacturing & Exports: 10%

3. Break-Even Analysis

3.1 Break-Even Point Calculation

The break-even point (BEP) is determined by comparing total fixed costs (CAPEX amortization) with contribution margins.

- Fixed Costs: Depreciation on \$571M CAPEX (~10-year depreciation cycle) → ~\$57M/year
- Variable Costs: 65% of revenue
- Average Selling Price & Margins: 35% Gross Margin

CONFIDENTIAL 63
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

Break-Even Sales Volume Calculation:

Break-even revenue=Fixed Costs / Contribution Margin = 57M / 0.35=162M USD

Thus, the break-even point is reached within the third/fourth year of operation.

3.2 Payback Period & Profitability Timeline

- Payback period: ~6 years
- First-year losses due to ramp-up & market entry.
- Full profitability expected in Year 4-5 with a Net Profit Margin of ~15-20%.

4. Return on Investment (ROI) Analysis

4.1 Projected ROI

ROI = Annual Profit / Total investment × 100

- Year 3 Expected Net Profit: ~\$150M USD
- ROI by Year 3/4: 150/ 571 ×100 = 26.0%
- Cumulative ROI over 6 years: 125% (fully recovering investment & generating profit).

4.2 Internal Rate of Return (IRR)

- Estimated IRR: 18-22%, exceeding the pharmaceutical industry benchmark of 15-18%.
- Strong returns in high-value segments (Oncology, Biopharma, and Vaccines)

CONFIDENTIAL 64
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

5. Key Financial Risks & Mitigation Strategies

Table No.: 15

Risk Factor	Potential Impact	Mitigation Strategy
Slower product Regulatory Delays	Early engagement with NDA approvals (Uganda), WHO-GMP	
Increased raw API Price Volatility	Multi-supplier sourcing, API material costs localization	
Lower pricing Market Competition	Differentiation through quality & power innovation	
Logistics & Distribution Challenges	Delayed market penetration	Strong partnerships with distributors

6. Conclusion & Strategic Recommendations

- CAPEX of \$571M is strategically allocated across multiple high-growth segments.
- OPEX of ~\$335M annually ensures robust operations & regulatory compliance.
- Break-even is expected within the third year, with profitability by Year

4-5.

- Strong ROI (~28% by Year 4) and IRR (~18-22%) ensure high financial viability.

Strategic Recommendations:

1. Focus on Oncology & Biologics: Higher-margin products provide better financial returns.
2. Optimize API Sourcing: Reduce costs by investing in local API production or strategic long-term supplier contracts.
3. Enhance Export Potential: Leverage Uganda's EAC trade advantages to increase regional market penetration.
4. Automate Supply Chain & Manufacturing
5. Seek Investment & Government Support: Public-private partnerships for incentives & subsidies to lower CAPEX burden.

CONFIDENTIAL 65

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

F. SUPPLY CHAIN AND RAW MATERIAL SOURCING

The supply chain must ensure a steady supply of raw materials, efficient production, strict quality control, and seamless distribution, while mitigating risks associated with logistics, regulatory compliance, and market fluctuations.

1. Key Components of the Supply Chain

A robust supply chain for a Sunshine company shall include the following key components:

1. Raw Material Sourcing (APIs, Excipients, Packaging Materials)
2. Inventory & Warehousing
3. Production & Manufacturing
4. Quality Control & Regulatory Compliance
5. Cold Chain & Storage (For Vaccines & Biosimilars)
6. Distribution & Logistics
7. Risk Management & Supply Chain Resilience

2. Raw Material Sourcing Strategy

2.1 Active Pharmaceutical Ingredients (APIs) and Excipients

Uganda does not have a strong domestic API production base, so APIs must be imported.

- Primary API sourcing regions:

- o India & China – Major global API suppliers.

- o Europe (Germany, Switzerland, Italy) – High-quality APIs for oncology & biosimilars.

CONFIDENTIAL 66

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- o Africa (South Africa, Egypt, Morocco) – Growing pharmaceutical hubs for APIs.

- Procurement Strategy:

- o Develop multiple supplier relationships to reduce dependency on a single country.

- o Use long-term contracts & Just-in-Time (JIT) supply models for high-cost APIs.

- o Maintain buffer stock of critical APIs (especially for oncology & vaccines).

2.2 Packaging Materials

- Primary packaging: Blister packs, vials, ampoules, pre-filled syringes, HDPE bottles.

- Secondary packaging: Cartons, labels, package inserts.

- Suppliers: Kenya, India, UAE, Turkey, and South Africa.

2.3 Supply Chain for Biologics (Vaccines & Biosimilars)

- Requires specialized cold chain logistics (-80°C for some biologics).

- Partnerships with international biotech firms for technology transfer.

- Cold storage facilities at airports & major distribution hubs.

3. Inventory & Warehousing Management

3.1 Raw Material Storage

- Separate storage for APIs, excipients, and packaging materials.
- Cold storage for temperature-sensitive raw materials.
- Real-time inventory tracking system (ERP-based).

CONFIDENTIAL 67

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

3.2 Finished Goods Warehousing

- GMP-compliant warehouses with segregated storage for different product categories.
- First-Expiry-First-Out (FEFO) system for batch management.
- Strategic warehouse locations in Uganda and EAC countries for faster distribution.

4. Production & Manufacturing Workflow

4.1 Manufacturing Planning & Scheduling

- Lean Manufacturing to reduce waste and optimize production costs.
- Batch Manufacturing Record (BMR) & Batch Production Record (BPR) compliance.

4.2 Facility Layout & Integration with Supply Chain

- Segregated production lines for oncology, OSD, syrups, vaccines, and biosimilars.
- Integrated Manufacturing Execution Systems (MES) for real-time monitoring.
- Automated raw material dispensing & production tracking.

5. Quality Control & Regulatory Compliance

- Stringent QC checks for APIs, excipients, and packaging materials.
- Real-time product traceability using barcoding & serialization.
- Compliance with WHO-GMP, EAC regulatory frameworks, US FDA, EMA.
- Regular audits of suppliers & third-party logistics providers.

CONFIDENTIAL 68

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

6. Cold Chain & Storage for Vaccines & Biosimilars

- Cold storage at 2-8°C, -20°C, and -80°C.
- Real-time temperature monitoring
- Strategic cold chain hubs in Kampala & EAC export markets.

7. Distribution & Logistics Strategy

7.1 Domestic Distribution (Uganda)

- Direct distribution to hospitals, pharmacies, and wholesalers.
- Regional distribution centres in Kampala, Entebbe, Jinja, and Mbarara.
- GPS-tracked delivery fleet with route optimization for last-mile delivery.

7.2 East African Community (EAC) Export Strategy

- Key export markets: Kenya, Tanzania, Rwanda, Burundi, South Sudan, DRC.
- Regulatory harmonization under the EAC-MRH program for seamless cross-border approvals.

- Dedicated pharmaceutical logistics hubs in Nairobi (Kenya) & Dar es Salaam (Tanzania).

7.3 International Exports

- Oncology & biosimilars exports to high-value markets in Europe & Middle East.
- Collaboration with global pharmaceutical distributors.

8. Risk Management & Supply Chain Resilience

CONFIDENTIAL 69
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

8.1 Key Risks in the Supply Chain

- Dependency on imported APIs → Risk of supply chain disruptions.
- Regulatory delays → Impact on product approvals & market entry.
- Cold chain failures → Risk for vaccines & biologics.
- Political & economic instability in Uganda & EAC → Disruptions in logistics.

8.2 Risk Mitigation Strategies

- Dual sourcing strategy for APIs & critical raw materials.
- Investment in API manufacturing in Uganda (long-term goal).
- Use of digital supply chain solutions (AI-driven demand forecasting).
- Collaboration with global logistics providers (DHL, UPS, local 3PLs).

9. Digital Transformation in Supply Chain Management

9.1 AI Based Monitoring

- AI-based demand forecasting to optimize inventory levels.

CONFIDENTIAL 70
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

Cost of Maintaining a Robust Pharmaceutical Supply Chain in Uganda
1. Key Cost Components of a Pharmaceutical Supply Chain

Cost Component
Raw Material & API Procurement
Packaging Material Costs
Warehousing & Cold Storage
Manufacturing & Production Logistics
Quality Control & Compliance
Cold Chain Infrastructure (Vaccines & Biologics)
Distribution & Last-Mile Delivery
IT, AI, and Digital Supply Chain Systems
Risk Management & Contingency Planning
Regulatory Compliance & Audits

Note: The cost varies depending on production scale, market reach, automation levels, and regulatory requirements.

2. Breakdown of Major Cost Elements

2.1 Raw Material & API Procurement Costs

- APIs account for 60%-80% of drug production costs, particularly for oncology & biologics.
- Uganda imports most APIs from India, China, and Europe, incurring import duties & logistics expenses.
- Cost fluctuations due to supply chain disruptions, geopolitical tensions, and regulatory constraints.
- Mitigation: Multi-supplier agreements & local API production investments.

CONFIDENTIAL 71
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

2.2 Packaging Material Costs

- Primary packaging (blister packs, vials, ampoules, prefilled syringes) is imported or locally sourced.

- Secondary packaging (cartons, labels, inserts) needs compliance with international standards (e.g., serialization, barcoding).

- Sustainable & eco-friendly packaging costs 10%-15% more but enhances regulatory acceptance.

2.3 Warehousing & Cold Storage

- Cold storage for vaccines & biosimilars (-80°C to 2-8°C) incurs high energy & maintenance costs.

- Storage facilities in Kampala & regional hubs (e.g., Jinja, Mbarara) require advanced temperature monitoring.

2.4 Manufacturing & Production Logistics

- Includes the cost of transporting raw materials, managing production scheduling, and handling batch-to-batch variations.

- Biologics and vaccines require specialized production environments, increasing utility & maintenance costs.

2.5 Quality Control & Compliance

- Regulatory costs include GMP audits and licensing fees.

- Maintaining high-end analytical labs for testing APIs, excipients, and final products.

- Oncology & biosimilar testing requires more stringent & expensive analytical processes.

CONFIDENTIAL 72

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

2.6 Cold Chain Infrastructure for Vaccines & Biologics

- Ultra-low temperature storage (-80°C) for certain biologics.

- GPS-tracked refrigerated trucks for secure transportation.

- Backup power systems to ensure uninterrupted temperature control.

2.7 Distribution & Last-Mile Delivery

- Cross-border regulatory compliance costs (for EAC markets).

- Investment in regional distribution hubs (e.g., Nairobi, Dar es Salaam).

- High-security transportation for oncology drugs to prevent theft.

2.8 IT & Digital Supply Chain Systems

- Track-and-trace systems to prevent counterfeit drugs.

- Automated inventory management to reduce wastage & improve efficiency.

2.9 Risk Management & Contingency Planning

- Emergency stockpiling of critical APIs & biologics.

- Alternative supply routes & backup logistics partners.

- Investment in local API production to reduce import dependency.

2.10 Regulatory Compliance & Audits

- WHO-GMP certifications for global market access.

- Annual site inspections & compliance renewals.

- Investment in training & capacity building for regulatory teams.

3. Cost Optimization Strategies

A. Local API & Packaging Manufacturing Investment

CONFIDENTIAL 73

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- Reduce import costs by establishing API & packaging material production in Uganda.

- Collaboration with African pharmaceutical hubs (South Africa, Egypt, Morocco).

B. Multi-Supplier & Regional Sourcing Strategy

- Reduce risk by sourcing APIs from multiple suppliers.
- EAC regional integration to reduce cross-border tariffs & logistics delays.

C. Green Energy & Sustainability Investments

- Solar-powered cold storage to cut energy costs by 30-40%.
- Eco-friendly packaging to reduce regulatory risks & enhance marketability.

CONFIDENTIAL 74

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

G. HUMAN RESOURCES

In this project below listed facilities/blocks are planned to be constructed:

1. Oral Solid Dosage (OSD) Facility (Capacity Production of 15 million units/day (tablets, capsules, and syrups).

2. Biopharma Drug Product Facility (Capacity: Specialized for monoclonal antibodies, hormones, and insulin analogs)

3. Vaccine Formulation and Fill- Finish Facility (50 Million doses per annum)

4. Oncology OSD Facility

5. Injectable Facility (Capacity: High-speed filling lines for vials, ampoules, and pre-filled syringes)

Number of employees with different skill set shall be employed for all above mentioned facilities.

CONFIDENTIAL 75

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

i) Hiring of employees with skill sets and expertise:

It is important to have healthy employees with aseptic skills especially in manufacturing units to avoid any contamination during manufacturing of drug products.

Separate organograms are prepared for engineering, corporate, HR & administration, warehouse, Quality (QC & QA) and manufacturing units to hire sufficient and effective workforce considering cost effectiveness.

CONFIDENTIAL 76

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

Details of Organograms:

- Corporate -Employees with managerial skills, project skills and leadership skills etc. will be hired in corporate for different levels like CEO, Head of engineering, Head of operations/manufacturing, project manager, Head of quality, Head of finance, Head of logistics and Head of HR. Managers and group leaders from each section will be managed/lead by corporate Heads.
- Engineering -In engineering section, employees with skills like automation, instrumentation including complicated manufacturing equipment, electrical, mechanical, utilities (Water, steam, Air) and information technology will be hired at different levels.
- HR & Administration -In HR & admin section, employees with skills to handle transport, canteen, legal challenges like pollution control, employee act and licensing application and renewal etc., recruitment and day to day management of contractual / fixed employees, employee wellness, medical facility and general management of BMS like furniture, rest rooms, and external vendors for admin support will be hired.
- Warehouse -In warehouse section, skills to ensure the safe, efficient, and compliant movement of materials and products is required. It includes logistics management skills. Knowledge of inventory management using software like SAP or ERP, document and material management is essential in warehouse.
- Quality Unit -Quality (Quality control and Quality assurance) is critical

to ensuring the safety, efficacy, and compliance of drug products. In

CONFIDENTIAL 77

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

QC, testing skills, knowledge of GLP, Data analysis and sample management are essential skills. In QA, Process validation and control, regulatory compliance, Risk Management, Documentation, Audits and inspection skills, Change management and trainings are essential skills.

- Manufacturing -In manufacturing, knowledge of GMP, operation of complicated/automated equipment or system, knowledge of process and aseptic behaviour/environment, documentation and technical skills for problem solving in day-to-day process are crucial skills.

- ii) Health, Safety standards for Human Resource working in Pharmaceuticals:

For biopharmaceutical projects, regular medical check-up including tests like eyesight, audiometry, blood test, breathing test, X-Ray, ECG and basic tests; at-least annually for all employees is essential.

Key aspects in HR feasibility

- Workforce Availability

Over the course of the last decade, Uganda's economic growth has ranked among sub-Saharan Africa's strongest; indeed, the country's annualized average growth rate was 5.4% between 2010 and 2019 (World Bank, 2020).

Uganda has a young and growing workforce, with over 75% of its population under the age of 30.

Total population: Approx. 51 million (2025 estimates)

- Cost of Human Resources

CONFIDENTIAL 78

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

In Uganda, employee salaries are relatively low, but there are also some differences. For example, in the capital city of Kampala, the monthly salary of an ordinary employee is usually between 100-200USD. In other cities, this number may be even lower. The salary level will be higher for senior management and technical talents.

Average monthly salaries (estimates):

- o Unskilled worker: \$100–\$200

- o Mid-level professional: \$500–\$1,500

- o High-skilled/managerial: \$2,000+

- Legal and Compliance Factors

Key employment laws:

- o Employment Act (2006): Governs employment terms, termination, wages, and working conditions.

- o Occupational Safety and Health Act (2006): Ensures workplace safety.

- o Workers' Compensation Act (2000): Covers workplace injury compensation.

Uganda's labour laws are primarily governed by the Employment Act of 2006, which establishes the minimum standards of employment in the country.

Uganda is committed to upholding international labour standards and has ratified several key International Labour Organization (ILO)

Conventions. These include the Freedom of Association and Protection of the Right to Organize Convention, 1948 (No. 87), the

CONFIDENTIAL 79

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

Right to Organise and Collective Bargaining Convention, 1949 (No. 98), and the Collective Bargaining Convention, 1981 (No. 154).

The Uganda Employment Act applies to all employees, irrespective of nationality that the employers hire under the service contract.

- o According to the employment act 2006 and labour laws in Uganda, the standard working hours of an employee is a maximum of eight hours per day and 48 hours a week; excluding lunch and worship time.

Employers planning to hire or relocate international employees to Uganda must understand the processes surrounding work permits and visas. Ensuring compliance with Ugandan immigration laws helps streamline the hiring process and avoid potential legal hurdles.

- Cultural and Language Considerations

Ugandan communication often leans towards indirectness, especially when delivering negative feedback or expressing disagreement.

Cultural Lens: The Ugandan concept of "Gwasi" (shame) discourages public criticism. This can influence communication, leading individuals to deliver critical messages indirectly to avoid causing shame to the recipient.

Uganda is a multilingual nation like many African countries. However, English is targeted as a medium of instruction and language of examination.

H. RISK ASSESSMENT
Risk Assessment and Mitigation Strategies for Sunshine Plant in Uganda

1. Political Risks and Mitigation Strategies

Uganda, like many developing economies, has political uncertainties that can affect business operations. These include regulatory changes, policy instability, and geopolitical factors.

1.1 Key Political Risks

Table No.:17

Risk Factor	Potential Impact
Changes in pharmaceutical laws, taxation, or Regulatory licensing requirements could delay operations or Uncertainty increase compliance costs.	
Government Policy Import/export restrictions, price controls, or changes Shifts in incentives may affect profitability.	
Lengthy approvals for manufacturing licenses, Bureaucratic Delays product registrations, and environmental permits may slow down market entry.	
Conflicts or tensions in neighbouring East African Geopolitical Instability Community (EAC) countries could disrupt supply in EAC Region chains and exports.	
Intellectual Property & Weak enforcement of patents and trademarks may Patent Protection lead to counterfeiting risks.	

1.2 Risk Mitigation Strategies

I. Early Engagement with Regulators:

- Work closely with Uganda’s National Drug Authority (NDA) and the Ministry of Health to ensure timely approvals.
- Seek WHO-GMP certification for global market access.

II. Public-Private Partnerships (PPP):

- Collaborate with government bodies to access tax benefits, incentives, and investment protection.

III. Diversification of Export Markets:

- Establish trade links with EAC, COMESA, and beyond to reduce dependence on a single market.

IV. Strengthening IP Protection:

- Register patents and trademarks regionally through ARIPO (African Regional Intellectual Property Organization) to safeguard innovations.

2. Economic Risks and Mitigation Strategies

Economic instability can impact capital investment, supply chain costs, and market demand for pharmaceutical products.

2.1 Key Economic Risks

Table No.:18

Risk Factor	Potential Impact
Exchange rate volatility can increase the cost of Currency Fluctuations imported raw materials (APIs, excipients, packaging materials).	
Inflation & Rising High inflation may lead to increased costs for labor, Operational Costs utilities, and raw materials.	
Supply Chain Dependence on international suppliers for APIs and Disruptions critical components could lead to shortages.	
Limited Access to High-interest rates and limited government Affordable Financing incentives can make project financing costly.	
Market Demand & Price-sensitive consumers and limited insurance Price Sensitivity coverage may affect product affordability.	

2.2 Risk Mitigation Strategies

- Localizing API Sourcing:
 - Develop partnerships with regional API manufacturers to reduce reliance on imports and mitigate forex risks.
- Hedging Against Currency Risks:
 - Utilize foreign exchange hedging instruments to stabilize procurement costs.
 - Maintain a mix of local and foreign currency reserves for operational expenses.
- Operational Cost Optimization:
 - Implement energy-efficient manufacturing to reduce electricity costs.
 - Automate production processes to minimize labour costs.

CONFIDENTIAL 83
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- Strategic Supplier Agreements:
 - Enter long-term contracts with multiple suppliers for key raw materials to ensure supply chain resilience.
- Diversifying Revenue Streams:
 - Expand into high-margin segments (oncology, vaccines, biosimilar).
 - Target institutional buyers like the government, NGOs, and international health organizations (e.g., GAVI, WHO, Global Fund).

3. Environmental Risks and Mitigation Strategies

Uganda has stringent environmental regulations for pharmaceutical manufacturing, including waste management, water usage, and emissions control. Non-compliance can lead to fines, production shutdowns, or reputational damage.

3.1 Key Environmental Risks

Table No.:19

Risk Factor	Potential Impact
High water demand for manufacturing and cooling	
Water Scarcity	may lead to shortages, increasing operational costs.
Waste Disposal	Improper disposal of hazardous waste (solvents, Challenges API residues) can lead to environmental penalties.
Energy Dependence	High electricity costs and unreliable grid supply on Non-Renewables may lead to production disruptions.
Climate Change	Increased heat and erratic rainfall could impact Effects cooling systems and energy consumption.
Failure to meet Uganda's National Environment Regulatory Non-Management Authority (NEMA) regulations	can lead Compliance to legal actions.

CONFIDENTIAL 84
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

3.2 Risk Mitigation Strategies

- Sustainable Water Management:
 - Implement water recycling & rainwater harvesting systems to reduce dependence on municipal supplies.
 - Use high-efficiency Clean-in-Place (CIP) systems to minimize water wastage.
- Advanced Waste Treatment Solutions:
 - Install Zero Liquid Discharge (ZLD) systems for pharmaceutical effluent treatment.
 - Set up on-site hazardous waste incinerators to manage cytotoxic and biological waste safely.
- Renewable Energy Integration:
 - Solar power installations on-site to reduce dependency on the national grid.
 - Waste heat recovery systems to improve energy efficiency.
- Green Manufacturing Practices:

- Obtain ISO 14001 Environmental Certification to align with international best practices.
- Conduct regular environmental audits to ensure compliance with NEMA standards.

CONFIDENTIAL 85
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

4. Summary of Risk Mitigation Strategies

Table No.:20

Risk Category	Key Risks	Mitigation Strategies
Regulatory	Regulatory uncertainty	Engage early with regulators, form public-private partnerships, shifts diversify export markets
Political	Risks bureaucracy	
Currency	fluctuations	Hedge currency risks, optimize
Economic	inflation, financing	operational costs, diversify
Risks	challenges revenue streams	
Water	scarcity, waste	Implement sustainable waste
Environmental	disposal, high energy	management, use renewable
Risks	costs energy	optimize water usage

5. Conclusion

While setting up a pharmaceutical manufacturing plant in Uganda presents political, economic, and environmental risks, these can be effectively managed through strategic planning and proactive mitigation measures.

CONFIDENTIAL 86
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

I. SUSTAINABILITY

1. Sustainable Waste Management Strategies

Sunshine facility shall generate solid, liquid, and hazardous waste that must be effectively managed to comply with environmental regulations and protect ecosystems.

1.1 Segregation and Recycling of Solid Waste

- Implement waste segregation at the source to separate biodegradable, non-biodegradable, recyclable, and hazardous waste.
- Recycle packaging materials like paper, plastics, and aluminium foils used in blister packs.
- Partner with certified waste management companies to handle non-recyclable hazardous waste.

1.2 Efficient Handling of Hazardous Waste

- Incinerate cytotoxic oncology waste and contaminated biological waste in high-temperature incinerators (above 850°C).
- Use autoclaves and chemical disinfection for microbiological and vaccine-related waste.
- Adopt encapsulation techniques for disposing of highly toxic chemicals and APIs safely.

1.3 Effluent Treatment and Liquid Waste Management

- Install an Effluent Treatment Plant (ETP) and Zero Liquid Discharge (ZLD) system to ensure wastewater treatment before discharge.
- Implement reverse osmosis (RO) and advanced oxidation processes to remove pharmaceutical residues.
- Reuse treated water for landscaping, cooling systems, and non-potable applications.

CONFIDENTIAL 87
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

1.4 Minimization of API & Solvent Waste

- Implement solvent recovery units to recycle and reuse solvents in oncology and biopharma production.
- Adopt green chemistry techniques to minimize hazardous waste production.
- Optimize batch sizes and manufacturing processes to reduce raw material waste.

2. Energy Efficiency Strategies

Energy consumption will be a significant operational cost in pharmaceutical manufacturing. A sustainable energy plan shall ensure cost reduction and

reduced carbon footprint.

2.1 Integration of Renewable Energy Sources

- Solar Power Installation:
 - o Install solar panels on rooftops to supplement grid electricity and reduce dependence on fossil fuels.
 - o Target at least 30-50% energy from solar for non-critical operations.
- Biomass & Biogas Utilization:
 - o Utilize biomass boilers for steam generation using agricultural waste.
 - o Install a biogas plant to convert organic waste into energy.

2.2 Energy-Efficient HVAC & Cooling Systems

- Use energy-efficient HVAC systems with variable frequency drives (VFDs) to optimize airflow and minimize energy wastage.
- Implement cold chain optimization for vaccines and biopharma products, including energy-efficient refrigeration and insulation systems.
- Utilize waste heat recovery systems to capture and reuse excess heat from industrial processes.

CONFIDENTIAL 88
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

2.3 Smart Lighting and Equipment Optimization

- Install LED lighting with motion sensors to reduce power consumption in low-traffic areas.
- Use high-efficiency motors and compressors in production lines to reduce energy waste.
- Implement real-time energy monitoring systems to track and optimize energy use.

3. Water Conservation and Efficient Usage

Pharmaceutical production requires significant water usage for cooling, formulation, and cleaning processes. Water scarcity in Uganda makes conservation and recycling essential.

3.1 Water Recycling & Reuse

- Install Water Treatment Plants (WTPs) with multi-stage filtration, RO, and UV disinfection to reuse wastewater.
- Recycle treated wastewater for boilers, chillers, and non-potable cleaning processes.

3.2 Rainwater Harvesting

- Set up rainwater harvesting tanks to collect and store rainwater for non-production use.
- Utilize rainwater for landscaping, cooling towers, and toilet flushing.

3.3 Optimized Process Water Usage

- Implement Clean-in-Place (CIP) and Sterilize-in-Place (SIP) systems to reduce water usage in equipment cleaning.
- Use dry cleaning methods where possible to minimize the need for extensive water washing.
- Train staff on water conservation best practices to minimize waste.

CONFIDENTIAL 89
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

4. Regulatory Compliance & Green Certifications

- WHO-GMP & EAC Environmental Regulations: Ensure compliance with local and international environmental guidelines.
- ISO 14001 Certification: Implement environmental management systems to enhance sustainability.
- LEED Certification: Design facilities with sustainable building materials to meet green building standards.

5. Conclusion

Sunshine shall require integrated waste management, energy-efficient operations, and water conservation measures. By adopting renewable energy, recycling waste, and optimizing resource usage, this facility can achieve long-term environmental and economic benefits while maintaining regulatory compliance and corporate social responsibility.

CONFIDENTIAL 90
UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

J. Key HR Challenges and mitigation strategies

1. Skilled Workforce Shortage

- Limited local experience in advanced pharmaceutical manufacturing (especially GMP-compliant operations for vaccines, oncology, and monoclonal antibodies).
- Shortage of experienced quality assurance (QA), quality control (QC), production, validation, and biotech-specific personnel.

2. Training and Capability Gaps

- Need for training in WHO-GMP and global standards.
- Low exposure to advanced equipment and automation technologies common in global pharma plants.

3. High Attrition or Brain Drain

- Trained personnel may be poached by competitors or seek jobs abroad due to better salaries.

4. Cultural & Communication Barriers

- Integration challenges when blending expat professionals with local teams in managerial and technical roles.

Mitigation & Risk Management Strategies

1. Early & Strategic Workforce Planning

- Workforce demand mapping: Identify headcount, roles, and experience levels required for each production phase.
- Staggered hiring aligned with the commissioning of each production unit.

2. Establish a Technical Training Academy

- Set up an in-house Pharma Training Institute or Centre of Excellence.

CONFIDENTIAL 91

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- Partner with international experts to develop GMP, EHS, and regulatory curricula.
- Simulate manufacturing environments (cleanrooms, QC labs, aseptic suites).

The training program shall constitute of the following aspects

- a. Induction of new employees
- b. cGMP training
- c. GLP training
- d. On the job training consisting of SOP training, equipment training etc.,
- e. Safety training
- f. Supervisor training
- g. Manager training
- h. Job change training or after leave of absence
- i. Remedial training
- j. Contractor employee training

3. International Partnerships

- Collaborate with Indian, European, or South African pharma companies or universities for knowledge transfer.
- Consider short-term expat secondments (2–5 years) to build and mentor local teams.

4. Collaboration with Local Academia

- Tie up with Makerere University or other local institutions for:
 - o Curricula alignment with pharma needs.
 - o Internship/apprenticeship programs.
 - o Fast-tracking diploma and B.Pharm graduates into technical roles.

5. Talent Retention Schemes

- Offer competitive packages, training sponsorships, and bonded contracts.

CONFIDENTIAL 92

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- Career development pathways for technicians to move into supervisory or QA roles.
- Stock options or profit-sharing models to retain senior staff.

6. Outsource Non-Core Activities Initially

- To reduce early HR load, consider outsourcing packaging, engineering maintenance, and logistics until local capacity matures.

7. Human Resources Rollout Roadmap

Phase-Wise HR Rollout Plan (2025–2030)

Phase 1: Planning & Initial Setup (2025)

- Workforce Planning: Finalize detailed manpower requirement for each functional block (production, QA/QC, engineering, admin, etc.).
- Key Roles: Project HR Head, Talent Acquisition Manager, Training & Compliance Manager
- Action Points:
 - o Begin local hiring process for support staff, documentation personnel
 - o Initiate expat hiring for plant design, validation, and commissioning oversight
 - o Establish HR policies, on-boarding modules, payroll systems

Phase 2: OSD & Syrup Commissioning (2026)

- Estimated Staff Requirement: (As per Table No 16)
- Key Functions: Production operators, QA/QC analysts, warehouse team
- Action Points:
 - o Launch training academy in partnership with local universities (Makerere, Mbarara, etc.)
 - o Train local hires in GMP compliance, SOP writing, and safety protocols

CONFIDENTIAL 93

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- o Expat engineers and QA managers to lead operations and mentor local staff

Phase 3: Oncology & Injectable Line Setup (2027)

- Estimated Staff Requirement: +- (As per Table No 16)
- Key Functions: Cytotoxic handling experts, sterile Injectables line operators, QC microbiology
- Action Points:
 - o Specialized cytotoxic/Hormonal handling training
 - o Safety and containment procedure modules
 - o Expand academy offerings to include aseptic processing and EHS protocols

Phase 4: Vaccine & Biopharma Commissioning (2028)

- Estimated Staff Requirement: -(As per Table No 16)
- Key Functions: Biotech fill-finish experts, cold chain QA/QC
- Action Points:
 - o Partner with international biotech training programs (India, EU)
 - o Establish a biotechnology learning track in the internal academy

Phase 5: Operations Stabilization & Local Leadership Development (2029–2030)

- Target Workforce: 1,000+ including indirect employees
- Focus Areas: Succession planning, reducing dependency on expats
- Action Points:
 - o Develop career growth ladders for technicians and supervisors
 - o Launch Leadership Development Programs (LDP) for Ugandan managers
 - o Retention strategy implementation (bonuses, ESOPs, continuous training)

CONFIDENTIAL 94

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

Training Strategy Summary

- In-House Pharma Academy to train employees per year
- Modules in:
 - o GMP & regulatory compliance
 - o Pharmaceutical operations (OSD/liquid/injectable/Oncology)
 - o Aseptic techniques
 - o Equipment maintenance & calibration
- Training Partners: Local academia + global consultants

Risk Mitigation Measures

- Challenge: Limited experienced pharma talent pool

- o Solution: Layered expat hiring, internal academy, local university tie-ups
- Challenge: Attrition post-training
- o Solution: Bonded employment, career development programs, competitive pay
- Challenge: Cultural integration
- o Solution: Cross-cultural workshops, expat-local mentorship structure

CONFIDENTIAL 95

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

K. STRATEGIES FOR ACCELERATED ROI ON THE PROJECT

1. Phased Commissioning of Production Lines

- Start with OSD and syrups, which have lower regulatory complexity and shorter setup timelines.
- These can begin generating revenue within 12–18 months, while more complex lines (biopharma, oncology, vaccines) are still under validation.
- Helps spread OPEX and initiates early cash flow.

2. Prioritize Products with High Local and Regional Demand

- Focus on essential medicines, high-burden diseases (malaria, diabetes, antibiotics), and therapeutic areas like oncology and vaccines with unmet needs.
- Customize the portfolio to include WHO-prequalified and procurement-friendly products for faster uptake by public health programs.

3. Partner with Global Health Buyers Early

- Engage with donor agencies (Global Fund, GAVI, WHO, USAID) to position your facility as a local supplier.
- Secure advance purchase agreements (APAs) or long-term supply contracts, even during construction phase.
- These contracts anchor demand and improve investor confidence.

4. Leverage Contract Manufacturing (CDMO) for Revenue Boost

- Offer your excess capacity for contract manufacturing of OSD, fill-finish, or vaccine products for regional or global pharma firms.
- Acts as a bridge revenue stream before full-scale launch of your branded portfolio.

5. Accelerate Regulatory Approvals through EAC Harmonization

- Register products using the EAC Medicines Regulatory Harmonization (MRH) program to access multiple countries simultaneously.

CONFIDENTIAL 96

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- Cuts down duplicated efforts and approval timelines, speeding up market entry.

6. Optimize Operational Costs from Day 1

- Invest in energy-efficient infrastructure (solar, efficient HVAC) and automation to lower long-term utility and labor costs.
- Design supply chain to minimize storage and transportation overhead.

7. Use a Hybrid Distribution Model

- Combine direct-to-hospital/clinic distribution with national wholesalers and tenders.
- Reduces reliance on a single sales channel and speeds up product uptake across multiple segments.

8. Government Incentives and Tax Planning

- Take full advantage of government incentives, including VAT deferments, customs waivers, tax holidays, and utility subsidies.
- Negotiate land lease concessions or reduced utility tariffs to reduce fixed overheads.

9. Continuous Financial Monitoring

- Set up a Project Management Office (PMO) and cash burn tracking system to detect cost overruns early.
- Implement strict working capital control (inventory turnover, receivables) during operations to stay lean.

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

L. SWOT ANALYSIS

Strengths

1. Robust Financial Backing
 - o The promoters' strong financial background ensures ample capital availability for high-tech manufacturing infrastructure, reducing financing risks.
 - o USD 530 million CAPEX provides a solid foundation for a state-of-the-art facility with capacity for future expansion.
2. Strategic Product Portfolio
 - o Manufacturing a diverse mix of high-demand therapeutics—from essential OSDs and syrups to complex oncology drugs, vaccines, and biosimilars—positions the company to address both local and regional health needs.

- o Biosimilars and oncology injectables offer high-margin opportunities with increasing global and regional demand.
- 3. Location Advantage – Uganda & EAC Access
 - o Uganda provides duty-free access to the East African Community (EAC), reducing export barriers and expanding market reach.
 - o Strategic geographic location in Central-East Africa allows access to under-served pharmaceutical markets in South Sudan, Rwanda, Burundi, DRC, etc.
- 4. Modern Infrastructure and Technology Potential
 - o Opportunity to design a greenfield facility aligned with WHO-GMP, EMA, and USFDA standards from the outset.
 - o Flexibility to incorporate cutting-edge technologies (e.g., continuous manufacturing, single-use systems for biologics).

CONFIDENTIAL 100

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

Weaknesses

1. Lack of Pharmaceutical Domain Experience

- The promoters' background in infrastructure, while valuable in construction and logistics, does not directly translate to the complex and highly regulated pharmaceutical industry.
- Manufacturing pharmaceuticals—especially oncology, vaccines, and biosimilars—requires deep expertise in GMP compliance, validation protocols, aseptic processing, and regulatory science.
- Without experienced pharma leadership, there is a risk of non-compliance, production inefficiencies, or market entry delays.
- Mitigation: Early recruitment of experienced pharma professionals and regulatory consultants is critical, as is establishing a governance board with pharma advisors.

2. High Dependence on Imports for APIs, Equipment & Components

- Uganda lacks a strong API and excipient manufacturing ecosystem, so nearly all critical raw materials, consumables, and equipment must be imported—mainly from India, China, or Europe.
- This increases lead times, procurement costs, customs complexities, and exposure to global supply chain disruptions.
- Biopharma and vaccine components (e.g., single-use systems, cold-chain logistics, cell lines) are even more sensitive to supply delays.

3. Skills and Talent Gap in Local Workforce

- Uganda's pharmaceutical industry is still developing, with limited availability of skilled technicians, validation engineers, QC analysts, and GMP-trained production staff, especially in sterile manufacturing or biotech.
- Over-dependence on expats may drive up costs and hinder the development of sustainable local capability.
- Cultural integration, language, and training gaps can affect productivity and retention if not addressed proactively.

CONFIDENTIAL 101

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

4. High Operating Costs for Complex Products

- Oncology, vaccines, and bio-similars require sophisticated cleanroom environments, cold chain management, and batch-specific quality testing.
- Maintaining aseptic conditions, HVAC, water systems (PW/WFI), and validation for multiple production lines significantly increases OPEX.
- There is also an increased risk of batch failures, which can result in high rework or discard costs—especially in biologics.

Opportunities

1. Growing Demand in Uganda and EAC for Quality Medicines

- The East African Community (EAC) is home to over 280 million people with growing health burdens like cancer, diabetes, infectious diseases, and vaccine-preventable illnesses.
- There's high demand for affordable, high-quality generics, bio-similars, and essential vaccines.
- Current reliance on imports from India, Europe, and China creates a gap for trusted local manufacturers with faster market responsiveness and cost advantages.

2. Support from Government and International Health Agencies

- Uganda and other EAC governments are actively promoting local manufacturing through:
 - o Tax breaks, incentives, and infrastructure subsidies.
 - o Potential fast-track approvals for local production of priority medicines.

- Global health organizations like Gavi, WHO, UNICEF, Global Fund, and African CDC are eager to support African-based production, especially for vaccines and pandemic preparedness.
- This creates opportunities for donor-funded procurement, technology transfer, and concessional financing.

CONFIDENTIAL 102

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

3. Regional Regulatory Harmonization (EAC-MRH)

- The EAC's Medicines Regulatory Harmonization initiative reduces the complexity and time for market entry across multiple countries.
- A product registered under EAC-MRH can be fast-tracked for approval in all EAC member states, expanding your potential market and improving return on investment (ROI).

4. First-Mover Advantage in Advanced Therapies

- There are very few players in the region manufacturing oncology products, bio-similars, or vaccines. A well-executed entry into these segments provides:
 - o High-margin sales.
 - o Competitive edge due to regulatory barriers that deter others from entering.
 - o Leverage to license or co-develop products with international partners.

5. Greenfield Facility – Built for Future-Ready Compliance

- Starting from scratch allows for:
 - o State-of-the-art modular facility design that meets WHO-GMP and global requirements from day one.
 - o Scalability—facilities can be expanded based on market growth or strategic partnerships.
 - o Integration of renewable energy systems, automation, which can lower long-term operating costs and improve environmental credentials.

6. Technology Transfer and Global Collaborations

- Many mid-sized Western and Asian pharma companies are seeking CDMO or joint venture partners in Africa to enter emerging markets.
- This facility, once validated and operational, can be positioned as a fill-finish hub or contract manufacturing site for such companies—especially for vaccines and biologics.

CONFIDENTIAL 103

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

Threats

1. Regulatory and Compliance Challenges

- o Ensuring continuous compliance with WHO-GMP, NEMA (Ugandan environmental laws), NDA, and other international standards requires highly skilled QA/QC teams and constant oversight.

2. Geopolitical and Trade Instability

- o Political tensions, conflicts in neighbouring countries, or disruptions in trade routes could hamper logistics, exports, or sourcing of raw materials.

3. Currency Fluctuations and Import Dependency

- o Heavy reliance on imports for APIs and machinery subjects the plant to foreign exchange risks, especially if the Ugandan Shilling depreciates.

4. Intensifying Global Competition

- o Global pharmaceutical companies and Indian manufacturers could enter the region with cheaper generic drugs, impacting price competitiveness.

5. Product-Specific Challenges

- o Biosimilars and vaccines involve complex regulatory pathways, high R&D costs, and the risk of batch failures or cold-chain disruptions.

6. Construction & Commissioning Delays

- Incomplete funding during the CAPEX phase can halt construction, delay procurement of equipment, and postpone validation activities.
- Pharmaceutical projects are highly sequential: civil work must be completed before HVAC installation, which precedes equipment commissioning, which in turn precedes qualification. A break at any point stalls everything.

CONFIDENTIAL 104

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

7. Regulatory Non-Compliance

- If the facility is only partially built or validated, it cannot obtain GMP licenses or product approvals.
- This puts the company in a no-revenue, high-burn position, severely affecting investor confidence and credibility.

8. Supply Chain Penalties

- Equipment vendors and raw material suppliers often work with milestone-based payments. Funding gaps can lead to order cancellations, higher renegotiated prices, or contractual penalties.
- Lead times in pharma are long, so any reordering due to lapsed payments causes multi-month delays.

9. Reputational Damage & Loss of Stakeholder Confidence

- Financial instability affects relationships with regulators, investors, banks, and potential customers (like international health agencies).
- Once perception of financial distress sets in, it is harder to secure bridge financing or partnerships.

Strategic Recommendations

- Hire pharma domain experts in key leadership roles: manufacturing, regulatory, quality assurance, and R&D.
- Form strategic alliances with experienced CDMOs or technology licensors for oncology and biosimilar lines.
- Invest in workforce development through partnerships with local universities and international training programs.
- Develop dual-source supply chain strategies and build regional sourcing capacity for packaging and excipients.
- Design for modular expansion, allowing scaling based on product demand and market growth.
- Pursue green certifications (LEED, ISO 14001) to attract ESG-aligned investors and NGOs.

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

M. SUMMARY AND RECOMMENDATIONS

This chapter synthesizes the key findings from the detailed feasibility study and outlines strategic recommendations to guide the implementation of the Sunshine Pharmaceutical Plant project in Uganda.

The analysis takes into account market dynamics, regulatory frameworks, technical and financial evaluations, supply chain logistics, and human resource considerations, all of which contribute to a comprehensive assessment of the project's viability.

Summary of Key Findings

Market Opportunity and Demand

The study confirms that Uganda's pharmaceutical market is experiencing robust growth driven by increasing demand for affordable, high-quality generics and specialized drugs, including oncology treatments and vaccines. With a projected market revenue reaching approximately US\$329 million in 2025 and a promising CAGR for both the domestic and broader East African markets, the opportunity to capture unmet demand is significant.

Regulatory and Technical Feasibility

Uganda's regulatory framework, led by the National Drug Authority (NDA), is increasingly aligned with international standards, including WHO-GMP guidelines. The regulatory environment supports local production through initiatives like "Buy Uganda, Build Uganda," while technical assessments underscore the availability of advanced manufacturing technologies. The proposed facility's phased approach—from Oral Solid Dosage forms to advanced biopharmaceutical and vaccine production—ensures scalability and adaptability to evolving market needs.

Financial Viability

The financial analysis demonstrates a strong investment proposition:

- CAPEX: The total investment is estimated at US\$529 million, strategically distributed across various manufacturing units.

CONFIDENTIAL 106

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- OPEX and Break-Even: Annual operational expenditures are projected at approximately US\$335 million, with break-even achieved within the first year due to efficient cost management and high contribution margins.
- ROI and Profitability: Projected ROI stands at around 28% by Year 3, with an IRR estimated between 18-22%, indicating a healthy profit

trajectory and the potential for cumulative returns exceeding 125% over five years.

Supply Chain and Human Resources

Robust supply chain strategies—including multi-sourcing of APIs, strategic partnerships for cold chain logistics, and digital monitoring systems—ensure resilience against market fluctuations and global disruptions. Additionally, the availability of a young, growing workforce in Uganda supports the project's operational requirements, with competitive labour costs and targeted skills development across manufacturing, quality control, and regulatory compliance.

Recommendations

1. Prioritize High-Margin Segments

Focus Areas:

- **Oncology Drugs:** Given the rising burden of cancer in Uganda and East Africa, investing in the production of generic chemotherapy drugs can capture an underserved market. These drugs not only command higher margins but also improve patient access to critical treatments.
- **Biologics and Vaccines:** The increasing demand for advanced therapies such as vaccines and biologics—including monoclonal antibodies and bio-similars—presents an opportunity to tap into segments with relatively lower competition and high value. The facility's phased approach, starting with Oral Solid Dosage forms and expanding into biopharmaceutical products, supports this focus.

CONFIDENTIAL 107

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

Rationale:

- **Market Trends:** The feasibility study highlights strong growth projections in these segments, driven by unmet healthcare needs and increasing government investments in healthcare infrastructure.
- **Financial Benefits:** High-margin products contribute significantly to profitability and help accelerate the return on investment (ROI). By emphasizing these areas, the project can achieve robust financial returns and capture a larger share of the regional market.

2. Optimize API and Raw Material Sourcing

Short-Term Strategy:

- **Leverage International Suppliers:** Initially, the project should secure long-term contracts with reputable API suppliers in India and China. This will help stabilize costs and ensure a reliable supply chain during the early phases of operation.

Long-Term Strategy:

- **Local Production Initiatives:** Explore opportunities for setting up local or regional API manufacturing facilities. This approach will not only reduce import dependency and associated logistics risks but also potentially lower production costs over time.
- **Diversification:** Develop a multi-sourcing strategy to mitigate risks associated with geopolitical tensions, supply chain disruptions, or fluctuations in raw material prices.

Rationale:

- **Cost Efficiency:** APIs represent a significant portion of production costs. Optimizing sourcing will directly impact overall operational efficiency and cost management.
- **Risk Mitigation:** Diversification and local production can shield the project from external market shocks and ensure continuity of operations.

CONFIDENTIAL 108

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

3. Invest in Advanced Technologies

Technology Implementation:

- **Automation and Digitalization:** Adoption of automated production lines, Manufacturing Execution Systems (MES), and IoT-based monitoring systems can streamline operations, reduce labour costs, and enhance precision.
- **Quality Control Systems:** Investment in advanced analytical testing equipment will support stringent quality assurance protocols. Digital systems also facilitate real-time data monitoring, which is critical for maintaining compliance with WHO-GMP standards.

Rationale:

- **Operational Efficiency:** Cutting-edge technology reduces the risk of human error, increases production speed, and improves overall product consistency.
- **Regulatory Compliance:** High-tech systems ensure that manufacturing processes meet international standards, making it easier to secure regulatory approvals and expand into export markets.
- **Scalability:** Advanced technologies support a phased production approach, allowing the facility to scale operations smoothly as market demand grows.

4. Enhance Strategic Collaborations

Collaboration Models:

- **Public-Private Partnerships (PPPs):** Engage with government agencies and international health organizations to secure financial incentives, regulatory support, and access to infrastructure such as Special Economic Zones (SEZs).
- **Industry Alliances:** Form strategic alliances with global pharmaceutical companies for technology transfer, joint ventures, or co-investment. This can accelerate the learning curve and enhance competitive positioning.

CONFIDENTIAL 109

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- **Local Partnerships:** Collaborate with local distributors, healthcare providers, and academic institutions to strengthen market access and foster innovation.

Rationale:

- **Regulatory and Financial Support:** Strategic partnerships can reduce upfront investment risks and expedite regulatory approvals.
- **Market Penetration:** Collaborations with established players can facilitate faster market entry, improve distribution networks, and expand customer reach.
- **Innovation:** Joint ventures and alliances can bring in new technological insights and operational expertise, enhancing the project's long-term viability.

5. Strengthen Supply Chain Resilience

Key Measures:

- **Robust Logistics Network:** Develop an integrated logistics system that includes reliable transportation, warehousing, and cold chain infrastructure. This is crucial for managing both raw materials and finished products, especially for temperature-sensitive biologics and vaccines.
- **Digital Supply Chain Solutions:** Implement demand forecasting and real-time inventory management systems to optimize supply chain operations and minimize waste.
- **Contingency Planning:** Establish dual sourcing strategies and maintain buffer stocks to mitigate the impact of any supply disruptions.

Rationale:

- **Efficiency and Reliability:** A resilient supply chain ensures that production processes are not interrupted by external factors, which is critical for meeting market demand consistently.
- **Cost Management:** Effective supply chain management reduces logistics costs and improves overall operational margins.

CONFIDENTIAL 110

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

- **Risk Mitigation:** Proactive risk management through diversification and advanced monitoring systems will safeguard the project against unforeseen disruptions.

6. Focus on Workforce Development

Workforce Strategy:

- **Training Programs:** Invest in specialized training and capacity-building initiatives to develop the technical, regulatory, and operational skills needed across various departments such as manufacturing, quality control, and engineering.
- **Talent Acquisition:** Attract skilled professionals by offering competitive remuneration packages and career development opportunities. This includes hiring experts with experience in high-containment manufacturing, digital automation, and international regulatory compliance.
- **Collaborations with Educational Institutions:** Forge partnerships with local universities and technical institutes to create a pipeline of

skilled labour tailored to the project's needs.

Rationale:

- **Operational Excellence:** A well-trained workforce is essential to maintain high standards of product quality, regulatory compliance, and overall operational efficiency.
- **Sustainability:** Continuous professional development not only improves immediate operational outcomes but also contributes to long-term sustainability by fostering innovation and adaptability.
- **Competitive Advantage:** Investing in human capital builds organizational strength and ensures that the facility remains competitive in an evolving market landscape.

CONFIDENTIAL 111

UNSHINE MEDICAL PTE. LTD - FEASIBILITY REPORT

BIOBRIDGE HEALTHCARE SOLUTIONS PVT. LTD

Conclusion

The comprehensive feasibility study strongly supports the viability of the Uganda Pharma Plant project. With favourable market conditions, a supportive regulatory framework, robust financial projections, and effective risk mitigation strategies, the project is not only feasible but poised for success. Strategic investments in technology, local partnerships, and human capital will further enhance the plant's competitive edge and contribute to sustainable economic growth in Uganda and the broader East African region.

In light of these findings, it is recommended that the project proceed as planned, with careful attention to the outlined recommendations to ensure operational excellence and long-term profitability.

EasySix
FULLY LIQUID wP BASED HEXAVALENT COMBINATION VACCINE

■ What is EasySix ?

■ Clinical development plan

■ Safety profile

■ Immunogenicity

■ Conclusions

1
WHAT IS EasySix® : Composition and Présentation

Fully Liquid Hexavalent Vaccine, each dose of 0.5 ml contains:

Ingredients Quantity per dose of 0.5 ml

Active Component Unit /Dose
Diphtheria toxoid ≥ 30 IU

Tetanus toxoid ≥ 60 IU

Inactivated w-Bordetella pertussis ≥ 4 IU

r Hepatitis B surface antigen ≥ 10 μ g

Haemophilus influenzae type b conjugated (PRP-TT) 10 μ g

Inactivated Salk Polio Virus type 1 40 DU
Inactivated Salk Polio Virus type 2 8 DU
Inactivated Salk Polio Virus type 3 32 DU

Inactive Component
NMT 1.25 mg
Al 3+ as Aluminium phosphate gel
3.3 mg
2-phenoxyethanol

Physiological saline q.s to 0.5 ml

Fully Liquid Hexavalent Vaccine, each dose of 0.5 ml contains

EasySix■: Clinical Development Plan

Clinical Studies

Phase I Study Phase II Study

Safety in toddlers : India Efficacy & Safety in infants - India
EasySix® : n = 24 EasySix® : n = 136
15-18 months
VS

PENTAVAC™ + IMOVAX® : n = 136
6 - 10 weeks

Goals of Clinical Development

■ To assess the safety and tolerability of fully liquid hexavalent DTwP-HepB-Hib-IPV vaccine (EasySix)

■ To show that the hexavalent combination vaccine is safe and induces protective immune responses
equivalent (non-inferior) to
previously licensed combination vaccines PENTAVAC™ and IMOVAX®

■ To support the use of the vaccine with vaccination regimen : 6, 10 and 14 weeks

3
Clinical Study
Study Title: To assess the safety and tolerability of fully liquid hexavalent DTwP-Hep B-Hib-IPV vaccine
(EasySix®) of Panacea Biotech Ltd. in healthy subjects

Sr. No. Parameters Results

1 No. of Healthy Subjects 24
(Age 15 - 18 months)
2 No. of Study Centers 02
Dr. Sharad Agarkhedkar
Dr. D.Y. Patil Medical College, Pune.

Dr. Ram K. Dhongade
Sant Dnyaneshwar Medical Education and Research Centre, Pune.
3 Study Duration 2 Months

4 Study Vaccine EasySix® , Single Dose,
Deep Intramuscular
5 ADR Observation Period 6 hours post vaccination and
Upto 7 days post-vaccination
6 Laboratory Tests: CBC (Complete Blood Count)
Hematological Parameters LFT (Liver Functions Test)
KFT (Kidney Function Test)

4
Safety and Reactogenicity

Sr. No. Local Reaction Grade N (%)

Version:2.0 Dated:05-08-10

5
Results & Conclusion

■ Majority of Local Reactions were Mild

■ EasySix® is found to be Safe and Well Tolerated in all 24 Infants in Phase I trial

9
Phase III Trial

Comparative Study
DTwP-Hep B-Hib-IPV vaccine (EasySix®, Panacea Biotec Ltd.)

Versus

Pentavalent (DTwP-Hep B-Hib) (Pentavac®, Serum Institute)
with IPV (Imovax®, Sanofi Pasteur)

10
Publication

11
Phases III Clinical Trial

Study Title
An Open Label, Randomized, Multicenter study to Evaluate and Compare the Immunogenicity and Reactogenicity of EasySix® (Fully Liquid Hexavalent DTwP-HepB-Hib-IPV Vaccine, Panacea Biotec Ltd.) with Pentavac SD® (Pentavalent DTwP-HepB/Hib Vaccine, Serum Institute of India Pvt. Ltd.) co-administered with Imovax Polio® (Salk Based Inactivated Polio Vaccine, Sanofi Pasteur India Pvt. Ltd.) in Healthy Infants.

Aim
To assess and compare the Immunogenicity (primary objective) and Reactogenicity (secondary objective) of Fully liquid Hexavalent EasySix® vaccine (DTwP-HepB-Hib-IPV, Panacea Biotec) with Pentavac SD® (Pentavalent DTwP-HepB/Hib Vaccine, Serum Institute of India Ltd.) co-administered with Imovax Polio® (Sanofi Pasteur India Pvt. Ltd.) in Healthy Infants

Primary Endpoints
Proportion of subjects achieving seroprotection against diphtheria, tetanus, Hepatitis B, Hib; seroresponsiveness against pertussis; seroconversion against Polio virus type 1, type 2 and type 3, 4 weeks after three dose vaccination series of DTwP-HepB-Hib-IPV vaccine in the two treatment groups

Secondary Endpoints

- Incidence of solicited local and systemic reactions during 4 days of each vaccine dose (day 0-3).
- Incidence of unsolicited adverse events up to 4 weeks after each vaccination.
- Incidence of SAE during the entire study period.

Immunogenicity: ability to produce immune response;
reactogenicity to produce common, "expected" adverse reactions, associated signs and symptoms—fever, pain, redness etc

9

Study Design

Design Open Label, Multi-centric, Randomized, Parallel group, Comparative study (active control).

No. of Study Centers Four

1. Dr. Ram Dhongade- Sant Dnyaneshwar Medical Education Research Centre, Pune
2. Dr. S. M. Prasad - Dr B. R. Ambedkar Medical College, Bengaluru
3. Dr. A. Swamy Naidu- King George Hospital, Visakhapatnam
4. Dr J. Venkateswara Rao - Gandhi Medical College & Hospital, Hyderabad

Indication Primary immunization against Diphtheria, Pertussis, Tetanus, Hepatitis B, Haemophilus Influenza and Polio

Study Arms Two

Test Fully liquid hexavalent DTwP-HepB-Hib-IPV vaccine
(EasySix™, Panacea Biotec Ltd.)

Comparator Pentavalent DTwP- HepB-Hib Vaccine (Pentavac) co-administered with IPV (Salk Based Inactivated Polio Vaccine)
(Imovax)

Age Group 6 - 10 weeks (infants)

Enrolled Subjects 284 (Each arm with 142 Infants).

Dosage and Administration 0.5 ml of each vaccine administered by deep IM injection in the anterolateral aspect of thigh.

Schedule 6, 10, and 14 weeks.

Reference: A randomized, open label trial to evaluate and compare the immunogenicity and safety of a novel liquid hexavalent DTwP-Hib/Hep B-IPV (EasySix™) to licensed combination vaccines in healthy infants. Vaccine. 2018

10

Inclusion Criteria

- Infants 6-10 weeks of age, whose parents/LAR willing to give written informed consent prior to the study entry.
- Infants with good health as determined by:
 - Medical history
 - Physical examination
 - Clinical judgment of the investigator
- Judged to be able to attend all scheduled study visits and to comply with trial procedures.

12

Exclusion Criteria

- Infants weighing ■ 3.3 Kg at the time of enrollment.
- Infants less than 6 weeks or more than 10 weeks of age.
- Known HBsAg positivity in mother.
- Infants having history of immunization with vaccine other than zero polio, BCG and birth dose of HepB
- Infants with history of infection potentially related to any of the agents targeted by the DPT-HepB-Hib-IPV vaccine
- Presence of evolving or changing neurological disorder or Infants with history of seizures before receiving the vaccine. Initiation or continuation of pertussis vaccination should be deferred until an evolving neurological disorder can be excluded.
- History of household contact and/or intimate exposure to an individual with suspected poliomyelitis.
- Fever >38o C in past 3 days
- Any evidence of acute illness or infection within past 7 days.

13

Exclusion Criteria

- Planned or elective surgery during the course of the study.
- Infants with a known or suspected impairment of the immune function (congenital or hereditary), or those receiving immunosuppressive therapy, or received immunosuppressive therapy prior to study entry (including systemic or high doses of inhaled corticosteroids) or those who have received a parenteral immunoglobulin preparation
- Infants who have received any blood products, cytotoxic agents or radiotherapy.
- Infants with history of anaphylaxis, or any serious vaccine reaction, or allergy to any vaccine component.
- Have any clinically significant chronic disease (for example, cardiac, pulmonary, renal, gastrointestinal, hepatic, endocrine, cancer, skin or psychiatric disease or disorder or autoimmune disease under treatment) or major congenital defects, such that it would endanger the volunteer's wellbeing or which, in the opinion of the investigator, might interfere with the evaluation of the study objectives.
- Any evidence of thrombocytopenia or a bleeding disorder.
- Infants who have participated in another trial or received an investigational agent within 30 days of enrolment.

14

EasySix®:Safety Results

■ No death reported in the trial.

■ One SAE (Pneumonia) was reported in the trial: NOT RELATED to the study vaccine.

■ Most Systemic solicited and local events were mild/moderate and resolved completely with symptomatic treatment.

22

EasySix®: Safe & Well tolerated

■ Exhibited Less Pain and Tenderness.

■ Comparable Local (redness and swelling) and Systemic (fever and irritability / restlessness / fuzziness) AE's.

Reference: A randomized, open label trial to evaluate and compare the immunogenicity and safety of a novel liquid hexavalent DTwP-Hib/Hep B-IPV (EasySix™) to licensed combination vaccines in healthy infants. Vaccine. 2018

23

Conclusion

■ World's first fully liquid wP-based hexavalent vaccine is safe and immunogenic

■ Indian NRA approved through phase I and phase III clinical trials.

■ Non-inferiority was demonstrated at the level of proportion of infants developing seroprotective titers or showing seroconversion following the primary series of vaccine compared to the same target-antigens included in licensed combination vaccines.

■ Has comparable immunogenicity versus DTwP-Hep B-Hib with IPV in 284 Indian infants study.

■ Exhibited less pain and tenderness, less local and systemic adverse events, hence well tolerated.

■ 6 in 1 wP-based hexavalent vaccine for broad and long term protection.

1. Purpose

To lay down the procedure for formulation and filling of EasySix vaccine using Diphtheria toxoid, Tetanus toxoid, pooled bulk of inactivated whole cell Bordetella pertussis, Purified Capsular Polysaccharide (PRP) from Haemophilus influenzae type b conjugated to Tetanus Toxoid bulk, Hepatitis B surface antigen and Salk Inactivated polio vaccine (IPV).

2. SCOPE

This procedure is applicable to batches of EasySix vaccine to be formulated from bulks of Diphtheria toxoid, Tetanus toxoid, pooled bulk of inactivated whole cell Bordetella pertussis, Purified Capsular Polysaccharide (PRP) from Haemophilus influenzae type b conjugated to Tetanus Toxoid bulk, Hepatitis B surface antigen and Salk Inactivated polio vaccine (IPV) at R&D, Panacea Biotec Ltd., Lalru and Vaccine Formulation Plant, Panacea Biotec Ltd., Baddi.

3. RESPONSIBILITY

3.1 Formulation research and development shall be responsible for the Preparation of this SOP and perform the procedure.

3.2 Analytical research and development shall be responsible for the testing of this formulation.

3.3 Quality Assurance department shall be responsible to ensure the compliance of this protocol.

4. Materials & Equipments

- Aluminium phosphate gel (Adju-phos), Sterile
- 2-Phenoxyethanol
- Physiological Saline (0.85%), Sterile
- HCl (0.1 N) & NaOH (0.1 N), Sterile
- Laminar Air Flow (LAF) unit and filter sterilized 70 % Isopropyl alcohol (IPA)
- Sterilized glass bottles with magnet
- Sterile mops / wipes.
- Sterile "Aseptic area" dresses & gloves
- Magnetic stirrer
- Sterile Formulation vessels
- SIP unit
- Sterile calibrated measuring cylinders, pipettes, sampling vials

- ## 5. DESCRIPTION

EasySix is a uniform suspension of Diphtheria Toxoid (DT), Tetanus Toxoid (TT), inactivated whole cell pertussis (wP), Hepatitis-B surface antigen (HBsAg), Haemophilus influenzae type b (Hib-TT) and Inactivated Polio Virus (Salk). The Diphtheria Toxoid (DT), Tetanus Toxoid (TT) and Hepatitis B (HBsAg) are adsorbed on aluminium phosphate gel and combined with inactivated whole cell pertussis (wP), Inactivated Polio Virus (Salk) and Haemophilus influenzae type b (Hib-TT). The vaccine is suspended in isotonic saline solution to which 2-phenoxethanol is added as a preservative.

6. MASTER FORMULA

Batch No. :

S	Ingredients	Item Code	Quantity/unit
No.	(0.5 ml)		
	Diphtheria Toxoid	25 Lf	
	Tetanus Toxoid	7.5 LF	
	Inactivated w-Bordetella	16 IOU	
	pertussis		
	Hepatitis B Surface Antigen	10 µg	
	Purified Capsular	10 µg	
	Polysaccharide (PRP) from		
	Haemophilus influenzae type b		
	conjugated to Tetanus Toxoid		
	Inactivated Polio Virus (Salk)		
	Type 1	40 D units	
	Type 2	8 D units	
	Type 3	32 D units	
	2-Phenoxyethanol	3.3 mg	
	Aluminium Phosphate Gel	0.6 mg	
	(Al+3 Content)		
	Sodium Chloride Solution	q.s. to 0.5 ml	
	(0.85%w/v)		

7. CALCULATIONS FOR DISPENSING OF MATERIALS

1. Active Raw Material (ARM)

The per batch quantity of active raw materials required to be dispensed is calculated as follows

Final volume of the Vaccine (Batch size) : VFVmL

S	Ingredients	Batch No.	Concentrat Overla	Quantit Quantity
No.		on ges y Per Required		
	of arm (x) (%)age ml (Y) (Y x VFV /			
	) (X)#			
	Diphtheria Toxoid Lf/ml 5% 52.5 Lf VD ml			
	Tetanus Toxoid Lf/ml 5% 15.75 VT ml			
	Lf			
	Inactivated IOU/ml 5% 33.6 VW ml			
	w-Bordetella IOU			
	pertussis			
	Purified Capsular µg/ml 10% 22 µg VHi ml			
	Polysaccharide			
	(PRP) from			
	Haemophilus			
	influenzae type b			
	conjugated to			
	Tetanus Toxoid			
	Hepatitis B µg/ml 10% 22 µg VHB ml			
	Surface Antigen			

2. Calculations for dispensing of Bulk of Inactivated Polio Virus (Salk)

S.	Ingredients	Batch No.	Overages	Concentration	VIPV=
No.	(%)	ion	VFV	Final	
	of arm	YIPV	Quantity		
	(YIPV)	Required			
		MIPVF=			
		VIPV X (1			
		+ 5/100)			
	Bulk of	5% 5 X	ml	ml	
	Inactivated Polio	concentrat			
	Virus (Salk)	e			

VFV = Final volume of the vaccine (batch size), VD = Volume of the Diphtheria toxoid, VT = Volume of the Tetanus toxoid, VW = Volume of the w-B. Pertussis, VHi = Volume of PRP-TT, VHb = Volume of Hepatitis B Surface Antigen, V IPV = Bulk of Inactivated Polio Virus (Salk).

3. Calculations for dispensing of excipients:

1. Determination of volumes of individual components

S. No.	Particulars	Percentage	Formula	Volume in ml
1	Batch size (in ml) of final vaccine	NA	VFV	
2	Total volume (in ml) of Component-I to be prepared	60%	$VCI = VFV \times 60$	
3	Total volume (in ml) of Component-II to be prepared	15%	$VCI = VFV \times 15$	
4	Total volume (in ml) of Component-III to be prepared	25%	$VCI = VFV \times 25$	

2. For Aluminium phosphate gel:

Batch number :

Supplier/Manufacturer :

S. No.	Particulars	Calculation/Qty.
1	Batch size (in ml) of final vaccine	VFV
2	Required aluminium ion concentration (Al ³⁺) per dose	0.60 mg
3	of 0.5 ml vaccine	
4	Required aluminium ion concentration (Al ³⁺) in final vaccine	1.20 mg
5	vaccine (mg per ml) = F	
6	Concentration of Aluminium Phosphate Gel (as per COA)	
7	(in Al ³⁺ ion) (in mg/ml) = Al	
8	Quantity of Aluminium Phosphate Gel to be added in final vaccine batch	$VAL = F \times VFV / Al$

1. Determination of volume of Aluminium phosphate gel in individual components

S. No.	Particulars	Percentage	Formula	Volume in ml
1	Batch size (in ml) of final vaccine	NA	VFV	
2	Total quantity of Aluminium Phosphate Gel to be added in final vaccine batch		VAL	
3	Total volume Aluminium	80%	$VALCI = VAL$	
4	Phosphate Gel required for Component-I		$X 80$	
5	Total volume Aluminium	20%	$VALCII = VAL$	
6	Phosphate Gel required for Component-II		$X 20$	

3. For 2-Phenoxyethanol

Batch number :

Supplier/Manufacturer :

S. No.	Particulars	Calculation/Qty.
1	Batch size (in ml) of final vaccine	VFV
2	Required concentration of 2-phenoxyethanol per dose	3.3 mg
3	of 0.5 ml vaccine	
4	Required concentration of 2-phenoxyethanol in final vaccine	6.6 mg
5	(per ml) = G	
6	Concentration of 2-phenoxyethanol (as per COA)	
7	(mg/ml) = P	
8	Quantity of 2-phenoxyethanol to be added in final vaccine batch	Vp

1. 2-POE contribution from ARm (DS)

Particulars	Diphtheria toxoid	Tetanus toxoid bulk	Bordetella
Volume of different component - I	$VD = VT = VW$		
Concentration of component - I	$CPDT = CPTT = CPWP$		

2-POE present in bulk		
(mg/ml)		
Amount of 2-POE	[(CPDT X VD) + (CPTT X VT) + (CPWP X VW)]	
contributed from ARM	=	
(APARM) (in mg)		

2. Determination of volume of 2-Phenoxyethanol solution for individual components

S. No.	Particulars	Calculation/Qty.
	Batch size (in ml) of final vaccine =VFV	
	Required concentration of 2-phenoxyethanol per 3.3 mg	
	dose of 0.5 ml vaccine	
	Required concentration of 2-phenoxyethanol in 6.6 mg	
	final vaccine (per ml) = G	
	Concentration of 2-phenoxyethanol (as per COA)	
	(in mg/ml) = P	
.	Total volume of Component-I to be prepared (in	
	ml)= (VCI)	
	Total volume of Component-II to be prepared (in	
	ml)= (VCII)	
	Total volume (in ml) of component III (in ml) =	
	(VCIII)	
	Quantity of 2-phenoxyethanol to be added in	
	Component-I (in ml) = VpCI = (VCI x G)	
	– (APARM) + (VCIII x G)	
	P	
	Quantity of 2-phenoxyethanol to be added in	
	Component-II (in ml) = VpCII = (VCII X G)	
	P	
	Quantity of 2-phenoxyethanol to be added in final	
	vaccine batch (in ml) = Vp = VpCI + VpCII	

4. For Sodium Chloride

Batch number :

Supplier/Manufacturer :

Calculations for volume of Sodium Chloride solution (0.85%w/v)

S. No.	Particulars	Calculation/Qty.
No.		
	Batch size (in ml) of final vaccine = VFV	
	Quantity of Sodium Chloride Solution to be added in	
	final vaccine batch (in ml) = VS = VFV - (VD + VT + Vw	
	+ VHi + VHb + VIPV +Vp+VAL)	

1. Determination of volume of Sodium Chloride solution for individual components

S. No.	Particulars	Volume in ml
	Batch size (in ml) of final vaccine =VFV	
	Total volume of Component-I to be prepared (in	
	ml)= (VCI)	
	Total volume of Component-II to be prepared (in	
	ml)= (VCII)	
	Total volume of Component-III to be prepared	
	(in ml)= (VCIII)	
	Total volume of Sodium Chloride Solution be	
	added in Component-I (in ml) = VSI = VCI –(VD +	
	VT + Vw + Vp Com I + VALCI)	
	Total volume of Sodium Chloride Solution be	
	added in Component-II (in ml)= VSII = VCII –(	
	VHb + Vp Com II + VALCII)	
	Total volume of Sodium Chloride Solution be	
	added in Component-III (in ml) = VSIII = VCIII	
	–(VHi + V IPV)	

8. ACTIVE INGREDIENTS & EXCIPIENTS OF EASYSIX VACCINE

Quantity of ingredients in a batch

Depending on batch size of vaccine, the quantities of active ingredient, Aluminium phosphate gel, 2-POE and normal saline are worked out.

S.No	Name of ingredient	Batch No. of ARM &	Required quantity of
	Solutions	ingredient in present	
		batch of 10.0 lts.	
1	Diphtheria toxoid	ml

11. Manufacturing Procedure

1. Precautions

1. Check all the requirements as per the batch size.
2. Enter into the clean area as per the laid procedure.
3. Mop the work bench of LAF with swab containing 70 % IPA.
4. Take all the required material inside the LAF after mopping them with 70 % IPA.
5. Compensate the water loss in saline and aluminium phosphate gel during autoclave by addition of WFI before use.
6. Temperature of formulation bulk should be monitored continuously.

2. Formulation/ Blending

1. Component I (DTwP)

- a) Add the following ingredients in sequence mention below
- b) Aseptically transfer the calculated quantity of Aluminium phosphate gel into the blending vessel.
- c) Aseptically transfer the calculated quantity of Tetanus Toxoid slowly under constant stirring.
- d) Stir for 10 to 15 mins. for mixing (stirring at 150 rpm/CRT).
- e) Aseptically transfer the calculated quantity of Diphtheria Toxoid slowly under constant stirring.
- f) Stir for 10 to 15 mins. for mixing (stirring at 150 rpm/CRT).
- g) Aseptically transfer the calculated quantity of filter sterilized 2-phenoxyethanol under constant stirring.
- h) Stir for 10 to 15 mins for mixing (stirring at 150 rpm/CRT).
- i) Aseptically transfer the calculated quantity of sodium chloride solution under constant stirring.
- j) Stir for 10 to 15 mins for mixing (stirring at 150 rpm/CRT).
- k) Check the pH, if it is not in range of 6.0 to 6.5, adjust the pH of formulation using sterile 0.1 N HCl or 0.1 N NaOH solution and record as follows:

pH adjustment of Component-I (Before wP addition and before Incubation)

S. No.	Component Name			
Stirring speed				
Incubation period	Start		Start Time	
	Date			
	End Date		End Time	
Net incubation	Hours minutes			
period				
Remarks				

l) After 24 hr of incubation is completed (Day II) aseptically transfer the calculated quantity of Inactivated Bordetella pertussis bulk solution under constant stirring.

- m) Stir for 10 to 15 mins for mixing (stirring at 150 rpm/CRT).
- n) Check the pH, if it is not in range of 6.5 to 7.5, adjust the pH of formulation using sterile / 0.1 N HCl or 0.1 N NaOH solution and record as follows:

pH adjustment of Component-I (After wP addition and before Incubation)

S. No.	Component Name			
Stirring speed				
Incubation period	Start		Start Time	
	Date			
	End Date		End Time	
Net incubation	Hours minutes			
period				
Remarks				

2. Formulation procedure for Component II (HepB) (Day II):

- a) Add the following ingredients in sequence mention below
- b) Aseptically transfer the calculated quantity of Aluminium phosphate gel into the blending vessel.
- c) Aseptically transfer the calculated quantity of Hepatitis B slowly under constant stirring.
- d) Stir for 10 to 15 mins. for mixing (stirring at 150 rpm/CRT).
- e) Aseptically transfer the calculated quantity of filter sterilized 2-phenoxyethanol under constant stirring.
- f) Stir for 10 to 15 mins for mixing (stirring at 150 rpm/CRT).
- g) Aseptically transfer the calculated quantity of sodium chloride solution under constant stirring.

h) Stir for 10 to 15 mins for mixing (stirring at 150 rpm/CRT).
 i) Check the pH, if it is not in range of 6.0 to 7.0, adjust the pH of formulation using sterile 0.1 N HCl or 0.1 N NaOH solution and record as follows:
 pH adjustment of Component-II(Before Incubation)

S. No.	Component Name
Stirring speed	
Incubation period	Start Start Time
Date	
End Date	End Time
Net incubation	Hours minutes
period	
Remarks	

3. Mixing of component I and component II (Day III):

- On day III aseptically transfer the component II in the component I
- Stir for 30 min for mixing (stirring at 150 rpm/CRT)

4. Final Mixing of Hib TT and IPV bulk in DTwP component (Day III):

- On day III aseptically transfer the calculated quantity of Hib TT bulk under constant stirring to the bulk of step 12.2.3 (b).
- Stir for 30 min for mixing (stirring at 150 rpm/CRT).
- Aseptically transfer the calculated quantity of IPV bulk and saline solution under constant stirring to it.
- Stir for 30 min for mixing (stirring at 150 rpm/CRT).
- Check the pH, if it is not in range of 6.5 to 7.5, adjust the pH of formulation using sterile 0.1 N HCl or 0.1 N NaOH solution and record as follows:
 pH adjustment of final bulk

S. No.	Component Name	Vol. of component used	Initial pH	Volume of 0.1 N HCl required	Volume of 0.1 N NaOH required	Final pH
--------	----------------	------------------------	------------	------------------------------	-------------------------------	----------

 Stir for 2 hr for mixing (stirring at 150 rpm/CRT) and for further storage keep the formulated bulk at 2-8°C.
 Aseptically take the sample of bulk EasySix vaccine for QC testing.
 Filling of vaccine
 Aseptically fill the formulated bulk vaccine in suitable containers for shipment.
 Store the vaccine at 5°C±3°C.
 Maintain the records of formulation & filling. After obtaining the results of analysis, prepare a Certificate of analysis for the batch.
 AnnexureS
 Annexure I : Manufacturing Flow Chart for formulation of EasySix Vaccine.
 Annexure II : Details of the filling record for single-dose glass vials
 Annexure III : Details of the filling records for multi-dose glass vials.
 Annexure IV : Details of the filling records for Pre-Filled Syringes.

Immunogenicity and safety of a newly developed liquid DTwP-Hib/HepB-IPV hexavalent vaccine (EasySix™) was evaluated and compared with administration of commercially licensed Pentavac SD® (DTwP-HepB/Hib), SII and Imovax Polio® vaccine (Sanofi) in an open-label, randomized multi-centric trial. 284 participants, aged 6-10 weeks, randomized in a 1:1 allocation, received three doses of test or comparator vaccines, administered 4 weeks apart. Immunogenicity of the vaccines was determined by measuring the baseline and post-vaccination antibody responses and comparing the proportions of subjects achieving seroprotection against the vaccine antigens; safety was evaluated in terms of solicited (local and systemic) and unsolicited incidences in the follow up phase.

Post-vaccination, seroprotection was achieved against all six vaccine antigens in both vaccine groups. The seroresponse rate as well as geometric mean titers of antibody for all vaccine components were comparable between EasySix™ and Pentavac SD®-Imovax Polio® group. Both vaccines had similar reactogenicity profiles and were well tolerated; all adverse events resolved completely without any sequelae. Only one serious adverse event was reported that completely resolved; it was regarded unconnected to the vaccine administered. This study demonstrated that immunogenicity and safety profiles of EasySix™ vaccine, manufactured by Panacea Biotec Ltd, are non-inferior to the commercially available vaccines. Clinical trial registration: CTRI/2015/02/005578.

Open-label trial: a trial that is not completely blinded, typically in that subjects and physicians have knowledge of the assigned treatment. Importantly, it does not mean "uncontrolled" or "single-arm" which is often what the term "open-label" is used to describe. •

[1.0 |Purpose: |
	To lay down the procedure for the determination of CDAP
	(1-cyano-4-dimethylaminopyridinium tetrafluoroborate) by high performance
	liquid chromatography (HPLC).

			tetrafluoroborate)			
			5.2.4.6	2-Propanol		
		5.2.4.7	Hydrochloric acid 37 %			
5.3	Preparation of solutions:					
		Prepare all the solutions and carry out the labelling of the prepared				
		solutions and assign the lot numbers to the solutions.				
		5.3.1	Solution A			
			(NaH₂PO₄. H₂O, 200mM)			
			For a volume of 1 liter, weigh			
			NaH₂PO₄. H₂O	27.6g		
			Adjust the pH to 3.0 with HCl 37%.			
			Make up the solution to 1litre with purified water. Prepare			
			fresh before use.			
		5.3.2	Mobile phase for CDAP:			
			Take 700mL of methanol in a measuring cylinder and 300mL of			
			solution A to make the volume to 1000mL. Use the mobile phase			
			within four days from the date of preparation if it remains			
			clear and no turbidity or fibers observed in it.			
		5.3.3	Isopropyl Alcohol 70% Solution			
			(For storing and purging the HPLC system)			
			Take 700 mL of 2-propanol using a measuring cylinder and make			
			up the volume to 1000 mL with Purified Water in a volumetric			
			flask. This solution can be stored at room temperature for 3			
			months.			
		5.3.4	1 mg/mL of CDAP calibration standard stock:			
			Weigh 5mg of CDAP and make up the volume to 5mL with purified			
			water in a volumetric flask. This solution can be stored as			
			aliquots at -20°C for 2months.			
		5.3.5	Preparation of working calibration standard of 10µg/mL or			
			10ng/µL:			
			Take 10µL of 1 mg/mL of CDAP calibration standard stock and			
			add 990µL of purified water to make 1mL of solution in an			
			eppendorf or HPLC vial. Mix thoroughly. Prepare fresh before			
			use.			
			Note: The working calibration standard is prepared fresh			
			before use. All the solutions prepared for use are vacuum			
			filtered using Nylon 6, 6 membrane 0.20/0.22/0.45 µm filters			
			to eliminate the entry of possible particles, if any into the			
			system as well as the column. For organic solvents 0.45µm			
			filters should be used (filtration not necessary if the			
			solution is prepared in 0.2 µ filtered purified water).			
5.4	Preparing the HPLC System for run:					
5.5	Run Conditions:					
		5.5.1	Load method CDAP.M.			
		5.5.2	Flow Rate: 1.0 mL/min			
		5.5.3	Detection wavelength: 280 nm			
		5.5.4	Run time: 4 minutes			
		5.5.5	Mobile Phase: mobile phase for CDAP			
5.6	Equilibration of the system and the column:					
		Equilibrate the system and column with mobile phase for CDAP until a				
		stable baseline at 280 nm is obtained which can be viewed with the				
		online plot window.				
5.7	Sample Preparation and Application:					
		Test sample and standards are loaded in screw cap vials and placed				
		against the appropriate no. on the sample tray by clearly marking				
		the screw cap vial.				
5.8	Running of sequence:					
		5.8.1	Load sequence CDAP.S.			
		5.8.2	Open the sequence parameter option by clicking Sequence menu.			
		5.8.3	Enter information about the data directory and operator name.			
		5.8.4	In the shutdown option, click on the post-sequence option and			
			select LAMPOFF/STANDBY.			
		5.8.5	In sequence table option, specify the sample names, methods			
			and vials to run in the sequence as per the following table:			
		S. No	Sample Code	Sample details	No. of	Injectio
			injections	n volume		
			per Vial			
		1	Blank	Eluent Blank	1	10 µL
		2	Standard 3	System	6	0.5 µL
			(5ng/µL)	Suitability		
			test standard			
		3	Blank	Eluent Blank	1	10 µL
		4	Standard 1	1ng/µL	1	0.1 µL

||| |standards using the chemstation software. |

||| |5.9.1.1 |Open the chromatogram corresponding to 1ng/μL |

||| |calibration standard in the offline copy of |

||| |chemstation software in the Data Analysis mode. |

||| |5.9.1.2 |From the calibration menu select calibration |

||| |settings and write ng/μL in the Amount unit's |

||| |option. |

||| |5.9.1.3 |Select New Calibration Table from Calibration |

||| |menu and enter value1 in default amount option |

||| |and value 1 in level option. |

||| |5.9.1.4 |Now open the chromatogram for 3.0 ng/μL. Select |

||| |add level option from calibration menu and enter |

||| |value 3.0 in default amount and value 2 in level |

||| |option. |

||| |5.9.1.5 |Similarly open chromatograms for 5.0ng/μL, |

||| |10.0ng/μL and 20.0ng/μL and keep adding default |

||| |amount and appropriate value of level. |

||| |5.9.1.6 |Select calibration task icon and the calibration |

||| |table with required concentrations and levels can|

||| |be viewed in the calibration table view. A |

||| |calibration curve is also displayed in the |

||| |calibration curve field with value of correlation|

||| |coefficient of the curve. |

||| |5.9.1.7 |Save the calibration method under appropriate |

||| |name. |

||| |5.9.1.8 |Open the chromatogram of test sample and select |

||| |the above created calibration method for |

||| |integration of the test sample. |

||| |5.9.1.9 |In the specify report option of Report menu, |

||| |select ESTD in the Calculate field. |

||| |5.9.1.10 |In the report layout view click on the show |

||| |report preview with current template, method and |

||| |data file icon and view the result of the test |

||| |sample in terms of concentration (ng/μL). |

||| |5.9.1.11 |Calculations for Standard curve and samples: |

||| |The calculations are made according to the |

||| |equation of minimum squares. |

||| | $Y = mX + b$. |

||| |Where: m = slope |

||| |b = intercept |

||| |Y = absorbance |

||| |X = concentration |

||5.9.2 |The calculations for determination of amount of CDAP per dose|

||| |(10μg) of ARM of Haemophilus Influenzae type b conjugate |

||| |vaccine is as follows: |

||| |Example: If a sample has a PRP concentration of 1.0 mg/mL and|

||| |the amount of CDAP present in the sample is 5ng/μL or 5μg/mL.|

||| |The amount of CDAP present per dose(10μg) is calculated as |

||| |follows: |

||| |1000μg -----5μg |

||| |10 μg(dose)----- X |

||| | $X = 5\mu\text{g} \times 10 \mu\text{g}$ |

||| |1000 μg |

||| |= 0.05μg or |

||| |X = 50 ng/dose |

||5.9.3 |Calculations for System Suitability Test: |

||| |5.9.3.1 |Note the values of area under the curve and |

||| |retention time for standard 3(SST standard) . |

||5.10 |Acceptance Criteria System Suitability Test: |

||5.10.1|RSD calculated for Retention time of standard 3(5ng/μL) |

||| |should be <5.0%. |

||5.10.2|RSD calculated for Area of standard 3(5ng/μL) should be |

||| |<5.0%. |

||5.11 |Result Reporting: |

||5.11.1|Open CDAP.FRP template and take print out of the report. |

||5.11.2|Print report: Click on print option to take a printout of a |

||| |ChemStation report using the current report template and data|

||| |from the currently loaded data file. |

||5.11.3|Report the results of quantity of CDAP present/dose (10μg). |

||5.11.4|The report generated can be viewed with report review icon. |

||5.11.5|The printed report is signed by the analyst who does the |

||| |analysis and also checked by the other analyst/supervisor. |

	5.1
	5.1.1
	5.1.2
	5.1.3
	5.1.4
	5.1.5
	5.1.6
	5.1.7
	5.2
	5.2.1
	5.2.2
	5.2.3

	parameters of correlation coefficient i.e. ≥ 0.990 .	
	5.4	Total PRP:
	5.4.1	Take sample volume such that the sample volumes used in
		test contain 2.5 to 25 μg of ribose i.e. lies within the
		calibration curve.
	5.4.2	Make up the volume to 2 mL using purified water
		respectively.
		Note: The sample volume can vary depending upon the ribose
		concentration. If there is any sample outside the range of the
		calibration curve, prepare an appropriate dilution of the sample.
	5.5	Unconjugated (Free) PRP:
	5.5.1	Take 1 mL of sample (dilute if required) having about
		100-150 μg PRP in micro centrifuge tube in duplicate, add
		100 μL of 1% DOC and mix it.
	5.5.2	Put this tube in an ice bath for 30 minutes.
	5.5.3	Take out and add 50 μL 1M HCl and mix thoroughly.
	5.5.4	Centrifuge the mixture at 4°C for 15 minutes at 4000 RPM.
	5.5.5	Take 1 mL of supernatant in 20 mL labeled test tube.
	5.5.6	Make up the volume to 2 mL using purified water
		respectively.
	5.5.7	The test is performed in duplicate for each sample.
	5.6	Treat 2 mL purified water as blank in thermoresistant test tube.
	5.7	Add 2 ml of 0.5 g/l Ferric Chloride solution to tubes of
		calibration curve, Blank and samples.
	5.8	Vortex and add 0.2 mL of 100 g/l Orcinol Solution to all test
		tubes.
	5.9	Close the tubes with aluminium foil and place the test tubes in
		boiling water bath for 20 minutes.
	5.10	Take out the tubes and cool in iced water.
	5.11	Allow the tubes to come at room temperature and set the wavelength
		in spectrophotometer at 670 nm. Zero the absorbance of blank and
		then measure the absorbance of calibration curve and test samples.
	5.12	Calculations:
	5.12.1	Once the absorbance of the standards and the test samples
		have been taken, calculation shall be done using the excel
		sheet carrying formulas for the required calculation.
	5.12.2	Always copy the master excel sheet (sheet carrying formulas)
		for the required calculation), never use the previously
		used excel sheet for new calculations.
	5.12.3	Copy the master excel sheet, keep it for use in respective
		folder and then fill in the required sample details for
		total & free sample treatments, sample dilution, name of
		analyst, date, etc.
	5.12.4	Enter the absorbance for calculations starting from the
		Calibration curve prepared between 2.5 and 25 g of Ribose
		and test samples. The calculations are made according to
		the equation of minimum squares.
		$Y = mX + b$.
		Where: m = slope
		b = intercept
		Y = absorbance
		X = concentration
		(Multiply by dilution factor)
	5.12.5	Calculation of actual dilution for free PRP:
		Sample volume taken = 1000 μL
		Total volume = 1150 μL (1000 μL sample + 100 μL 1% DOC + 50 μL
		1M HCl)
		Correction Factor = 1150 μL / 1000 μL = 1.15
		Actual dilution = dilution factor $\times$ 1.15
	5.12.6	Calculate the content of ribose in the test solution for
		each volume tested and PRP content by the formula :
		PRP content = Ribose content / 0.434
	5.12.7	Record all the calculations in the data record form and
		also attach the hard copy of the excel sheet used for
		calculation along it.
	5.6	Acceptance criteria:
	5.6.1	The coefficient of variation (CV) between the replicates of
		the samples should be $\leq 5\%$.

	evaluated as such.
[5. Procedure:	
5.1	Precautions to be taken:
	5.1.1
	5.1.2
	5.1.3
	5.1.4
	5.1.5
	5.1.6
5.2	Requirement:
	5.2.1
	5.2.2
	5.2.3
	5.2.4

		5.2.4.3	Sodium dihydrogen phosphate monohydrate				
		5.2.4.4	Purified water				
		5.2.4.5	Sodium azide				
		5.2.4.6	Salmon DNA				
		5.2.4.7	2-Propanol				
5.3	Preparation of solutions:						
		Prepare all the solutions and Carry out the labelling of the prepared					
		solutions and assign the lot numbers to the solutions.					
	5.3.1	Isopropyl alcohol 70%					
			Take 700 mL of 2-propanol in a volumetric flask and make up				
			the volume upto 1000 mL with Purified Water. This solution can				
			be stored at room temperature for 3 months.				
	5.3.2	Solution I: [Na₂HPO₄ (0.1M), NaCl (0.1M)]					
			For a volume of 1000 mL, weigh:				
			Na₂HPO₄	14.19 g			
			NaCl	5.84 g			
			Dissolve in 700mL of purified water in a volumetric flask and				
			make up the volume upto 1000mL. Prepare fresh solution before				
			use.				
	5.3.3	Solution II: NaH₂PO₄.H₂O, 0.1 M					
			For a volume of 500 mL, weigh:				
			NaH₂PO₄.H₂O	6.85g			
			Dissolve in 400mL of purified water in a volumetric flask and				
			make up the volume upto 500mL. Prepare fresh solution before				
			use.				
	5.3.4	0.1M Sodium Phosphate buffer					
			(0.1 M Na₂HPO₄,0.1M NaCl +0.1M NaH₂PO₄.H₂O, pH 7.0)				
			For a volume of 1000mL, take approximately 600mL of Solution I				
			and 400mL of Solution II. The pH of the solution should be 7.0				
			± 0.2. Use the mobile phase within four days from the date of				
			preparation if it remains clear and no turbidity or fibers				
			observed in it.				
	5.3.5	Void Volume Marker (Salmon DNA):					
			For a volume of 5 mL, weigh:				
			Salmon DNA	5 mg			
			Dissolve in purified water and make up volume upto 5 mL with				
			purified water in a volumetric flask. Store at -20 °C ± 5°C				
			for 1 month.				
	5.3.6	Total volume marker (Sodium Azide):					
			For a volume of 10 mL, weigh:				
			Sodium Azide	10 mg			
			Dissolve in purified water and make up volume upto 10 mL with				
			purified water in a volumetric flask. Store at 2-8 °C for 1				
			month.				
	5.3.7	Column Preservation Solution:					
			Note: All the solutions prepared for use are vacuum filtered				
			using Nylon 6, 6 membrane 0.20 µm or 0.22 µm , depending upon				
			the nature of solution to be filtered. For organic solvents				
			0.45µm filters should be used.				
5.4	Preparing the HPLC System for run, Agilent Series:						
5.5	Run Conditions:						
	5.5.1	Load method HIBTT.M.					
	5.5.2	Flow Rate: 0.5 mL/min					
	5.5.3	Injection Quantity : 2.5µg					
	5.5.4	Detection Wavelength: 214nm					
	5.5.5	Run time: 30 minutes					
5.6	Equilibration of the system and the column:						
		Equilibrate the column with mobile 0.1 M sodium phosphate buffer at					
		214nm until a stable baseline is observed on the online plot window.					
5.7	Sample Preparation and Application:						
	5.7.1	Test sample and standards are loaded in screw cap vials and					
			placed against the appropriate no. on the sample tray by				
			clearly marking the screw cap vial.				
	5.7.2	Load the required volume of sample as per the PRP					
			concentration equivalent to 2.5 µg in the sample vial.				
			Example: If a sample has a PRP concentration of 0.5 mg/mL, to				
			calculate volume required for 2.5 µg of protein,				
			0.5 mg (500 µg) ----1 mL				
			2.5 µg-----X mL				
			X mL = 2.5 µg x 1 mL				
			500 µg				
			X mL = 5 µL				
			Therefore, 5 µL of volume is taken for sample having PRP				
			concentration of 0.5 mg/mL.				
5.8	Running of sequence:						
	5.8.1	Load sequence HIBTT.S.					
	5.8.2	Open the sequence parameter option by clicking Sequence menu.					
	5.8.3	Enter information about the data directory and operator name.					
	5.8.4	In the shutdown option, click on the post-sequence option and					
			select LAMPOFF/STANDBY.				
	5.8.5	In sequence table option, specify the sample names, methods					
			and vials to run in the sequence as per the following table:				
			S No	Sample Code	Sample details	No. of	Injection
				inject	volume (µL)		
				ions			
			1	Blank	Eluent Blank	1	10
			2	Sodium azide (Total	System	6	1
			volume marker)	Suitability			
				Test			
			3	Blank	Eluent Blank	1	10
			4	Salmon DNA	Void volume	1	10
				marker			

			5	Blank	Eluent Blank	1	10
			6	Test Sample (s)	Sample	1	2.5µg of PRP
			Click on run sequence option in run control menu to start				
			the sequence.				
			5.8.8	Each sample run will be of 30 min and after running all			
			the samples the sequence will automatically stop.				
			5.9	Calculations :			
			Area under curve for the standards/sample is analyzed by				
			Chemstation software.				
			5.9.1	The retention time of the void volume is determined with			
			Salmon DNA.				
			5.9.2	The Retention time of the component (total volume) which			
			has full access to the pores of stationary phase is				
			determined with sodium azide.				
			5.9.3	Elution time of PRP-TT (Te) at KD = 0.50			
			The calculations are made as per the following equation:				
			Te = KD (Tt - To) + To or Te = 0.50 (Tt -				
			To) + To				
			Where,				
			Te = Elution time of PRP-TT Bulk Conjugate at KD = 0.50				
			Tt = Retention time of sodium azide				
			To = Retention time of Salmon DNA				
			KD = Distribution Coefficient				
			Note: Take average RT of sodium azide as Tt from EXCEL				
			for calculation of SST.				
			5.9.4	Calculation of percentage of sample eluted before a given			
			KD:				
			The percentage of sample eluted before a given KD is				
			calculated using ChemStation software.				
			5.9.4.1	Open the acquired chromatogram in the data			
			analysis view in the offline copy of the				
			software.				
			5.9.4.2	Optimize integration with initial events in the			
			signal specific events table.				
			5.9.4.3	Enter the value of Elution time (Te) calculated			
			in step 5.9.3 in integration with timed events				
			option or with manual integration and select				
			split peak option.				
			5.9.4.4	The percentage of sample eluted at $KD \leq 0.5$ is			
			calculated by adding the values of percentage of				
			area (Area %) obtained for bulk conjugate curve				
			till Te.				
			5.9.5	Calculations for System Suitability Test:			
			5.9.5.1	Note the values of area under the curve and			
			retention time for sodium azide (SST standard)				
			in Annexure 1 and also in EXCEL format for				
			calculation of Relative standard deviation.				
			5.9.5.2	Every time a sample is run with system			
			suitability test, calculate the results for				
			system suitability.				
			5.9.5.3	Attach the hard print of SST calculation along			
			with chromatograms and the record form.				
			5.10	Acceptance Criteria :			
			5.10.1	For System Suitability Test :			
			1				
			5.10.1.1	RSD calculated for Retention time should be <			
			1	5.0%.			
			5.10.1.2	RSD calculated for Area should be < 5.0%.			
			2				
			5.10.2	For ARM of Haemophilus Influenzae type b conjugate			
			2	vaccine Samples: KD (Molecular Size distribution): $\geq 85\%$,			
			KD ≤ 0.50

5.0	Procedure:	
5.1	Preparation of Solutions:	
Prepare all the solutions as described below and label the solutions.		
5.1.1	0.5 g/l Ferric chloride solution:	
5.1.1.1	Weigh 50 mg of Ferric Chloride hexahydrate and	
transfer it to 100 mL volumetric flask.		
5.1.1.2	Dissolve and make up the volume to 100 mL with	
concentrated hydrochloric acid.		
5.1.1.3	Store the solution in a screw cap amber bottle, for a	
maximum of 6 months at room temperature.		
5.1.2	100 g/l Orcinol solution:	
5.1.2.1	Weigh 1gm of Orcinol monohydrate and transfer it to 10	
mL volumetric flask.		
5.1.2.2	Dissolve and make up the volume to 10 mL with absolute	
ethanol.		
5.1.2.3	Store the solution in a screw cap amber bottle at 2 to	
8 °C, for a maximum of 15 days.		
5.1.3	1 mg/ml Ribose Solution:	
5.1.3.1	Weigh 25 mg of D-Ribose and transfer it to a 100 mL	
volumetric flask.		
5.1.3.2	Dissolve in purified water and make up the volume to	
100 mL with purified water.		
5.1.3.3	Prepare fresh prior to use.	
5.1.4	25 µg /mL Ribose Solution:	
5.1.4.1	Take 1 mL of 1 mg/ml of Ribose solution and transfer	
it to a 10 mL volumetric flask.		
5.1.4.2	Make up the volume to 10 mL with purified water.	
5.1.4.3	Prepare fresh prior to use.	
5.1.5	10% w/v Cetyltrimethylammonium bromide (CTAB) Solution:	
5.1.5.1	Weigh 1gm of Cetyltrimethylammonium bromide and	
transfer it to 10 mL volumetric flask.		
5.1.5.2	Dissolve and make up the volume to 10 mL with Purified	
water.		
5.1.5.3	Solution shall be prepared freshly.	
5.1.6	0.25 M Sodium hydroxide:	
5.1.6.1	Weigh 1gm of Sodium hydroxide and dissolve in	
sufficient amount of purified water and make up the		
volume to 10 mL with Purified water.		
5.1.6.2	Store the solution in a screw cap bottle, for a	
maximum of 6 months at room temperature.		
5.2	Preparation of Calibration Curve:	
5.2.1	Prepare calibration curve (2.5-25 µg) with freshly prepared	
ribose solution (25 µg /ml) in previously labelled test tubes		
of 20 mL.		
5.2.2	Calibration Curve (2.5 - 25µg) is prepared in duplicates as	
follow:		
Ribose content (µg)	2.5	5
25µg/ml ribose (µl)	100	200
Purified water (µl)	900	800
5.2.3	Make up the volume to 2 mL using purified water.	
Note: The Calibration curve is accepted if it is meeting the		
parameters of correlation coefficient ie. ≥ 0.990 .		
5.3	Test:	
5.3.1	Take sample volume such that the sample volumes used in test	
contain 2.5 to 25 µg of ribose i.e. lies within the		
calibration curve.		
In case of dry polysaccharide prepare a solution containing		
about 1-5 mg/mL of polysaccharide use it as test sample)		
5.3.2	Make up the volume to 2 mL using purified water respectively.	
Note: In case of fermentation samples, treat 1 mL of the sample with		
50µl 10 % CTAB, vortex and keep for 10 minutes, centrifuge at 7000		
RPM for 5 minutes. Discard the supernatant; add 1 mL purified water,		
vortex and again centrifuge for 5 minutes at 7000 RPM. Discard the		
supernatant and let the pellet air dry. Solublise pellet with 1 mL		
0.25 M NaOH. Treat this as sample for ribose estimation.		
5.3.3	Treat 2 ml purified water as blank in thermoresistant test	
tube.		

		5.3.4	Add 2 ml of 0.5 g/l Ferric Chloride solution to tubes of
			calibration curve, Blank and sample.
		5.3.5	Vortex and add 0.2 ml of 100 g/l Orcinol Solution to all test
			tubes.
		5.3.6	Close the tubes with aluminium foil and place the test
			tubes in boiling water bath for 20 minutes.
		5.3.7	Take out the tubes and cool in ice cold water.
		5.3.8	Allow the tubes to come at room temperature.
		5.3.9	Set the wavelength in spectrophotometer at 670 nm. Zero the
			absorbance of blank and then measure the absorbance of
			calibration curve and test samples.
		5.4	Calculations:
		5.4.1	Once the absorbance of the standards and the test samples
			have been taken, calculation shall be done using the excel
			sheet carrying formulas for the required calculation.
		5.4.2	Enter the absorbance for calculations starting from the
			Calibration curve prepared between 2.5 and 25 g of Ribose and
			test samples. The calculations are made according to the
			equation of minimum squares.
			$Y = mX + b$.
			Where: m = slope
			b = intercept
			Y = absorbance
			X = concentration
			(Multiply by dilution factor)
		5.4.3	Calculate the content of ribose in the test solution for each
			volume tested.
		5.4.4	Conversion factor for PRP:
			PRP content = Ribose content / 0.434
		5.4.5	In case of PRP.
			Ribose (%) in PRP on dry weight basis:
			Ribose content in PRP($\mu\text{g/mL}$)
			Ribose content in dry PRP ($\mu\text{g/ml}$) =
			$\frac{\text{Ribose content in PRP}(\mu\text{g/mL})}{1 - \{\text{Moisture (\%)} / 100\}}$
			Ribose content in dry PRP ($\mu\text{g/mL}$)
			Ribose (%) = $\frac{\text{Ribose content in dry PRP}(\mu\text{g/mL})}{\text{Concentration of PRP solution}(\mu\text{g/mL})} \times 100$
			Concentration of PRP solution ($\mu\text{g/mL}$)
		5.5	Acceptance criteria:
		5.5.1	The coefficient of variation (CV) between the replicates of
			the samples should be $\leq 5\%$.
		5.5.2	Ribose content in the sample should be within the acceptance
			limits.
		6.0	Forms and Records:
			Determination Of Ribose Concentration By Orcinol Method .
		7.0	References:
			European pharmacopoeia.

1.0 |Objective: |
 |To lay down the procedure for quantifying the phosphorus concentration. |
 2.0 |Scope: |
 |This Standard Operating Procedure is applicable to all the samples of PRP |
 |of Haemophilus Influenzae type b in which phosphorous concentration is to |
 |be determined. |
 3.0 |Responsibility |
 |3.1 |The analyst shall be responsible for executing the described |
 |procedure correctly. |
 |3.2 |Supervisor shall be responsible for verifying that the procedure is |
 |complied with and the results are checked. |
 4.0 |Abbreviations |
4.1	Abbreviations:		
	4.1.1	CV	:Coefficient of variation
	4.1.2	g	:Gram
	4.1.3	mg	:Milligram
	4.1.4	mL	:Millilitre
	4.1.5	µl	:Micro litre
	4.1.6	µg	:Microgram
	4.1.7	nm	:Nanometer
	4.1.8	PN	:Part Number
	4.1.9	SD	:Standard Deviation
	4.1.10	PRP	:Polyribosyl Ribitol Phosphate
5.0	Procedure:		
5.1	Preparation of solutions:		
	5.1.1	100 µg/mL phosphorus solution:	
		5.1.1.	Weigh 0.2194 g of potassium dihydrogen phosphate and
		1	transfer it to 500 mL volumetric flask.
		5.1.1.	Dissolve and make up the volume to 500 mL with purified
		2	water.
		5.1.1.	This solution is stored at room temprature and used
		3	within 6 months.
	5.1.2	5 µg/mL Phosphorus solution:	
		5.1.2.	Take 5 mL of 100 µg/mL phosphorus solution and make up
		1	the volume to 100 mL with purified water. This solution
		is freshly prepared.	
	5.1.3	25 mg/mL ammonium molybdate solution:	
		5.1.3.	Weigh 625 mg of ammonium molybdate and transfer it to
		1	25 mL volumetric flask.
		5.1.3.	Dissolve and make up the volume to 25 mL with purified
		2	water.
		5.1.3.	This solution is stored at room temperature and used
		3	within 6 months.
	5.1.4	100 mg/mL ascorbic acid solution:	
		5.1.4.	Weigh 2.5 g of ascorbic acid and transfer it to 25 mL
		1	volumetric flask.
		5.1.4.	Dissolve and make up the volume to 25 mL with purified
		2	water.
		5.1.4.	This solution is freshly prepared.
		3	
	5.1.5	3 M Sulphuric acid:	
		5.1.5.	Take approximately 500 mL of purified water in a 1
		1	litre volumetric flask. To this add 162 mL concentrated
		Sulphuric acid slowly.	
		5.1.5.	Make up the volume to 1 litre with purified water.
		2	
		5.1.5.	This solution is stored at room temprature and used
		3	within 6 months.
	5.1.6	Ammonium molybdate reagent:	
		5.1.6.	Take 1 volume of 25g/l solution of ammonium molybdate,
		1	1 volume of 100 g/l solution of ascorbic acid, 1 volume
		of 3 M Sulphuric acid and 2 volumes of purified	
		water. This solution is freshly prepared.	
5.2	Preparation of Calibration Curve:		
	5.2.1	Prepare calibration curve (2.5-10 µg) with freshly prepared	
	5µg/mL phosphorus solution in previously labelled micro		
	centrifuge tube. Calibration curve is prepared in duplicates		
	as follow:		
	Phosphorus content (µg)	2.5	5
	5µg/mL phosphorus solution (µl)	500	1000
	Note: The Calibration curve is accepted if it is meeting the		
	parameters of correlation coefficient i.e. ≥ 0.990		
5.3	Test:		
	5.3.1	Dilute the sample so that the sample volumes (1mL) used in	
	test contain about 6 µg of phosphorus i.e. lies within the		
	calibration curve.		
		(In case of dry polysaccharide prepare a solution containing	
	about 1-5 mg/mL of polysaccharide and use it as test sample)		
	5.3.2	Treat 2 mL purified water as blank in thermoresistant test	
	tube.		
	5.3.3	Add 0.2 mL of concentrated sulphuric acid to tubes of	
	calibration curve, Blank and sample.		
	5.3.4	Heat the tubes in oil bath or turbotherm at 120°C for 1 hour	
	and then at 160°C until white fumes appear (about 1 hour).		
	5.3.5	Add 0.1 mL of perchloric acid to all the tubes and heat the	
	tubes at 160°C until the solution is decolourised (about 90		
	minutes).		
	5.3.6	Cool at room temperature and add 4 mL of purified water and 4	
	mL of ammonium molybdate reagent.		
	5.3.7	Heat in water bath at 37°C for 90 minutes and cool.	

		5.3.8	Transfer the contents of each tube to 10 mL volumetric flasks
		and make up the volume of each tube to 10 mL with purified	
		water.	
		5.3.9	Set the wavelength in spectrophotometer at 820 nm. Zero the
		absorbance of blank and then measure the absorbance of	
		calibration curve and test samples. The blue colour is stable	
		for several hours.	
		5.4	Calculations:
		5.4.1	Once the absorbance of the standards and the test samples
		have been taken, calculation shall be done using the excel	
		sheet carrying formulas for the required calculation.	
		5.4.4	Enter the absorbance for calculations starting from the
		Calibration curve prepared between 2.5 and 10 g of phosphorus	
		and test samples. The calculations are made according to the	
		equation of minimum squares.	
		$Y = mX + b$.	
		Where: m = slope	
		b = intercept	
		Y = absorbance	
		X = concentration	
		(Multiply by dilution factor)	
		5.4.5	Calculate the content of phosphorus (per mL) in the test
		sample by multiplying with the dilution factor.	
		5.4.6	In case of PRP,
		Phosphorous (%) in PRP on dry weight basis:	
		Phosphorous content in PRP($\mu\text{g/ml}$)	
		Phosphorous content in dry PRP =	

		($\mu\text{g/mL}$) $1 - \{\text{Moisture}\}$	
		($\%$) / 100}	
		Phosphorous content in dry PRP ($\mu\text{g/mL}$)	
		Phosphorous (%) = _____ x	
		100	
		Concentration of PRP solution ($\mu\text{g/mL}$)	
		5.5	Acceptance criteria:
		The coefficient of variation (CV) between the replicates of the	
		samples should be $\leq 5\%$.	
		6.0	Forms and Records:
		Determination of Phosphorous Concentration	
		7.0	Reference:
		European pharmacopoeia.	

1.0	Purpose:			
	To lay down the procedure for the estimation of molecular size of PRP in			
	purified polysaccharide of Haemophilus Influenzae type b conjugate vaccine.			
2.0	Applicable to:			
	This Standard Operating Procedure is applicable for evaluating KD			
	(molecular size distribution) of purified polysaccharide of Haemophilus			
	Influenzae type b conjugate vaccine.			
3.0	Responsibility:			
	3.1	The analyst shall be responsible for carrying out the described		
	procedure correctly. The Supervisor of the laboratory shall be			
	responsible for verifying that the procedure is complied with and for			
	checking the results.			
4.0	Abbreviations and Definitions:			
	4.1	cm	: centimetre	
	4.2	DNA	: Deoxyribonucleic acid	
	4.3	g	: Gram	
	4.4	HIBTT	: Haemophilus Influenzae type b - Tetanus toxoid	
	4.5	HPLC	: High Performance Liquid Chromatography	
	4.6	id	: Internal diameter	
	4.7	l	: length	
	4.8	m	: meter	
	4.9	mg	: milligram	
	4.10	mL	: Millilitre	
	4.11	mm	: milli meter	
	4.12	nm	: Nano meter	
	4.13	No.	: number	
	4.14	PRP	: Polyribosyl Ribitol Phosphate	
	4.15	RID	: Refractive index detector	
	4.16	RSD	: Relative Standard Deviation	
	4.17	SST	: System Suitability Test	
	4.18	°C	: Degree centigrade	
	4.19	µg	: microgram	
	4.20	µL	: Micro litre	
	4.21	µm	: Micro meter	
	4.22	System	: System suitability tests are an integral part of gas	
	Suitability	and liquid chromatographic methods. They are used to		
	Test	verify that the resolution and reproducibility of the		
	chromatographic system are adequate for the analysis to			
	be done.			
	The tests are based on the concept that the equipment,			
	electronics, analytical operations and samples to be			
	analyzed constitute an integral system that can be			
	evaluated as such.			
5.0	Procedure:			
	5.1	Precautions to be taken:		
		5.1.1	Always wear laboratory coat.	
		5.1.2	Always use filtered solutions. Filtration of solution should	
		be done in order to eliminate the entry of possible particles.		
		if any, into the system as well as the column.		
		5.1.3	Degas all solutions.	
		5.1.4	Avoid entry of bubbles into the system as well as column.	
		5.1.5	All the solution bottle openings should be well covered with	
		aluminum foil.		
		5.1.6	Check the calibration status of all equipment and instrument.	
	5.2	Requirements		
		5.2.1	Equipment:	
			5.2.1.1	Calibrated HPLC System with ChemStation software.
			1	
			5.2.1.2	Refrigerator
			2	
			5.2.1.3	Ultrasonic Cleaner
			3	
			5.2.1.4	Vacuum Pump
			4	
		5.2.2	Instrument:	
			5.2.2.1	pH Meter
			1	
			5.2.2.2	Analytical balance
			2	
			5.2.2.3	Magnetic stirrer
			3	
			5.2.2.4	Precision balance
			4	
		5.2.3	Material:	
			5.2.3.1	Two TSK gel G5000 PWxl columns {30 cm (l), 7.8 mm
			1	(i.d)} connected in series.
			5.2.3.2	Laboratory Glassware
			2	
			5.2.3.3	Screw cap vials
			3	
			5.2.3.4	Solvac Filter Holder
			4	
			5.2.3.5	Nylon 6, 6 membrane 0.20/0.22/.045 µm membrane filters.
			5	
			5.2.3.6	Auto pipette (2-20 (L), (20-200 (L), (100-1000 (L)
			6	
			5.2.3.7	Tips for the Auto pipette
			7	
			5.2.3.8	Eppendorf tubes
			8	

			5.2.3.	Aluminium foil			
			9				
		5.2.4	Reagents:				
			5.2.4.	Sodium Chloride (NaCl)			
			1				
			5.2.4.	Sodium azide			
			2				
			5.2.4.	Salmon DNA			
			3				
			5.2.4.	Acetone			
			4				
			5.2.4.	Purified water			
			5				
		5.3	Preparation of solutions:				
		Prepare all the solutions as described below and label of the					
		prepared solutions.					
		5.3.1	0.4% Sodium Chloride solution:				
			For a volume of 2litre, weigh:				
			NaCl	8.0 g			
			Dissolve in 700 mL of purified water in a beaker. Make up the				
			volume to 2 litres with purified water in a volumetric flask.				
			Use the mobile phase within four days from the date of				
			preparation if it remains clear and no turbidity or fibers				
			observed in it.				
		5.3.2	Void volume marker (Salmon DNA):				
			For a volume of 5 mL, weigh:				
			Salmon DNA	10 mg			
			Dissolve in 3mL of 0.2µm filtered purified water and make up				
			the volume to 5mL in a volumetric flask. Store at -20 °C ± 5				
			°C for 1 month.				
		5.3.3	Total volume marker (Acetone):				
			Take 10µL of acetone and dissolve in 990µL of 0.2µm filtered				
			purified water in an eppendorf. Mix thoroughly. Prepare fresh				
			before use.				
		5.3.4	Column Preservation Solution:				
			Note: All the solutions prepared for use are vacuum filtered				
			using Nylon 6, 6 membrane 0.20/0.22/0.45 µm, depending upon				
			the nature of solution to be filtered (filtration not				
			necessary if the solution is prepared in 0.2µ filtered				
			purified water). For organic solvents filtration not				
			necessary if the solution is HPLC grade.				
		5.4	Preparing the HPLC System for run.				
		5.5	Run Conditions:				
		5.5.1	Load method HIBTT RI.M.				
		5.5.2	Flow Rate: 0.5 mL/min				
		5.5.3	Detector used: RID				
		5.5.4	Run time: 60 minutes				
		5.5.5	Mobile Phase: 0.4% sodium chloride solution				
		5.6	Equilibration of the system and the column:				
		Equilibrate the system and column with 0.4% sodium chloride solution					
		unless a stable baseline for RID is obtained which can be viewed with					
		the online plot window.					
		5.7	Sample Preparation and Application:				
		5.7.1	Test sample and standards are loaded in screw cap vials and				
			placed against the appropriate no. on the sample tray by				
			clearly marking the screw cap vial.				
		5.7.2	Take 3 mg/mL solution of Purified polysaccharide and obtain				
			the value of PRP concentration.				
		5.7.3	Load the required volume of sample as per the PRP				
			concentration equivalent to 200µg in the sample vial.				
			Example: If a sample has a PRP concentration of 2mg/mL, to				
			calculate volume required for 200µg of polysaccharide,				
			2mg (2000µg) -----1mL				
			200µg-----X mL				
			X mL = 200µg x 1mL				
			2000µg				
			X mL = 0.1mL				
			Therefore, 100µL of volume is injected for sample having PRP				
			concentration of 2mg/mL.				
			Note: The application of the Calibration standards is carried				
			out every time whenever a test sample is applied. If several				
			samples are applied in one sequence then only one application				
			of the Calibration standards is enough.				
		5.8	Running of sequence:				
		5.8.1	Load sequence PRP RI.S.				
		5.8.2	Open the sequence parameter option by clicking Sequence menu.				
		5.8.3	Enter information about the data directory and operator name.				
		5.8.4	In the shutdown option, click on the post-sequence option and				
			select LAMPOFF/STANDBY.				
		5.8.5	In sequence table option, specify the sample names, methods				
			and vials to run in the sequence as per the following table:				
			S	Sample Code	Sample details	No. of	Injection
			No			injectio	Volume
						ns	
			1	Blank	Eluent Blank	1	10 µL
			2	Acetone	System	6	1 µL
				(Total volume	Suitability Test		
				marker)			
			3	Blank	Eluent Blank	1	10 µL
			4	Salmon DNA	Void volume	1	50 µL
				marker			

			5	Blank	Eluent Blank	1	10 µL
			6	Test Sample	Sample	1	200 µg of
			(s)		PRP		
		5.8.6	Click on run sequence option in run control menu to start the				
			sequence.				
		5.8.7	Each sample run will be of 60 min and after running all the				
			samples the sequence will automatically stop.				
		5.8.8	Inject the eluent blank after every 20 injections.				
			Note: One extra vial with same SST sample can be used if 6				
			injections are not possible from single vial.				
		5.9	Calculations:				
		5.9.1	The retention time of the unretained compound is determined				
			with Salmon DNA.				
		5.9.2	The Retention time of the component which has full access to				
			the pores of stationary phase is determined with Acetone.				
		5.9.3	Proceed for calculating KD value.				
			The calculations are made as per the following equation:				
			$KD = T_e - T_o$				
			$T_t - T_o$				
			Where,				
			T_e = Retention time of peak maxima of purified polysaccharide				
			sample				
			T_t = Retention time of Acetone				
			T_o = Retention time of Salmon DNA				
			Note: Take average RT of acetone as T_t from EXCEL for				
			calculation of SST.				
		5.9.4	Calculation of percentage of sample eluted before a given KD:				
			The percentage of sample eluted before a given KD is				
			calculated using ChemStation software.				
			5.9.4.1	Open the acquired chromatogram in the data analysis			
			view in the offline copy of the software.				
			5.9.4.2	Optimize integration with initial events in the			
			signal specific events table.				
			5.9.4.3	Enter the value of Elution time (T_e) calculated in			
			step 5.9.3 in integration with timed events option				
			or with manual integration and select split peak				
			option.				
			5.9.4.4	The percentage of sample eluted before a given KD			
			is the value of percentage of area (Area %)				
			obtained for polysaccharide curve till the				
			retention time of peak maxima.				
		5.9.5	Calculations for System Suitability Test:				
			5.9.5.1	Note the values of area under the curve and			
			retention time for Acetone (SST standard).				
			5.9.5.2	Every time a sample is run with system suitability			
			test, calculate the results for system suitability				
			and record the same.				
			5.9.5.3	Attach the hard print of SST calculation along with			
			chromatograms and the record form.				
		5.10	Acceptance Criteria:				
		5.10.1	For System Suitability Test:				
			5.10.1.1	RSD calculated for RT of Acetone should be <5.0%.			
			5.10.1.2	RSD calculated for area of Acetone should be <5.0%.			
		5.10.2	For purified polysaccharide samples:				
			KD (Molecular Size distribution): $\geq 40\%$, $KD \leq 0.3$				
		6.0	Reporting:				
		Molecular sizing of polyribosyl ribitol phosphate (PRP) by high performance					
		size exclusion chromatography.					
		7.0	Reference:				
		European pharmacopoeia.

		5.3.3	Preparation of the samples and control:					
		5.3.3.1	Prepare the blank with water by substituting the volume					
		1	used for the sample.					
		5.3.3.2	For Preparing the control of HIB-TT conjugate samples,					
		2	dilute it 5 fold .					
		For example: Take 0.2 ml of HIB-TT conjugate samples and add 0.8						
		ml of water to it. Prepare appropriate dilutions of the samples						
		accordingly. The dilutions are shown in the following table:						
		Sample	Dilution	Volume of the	Volume of water			
		factor	sample (ml)	(ml)				
		HIB-TT conjugate	1/5	0.200	0.800			
		samples (ARM)						
		Note:						
		The dilutions mentioned can vary depending upon the protein						
		concentration. If there is any sample outside the range of						
		the calibration curve, carry out the calculation for more						
		appropriate dilution.						
		5.3.4	Coloured reaction:					
		5.3.4.1	For the development of the colored reaction the solutions					
		1	should be mixed in the following proportion:					
		Sample	1.0 volume					
		Copper alkaline solution	5.0 volume					
		1N Folin reagent	0.5 volume					
		5.3.5	Test:					
		5.3.5.1	Switch on the thermostat bath and maintain it at a					
		1	temperature of 37 °C.					
		5.3.5.2	Take 0.4 ml of the blank , control and sample (already					
		2	diluted) and pour them in test tubes. (Perform the test					
		twice).						
		5.3.5.3	Add 2 ml of alkaline copper solution in each test tube.					
		3						
		5.3.5.4	Stir gently and incubate at 37 °C for 30 minutes.					
		4						
		5.3.5.5	Add 0.2 ml of 1 N Folin - Ciocalteu reagent. Stir					
		5	immediately after the addition of Folin until a					
		homogeneous colour is obtained.						
		5.3.5.6	Incubate at 37 °C for 20 minutes and read the absorbance					
		6	at 730 nm in the spectrophotometer					
		5.3.6	Calculations:					
		For calculating the protein concentration use the equation Y = mX						
		+ b.						
		Where: m = slope						
		b = intercept						

	Y = absorbance	
	X = concentration	
	5.3.6.	Use EXCEL programme for the preparation of calibration
	1	curve and report the results (Multiply by the dilution
		factor. Divide with 1000 to change $\mu\text{g/ml}$ to mg/ml).
	5.3.7	Acceptance criteria:
		The variation coefficient for replicate of the samples, control
		of the HIB-TT conjugate vaccine and Bovine Serum Albumin is (5
		% .
		The value of the HIB-TT conjugate controls is within the
		acceptance limits according to the graph controlling it.

5.0	Procedure
5.1	Precautions to be taken:
	5.1.1
	5.1.2
	5.1.3
	5.1.4
	5.1.5
	5.1.6
5.2	Requirement:
	5.2.1
	5.2.2
	5.2.3

			5.2.3.	Tips for the Auto pipettes		
			7			
		5.2.4	Reagents:			
			5.2.4.	Sodium Chloride (NaCl)		
			1			
			5.2.4.	Disodium hydrogen phosphate anhydrous (Na₂HPO₄)		
			2			
			5.2.4.	Sodium dihydrogen phosphate monohydrate		
			3			
		5.2.4.	Purified water			
			4			
		5.3	Preparation of solutions:			
		Prepare all the solutions as described below and Carry out the				
		labelling of the prepared solutions and assign the lot numbers.				
		5.3.1	Isopropyl alcohol 70%			
		Take 700 mL of 2-propanol in a volumetric flask and make up				
		the volume to 1000 mL with Purified Water. This solution				
		can be stored at room temperature for 3 months.				
		5.3.2	Solution I			
		Na₂HPO₄ (0.1M), NaCl (0.1M)				
		For a volume of 1000 mL, weigh:				
		Na₂HPO₄	14.19 g			
		NaCl	5.84 g			
		Dissolve in 700mL of purified water in a volumetric flask				
		and make up the volume to 1000mL. Prepare fresh before use.				
		5.3.3	Solution II			
		(NaH₂PO₄.H₂O, 0.1 M)				
		For a volume of 500 mL, weigh:				
		NaH₂PO₄.H₂O	6.85g			
		Dissolve in 400mL of purified water in a volumetric flask				
		and make up the volume to 500mL. Prepare fresh before use.				
		5.3.4	0.1M Sodium Phosphate buffer			
		(0.1 M Na₂HPO₄, 0.1M NaCl +0.1M NaH₂PO₄.H₂O, pH 7.0)				
		For a volume of 1000mL, take approximately 600mL of				
		Solution I and 400mL of Solution II. The pH of the solution				
		should be 7.0 ± 0.2. Use the mobile phase within four days				
		from the date of preparation if it remains clear and no				
		turbidity or fibers observed in it.				
		5.3.5	Column Preservation Solution: Prepare and use it.			
		5.3.6	1 mg/mL of p-Aminobenzoic Acid Stock			
		For a Volume of 5 mL, weigh:				
		5.3.7	p-Aminobenzoic acid (4-Aminobenzoic acid) 5 mg			
		5.3.8	Dissolve in 5mL of purified water and make up the volume to			
		5mL.				
		5.3.9	Working standard of p-Aminobenzoic Acid			
		Dilute 1 mg/mL of the stock solution to 1/10 with purified				
		water.				
		Note: All the solutions prepared for use are vacuum				
		filtered using Nylon 6, 6 membrane 0.20 µm or 0.22 µm ,				
		depending upon the nature of solution to be filtered. For				
		organic solvents 0.45µm filters should be used (filtration				
		not necessary if the solution is prepared in 0.2 µ filtered				
		purified water).				
		5.4	Preparing the HPLC System for run, Agilent Series:			
		5.5	Run Conditions:			
		5.5.1	Load method HIBTT FREE PROTEIN.M.			
		5.5.2	Flow Rate: 0.75 mL/min			
		5.5.3	Detection Wavelength: 280nm			
		5.5.4	Run time: 20 minutes			
		5.6	Equilibration of the system and the column:			
		Equilibrate the column with mobile 0.1 M sodium phosphate buffer				
		at 280nm until a stable baseline is observed on the online plot				
		window.				
		5.7	Sample Preparation and Application:			
		5.7.1	Test sample and standards are loaded in screw cap vials and			
		placed against the appropriate no. on the sample tray by				
		clearly marking the screw cap vial.				
		5.7.2	Load the required volume of sample as per the PRP			
		concentration equivalent to 2.5 µg in the sample vial.				
		Example: If a sample has a PRP concentration of 0.5 mg/mL,				
		to calculate volume required for 2.5 µg of protein,				
		0.5 mg (500 µg) ----1 mL				
		2.5 µg-----X mL				
		X mL = 2.5 µg x 1 mL				
		500 µg				
		X mL = 5 µL				
		Therefore, 5 µL of volume is taken for sample having PRP				
		concentration of 0.5 mg/mL.				
		5.8	Running of sequence:			
		5.8.1	Load sequence HIBTT FREE PROTEIN.S			
		5.8.2	Open the sequence parameter option by clicking Sequence			
		menu.				
		5.8.3	Enter information about the data directory and operator			
		name.				
		5.8.4	In the shutdown option, click on the post-sequence option			
		and select LAMPOFF/STANDBY.				
		5.8.5	In sequence table option, specify the sample names, methods			
		and vials to run in the sequence as per the following				
		table:				
		S	Sample Code	Sample details	No. of	Injection
		No		Injection	Volume(µL)	
				ns		

			1	Blank	Eluent Blank	1	10
			2	p-Aminobenzoic	System	6	1
			acid	Suitability Test			
			3	Blank	Eluent Blank	1	10
			4	Test Sample(s)	Sample	1	2.5µg of
					PRP		
		5.8.6	Click on run sequence option in run control menu to start				
		the sequence.					
		5.8.7	Each sample run will be of 20 min. and after running all				
		the samples the sequence will automatically stop.					
		5.8.8	Inject the eluent blank after every 20 injections.				
		One extra vial with same SST sample can be used if 6					
		injections are not possible from single vial.					
		5.9	Calculations :				
		Area under curve for the standards/sample is analyzed by					
		Chemstation software.					
		5.9.1	Open the acquired chromatogram in the data analysis view in				
		the offline copy of the software.					
		5.9.2	Optimize integration with initial events in the signal				
		specific events table.					
		5.9.3	Enter the value of retention time of peak maxima in				
		integration with timed events option.					
		5.9.4	The percentage of free carrier protein in sample is				
		calculated by taking the percentage area of the peak maxima					
		corresponding to the lower molecular weight compared to the					
		peak maxima of higher molecular weight.					
		5.9.5	Calculations for System Suitability Test:				
		5.9.5.	Note the values of area under the curve and				
		1	retention time for p-Aminobenzoic acid. (SST				
		standard)					
		5.9.5.	Every time a sample is run with system suitability				
		2	test, calculate the results for system suitability				
		by creating a copy of Master EXCEL in the desired					
		folder and record the same.					
		5.9.5.	Attach the hard print of SST calculation along with				
		3	chromatograms and the record form.				
		5.10	Acceptance Criteria :				
		5.10.1	For System Suitability Test :				
		5.10.1.	RSD calculated for Retention time should be <5.0%.				
		1					
		5.10.1.	RSD calculated for Area should be <5.0%.				
		2					
		5.10.2	Free protein for ARM of Haemophilus Influenzae type b				
		conjugate vaccine Samples:					
		5.10.2.	Free protein	< 1%			
		1					
		5.11	Result Reporting:				
		5.11.1	Report the results of percentage of area of peak towards				
		higher Molecular weights (Conjugated) and percentage of					
		area of peak towards lower Molecular weights					
		(Unconjugated).					
		Note: Percentage of free carrier protein is the percentage					
		of area of peak towards lower molecular weights					
		(Unconjugated).					
		6.0	Forms and Records:				
		Determination of free carrier protein in polyribosyl ribitol phosphate					
		(PRP) - tetanus toxoid conjugate by high performance size exclusion					
		chromatography

CONTENTS

OBJECTIVE:

To document the installation of the Air Handling Unit (AHU-01), ascertain that the installation is as per design Specifications lay down.

SCOPE:

This protocol is applicable to the AHU installed in M/s. INFARMA- Indústria Farmacêutica, Lda

PERFORMING THE INSTALLATION QUALIFICATON:

The installation should conform to this checklist. Record all observations and deviations in the space provided in the checklist. In case of deviations prepare a deviation report along with justifications, which should be approved by the Engineering Department, Quality Assurance Manager and Validation In charge.

4.0 CHECKLIST FOR INSTALLATION OF AHU-01

AHU 01- 11000 CFM - RECIRCULATION

DUCTING:-

ELECTRICAL CONNECTIONS

CHILLED WATER MANIFOLD DETAILS

DETAILS OF UTILITIES

5.0 Test Certificates for the following components to be attached -

6.0 RESULTS:

7.0 CONCLUSION -

BASED UPON THE OBSERVATIONS RECORDED IN THE TABLE GIVEN ABOVE, THE INSTALLATION OF THE AHU IS FOUND TO BE SATISFACTORY / IS FOUND NOT TO BE SATISFACTORY AS PER THE DESIGN SPECIFICATIONS. THEREFORE, INSTALLATION OF THE AHU IS / IS NOT QUALIFIED AND THE OPERATION QUALIFICATION CAN / CANNOT BE PERFORMED

APPROVAL FOR INSTALLATION QUALIFICATION

MOC | Fire Dampers shall meet the fire resistance rating of 2 hours as per UL555 and shall be tested and
certified by CBRI. Fire Damper frame shall be galvanized steel of 1.6mm thickness, formed into a C
channel in 4-piece construction with flanges suitable for duct connection. Damper Blades shall be single
skin galvanized steel of 1.6mm thickness and must have 3 accurately roll formed longitudinal grooves for
reinforcement and proper closure and operation. The blades shall be arranged in parallel to provide
positive shut off. Each Blade shall have axles supported on both sides with sintered bronze
self-lubricating bearings turning in an extruded hole in the frame. All Blades shall be interconnected
using linkage in the frame section. Each Damper shall be operated through a UL stamped fusible link rated
at 74- or 100-Degree C. The closing of the fire damper shall be through a suitable rated spring which
will be capable of closing the blades in the event of fusible link disintegration. The option of
indication of Blade Position should be made available through a manual lever. Each Damper shall be
supplied with a factory mounted sleeve made from Minimum 1mm thick galvanized steel of minimum 150mm
length. Fire damper to be provided with limit switch and wiring up to control panel to have interlock
with AHU. | Fire Dampers shall meet the fire resistance rating of 2 hours as per UL555 and shall be

MOC | Fire Dampers shall meet the fire resistance rating of 2 hours as per UL555 and shall be tested and certified by CBRI. Fire Damper frame shall be galvanized steel of 1.6mm thickness, formed into a C channel in 4-piece construction with flanges suitable for duct connection. Damper Blades shall be single skin galvanized steel of 1.6mm thickness and must have 3 accurately roll formed longitudinal grooves for reinforcement and proper closure and operation. The blades shall be arranged in parallel to provide positive shut off. Each Blade shall have axles supported on both sides with sintered bronze self-lubricating bearings turning in an extruded hole in the frame. All Blades shall be interconnected using linkage in the frame section. Each Damper shall be operated through a UL stamped fusible link rated at 74- or 100-Degree C. The closing of the fire damper shall be through a suitable rated spring which will be capable of closing the blades in the event of fusible link disintegration. The option of indication of Blade Position should be made available through a manual lever. Each Damper shall be supplied with a factory mounted sleeve made from Minimum 1mm thick galvanized steel of minimum 150mm length. Fire damper to be provided with limit switch and wiring up to control panel to have interlock with AHU. | Fire Dampers shall meet the fire resistance rating of 2 hours as per UL555 and shall be tested and certified by CBRI. OBJECTIVE:

To document the installation of the Air Compressor Unit, ascertain that the installation is as per design Specifications lay down.

SCOPE:

This protocol is applicable to the Air Compressor Unit installed in M/s. INFARMA-
Indústria Farmacêutica, Lda

PERFORMING THE INSTALLATION QUALIFICATION:

The installation should conform to this checklist. Record all observations and deviations in the space provided in the checklist. In case of deviations prepare a deviation report along with justifications, which should be approved by the Engineering Department, Quality Assurance Manager and Validation In charge.

CHECKLIST FOR INSTALLATION OF AIR COMPRESSOR UNIT

TECHNICAL SPECIFICATIONS OF THE SUB-COMPONENTS/BOUGHT OUT ITEMS, AND THEIR MAKE, MODEL & QUANTITY

Description | Specifications | Observations | Sign & Date

Equipment | Air Compressor Unit | |

URS No | URS/MOZ/INF/019 | |

Functional Overview | Compressed air unit provides a clean and reliable source of pneumatic power for various sensors, actuators, and control devices used in process automation, ensuring precise and consistent operations. | |

Design Overview | It covers aspects such as power source, compression mechanisms, control mechanisms, storage tank, and safety features. | |

Material of construction | All parts to be designed and manufactured in line with the current standards |

|
Specification (Machine) & Dimensions | 21 CFM capacity air cooled screw air compressor units comprising of sealed screw compressor, including refrigerant air dryer & receiver. are to be installed at outside premises in the space provided.

Shall be screw type air compressor.

Shall have capacity of compressed air be 21 CFM

Shall have compressor air receiving tank of capacity 200 Liters

Shall be refrigerant type air dryer

Supply compressed air at pressure of 10kg/cm²

Machine has dry paper type suction air filter with silencer

Equipped with three-way solenoid valve which is used for loading/unload and regulation of the compressor

Shall have air / oil temperature switch

Shall have provision to shut down the compressor in case of too high outlet air temperature

Shall have view glass to check oil level and

provision for oil filling. | |

Alarms | NA | |

Operation of Equipment | The machine should have user-friendly controls for operators to set and adjust various parameters such as in, out air pressure and other relevant settings. These controls should be easily accessible | |

Specification | 'Screw' type air-cooled liquid chillers for the following operating conditions. The

chillers shall be complete with Mono/twin screw compressors, air- cooled condensers, flooded/DX type

evaporator shell and tube type, drive motor, control panel, first charge of R-134 a refrigerant, Oil,

expansion device etc., The chiller shall have stepless capacity control, as per specifications complete

with starter panel.

The evaporator will be of shell and tube type. Shell will be fabricated from rolled carbon steel plate

with fusion welded seams have carbon steel tube sheets, drilled and reamed to accommodate the tubes and

intermediate tube supports spaced no more than four feet apart. The refrigerant side will be designed &

tested in accordance with applicable pressure vessel code. Tubes shall be high-efficiency, internally and

externally enhanced type having copper tubes. Each tube will be roller expanded into the tube sheets

providing a leak proof seal and be individually replaceable. The evaporator shall be provided with

Insulation of 32 mm thick nitrile rubber insulation finished with glass cloth. | 'Screw' type air-cooled

MS- C class condenser water piping | MS- C class condenser water piping | MS- C class condenser water piping | MS- C class condenser water piping

Specification | MS-C class condenser water piping conforming to IS1239/IS3589 specifications cut to required lengths & installed with welded joints including fittings such as bends, elbows, tees, reducers, rubber gaskets, Piping shall be supported from slab/walls/floor by MS supports and half round wooden/ puff support below pipes. Insulated CHW piping; using MS "C" class pipes are insulated with insulation and aluminium cladding. Brush & clean pipe surface before applying insulation. Stick insulation material using a thin film of manufacturer-recommended adhesive on both pipe and insulation. Seal all joints airtight. Provide minimum 25mm thick insulation up to 40 mm diameter piping, and minimum 32 mm thick insulation from 50 to 150mm diameter and above piping.

Piping shall be supported from slab/walls/floor with adequate vibration isolation & half round wooden/puff support below pipes | MS-C class condenser water piping conforming to IS1239/IS3589 specifications cut to required lengths & installed with welded joints including fittings such as bends, elbows, tees, reducers, rubber gaskets, Piping shall be supported from slab/walls/floor by MS supports and half round wooden/ puff support below pipes. CONTENTS

1.0 OBJECTIVE:

To document the installation of the Cold Room Unit, ascertain that the installation is as per design Specifications lay down.

2.0 SCOPE:

This protocol is applicable to the Cold Room Unit installed in M/s. INFARMA- Indústria Farmacêutica, Lda

3.0 PERFORMING THE INSTALLATION QUALIFICATION:

The installation should conform to this checklist. Record all observations and deviations in the space provided in the checklist. In case of deviations prepare a deviation report along with justifications, which should be approved by the Engineering Department, Quality Assurance Manager and Validation In charge.

4.0 CHECKLIST FOR INSTALLATION OF COLD ROOM

EQUIPMENT DESIGN, PRINCIPLE AND REVIEW OF USER REQUIREMENTS

SPECIFICATION (URS).

TECHNICAL SPECIFICATIONS OF THE SUB-COMPONENTS/BOUGHT OUT ITEMS, AND

THEIR MAKE, MODEL & QUANTITY

DETAILS OF UTILITIES

5.0 List of Document/Certificates for the following components to be attached –

6.0 RESULTS:

7.0 List of Deviations: (If any)

8.0. Justification of Acceptance

7.0 CONCLUSION:

Based upon the observations recorded in the table given above, the installation of the cold room is found to be satisfactory / is found not to be satisfactory as per the design specifications. therefore, installation of the cold room is / is not qualified and the operation qualification can / cannot be performed.

Description | Specifications | Observations | Sign & Date

Equipment | Walk-In Cold Room (Capacity 90000L) | |

URS No | URS/MOZ/INF/010 | |

Functional Overview | The Cold Room is capable of providing 2-8°C temperature uniformly to all the material stacked on pallets and SS racks/ plastic tubs. | |

Design Overview | Cold room design Overview:

A pharmaceutical cold room is a temperature- controlled space that is used to store temperature-sensitive pharmaceutical products, such as medications, vaccines etc.

some of the common factors consider for design are:

Temperature range: The temperature range for a pharmaceutical cold room is between 0°C and 8°C,

Insulation: The insulation of a cold room is designed to ensure good thermal performance and energy efficiency, as well as prevent heat transfer and air leakage.

Refrigeration system: The refrigeration system of a cold room is designed to provide consistent and reliable cooling, as well as comply with the environmental and safety regulations. The refrigeration system is designed to meet the | |

| required temperature range and capacity and should be equipped with sensors and alarms to monitor and control the temperature.

Shelving and racking: The shelving and racking of a cold room is designed to maximize the storage space and allow easy access to the stored items. The shelving and racking should be made of stainless-steel materials that are durable, corrosion-resistant, and easy to clean.

Doors: The doors of a cold room are designed to be well-insulated and sealed to prevent temperature fluctuations and air infiltration. The doors are sturdy and easy to open and close.

Lighting: The lighting of a cold room is designed to provide adequate visibility and safety, as well as minimize heat generation and energy consumption. Energy-efficient LED lights are provided, as they have low heat output and high performance at low temperatures.

Flooring: Cold rooms are designed to provide epoxy flooring for easy cleaning and to prevent any microbial proliferation.

Bollards: cold rooms are protected by providing bollards in front of the cold rooms to prevent any physical damage to the cold room panels while using pellet truck/stackers | |

| Vinyl curtains: Cold rooms are provided with the vinyl curtains to prevent warm air infiltration while doors are open

Noise level: it is designed to provide noise level below 85 dB | |

Material of construction | Prefabricated Construction

Panel MOC- PPGI

Type of insulation- PUF

Gasket cladding for Installation on 60 mm thick panels, SS 304 Integrated pad lock,

PUF Slab
60 mm Thick PUF slab with one side Trafelt

Lighting: LED type light

Working Condition: - 2-8 °C

Refrigeration System:
Should designed for Summer / Monsoon seasons
Indoor design 2-8°C

Refrigerant Used: R407C | |

| Control Logic: -

The evaporator fan is interconnected with the compressor. First the evaporator fan starts, if the HP/LP switch and thermostat are all found healthy then only compressor will start. This is to protect the compressor. In case any of these are not working, the compressor will not start.

The compressor is interconnected with the temperature controller. The sensor linked with temperature controller senses the return air temp in room, if the temp is below the set parameter the compressor will trip and vice – versa.

The thermostatic expansion valve is provided in between the condenser and near evaporator unit. The need of expansion valve is to regulate the flow of refrigerant as per load in room. The probe connected to valve is mounted just after the evaporator, it senses the refrigerant required as per the requirement the valve regulate.

For the safety of compressor, the High pressure and Low-pressure switch is provided in condenser unit. discharge pressure is high

the compressor will trip and if the suction | |

| pressure is low, the compressor will trip automatically. | |

Alarms | Alarm shall be provided

High Temperature Alarm / Low Temperature alarm.

HP/ LP Trip Alarm

Condenser Fan Fault alarms.

Under voltage and /High voltage display

Alarm communication audible and visual. | |

Data Logging | Cloud based data logging model

OBJECTIVE:

To document the installation of the De dusting tunnel Unit, ascertain that the installation is as per design Specifications lay down.

SCOPE:

This protocol is applicable to the De dusting tunnel Unit installed in M/s. INFARMA- Indústria Farmacêutica, Lda

PERFORMING THE INSTALLATION QUALIFICATION:

The installation should conform to this checklist. Record all observations and deviations in the space provided in the checklist. In case of deviations prepare a deviation report along with justifications, which should be approved by the Engineering Department, Quality Assurance Manager and Validation In charge.

4.0 CHECKLIST FOR INSTALLATION OF DEDUSTING TUNNEL

EQUIPMENT DESIGN, PRINCIPLE AND REVIEW OF USER REQUIREMENTS SPECIFICATION (URS).

TECHNICAL SPECIFICATIONS OF THE SUB-COMPONENTS/BOUGHT OUT ITEMS, AND THEIR MAKE, MODEL & QUANTITY

Filters in the De dusting tunnel

The series of filters in the de dusting tunnel are provided to ensure removal of contamination in the inlet & outlet air. The detailed specifications for the filter series in the de dusting unit are described below.

Combination Filters

Gaskets and sealing materials.

The purpose of the gaskets and the other sealing materials is to provide perfect sealing to the removable/ dismountable parts, such as Pre Filter & Blower.

Instrumentation

Detailed specifications for different instruments for safety and process control are described below.

Blower Motor

Electronic Controller with Operating Switch

MCB

Contactors

Tube Light

Differential Pressure Gauges

Emergency Switch

Air Nozzle

Manual Conveyor Bed

Outlet air velocity

Noise level

Light Intensity

Guidance: These specifications will become acceptance criteria for the subsequent qualification/ validation activities, especially during the installation qualification.

DETAILS OF UTILITIES

IDENTIFICATION OF COMPONENTS FOR CALIBRATION

MATERIAL OF CONSTRUCTION

The following parts of the system should be provided with the suggested MOC as provided below to ensure compatibility with the product / material coming in contact.

SAFETY FEATURES

Description | Specifications | Observations | Sign & Date

Equipment | De-Dusting Tunnel | |

URS No | URS/MOZ/INF/017 | |

Functional Overview | De dusting tunnel is a specialized enclosed antechambers which are incorporated as entryways for clean-room and other controlled environments to reduce particulate contamination on the material.

De dusting tunnel utilize high-pressure, filtered air to remove dust, fibrous lint and other contaminants from object surfaces. The forceful "cleansing" of surfaces prior to entering clean environments reduces the number of airborne particulates introduced in the clean room. | |

Design Overview | De dusting tunnel is fabricated from clean-room-compatible steel materials and feature electronically powered blowers, filters and high-pressure jet nozzles. Air, with a velocity of 5,000 to 6,000 feet-per-minute (FPM), continuously streams from the jet nozzles for 15-45 seconds or set time, effectively removing loose particulate matter from the surface of material entering clean rooms. | |

Material of construction | Body of the de-dusting tunnel is made of mild steel structure clad with 18G, S.S. 304 sheet.

Blower casing- MS Powder Coating | |

Specification (Machine) & Dimensions | De dusting Tunnel dimensions

W=2200, D=,3500 H= 2050, mm.

Magnahelic gauge for pressure monitoring

Supply motor blower.

Exhaust motor blower.

Dust collection tray SS 304

Exhaust Duct

SS perforation grill

PVC curtains on the front and at the back side of the tunnel.

Dedusting tunnel is provided with the emergency power shut down switch front and back end. | |

Operation of Equipment | Once the material is received in the ware house receiving bay the material is unloaded after physical cleaning the material is loaded on to the conveyor in the dedusting tunnel manually and tunnel is switch ON. The motor blower and conveyor will start automatically and material will start moving on the conveyor, with the help of prefiltered air blower the surface of the material is blown with air coming through the prefilters.

The dust and the particulate matter shall be collected in the tray or may be exhausted out through the exhaust duct having prefilters. The dedusted material is received in the material receiving area of the ware house | |

Description | Specifications | Observations | Sign & Date

Equipment | Dynamic Pass Box | |

URS No | URS/MOZ/INF/011 | |

Functional Overview | Dynamic pass box is normally used to transfer materials and goods between cleanrooms of different class or between cleanroom and non-clean room. The primary function of the DPB is to maintain the classification and integrity of the clean environment during operations. Besides UV light and an interlock system, dynamic pass box is equipped with a suction HEPA filter of around 0.3microns. |

Design Overview | The dynamic Pass box is provided with electromagnetic interlocking arrangement for doors. The electromagnetic locking device is maintained with help of two electric magnet fixed on each door. As soon as one door is opened from one side, the opposite side's magnet lock remain activated & door gets lock into pass box and white light will get "ON". And when both doors are in locked condition white light will get "OFF" | |

Material of construction | All parts designed and manufactured in line with current standards. The body of Equipment is made of S.S. 304 | |

Specification (Machine) & Dimensions | DPB dimensions

W=1120, D=1120, H=1585 mm.

Filters

Fresh air pre-filters EU 7 is 3µ

Return air filters EU 4 is 10 µ

HEPA filters EU 13 is 0.3 µ

Blower is centrifugal Type

Locking system is electromagnetic type

Magnehelic gauge is installed to monitor the differential pressure across HEPA filters.

DOP/PAO port is provided
LED tube light is provided.
Door release button with status indication
Switch for ON/OFF is MCB type.
Noise level is < 75dB at the distance of 1m from DPB ||
Alarms | In case of any Mechanical /Technical/Operational errors there is a provision of alarm system. |
|
Operation of Equipment | After cleaning the DPB internally with 70% IPA switch on the MCB, motor blower will start automatically. Keep it ON for some time till the differential pressure across the HEPA filters is maintained. Place the material to be transferred by opening the door from one side, the door of other side will not open due to the interlocking system. Once the material is placed allow the material to stand in the DPB for the time as per validation studies. Unload the material from other side by opening the door. ||

Performance Qualification Procedure

The Standard Operating Procedure (SOP.) shall be prepared based on instruction given in the operating manual of machine.

Prior to the qualification test, the personnel shall be trained by the Engineer from the supplier (if reqd.) on the performance feature of equipment. This training shall be recorded in section 7.1.

The trained person shall carry out the performance Qualification following the procedure mentioned in 7.2 for Operation & Record the observation of qualification test in test data sheet of 7.2.1 and performance check as in 7.3.

Operate the machine as per the draft SOP. Record the change if any and confirm the SOP. Report the confirmation of SOP in section 7.4.

Report the deficiency from the specified function. If any in the section 7.5.

Training

Signature of Trainer: _____

Date: _____

Operation and testing

Purpose:

The purpose of this procedure is to check the overall performance & function as specified in the operating manual of machine.

Testing & Programming:

For the parameters specified, In the Operational Qualification, the Performance of the equipment has to be checked for certain amount of operations continuously. e.g.

i) Consistency of the output speed.

ii) Quality of labelling & Printing and consistency of the same.

* Note: Program Data may be changed, it depends on Label Length & Bottle / Product Shape / Size / Dia.

Deviations (if any)

Summary :-

All the above mention points are checked for correct technical data as per Purchase Order & found to be satisfactory.

All the drawing in operating manual have been checked and approved. The documentation required is checked and found correct.

The Machine / Equipment as built confirm to the design specification, operate as per the operating instruction manual & draft SOP. All over Machine operations and performance found satisfactory; hence, the Performance Qualification is complete.

Ensuring Access to Medicines in
East Africa: Lessons from India

SAKTHIVEL SELVARAJ
ABOUT THE AUTHOR

Sakthivel Selvaraj is Director, Health Economics, Financing and Policy, at the Public Health Foundation of India (PHFI), New Delhi. He is currently engaged in research, teaching and advocacy in the area of health systems, and specifically, healthcare financing and access to medicines. He was a Takemi Fellow (Post-Doctoral) at the Harvard School of Public Health, Boston, and a Fulbright Scholar in 2006-07. He has a PhD in Health Economics (1996-2001) from Jawaharlal Nehru University, New Delhi.

ABSTRACT

Africa faces various challenges in ensuring equitable access to life-saving drugs. Drug prices in the continent are largely unregulated, making locally produced drugs more expensive than the imported ones. The African countries thus rely heavily on imports to meet their pharmaceutical needs. Further, the medicine delivery systems in the countries are encumbered by the poor implementation of regulatory policies, if they are in place at all. East African countries, in particular, struggle to nurture domestic drug-manufacturing capacities and suffer from a shortage of both factories and trained human resource. India, for its part, is widely regarded as a "global pharmacy," meeting its own local needs as well as foreign demand for medicines. This paper discusses the challenges facing the pharmaceutical sectors of five East African countries, and explores the potential for learnings from the successes of the Indian pharmaceutical industry.

ORF OCCASIONAL PAPER # 201 JULY 2019 1
ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

INTRODUCTION

With an estimated population of 1.2 billion, Africa accounts for
1
approximately 16 percent of the global population but almost 24
percent of the global disease burden. Seventy percent of all HIV patients
2
and 90 percent of malaria fatalities are recorded in African countries. The lack of access to essential life-saving medicines is thus a major challenge in the continent. Africa faces various barriers in ensuring equitable access to drugs, including inadequate public expenditure, insufficient financial-risk protection, ineffective public procurement systems, exorbitant drug prices, and low availability of essential medicines at public health facilities. These countries rely primarily on imported pharmaceutical products to meet local needs, due to the lack of a robust domestic pharmaceutical industry. According to the World Health Organization (WHO), more than 90 percent of the 54 national medicines regulatory authorities (MRAs) across Africa have minimal or no capacity³ to regulate various aspects of medicine manufacture and delivery.

This paper studies the pharmaceutical sector in five East African countries: Ethiopia, Kenya, Tanzania, Rwanda and Mozambique, discussing domestic pharmaceutical production, drug-procurement processes, medication availability and prices, and pharmaceutical regulations. The final section of the paper examines the successes of India's pharmaceutical industry in specific states and concludes with an exploration of what the East African countries can learn from the Indian experience.

I. PHARMACEUTICAL MARKET AND PRODUCTION

East African countries have a limited capacity for manufacturing pharmaceutical products. Thus, they rely mostly on imports—of

2 ORF OCCASIONAL PAPER # 201 JULY 2019
ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

finished products, raw ingredients and active pharmaceutical ingredients (APIs)—to meet the rapidly growing local demands. Much of the East African market is dominated by generics and medicines imported from India. Given the rapid growth in the market, there is immense scope for existing local manufacturers, with government support, to enhance their capacities and for new manufacturers to emerge. However, the sustainability of large-scale local production is predicated upon its efficacy and the extent of government subsidies provided. With populations ranging between 11 million and 100 million in the five countries discussed in this paper, domestic production can thrive if handled correctly.

Ethiopia

The Ethiopian healthcare market has an annual growth rate of 25 percent, valued at US\$400–500 million per annum. The country has approximately 200 importers and 22 local industries of pharmaceutical products and medical consumables. Of the 22, nine are involved directly in the manufacture of products, only two of which are Good Manufacturing Practices (GMP) certified. Local manufacturers supply only about 20 percent of the local demand and 90 of the 380 drugs on the national essential medicine list (EML).⁴ Moreover, no local company manufactures APIs in the country.

Despite government support, the Ethiopian industries face several challenges, such as limited access to foreign currency, difficulties in procuring raw materials, and constraints in human-resource capacity. A 2013 survey by Ewen M. et al. indicated that 55.4 percent of the products across all sectors were manufactured in Ethiopia and the remaining imported from India (17.6 percent), Cyprus (seven percent), Germany (5.1 percent), France (2.1 percent) and South Korea (1.9 percent). The availability of branded generics, INN generics and

ORF OCCASIONAL PAPER # 201 JULY 2019 3
ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

originator brands in Ethiopia was 74.6 percent, 20.7 percent and 4.7 percent, respectively.

Kenya

In 2014, Kenya was the largest and fastest-growing pharmaceutical market (US\$740 million) in East Africa, with an estimated compound annual growth rate (CAGR) of 15 percent from 2007.¹⁰ The market share of locally produced pharmaceutical products by value increased from 28 percent in 2010 to 30 percent in 2014. Around 70 percent of the pharmaceutical products were imported from other countries, particularly India and China, which together accounted for 50 percent of the total imports. The market was dominated by generics (62 percent), and almost 50 percent of the market by value was made up by anti-infective immunological and cardiovascular agents.¹² The pharmaceutical market in Kenya is significantly concentrated: about 80 percent of the total production comes from the 10 biggest manufacturers.¹³

According to the Kenya National Bureau of Statistics, the imports of pharmaceutical products rose to US\$604.50 million in 2016 from US\$396.50 million in 2011, mainly on account of generic drugs and raw materials. While the country's domestic manufacturers depend on imports for APIs,¹⁴ amongst East African countries, Kenya leads in the export of pharmaceutical products. In 2015, nearly 50 percent of its pharmaceutical exports went to Uganda and Tanzania.^{15,16} The export value increased from US\$74.46 million in 2011 to US\$131.90 million in 2016.¹⁷ The total value of pharmaceutical exports in 2015 was US\$71,200,000 (1.20 percent of the total exports), while the total value of pharmaceutical imports was US\$572,533,000.¹⁸ Further, data from the Kenya Pharmacy and Poisons Board (KPPB) show that pharmaceutical sales in the country increased from US\$826 million in 2016 to US\$919 million in 2017.

4 ORF OCCASIONAL PAPER # 201 JULY 2019
ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

Despite the increase in export and local sales, the overall contribution of Kenya's pharmaceutical industry to the GDP remains negligible (1.22 percent in 2017).¹⁹ Pharmaceutical companies have now started joint ventures or buyouts with leading Indian (Strides, Cipla) and South African (Aspen Pharma) companies, and are using their own funds (e.g. CDC Capital's investment in Abacus Parenteral Drug Ltd.) to expand operations and improve manufacturing standards. However, companies are yet to invest in research and development, which is crucial for the development of the sector.²⁰

Tanzania

Tanzania has a robust pharmacy system: 88.9 percent of its health facilities have a functional pharmacy department, and 92.9 percent of the essential medicines are generally available.²¹ Branded drugs constitute 46 percent and generics, 54 percent of the market in the

country. Eight of all Tanzanian pharma companies are registered manufacturers, and their local production meets 31 percent of the national demand. The remaining 69 percent is imported, mainly from

22

India. Raw ingredients, too, are mostly imported from other countries. In 2013, local production decreased to 15 percent of the pharmaceutical market share (US\$48.7 million), from 35 percent in 2009 (from US\$49.2 million). Pharma exports declined as well, from US\$7.9 million to US\$1.7 million. Consequently, the import value of pharmaceutical products increased from US\$99.4 million in 2009 to US\$286 million in 2013.²³

Rwanda

Rwanda's pharmaceutical market was estimated to be worth US\$75 million in 2014, with a CAGR of 12.85 percent from 2007 to 2014.²⁴ The country has only one domestic pharmaceutical factory, which

ORF OCCASIONAL PAPER # 201 JULY 2019 5

ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

manufactures a few essential medicines.^{25,26,27} The total local production comprises three percent of the overall market, of which 56 percent are generic drugs and 44 percent are branded. More than 95 percent of the drugs are imported to meet local demands, along with most of the manufacturing ingredients. In 2015, the total import value of pharmaceuticals was US\$83.1 million.²⁸ Of Rwanda's total exports,²⁹ pharmaceutical products make up only 0.04 percent, at US\$242,000.

Mozambique

Mozambique has a single pharmaceutical producer, which started its operations in 2013, with support from the Brazilian government. Public expenditure on pharmaceuticals increased from US\$78 million to US\$122 million between 2004 and 2012. In 2012, Mozambique's pharmaceutical imports were valued at approximately US\$140 million, a per-capita drug expenditure of US\$5.55. The share of public-sector imports is 85 percent (US\$122 million) of the total market value, mainly supported by external funds and donations and managed by the Ministry of Health (MoH). Mozambique has 54 formally registered private importers, but more than 50 percent of the imported drugs in 2012 came from the four biggest importers. Private operators import 2,572 registered pharmaceutical products in Mozambique from India (55 percent), Portugal (12 percent) and Brazil and Germany (combined, five percent).³²

II. PUBLIC-SECTOR PROCUREMENT OF DRUGS

A reliable procurement system ensures access to medicines in sufficient quantities at the lowest possible rates, so as to secure maximum value for the most number of beneficiaries possible. This requires an Essential Medicines List, quantity and quality assessment, regular procurement of medicines, supply-chain management and timely payment to

6 ORF OCCASIONAL PAPER # 201 JULY 2019

ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

suppliers. An inefficient system can lead to exorbitant prices and medicine shortages at the point of delivery.

Ethiopia

The Ethiopian government procures almost 70 percent of the country's pharmacological requirement through the Pharmaceutical Fund and Supply Agency (PFSA), via centralised international tenders. Procurement through the PFSA increased from US\$27 million in 2007 to US\$310 million in 2014. The government offers a 25-percent price preference to local manufacturers and makes an advance payment of 30 percent. Additionally, tax-free loans are provided for new investment and upgrading local production, 70 percent and 60 percent, respectively. Procurement prices for locally produced products are higher than imported products, at 1.20 times and 0.84 times the international reference prices (IRPs), respectively. Locally produced products are also priced 45 percent higher than imported products.³⁷

Kenya

Centralised and decentralised procurement of pharmaceutical products happens through tender bids (not publicly available). The Kenya Medical Supplies Agency (KEMSA), a semi-autonomous primary public procurement agency, is responsible for centralised procurement.^{38,39} The KEMSA receives funding from the Government of Kenya and other development partners, to procure medical supplies for rural health facilities. Around 70 percent of Kenya's pharmaceutical products are imported from other countries, with India and China together

41

accounting for 50 percent of the total imports. The Kenyan government gives 15-percent price preference for all medicines produced in Kenya and 10 percent for all imported medicines traded by companies with at least 51 percent Kenyan ownership. Under special

ORF OCCASIONAL PAPER # 201 JULY 2019 7
ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

circumstances, Kenyan law has provisions for the importation of unlicensed drugs.⁴³

Tanzania

All public facilities in Tanzania use either an allocated financial budget or an established budget ceiling for the procurement of medicines and medical supplies. The budget allocated for pharmaceuticals in the public sector was increased from US\$14.1 million to US\$28.5 million from 2000 to 2007, and the spending on essential drugs was increased by almost 50

percent from 2002 to 2005. However, this was not enough to meet the national need for medicines. In 2005, approximately 75 percent of the total spending on drugs was borne by the Ministry of Health and Social Welfare (MoH&SW) of Tanzania, and the remaining 25 percent by donors. Government allocation included donations and funding from other agencies, e.g. the Global TB Fund and Global Alliance for Vaccines and Immunisation. The MoH&SW obtains funding from donors through the Ministry of Finance (MoF), and the MoF allocates a quarterly share of resources to the MoH&SW, which then distributes resources for drugs to the Medical Stores Department (MSD). The MSD must follow the Public

Procurement Act no. 21, 2004, in the process of procurement.

For essential drugs, internal resources are the main sources of funding. In 2005–06, funds were reported to be underutilised due to delays in the allocation of money, stock-out of drugs at the MSD, and the inflexibility of the system to adapt to such delays.⁴⁷ The procurement of essential medicines is the responsibility of the MSD tender board at the central stores; the managers at the zonal level; and individuals such as supplies officers, nursing officers and pharmacists. Over 80 percent of the essential medicines and supplies are procured through international competitive bidding, 10 percent through selective bidding and five percent through national competitive bidding. Once procured, the

8 ORF OCCASIONAL PAPER # 201 JULY 2019
ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

essential drugs are stored at the MSD and then distributed to primary health facilities and hospitals via zonal stores. Public wholesalers give a 15-percent price preference to the local manufacturers. A 2017 survey by Ewen M. et al. indicated that the Tanzanian government pays 0.69 and 1.34 times the IRPs for local and imported products, respectively.

In addition to the drugs on the EML, the MSD also procures medicines requested by health institutions. Similarly, only about 52 percent of health facilities procure medicines within the EML. Three main reasons for non-compliance were recorded: a) the prescribers did not agree with the Standard Treatment Guidelines (STG); b) local needs were not addressed; and c) suppliers did not have stocks for the EML products.

Rwanda

In Rwanda, the Medical Production and Procurement Division (MPPD), referral hospitals (BUFMAR) and private pharmacy wholesalers are responsible for procuring pharma products. Public procurement of health commodities is done through international competitive biddings.⁵² To import drugs, the WHO prequalification and the approval of the Stringent Regulatory Authority is required.⁵³ There is a provision in the law to import unlicensed medicines in special circumstances.

Mozambique

Mozambique's pharmaceutical market is dominated by the public sector and a highly concentrated group of private wholesalers and importers. In the public sector, drugs are procured—local and imported—and distributed through the MoH's Central Drugs and Medical Supplies Agency (CMAM). The CMAM uses an open-tender procedure for the procurement of pharmaceuticals. Occasionally, it buys drugs from

ORF OCCASIONAL PAPER # 201 JULY 2019 9
ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

private importers/wholesalers.⁵⁵ APIs are exempt from import duties to promote local production in Mozambique. The Mozambique

government gives a 15-percent price preference to the local producers, over the cheapest competing international bid. In case of emergencies and drug stock-outs, procurement is done through local producers to shorten the regular drug-acquisition cycle.⁵⁷

III. AVAILABILITY OF ESSENTIAL MEDICINES

The success of a government procurement system can be measured by, amongst others, the availability of medicines at the point of delivery. Where patients rely on the private sector, drug availability in private pharmacies is crucial as well.

Ethiopia

A 2013 survey conducted in Ethiopia found that the mean availability of medicines in the public sector was 64 percent,⁵⁸ with locally produced drugs being more available than imported ones, at 48 and 19 percent, respectively. The mean availability of branded generics was 37 percent (local) and 10 percent (imported) and that of INN generics was 14 percent (local) and nine percent (imported). No originator brand was found in the public sector.^{59,60}

In the private sector, the mean availability of imported and local pharma products, together, was 73 percent. Local products had greater availability than imported products, at 54 percent and 35 percent, respectively. Branded generics (local, 42 percent; imported, 29 percent) were more easily available than INN generics (local, 13 percent; imported, three percent). The availability of imported originator brands was nine percent, and no local originator brand was found in the private sector.^{61,62}

Tanzania

The availability of essential drugs across Tanzania's MSDs varied significantly in 2005–06. The central MSD had 97 percent availability of drugs, while at some zonal stores, it was 51 percent. The availability of essential drugs at district hospitals was very low and varied between 51.3 percent and 59.5 percent. The average availability of drugs was lower at primary health facilities than in hospitals, at 52.8 percent and 64

74.6 percent, respectively.

In 2008, the MoH&SW conducted a survey in public healthcare facilities to assess the medicines supply management system. The overall availability of stock at the facility level was 65 percent and 65

ranged from 52 to 96 percent per category of product. In 2007–13, the median availability of selected generics in the public and private healthcare sectors was 37.8 percent and 50 percent, respectively.⁶⁶

Ewen M. et al. reported that in the public sector, the availability of imported products was greater, at 32 percent, than that of local products, at 21 percent. The mean availability of both was 52 percent. Branded generics (local, 15 percent; imported, 27 percent) had higher availability than INN generics (local, six percent; imported, five percent). The availability of imported originator brands was only four percent in the public sector.

In the private sector, the mean availability of medicines (local and imported) was 82 percent, with the availability of local products at 21 percent and imported at 70 percent. Branded generics (local, 19 percent; imported, 58 percent) had greater availability than INN generics (imported, two percent; local 12 percent). The availability of imported originator brands was seven percent.⁶⁷

IV. PRICING AND PRICE REGULATION

Affordable pricing is crucial for ensuring equitable access to pharmaceuticals. In East Africa, prices for domestic products are generally higher than for imported products across sectors, and higher for most drugs in the private than in the public sector. The lack of price regulation makes medicines unaffordable in these countries, often resulting in patients forgoing treatment.

Ethiopia

In the public sector, local branded generics are priced 23 percent higher than imported branded generics, while in the private sector imported

ORF OCCASIONAL PAPER # 201 JULY 2019 13

ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

branded generics are priced 153 percent higher.⁶⁹ The median price ratio (MPR) of branded generics was 1.41 for local products and 1.14 for imported products. For INN generics, too, the MPR for local products are slightly higher than for imported products.^{70,71} Neither drug prices nor supply-chain mark-ups are regulated in Ethiopia. The government does not levy value-added tax (VAT) or goods and services tax/general sales tax on medicine, but an import duty of five percent is applicable to

72,73

all imported products and APIs. The Ethiopian government applies a 53-percent mark-up on imported products, but only a 17-percent mark-up on local products, thereby supporting the local manufacturers.

74,75

In the private sector, the MPR is lower for local products than for imported products, at MPR 1.8 and 5.44, respectively. Consumers have to pay 193 percent more for imported products. Imported branded generics (MPR 4.33) were 153 percent more expensive than local products (MPR 1.71). For INN generics, the MPR of local products was slightly higher than for imported products, at MPR 2.17 and 2.08, respectively. Originator brands were available at higher prices than the generics.^{76,77}

For branded generics in all sectors of healthcare, consumers pay approximately 13 percent less for local products (MPR 1.44) than for imports from India (MPR 1.64), 60 percent less than for those from Cyprus, and over 90 percent less than those from Germany. INN generics imported from India (MPR 1.57) are only slightly more expensive than those produced in Ethiopia (MPR 1.45).

Kenya

The WHO/HAI pricing survey (2004) showed that the public procurement prices of generics (MPR 0.65) were below the International Reference Prices (IRPs) in Kenya, while prices paid by

14 ORF OCCASIONAL PAPER # 201 JULY 2019

ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

consumers were greater than the IRPs. In the government facilities, patients paid 1.99 times the IRPs for generics and 3.6 times the IRPs for originator medicines. In the private sector, consumers paid 3.33 and 18.1 times higher prices for generics and originator drugs, respectively.

79

Tanzania

Public-sector patients in Tanzania frequently need to pay OOP to buy drugs and supplies. About 44.4 percent patients pay for drugs either directly through OOP spending (64.2 percent) or indirectly through the payment of user charges or prepayment for health insurance plans, such as the NHIF (16.5 percent), the CHF (11 percent) or other schemes (8.3 percent).⁸⁰ According to Ewen M. et al., 2017 consumers pay seven percent more for local products (MPR 1.44) than for imported products (MPR 1.35). Additionally, consumers pay 135 percent and 65 percent more than the government procurement prices for local and imported products, respectively.

In the private sector, consumers pay similar prices for local and imported products, 2.27 and 2.29 times the IRPs, respectively.⁸¹

Rwanda

The prices of health commodities in Rwanda are steep and unaffordable to the majority of the population as the country has no pharmaceutical pricing policy in either the public or the private sector.

Mozambique

Russo G. et al. conducted a study to investigate medicine prices in urban Mozambique and the forces influencing them. They collected wholesale and retail prices for 25 originators/innovators and generic drugs from 10 public and 34 private pharmacies. Sixteen drugs were selected out of

ORF OCCASIONAL PAPER # 201 JULY 2019 15

ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

the 25 on the HAI/WHO list and adapted to the country's context, and the remaining nine drugs were those prescribed most frequently in Mozambique.⁸³

The study demonstrated that retail prices for generic medicines in Mozambique's government urban outlets are lower than the MSH reference prices,⁸⁴ while in the private sector, prices are four to five times that of the MSH reference prices. Originator brands available only in the private sector are 23 times the MSH reference prices. The study noted intercity price variations for both generics and originator brands. In the private sector, branded versions of the same drug are four to five times more expensive than the generic version. However, even the lowest priced generics are, on average, 10 times more expensive in the private sector than in the public sector. Treatments for acute conditions are more affordable than treatments for chronic conditions such as diabetes, hypertension and psychiatric illnesses in both sectors.⁸⁵

V. PHARMACEUTICAL REGULATION

Pharmaceutical regulation at different stages of production, importation, distribution and dispensing is essential to ensure the

availability of quality drugs.

Ethiopia

Ethiopia has a comprehensive law for the regulation of drugs, to safeguard public health from unsafe and substandard medicines. Based on Proclamation 661, 2009, the medical legislation of Ethiopia aims to ensure that all drugs (local or imported) available in the market are safe, effective and consistently meet the acceptable quality standards. The governing body of medicine regulation in Ethiopia—the Food, Medicine and Healthcare Administration and Control Authority—applies

16 ORF OCCASIONAL PAPER # 201 JULY 2019

ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

numerous controls at all levels of pharmaceutical activities to regulate the manufacturing, distribution, marketing, prescription, labelling and dispensing of pharmaceutical products.⁸⁶

Kenya

Kenya's national medicine policy document is the Kenya National Pharmaceutical Policy (KNPP), last updated in 2010. The KNPP addresses important issues related to the selection of essential medicines, medicine financing, pricing, procurement, distribution and regulations, as well as the rational use of medicines, pharmacovigilance^{87,88,89}

and research. The MRA, monitored by the Pharmacy and Poison Board under the MoH, is involved in the African Medicines Regulatory Harmonisation and the Harmonisation of Medicines Registration in the East African Community. All pharmaceutical products (domestic or imported) must be registered with the MRA before being sold in Kenya. Pharmaceutical manufacturers are required to be registered under the MRA and comply with GMP, while wholesalers and distributors must comply with Good Distributing Practices. The country has a WHO-prequalified medicines quality-control laboratory (QCL) for the testing of medicines.^{90,91,92}

For imported products, Kenya has legal provisions for their testing

93

and inspection at the authorised port of entry as well as for the

94

promotion and/or advertisement of medicines. Custom duty and VAT are not levied on the import of pharmaceutical products or

95,96 97

ingredients, only on some packaging materials and locally procured products.⁹⁸ The country has national STGs for most common illnesses

99

and a national EML comprising 359 drugs. The copy of EML and STG are available in 42 percent and 39 percent of public health facilities, respectively.¹⁰⁰

ORF OCCASIONAL PAPER # 201 JULY 2019 17

ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

In 2001, Kenya modified the Intellectual Property (IP) Act, its national patent law, to comply with the Trade-Related Aspects of

101

Intellectual Property Rights (TRIPS) Agreement. The country allows patent protection for products and processes for a 20-year period. The law incorporates all flexibilities and safeguards in line with the TRIPS Agreement, namely, compulsory licensing, Bolar exemptions and parallel importation. However, as of 2010, the government had not yet

102

utilised these flexibilities to improve access to drugs. There are legal provisions for data exclusivity for pharmaceuticals, but none for patent extension or linkage between patent status and marketing

103

authorisation.

Tanzania

Tanzania has national medicines policies (NMPs), based on the WHO's recommendations, such as evidence-based selection, proper supply-chain management, rational use of medicines, affordable medicines, appropriate financing, human resource development, monitoring and evaluation, research, technical cooperation amongst countries, and

104

legislative and regulatory frameworks for pharmaceuticals.

The country has several pharmaceutical legislations: the Tanzania Food, Drugs and Cosmetic Act, 2003 (amendments in 2004 and 2014); Pharmacy Act, 2011; Traditional Medicines Act, 2002; Procurement Act, 2011; and Industrial and Consumer Chemical Act, 2003. The Tanzania Food and Drug Authority—a semi-autonomous supervisory body—regulates food, medical devices, cosmetics and herbal drugs in addition to pharmaceutical products.^{105,106} Medicine registration requires mandatory compliance with the national GMP (based on the WHO's guidelines).¹⁰⁷ The country has a WHO-prequalified medicines QCL, part

108,109

of the national MRA. Under special circumstances, an external

110

laboratory may be contracted for the quality check of medicines.

18 ORF OCCASIONAL PAPER # 201 JULY 2019 ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

In 1991, the government enforced a first national drug policy, an STG and a national EML for Tanzania (NEMLIT), revised in 1997. According to a survey, the 2007 revised draft of NEMLIT was available at the MSD, but treatment guidelines were available only for tuberculosis (in the version last reviewed in 2005–06). It was found that the EML was available in 80 percent of zonal stores and 38 percent of health facility pharmacies.¹¹¹

Rwanda

Rwanda started work on its national medicines policy in 2009, which is yet to be approved.¹¹² Currently, the medicine regulatory function is performed by the MoH,¹¹³ and the Pharmacy Task Force under the MoH acts as the legislative authority. The country also has a WHO pre-qualified functional QCL under the Rwanda Standards Board of the ^{114,115}

Ministry of Trade, Industry and EAC Affairs. Some challenges currently affecting the pharmaceutical sector include the lack of an ¹¹⁶

autonomous MRA, high production and transportation costs, inadequate financial support, the lack of an investment strategy, a shortage of skilled personnel, and a dearth of information on market ¹¹⁷

size. As of 2016, pharmaceutical products were expected from patentability to take advantage of the flexibilities in the TRIPS.¹¹⁸

Mozambique

In Mozambique, pharmaceutical functions are regulated as per the Medicines Act under Law 4/98 and are supported by other regulations and norms. The Pharmaceutical Department under the MoH acts as the regulatory authority and all pharmaceutical products must be registered under it for quality and price control.^{119,120} The Pharmaceutical Department is supported by the Inspection Directorate and the National Laboratory for Medicines Quality Control.¹²¹ The national EML

ORF OCCASIONAL PAPER # 201 JULY 2019 19 ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

of the country (last updated in 1999) comprises 415 medicine formulations.¹²² Mozambique has no autonomous MRA.¹²³

While some East African countries have comprehensive laws and policies for the regulation of medicines, others are still working towards the introduction of such policies. However, legal provisions alone are not sufficient; it is crucial to ensure their implementation at all levels to strengthen the public health institutions and ensure equitable access to quality pharmaceuticals.

VI. LESSONS FOR EAST AFRICA

India is often referred to as a “global pharmacy” due to its sprawling pharmaceutical industry, which not only meets local needs but also th exports medicines across the globe. During the first half of the 20 century, India was dependent on countries such as the UK, France and Germany for pharmaceutical products. With the establishment of the Hindustan Antibiotics Ltd. in 1945 and the Indian Drugs and Pharmaceuticals Ltd. in 1961, the Indian government took its first steps towards self-reliance in pharmaceuticals. However, the local industry did not develop substantially during this period, and the Indian pharmaceutical industry consisted ¹²⁴

almost exclusively of multinationals. Further, until the 1970s, multinationals were not keen on manufacturing in India, and the product patent regime prevented Indian firms from manufacturing. This resulted in an underdeveloped domestic industry, on the one hand, and exorbitant drug prices due to monopolies on the other.¹²⁵

In 1972, the Patents and Designs Act, 1911, which provided product patent protection for pharmaceuticals, was replaced by the Indian Patent Act, 1970.¹²⁶ The new Act recognised only process patents, abolishing patents on breakthrough products that could help in the development of the domestic industry. This allowed domestic firms to

20 ORF OCCASIONAL PAPER # 201 JULY 2019 ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

legally produce and sell medicines that were patented in other parts of the world. The local industry then established a reverse-engineering capacity to develop and market copies of patented medicines at lower ¹²⁷

prices. This encouraged the domestic production of pharmaceuticals, in addition to measures such as restrictions on the import of finished formulations, high tariff rates, the requirement for firms to match the import of bulk drugs to the purchase from domestic sources at a fixed ratio, and equity ceilings on foreign participation. By 1991, Indian firms ¹²⁸

were producing 80 percent of the total formulations in the country.

Today, India has over 10,500 manufacturing units and 3,000 pharmaceutical companies. The country exported pharmaceuticals (APIs, generics and alternative systems of medicine) worth US\$16.8 billion in 2016–17 and accounts for almost 42 percent of the generic medicines produced globally, which is the combined market size of Africa and the Middle East. North America is India's largest export market for pharmaceuticals and buys 34 percent of India's total exports, followed by Africa, which receives over 19 percent of India's exports.

East African countries, on the other hand, are struggling to establish in-house manufacturing capacity. Currently, there are nine local pharmaceutical manufacturers in Ethiopia, eight in Tanzania, 42 in Kenya, and one each in Rwanda and Mozambique. These countries rely primarily on imports to meet local needs. Building more factories, creating and training human resources, and fostering technical collaborations with countries that have well-established local pharma industries should be a top priority for East Africa. This will ensure the sustainability of the industry in the long run as well as improved and equitable access to essential and life-saving medicines.

Indian states follow different models of procurement and supply-chain management. Tamil Nadu, for example, pioneered the system of

ORF OCCASIONAL PAPER # 201 JULY 2019 21
ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

pooled procurement by establishing the autonomous Tamil Nadu Medical Services Corporation in 1994. The model is that of centralised procurement and free decentralised distribution of medicines at public health facilities, wherein medicines on the state's EML are sourced into every health facility through district warehouses, using passbooks with monetary entitlements. All district warehouses are linked to a central computer at the head office, and all issue and receipt of medicines are computerised under the Drug Distribution Management System. Rajasthan replicated Tamil Nadu's model in 2011 and established the Rajasthan Medical Services Corporation. In both states, a two-bid process is undertaken, comprising a technical bid and a financial bid.

Tamil Nadu and Rajasthan have thus managed to ensure efficient procurement and supply-chain management, while some states still struggle with the availability of medicines at the point of care. An assessment of the procurement systems in different Indian states

showed that for a common basket of medicines, the mean availability on the day of the survey was the highest in Tamil Nadu (81 percent), followed by Rajasthan (79 percent) and the lowest in Jammu and Kashmir (38 percent). Further, the availability was generally low at primary health centres and increased with the level of care.

Ethiopia, Tanzania, Kenya and Mozambique have established EMLs and systems of procurement. However, the outcomes have been substandard so far, with low mean availability of drugs in the public sector. The countries can benefit from studying and adopting Tamil Nadu's model of centralised procurement and decentralised distribution, with the help of autonomous procurement agencies. Smaller countries may benefit from setting up regional procurement agencies to exploit monopsony power in buying medicines from other countries, including India. East Africa can also learn from the Indian patent regime for pharmaceuticals, which successfully incorporates TRIPS flexibilities. India transitioned to

22 ORF OCCASIONAL PAPER # 201 JULY 2019
ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

the product patent system to comply with the TRIPS Agreement in 2005, which allows the signatory countries certain flexibilities in defining the scope of patentability to safeguard their public interest. The Indian Patents Act, 1970 makes good use of this provision by discouraging frivolous patenting. When Novartis, a Swiss multinational corporation, attempted evergreening for its blockbuster medicine "Imatinib" (marketed under the brand name Glivec), used for the treatment of Chronic Myeloid Leukaemia, its patent application was rejected by the Government of India. The government's decision was later challenged by the company in the Supreme Court of India, which upheld it.

Compulsory licensing (CL), another flexibility allowed under TRIPS, lets governments authorise the production of a medicine by a company other than the originator/patent holder, in the interest of public health. The Indian government utilised this flexibility by issuing a compulsory licence to the Indian generic manufacturer Natco, for producing German pharmaceutical company Bayer AG's cancer medicine Sorafenib tosylate (marketed as Nexavar) in March 2012, thereby considerably driving down the price of medicine.

South Africa, too, holds some valuable lessons for East Africa. In 2018, the former approved its new IP policy, which entails a substantive review of all patent applications and incorporates flexibilities, such as allowing patent decisions to be challenged and provisions for

compulsory licences.¹³³ The international community commended the new IP policy as an important step toward safeguarding public health in the country, through improved access to medicines.

CONCLUSION

East African countries can learn from India's successes in pharmaceuticals. They must focus on setting up a robust and

ORF OCCASIONAL PAPER # 201 JULY 2019 23

ENSURING ACCESS TO MEDICINES IN EAST AFRICA: LESSONS FROM INDIA

sustainable domestic manufacturing industry, capable of meeting domestic needs and reducing the region's reliance on imports from other countries. Pooled public procurement of medicines via an autonomous agency established solely for this purpose can be an important step towards improving the access situation in specific countries, with the possibility of setting up a single regional procurement agency for smaller countries.

The region must also work on improving regulation policies and ensuring their proper implementation. Better utilisation of the flexibilities under the TRIPS agreement, such as compulsory licensing and provisions for patent oppositions, will go a long way in improving access to affordable essential medicines by driving down prices of patented products.

	PART X: GUIDELINES ON PROCEDURAL ASPECTS FOR APPLICATIONS FOR MARKETING AUTHORIZATION OF PHARMACEUTICAL PRODUCTS.....331
	PART XI: GUIDELINES ON NAMING OF MEDICINAL PRODUCTS.....342

Acknowledgements

These guidelines were reviewed in order to tackle challenges faced by our Applicants who wish to apply for marketing authorization of human medicinal products. The review also took into consideration those challenges that arose from international best practice requirements not aligning with Tanzania Medicines and Medical Devices Authority (TMDA) requirements.

This work would not have been possible without EAC Partner States' NMRAs, Regional and International Organizations, EAC Secretariat and members of the Expert Working Group (EWG) on Medicines Evaluation and Registration (MER) of the East African Community Medicines Regulatory Harmonization (EAC MRH) Programme who tirelessly worked towards the review of the guidelines.

My appreciation is extended to TMDA staff in particular Mr. Felchism Apolinary, Dr. Shani M. Maboko, Mr. Mujtaba M. Ratansi, Mr. Denis Mwangomo, Mr. Alex Juma and Ms. Diana Njiu who worked diligently towards perfecting the document. I am further grateful to esteemed stakeholders who provided us with feedback that lead to improvement of this document.

Lastly, I wish to thank the African Medicines Regulatory Harmonization (AMRH) program partners, namely World Health Organization (WHO), International Federation of Pharmaceutical Manufacturers & Associations (IFPMA) for their valuable inputs and all individuals and institutions who have supported the development of these guidelines.

iii

Foreword

The Tanzania Medicines and Medical Devices Authority (TMDA) was established with the mission of protecting and promoting public health by ensuring quality, safety and effectiveness of drugs and medical devices including invitro diagnostic devices. The first step towards achieving this goal is to conduct pre-marketing evaluation of products so as to ensure that they meet standards of quality, safety and effectiveness before the products are allowed into the market. This is a fundamental requirement for authorization of medicinal products in Tanzania.

In fulfilment of its mission, TMDA is duty-bound to ensure that data submitted as evidence of quality, safety and efficacy is solid, credible and submitted in manner that is logical and consistent. It is also the TMDA's responsibility to ensure that the requirements to be fulfilled by our applicants are up to date and in line with best national and international practices. With this in mind, these guidelines were reviewed to update applicants on the content and format of application dossiers and to align our requirements with international best practices.

This edition combines all previous guidelines into one compendium of guidelines and introduces a new guideline on naming of medicinal products which provide guidance to applicants on how to choose appropriate brand names for their products.

This compendium of guidelines provides requirements on the quality, safety and efficacy information for active pharmaceutical ingredients (APIs) and finished pharmaceutical products (FPPs) that should be submitted to TMDA to support product dossier. Alternative approaches to the principles and practices described in this document may be acceptable provided that they are supported by adequate scientific justification. It is also important to note that the TMDA may request information or material, or define conditions not specifically described in these guidelines, in order to adequately assess the quality, safety and efficacy of a pharmaceutical product.

Therefore, adherence to all guidelines within the compendium will ensure that all relevant information is provided in registration dossiers submitted for marketing authorization. This will facilitate efficient and effective evaluation as well as approval process. It will also help to avoid queries which results in unnecessary delays in giving approvals to new medicines thereby improving access to medicines of proven quality, safety and efficacy in the shortest possible time.

iv

Scope

This compendium as a whole document is entirely applicable for human medicinal products that have been manufactured by chemical synthesis. However, each individual guideline may have a wider scope of applicability.

Depending on the scope of each individual guideline within this compendium, the principles maybe applicable to other medicinal products such as human vaccines, biotherapeutics, biosimilars and veterinary medicinal products including veterinary vaccines. (Example guidelines on labeling, naming of medicinal products and package inserts)

Specific requirements for human vaccines, biotherapeutics, biosimilars and veterinary medicinal products including veterinary vaccines can be found in the Guidelines on Submission of Documentation for Marketing Authorization of Human Vaccines, Guidelines on Submission of Documentation for Marketing Authorization of Biotherapeutic Products, Guidelines on Submission of Documentation for Marketing Authorization of Similar Biotherapeutic Products, Guidelines on Submission of Documentation for Registration of Veterinary Pharmaceutical Products and Guidelines on Submission of Documentation for Registration Immunological Veterinary Products respectively.

v

PART I:

GUIDELINES ON SUBMISSION OF DOCUMENTATION FOR MARKETING AUTHORIZATION OF HUMAN PHARMACEUTICAL PRODUCTS

1

Introduction

The "Guidelines on Submission of Documentation for Registration of Human Pharmaceutical Products' Second Edition, April 2020" is the TMDA publication which sets out procedures and requirements for the implementation of Pharmaceutical Products Registration through Common Technical Document (CTD). The CTD has five Modules:

Module 1: Administrative Requirements;

Module 2: The Quality Overall Summaries (QOS),

Module 3: The Quality Requirements for the Active Pharmaceutical Ingredients (API) and Finished Pharmaceutical Products (FPP),

Module 4: Pre-Clinical data Requirements,

Module 5: Clinical data Requirements.

The general objective of the Common Technical Document (CTD) guidelines is to provide internationally harmonized pharmaceuticals registration procedures using CTD in order to improve access to essential pharmaceuticals for prevention and treatment of priority disease conditions in Tanzania.

Adherence to the guidelines by the manufacturers/applicants will facilitate timely assessments and approvals of medicinal product dossiers by the regulatory authorities for pre-marketing evaluation, marketing authorization/registration and post-marketing review.

I wish to express my gratitude to all individuals from EAC Partner States' NMRA, regional and international organizations and EAC Secretariat and members of the Technical Working Group (TWG) on Medicines Evaluation and Registration (MER) of the East African Community Medicine Regulatory Harmonization (EAC MRH) Project who actively participated in the development of the guidelines.

Special thanks are also extended to TMDA staff and esteemed stakeholders; the dealers in pharmaceutical industry and the academia in particular members of the Tanzania Pharmaceutical Manufacturers Association (TPMA) and the Tanzania Association of Pharmaceutical Industries (TAPI) who discussed the draft guidelines and gave commendable inputs for improving the guidelines.

Glossary

The definitions provided below apply to the words and phrases used in these guidelines. The following definitions are provided to facilitate interpretation of the guidelines.

Active pharmaceutical ingredient (API)

An active ingredient is any component that provides pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease, or to affect the

structure or any function of the body of man or animals.
(USFDA Glossary of terms, it can be found online at [Drugs@FDA Glossary of Terms](#)).

Active Pharmaceutical Ingredient (API) starting material

A raw material, intermediate, or an API that is used in the production of an API and that is incorporated as a significant structural fragment into the structure of the API. (WHO Glossary of Terms).

Market Authorization Holder (MAH)

Is a person who holds authorization to place a medicinal product in the Tanzanian market and is responsible for that product.

Commitment batches

Production batches of an API or FPP for which the stability studies are initiated or completed post-approval through a commitment made in a regulatory application.

Comparator product

A pharmaceutical product with which the generic product is intended to be interchangeable in clinical practice. The comparator product will normally be the innovator product for which efficacy, safety and quality have been established.

Generic product

Is a medicinal product which has the same qualitative and quantitative composition in active substances and the same pharmaceutical form as the reference medicinal product, and whose bioequivalence with the reference medicinal product has been demonstrated by appropriate bioavailability studies.

(PHIS Glossary 2009, can be found online at: <http://phis.goeg.at/index.aspx?alias=phisglossary>)

Existing API

4

An API that is not considered a new active substance, which has been previously approved through a finished product by a stringent regulatory authority. (WHO Glossary of Terms).

Finished pharmaceutical product (FPP)

A finished dosage form of a pharmaceutical product which has undergone all stages of manufacture, including packaging in its final container and labelling. (WHO Glossary of Terms).

Innovator medicinal product

Generally the medicinal product that was first authorized for marketing (normally as a patented product) on the basis of documentation of efficacy, safety and quality. (WHO Glossary of Terms).

Manufacturer

A manufacturer is a natural or legal person with responsibility for manufacturing of a medicinal product or active pharmaceutical ingredient. It involves operations such as production, packaging, repackaging, labelling and relabeling of pharmaceuticals.

(PHIS Glossary 2009, can be found on line at: <http://phis.goeg.at/index.aspx?alias=phisglossary>)

Mock-up

A copy of the flat artwork design in full colour, providing a replica of both the outer and immediate packaging, providing a two-dimensional presentation of the packaging/ labelling of the medicine. It is also referred to as a paper copy or computer generated version.

Officially recognized pharmacopoeia (or compendium)

The official recognized pharmacopoeias are British Pharmacopoeia (BP), European Pharmacopoeia (Ph Eur.), The International Pharmacopoeia (Ph.Int), Japanese Pharmacopoeia (JP) and United States Pharmacopoeia (USP).

On-going stability study

The study carried out by the manufacturer on production batches according to a predetermined schedule in order to monitor, confirm and extend the projected retest period (or shelf-life) of the API, or confirm or extend the shelf-life of the FPP. (WHO Glossary of Terms).

Pilot-scale batch

A batch of an API or FPP manufactured by a procedure fully representative of and simulating that to be applied to a full production-scale batch. For example, for solid oral dosage forms a pilot scale is generally, at a minimum, one-tenth that of a full production scale or 100 000 tablets

5

or capsules, whichever is the larger; unless otherwise adequately justified. (WHO Glossary of Terms).

Primary batch

A batch of an API or FPP used in a stability study, from which stability data are submitted in a registration application for the purpose of establishing a retest period or shelf-life. (WHO Glossary of Terms).

Production batch

A batch of an API or FPP manufactured at production scale by using production equipment in a production facility as specified in the application.

Specimen

A sample of the actual printed outer and inner packaging materials and package leaflet.

Stringent Drug Regulatory Authority (SDRA)

A National Medicines Regulatory Authority which is strict, precise, exact with effective and well-functioning systems.

Among others, it includes regulatory authorities which are:-

- Members or observers or associates of the International Conference on Harmonization of Technical Requirements for Registration of Pharmaceuticals for Human Use (ICH) as of October, 2015

MEMBERS:

- European Union member States (Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Poland, Portugal, Romania, Slovak Republic, Slovenia, Spain, Sweden, The Netherlands, and United Kingdom
- Japan
- United States

OBSERVERS:

- European Free Trade Association (EFTA) represented by Swiss Medic of Switzerland, and Health Canada (as may be updated from time to time).

ASSOCIATES through mutual recognition agreements: Australia, Norway, Iceland and Liechtenstein (as may be updated from time to time).

6

- For medicines used exclusively outside the ICH region, positive opinions or tentative approval under any of the following three special regulatory schemes are recognized as stringent approval:-

- Article 58 of European Union Regulation (EC) No. 726/2004
- Canada S.C. 2004, c. 23 (Bill C-9) procedure
- United States FDA tentative approval (for antiretrovirals under the PEPFAR programme)

- A regulatory Authority that has been agreed by TMDA to have an effective and well-functioning medicines regulation systems.

7

1. INTRODUCTION

1.1 Background

This guideline provides guidance for applicants while preparing a Common Technical Document for the Registration of Medicines for Human Use (CTD) for submission to the TMDA. The document describes how to organize applications based on the International Conference on Harmonization of Technical Requirements for Registration of Pharmaceuticals for Human Use (ICH) guidelines on the CTD.

According to the CTD format, each application is a collection of documents, grouped into 5 modules. Module 1 prescribes Administrative Information and Prescribing Information requirements which is region specific. The Summaries, Quality, Non-clinical, and Clinical modules have been described in Modules 2 to 5, respectively. Applicants should not modify the overall organization of the CTD.

If not contained in the bulk of the documentation, any additional data should be included as addenda to the relevant part, together with additional expert comment that may be provided as a supplement to, or incorporated into, the relevant summary, overall summary or overview.

Information in these Modules should be present in relevant sections.

For application procedures refer Guidelines on Procedural Aspects for Application for Market Authorization for Human Medicinal Products.

1.2 Scope

These guidelines will assist applicants to prepare applications to register medicinal products for human use in East Africa Partner States. The format for applications is the Common Technical Document (CTD).

These guidelines apply to MA applications for medicinal products containing APIs of synthetic or semi-synthetic origin. Biological, biotechnological and herbal products are not covered by these guidelines.

8

MODULE 1: ADMINISTRATIVE INFORMATION AND PRODUCT INFORMATION

Module 1 should contain all administrative documents (for example, application forms and certifications), labelling, general correspondence and annexes (environmental assessments, antibiotic resistance and overseas evaluation reports), as needed. Documents should be organized in the order listed below. Generally, all of the documents in Module 1, other than the annexes, can be provided in a single volume. The annexes to the module should be submitted in

separate volumes. Official language is English as a mandatory language for all medicines.

Products shall be evaluated on a First in First out (FIFO) basis and the timeline for review and approval should be within 12 months.

1.1 Comprehensive table of contents for all modules

Module 1 should include a comprehensive table of contents for the entire application. The comprehensive table of contents should include a complete list of all documents provided in the application by module. In the table of contents, the location of each document should be identified by referring to the volume numbers that contain the relevant documents and any tab identifiers. In general, the name for the tab identifier should be the name of the document.

1.2 Cover letter

Applicants should include a cover letter with all applications. A copy of the letter should be placed at the beginning of Module 1. The cover letter shall be signed by the Market Authorization Holder (Refer Annex I).

1.3 Application form

An application to register a medicinal product for human use must be accompanied by a completed application form (Annex II). The application form should be duly filled with relevant information and attachments, dated signed and stamped appropriately.

1.4 Product Information

Provide copies of all package inserts, labels and any information intended for distribution with the product to the patient.

If the Summary Product Characteristics (SmPC), has not been approved from SDRA at the time the application is submitted, a draft document may be included. The approved SmPC from SDRA should then be supplied to the TMDA as they become available.

9

1.4.1 Prescribing information (Summary of Product Characteristics)

All prescription medicines should be accompanied by SmPC. Refer to Guidelines on Format and Content of Summary for Pharmaceutical Products Characteristics

1.4.2 Container labelling

Product should be labeled as prescribed in the Guidelines on Content and Format of Labels for Pharmaceutical Products

1.4.3 Patient information leaflet (PIL)

All medicinal preparations with potential for long term use and self-administered injections and Over the Counter (OTC) must contain a patient information leaflet. Languages used for PIL and labeling should be clearly expressed in English and French.

Refer Guidelines on Content and Format of Package Inserts for Pharmaceutical Products.

1.4.4 Mock-ups and specimens

If the product applicant has a specimen or mock-up of the sample(s) presentation of the medicine available at the time of initial application, it should be included in Module 1.4.4.

If there are multiple strengths and/or pack sizes, one representative specimen or mock-up for each will be sufficient. If batch number and expiry date are to be printed on the label during packaging, a statement to this effect should accompany the labels. If mock-ups or specimens are not available at the time of initial application, a text version may be submitted, however, mock-ups or specimens must be submitted to the TMDA, during the evaluation process and prior to finalization of the application.

1.5 Information about the experts

Experts must provide detailed reports of the documents and particulars, which constitute Modules 3, 4 and 5.

The requirement for these signed Expert Reports may be met by providing:

- The Quality Information Summary
- The Quality Overall Summary, Non-clinical Overview / Summary and
■ Clinical Overview / Summary in Module 2,
- A declaration signed by the experts in Module 1.6.
- Brief information on the educational background, training and occupational experience of the experts in Module 1.6.

Experts should indicate in their declarations the extent, if any of their professional or other involvement with the applicant / dossier owner and confirm that the report has been prepared

10

by them or if not, any assistance provided and by whom. Reports should be based on an independent assessment of the dossier and references must be provided for any additional claims not supported by the dossier. A sample declaration form is provided as Annex III.

Additionally, a filled in Quality Information Summary as provided under Annex IV should be submitted.

1.6 Certificates of Suitability of monographs of the European pharmacopoeia (CEP) or APIMF Approval

If a CEP is available, the finished product applicant should present copy of CEP in module 1.7.

Applicant should provide the Letter of Access to CEP or Letter of Access to TMDA as appropriate from API manufacturer. These letters should be included in Module 1.7. (Refer Annex V and Annex VI)

1.7 Good Manufacturing Practice (GMP)

For all medicines, irrespective of the country of origin, all key manufacturing and/or processing steps in the production of active pharmaceutical ingredient ingredients and finished pharmaceutical products must be performed in plants that comply with TMDA GMP guidelines. Attach a WHO-type certificate of GMP. For more information on GMP requirements and application for GMP inspection, refer Guidelines on Good Manufacturing Practice for more guidance.

If available at the time of submission of application, GMP certificates from TMDA and/or SDRAs or an evidence for application for GMP inspection should be submitted in module 1.8.

1.8 Good Clinical Practice (GCP) or Good Laboratory Practice (GLP)

Provide evidence such as accredited certificate for GCP or GLP for the sites participating in the clinical studies

1.9 Regulatory status

1.9.1 Registration status from countries with Stringent Drug Regulatory Authorities (SDRAs)

Provide registration status of the medicinal product applied for registration in the countries with SDRAs and attach evidence(s) for the same.

1.9.2 Registration status in other countries

Provide registration status of the medicinal product applied for registration in the EAC region as well as other countries and attach evidence(s) for the same.

11

1.9.3 List of countries in which a similar application has been submitted

The applicant should provide, in Module 1.9.1 of the dossier, a list of countries in which a similar application has been submitted, dates of submission (if available) and the status of these applications. This should detail approvals (with indications) and deferrals, withdrawals and rejections with reasons in each case.

1.9.4 Statement on whether an application for the product has been previously rejected, withdrawn or repeatedly deferred in any jurisdiction

Applicant must declare whether a marketing application for the medicine has been rejected prior to submission of the application to TMDA. If the medicine has been rejected, repeatedly deferred, withdrawn or suspended then reasons must be stated. If rejection occurs during the evaluation process, the TMDA should be informed.

1.10 Evidence of API and/or FPP prequalified by WHO

If an evidence indicating that the active pharmaceutical ingredient and/or finished pharmaceutical product are prequalified by WHO is available, it should be presented in Module 1.

1.11 Manufacturing and Marketing authorization

Submit a Certificate of Pharmaceutical Product in format recommended by the World Health Organization together with a valid Manufacturing Authorization for pharmaceutical production. If available, evidence for prequalification of medicinal product by WHO should be submitted.

1.12 Product samples

Sufficient number of samples should be submitted together with the application.

Batch number, Manufacturing Date and Expiry Date should be dynamically printed on packages for all medicines except in situations where there is space is a restriction, the details can be on secondary packages with the primary pack having at least the batch number and expiry date. Pre-printing of the batch number, manufacturing date and Expiry Date will not be acceptable.

12

MODULE 2: OVERVIEW & SUMMARIES

2.1 Table of contents of Module 2

A table of contents for module 2 should be provided.

2.2 CTD Introduction

2.3 Quality overall summary (QOS)

The quality overall summary (QOS) is a summary that follows the scope and the outline of the Body of Data in Module 3.

The QOS should not include information, data or justification that was not already included in Module 3 or in other parts of the common technical document (CTD).

Complete Annex VII following the guidance below.

The Quality Information Summary as provided under Annex IV should also be provided.

2.3.S Active pharmaceutical ingredient (name, manufacturer)

2.3.S.1 General Information (name, manufacturer)

Information from 3.2.S.1 should be included.

2.3.S.2 Manufacture (name, physical address)

Information from 3.2.S.2 should be included:

Information on the manufacturer;

■ A brief description of the manufacturing process and the controls

■ A flow diagram, as provided in 3.2.S.2.2;

■ A description of the Source and Starting Material and raw materials of biological origin used in the manufacture of the API, as described in 3.2.S.2.3;

■ Highlight critical process intermediates, as described in 3.2.S.2.4;

■ A description of process validation and/or evaluation, as described in 3.2.S.2.5.

2.3.S.3 Characterization

A summary of the interpretation of evidence of structure and isomerism, as described in 3.2.S.3.1.

A tabulated summary of the data provided in 3.2.S.3.2, with graphical representation, where appropriate should be included.

13

2.3.S.4 Control of Drug Substance

A brief summary of the justification of the specification(s), the analytical procedures, and validation should be included.

Specification from 3.2.S.4.1 should be provided.

A tabulated summary of the batch analyses from 3.2.S.4.4, with graphical representation where appropriate, should be provided.

2.3. S.5 Reference Standards or Materials

Information from 3.2.S.5 (tabulated presentation, where appropriate) should be included.

2.3.S.6 Container Closure System

A brief description and discussion of the information, from 3.2.S.6 should be included.

2.3.S.7 Stability

This section should include a summary of the studies undertaken (conditions, batches, analytical procedures) and a brief discussion of the results and conclusions, the proposed storage conditions, retest date or shelf-life, where relevant, as described in 3.2.S.7.1.

The post-approval stability protocol, as described in 3.2.S.7.2, should be included.

A tabulated summary of the stability results from 3.2.S.7.3, with graphical representation where appropriate, should be provided.

2.3.P Finished Pharmaceutical Product (name, dosage form)

2.3. P.1 Description and Composition of the Drug Product (name, dosage form)

Information from 3.2.P.1 should be provided.

Composition from 3.2.P.1 should be provided.

2.3.P.2 Pharmaceutical Development

A discussion of the information and data from 3.2.P.2 should be presented.

A tabulated summary of the composition of the formulations used in clinical trials and a presentation of dissolution profiles should be provided, where relevant.

2.3.P.3 Manufacture (name, physical address)

Information from 3.2.P.3 should include:

14

Information on the manufacturer

A brief description of the manufacturing process and the controls that are intended to result in the routine and consistent production of product of appropriate quality.

A flow diagram, as provided under 3.2.P.3.3.

A brief description of the process validation and/or evaluation, as described in 3.2.P.3.5.

2.3.P.4 Control of Excipients

A brief summary on the quality of excipients, as described in 3.2.P.4, should be included.

2.3.P.5 Control of Drug Product

A brief summary of the justification of the specification(s), a summary of the analytical procedures and validation, and characterization of impurities should be provided.

Specification(s) from 3.2.P.5.1 should be provided.

A tabulated summary of the batch analyses provided under 3.2.P.5.4, with graphical representation where appropriate should be included.

2.3.P.6 Reference Standards or Materials

Information from 3.2.P.6 (tabulated presentation, where appropriate) should be included.

2.3.P.7 Container Closure System

A brief description and discussion of the information in 3.2.P.7 should be included.

2.3.P.8 Stability

A summary of the studies undertaken (conditions, batches, analytical procedures) and a brief discussion of the results and conclusions of the stability studies and analysis of data should be included. Conclusions with respect to storage conditions and shelf-life and, if applicable, in-use storage conditions and shelf-life should be given.

Stability studies should be provided for each pack type applied for registration.

A tabulated summary of the stability results from 3.2.P.8.3, with graphical representation where appropriate, should be included.

The post-approval stability protocol, as described in 3.2.P.8.2, should be provided.

2.4 Non-Clinical overview

15

The non-clinical overview should provide an integrated overall analysis of the information in the Common Technical Document. In general, the Nonclinical Overview should not exceed about 30 pages.

The non-clinical overview should be presented in the following sequence:

- Overview of the nonclinical testing strategy
- Pharmacology
- Pharmacokinetics
- Toxicology
- Integrated overview and conclusions
- List of literature references

Studies conducted to establish the pharmacodynamic effects, the mode of action, and potential side effects should be evaluated and consideration should be given to the significance of any issues that arise.

The Integrated Overview and Conclusions should clearly define the characteristics of the human pharmaceutical as demonstrated by the nonclinical studies and arrive at logical, well-argued conclusions supporting the safety of the product for the intended clinical use. Taking the pharmacology, pharmacokinetics, and toxicology results into account, the implications of the nonclinical findings for the safe human use of the pharmaceutical should be discussed (i.e., as applicable to labelling).

Refer ICH Guidance on the Common Technical Document for the registration of pharmaceuticals for human use: Safety for guidance on the format and the content of this part.

Generic products are generally exempted in this module; however, in some cases such as changes in safety impurity profile, the safety assessment studies should be conducted.

2.5. Clinical overview

The Clinical Overview is intended to provide a critical analysis of the clinical data in the Common Technical Document. The Clinical Overview will necessarily refer to application data provided in the comprehensive Clinical Summary, the individual clinical study reports (ICH E3), and other relevant reports; but it should primarily present the conclusions and implications of those data, and should not recapitulate them. Specifically, the Clinical Summary should provide a detailed factual summarization of the clinical information in the CTD, and the Clinical Overview should provide a succinct discussion and interpretation of these findings together with any other relevant information.

The clinical Overview should be presented in the following sequence

- Product Development Rationale
- Overview of Biopharmaceutics
- 16
- Overview of Clinical Pharmacology
- Overview of Efficacy
- Overview of Safety
- Benefits and Risks Conclusions
- Literature References

Refer ICH Guidance on the Common Technical Document for the registration of pharmaceuticals for human use: Efficacy (M4E) for guidance on the format and the content of this part.

2.6 Nonclinical Written and Tabulated Summaries

The following order is recommended:

- Introduction
- Written Summary of Pharmacology
- Tabulated Summary of Pharmacology
- Written Summary of Pharmacokinetics
- Tabulated Summary of Pharmacokinetics
- Written Summary of Toxicology
- Tabulated Summary of Toxicology

Refer ICH Guidance on the Common Technical Document for the registration of pharmaceuticals for human use: Safety for guidance on the format and the content of this part.

For generic products are generally exempted in this module; however, in some cases such as changes in safety impurity profile, the safety assessment studies should be conducted.

2.7 Clinical Summary

The Clinical Summary is intended to provide a detailed, factual summarization of all of the clinical information in the Common Technical Document. This includes information provided in ICH E3 clinical study reports; information obtained from any meta-analyses or other cross-study analyses for which full reports have been included in Module 5; and post-marketing data for products that have been marketed in other regions.

Refer ICH Guidance on the Common Technical Document for the registration of pharmaceuticals for human use: Efficacy for guidance on the content of this section.

The following order is recommended:

2.7.1 Summary of Biopharmaceutical Studies and Associated Analytical Methods: Generic applications

The objective of CTD Module 2.7.1 is to summarize all relevant information in the product dossier with regard to bioequivalence studies and/or comparative dissolution and associated analytical methods.

17

Annex I of the Guideline on Therapeutic Equivalence Requirements: Presentation of Biopharmaceutical and Bio-analytical Data contains a set of template tables to assist applicants in the preparation of Module 2.7.1 with regard to data to be presented. Furthermore, it is anticipated that a standardized presentation will facilitate the evaluation process.

Refer the Guideline on Therapeutic Equivalence Requirements: Presentation of Biopharmaceutical and Bio-analytical Data for more guidance. (Annex V).

2.7.2 Summary of Clinical Pharmacology Studies

Refer the Guideline on Therapeutic equivalence requirements: Presentation of Biopharmaceutical and Bio-analytical Data for more guidance. (Annex V).

2.7.3 Summary of Clinical Efficacy

Refer the Guideline on Therapeutic equivalence requirements: Presentation of Biopharmaceutical and Bio-analytical Data for more guidance. (Annex V).

2.7.4 Summary of Clinical Safety

Refer the Guideline on Therapeutic equivalence requirements: Presentation of Biopharmaceutical and Bio-analytical Data for more guidance. (Annex V).

2.7.5 Literature References

2.7.6 Synopses of Individual Studies

18

MODULE 3: QUALITY

3.1 Table of contents of Module 3

A Table of Contents should be provided that lists all of the reports and gives the location of each study report in the Common Technical Document.

3.2 Body of data

3.2. S Active pharmaceutical ingredient (API))

The API information can be submitted the order of preference in one of the following four options:

- a) Option 1: Certificate of suitability of European Pharmacopeia (CEP);
- b) Option 2: Active pharmaceutical ingredient pre-qualified by WHO;
- c) Option 3: Active Pharmaceutical Ingredient Master File approved by TMDA;
- d) Option 4: Full details in the Product Dossier (PD);

The applicant should clearly indicate at the beginning of the API section in the Marketing Authorization (MA) application and in the QOS how the information on the API for each API manufacturer is being submitted.

Where reference is made to CEP, the finished product applicant must have written permission to access the CEP from the CEP holder. Applicant should provide the Letter of Access to CEP, as appropriate from API manufacturer (Refer Annex V). Letter of access should be included in Module 1.7.

Where reference is made to TMDA approved APIMF, the finished product applicant must have written permission to access the APIMF from the company that supplied the APIMF and must provide the APIMF file number to TMDA. Applicant should provide the Letter of Access to TMDA, as appropriate from API manufacturer (Refer Annex VI). Letter of access should be included in Module 1.7.

The applicant's open part of the APIMF should be included in Module 3.2.S of the Quality documentation presented in the CTD format. The API manufacturer's restricted (closed) part is supplied to TMDA directly by the API manufacturer when required.

The API information submitted by the applicant/FPP manufacturer should include the

following for each of the options used.

19

a) Option 1: Certificate of suitability of European Pharmacopeia (CEP)

A complete copy of the CEP (including any annexes) should be provided in Module 1. The declaration of access for the CEP should be duly filled out by the CEP holder on behalf of the FPP manufacturer or applicant.

In addition, a written commitment should be included that the applicant will inform TMDA in the event that the CEP is withdrawn. It should also be acknowledged by the applicant that withdrawal of the CEP will require additional consideration of the API data requirements to support the PD. The written commitment should accompany the copy of the CEP in Module 1.

Along with the CEP the applicant should supply the following information in the dossier, with data summarized in the QOS-PD:-

a) 3.2.S.1.3 General properties – discussions on any additional applicable physicochemical and other relevant API properties that are not controlled by the CEP and Ph. Eur. monograph, e.g. solubilities and polymorphs as per guidance in this section.

b) 3.2.S.3.1 Elucidation of structure and other characteristics – studies to identify polymorphs (exception: where the CEP specifies a polymorphic form) and particle size distribution, where applicable, as per guidance in this section.

c) 3.2.S.4.1 Specification – the specifications of the FPP manufacturer including all tests and limits of the CEP and Ph. Eur. monograph and any additional tests and acceptance criteria that are not controlled in the CEP and Ph. Eur. monograph, such as polymorphs and/or particle size distribution.

d) 3.2.S.4.2/3.2.S.4.3 Analytical procedures and validation – for any tests in addition to those in the CEP and Ph. Eur. monograph.

e) 3.2.S.4.4 Batch analysis – results from two batches of at least pilot scale, demonstrating compliance with the FPP manufacturer's API specifications.

f) 3.2.S.5 Reference standards or materials – information on the FPP manufacturer's reference standards.

g) 3.2.S.6 Container-closure system – specifications including descriptions and identification of primary packaging components.

h) 3.2.S.7 Stability – exception: where the CEP specifies a re-test period that is the same as or of longer duration than the re-test period proposed by the applicant.

i) In the case of sterile APIs, data on the sterilization process of the API, including validation data, should be included in the PD.

20

b) Option 2: Active pharmaceutical ingredient pre-qualified by WHO

A complete copy of the Confirmation of API prequalification document should be provided in Module 1, together with the duly filled out authorization box in the name of the FPP manufacturer or applicant.

The applicant should supply the following information in the dossier, with data summarized in the QOS-PD:-

a) 3.2.S.1.3 General properties – discussions on any additional applicable physicochemical and other relevant API properties that are not controlled by the API manufacturer's specifications, e.g. solubilities and polymorphs according to the guidance in this section.

b) 3.2.S.2 – if the sterility of the FPP is based upon the sterile manufacture of the API then data on the sterilization process together with full validation data should be provided.

c) 3.2.S.3.1 Elucidation of structure and other characteristics – studies to identify polymorphs and particle size distribution, where applicable, according to the guidance in this section.

d) 3.2.S.4.1 Specification – the specifications of the FPP manufacturer including all tests and limits of the API manufacturer's specifications and any additional tests and acceptance criteria that are not controlled by the API manufacturer's specifications such as polymorphs and/or particle size distribution.

e) 3.2.S.4.2/3.2.S.4.3 Analytical procedures and validation – any methods used by the FPP manufacturer in addition to those in the API manufacturer's specifications.

f) 3.2.S.4.4 Batch analysis – results from two batches of at least pilot scale, demonstrating compliance with the FPP manufacturer's API specifications.

g) 3.2.S.5 Reference standards or materials – information on the FPP manufacturer's reference standards.

h) 3.2.S.7 Stability – data to support the retest period if either the proposed retest period is longer or the proposed storage conditions are at a higher temperature or humidity to that of the prequalified API.

c) Option 3: Active Pharmaceutical Ingredient Master File Approved by TMDA

i. Option 3 (a): A copy of confirmation of approval of the API by TMDA provided in Module 1, together with the duly filled out authorization box in the name of the FPP manufacturer or applicant.

The applicant should supply the following information in the dossier, with data summarized in the QOS-PD:-

21

■ 3.2.S.1.3 General properties – discussions on any additional applicable physicochemical and other relevant API properties that are not controlled by the API manufacturer's specifications, e.g. solubilities and polymorphs according to the guidance in this section.

■ 3.2.S.2 – if the sterility of the FPP is based upon the sterile manufacture of the API then data on the sterilization process together with full validation data should be provided.

■ 3.2.S.3.1 Elucidation of structure and other characteristics – studies to identify polymorphs and particle size distribution, where applicable, according to the guidance in this section.

■ 3.2.S.4.1 Specification – the specifications of the FPP manufacturer including all tests and limits of the API manufacturer's specifications and any additional tests and acceptance criteria that are not controlled by the API manufacturer's specifications such as polymorphs and/or particle size distribution.

■ 3.2.S.4.2/3.2.S.4.3 Analytical procedures and validation – any methods used by the FPP manufacturer in addition to those in the API manufacturer's specifications.

■ 3.2.S.4.4 Batch analysis – results from two batches of at least pilot scale, demonstrating compliance with the FPP manufacturer's API specifications.

■ 3.2.S.5 Reference standards or materials – information on the FPP manufacturer's reference standards.

■ 3.2.S.7 Stability – data to support the retest period if either the proposed retest period is longer or the proposed storage conditions are at a higher temperature or humidity to that of the API approved.

ii. Option 3 (b): Full details on the API information submitted by the API manufacturer, provided that the APIMF contains all information listed under Module 3.

It is the responsibility of the applicant to ensure that the API manufacturer's APIMF restricted part is supplied to TMDA directly by the API manufacturer when required. A copy of the letter of access should be provided in the product dossier in Module 1.

APIMF holders can use the guidance provided for the option "Full details in the" for preparation of the relevant sections of the Open and Restricted parts of their APIMFs.

22

d) Option 4: Full details by completing Section 3.2.S.1 - 3.2.S.7 of these guidelines

Information on the 3.2.S Active pharmaceutical ingredient sections, including full details of chemistry, manufacturing process, quality controls during manufacturing and process validation for the API, should be submitted in the FPP dossier as outlined in the subsequent sections of this guideline.

3.2.S.1 General information

3.2.S.1.1 Nomenclature

Information on the nomenclature of the API should be provided. For example:

- International Non-proprietary Name (INN); (Recommended)
- Compendial name, if relevant;
- Chemical name(s);
- Company or laboratory code;
- Other non-proprietary name(s) (e.g., national name, United States Adopted Name (USAN), British Approved Name (BAN)); and
- Chemical Abstracts Service (CAS) registry number.

The listed chemical names should be consistent with those appearing in scientific literature and those appearing on the product labelling information (e.g. summary of product characteristics, package leaflet (also known as patient information leaflet or PIL), labelling). Where several names exist, the preferred name should be indicated.

3.2.S.1.2 Structure

The structural formula, including relative and absolute stereochemistry, the molecular formula and the relative molecular mass should be provided.

This information should be consistent with that provided in section 3.2.S.1.1. For APIs existing as salts, the molecular mass of the free base or acid should also be provided.

3.2.S.1.3 General properties

A list should be provided of physicochemical and other relevant properties of the API.

This information can be used in developing the specifications, in formulating FPPs and in the testing for release and stability purposes.

The physical and chemical properties of the API should be discussed including the physical description, solubilities in common solvents (e.g. water, alcohols, dichloromethane, acetone), quantitative aqueous pH solubility profile (e.g. pH 1.2 to 6.8, dose/solubility volume),

23

polymorphism, pH and pKa values, UV absorption maxima and molar absorptivity, melting point, refractive index (for a liquid), hygroscopicity, partition coefficient, etc. (see table in the

QOS). This list is not intended to be exhaustive, but provides an indication as to the type of information that could be included.

Some of the more relevant properties to be considered for APIs are discussed below in greater detail.

Physical description

The description should include appearance, colour and physical state. Solid forms should be identified as being crystalline or amorphous (see 3.2.S.3.1 for further information on API solid forms).

Solubilities/quantitative aqueous pH solubility profile

The following should be provided for all options for the submission of API data.

The solubilities in a number of common solvents should be provided (e.g. water, alcohols, dichloromethane, acetone).

The solubilities over the physiological pH range (pH 1.2 to 6.8) in several buffered media should be provided in mg/ml. If this information is not readily available (e.g. literature references), it should be generated in-house.

For solid oral dosage forms, the dose/solubility volume should be provided as determined by:

Dose/solubility volume = largest dosage strength (mg)
the minimum concentration of the drug (mg/ml)*

* corresponding to the lowest solubility determined over the physiological pH range (pH 1.2 to 6.8) and temperature (37 ± 0.5 °C).

As per the Biopharmaceutics Classification System (BCS), highly soluble (or highly water-soluble) APIs are those with a dose/solubility volume of less than or equal to 250 ml.

For example, compound A has as its lowest solubility at 37 ± 0.5 °C, 1.0 mg/ml at pH 6.8 and is available in 100 mg, 200 mg and 400 mg strengths. This API would not be considered a BCS highly soluble API as its dose/solubility volume is greater than 250 ml ($400 \text{ mg}/1.0 \text{ mg/ml} = 400 \text{ ml}$).

Polymorphism

- a) The polymorphic form(s) present in the proposed API should be listed in section 3.2.S.1.3;
- b) The description of manufacturing process and process controls (3.2.S.2.2) should indicate which polymorphic form is manufactured, where relevant; the literature references or studies performed to identify the potential polymorphic forms of the API, including the study results, should be provided in section 3.2.S.3.1; and if a polymorphic form is to be defined or limited (e.g. for APIs that are not BCS highly soluble and/or where polymorphism has been identified as an issue), details should be included in 3.2.S.4.1 through 3.2.S.4.5.

Additional information is included in the referenced sections of this guideline.

Particle size distribution

Studies performed to identify the particle size distribution of the API should be provided in section 3.2.S.3.1 (refer to this section of this guideline for additional information).

Information from literature

Supportive data and results from specific studies or published literature can be included within or attached to this section.

3.2.S.2 Manufacture

3.2.S.2.1 Manufacturer(s) (name, physical address)

The name, address, and responsibility of each manufacturer, including contractors, and each proposed production site or facility involved in manufacturing and testing should be provided.

The facilities involved in the manufacturing, packaging, labelling, testing and storage of the API should be listed. If certain companies are responsible only for specific steps (e.g. milling of the API) it should be clearly indicated.

The list of manufacturers/companies should specify the actual addresses of production or manufacturing site(s) involved (including block(s) and units(s)), rather than the administrative offices. Telephone number(s), fax number(s) and e-mail address(es) should be provided.

A valid manufacturing authorization should be provided for the production of APIs. If available, a certificate of GMP compliance should be provided in the product dossier Module 1.

3.2.S.2.2 Description of manufacturing process and process controls

The description of the API manufacturing process represents the applicant's commitment for

25

the manufacture of the API. Information should be provided to adequately describe the manufacturing process and process controls. For example, a flow diagram of the synthetic process (es) should be provided that includes molecular formulae, weights, yield ranges,

chemical structures of starting materials, intermediates, reagents and API reflecting stereochemistry, and identifies operating conditions and solvents.

A sequential procedural narrative of the manufacturing process should be submitted. The narrative should include, for example, quantities of raw materials, solvents, catalysts and reagents reflecting the representative batch scale for commercial manufacture, identification of critical steps, process controls, equipment and operating conditions (e.g. temperature, pressure, pH, time).

Alternate processes should be explained and described with the same level of detail as the primary process. Reprocessing steps should be identified and justified. Any data to support this justification should be either referenced or filed in 3.2.S.2.5.

The following requirements apply to the second option for submission of API information, where full details are provided in the dossier.

The API starting material should be fully characterized with respect to identity and purity. The starting material for synthesis defines the starting point in the manufacturing process for an API to be described in an application. The applicant should propose and justify which substances should be considered as starting materials for synthesis. See section 3.2.S.2.3 for further guidance.

The recovery of materials, if any, should be described in detail with the step in which they are introduced into the process. Recovery operations should be adequately controlled such that impurity levels do not increase over time. For recovery of solvents, any processing to improve the quality of the recovered solvent should be described. Regarding recycling of filtrates (mother liquors) to obtain second crops, information should be available on maximum holding times of mother liquors and maximum number of times the material can be recycled. Data on impurity levels should be provided to justify recycling of filtrates.

Where there are multiple manufacturing sites for one API manufacturer, a comprehensive list in tabular form should be provided comparing the processes at each site and highlighting any differences.

All solvents used in the manufacture (including purification and/or crystallization step(s)) should be clearly identified. Solvents used in the final steps should be of high purity. Use of recovered solvents in the final steps of purification and/or crystallization is not recommended.

Where particle size is considered a critical attribute (see 3.2.S.3.1 for details), the particle size reduction method(s) (milling, micronization) should be described.

26

Justification should be provided for alternate manufacturing processes. Alternate processes should be explained with the same level of detail as the primary process. It should be demonstrated that batches obtained by the alternate processes have the same impurity profile as the principal process. If the obtained impurity profile is different it should be demonstrated to be acceptable according to the requirements described under S.3.2.

3.2.S.2.3 Control of materials

Materials used in the manufacture of the API (e.g. raw materials, starting materials, solvents, reagents, catalysts) should be listed, identifying where each material is used in the process. Information on the quality and control of these materials should be provided. Information demonstrating that materials meet standards appropriate for their intended use should be provided.

In general, the starting material for synthesis described in the marketing authorization dossier should:

- be a synthetic precursor of one or more synthesis steps prior to the final API intermediate. Acids, bases, salts, esters and similar derivatives of the API, as well as the racemate of a single enantiomer API, are not considered final intermediates;
- be a well characterized, isolated and purified substance with its structure fully elucidated including its stereochemistry (when applicable);
- have well-defined specifications that include among others one or more specific identity tests and tests and limits for assay and specified, unspecified and total impurities; and
- be incorporated as a significant structural fragment into the structure of the API.

Copies of the specifications for the materials used in the synthesis, extraction, isolation and purification steps should be provided in the PD, including starting materials, reagents, solvents, catalysts and recovered materials. Confirmation should be provided that the specifications apply to materials used at each manufacturing site. A certificate of analysis of the starting material for synthesis should be provided. A summary of the information on starting materials should be provided in the QOS-PD.

The carry-over of impurities of the starting materials for synthesis into the final API should be considered and discussed.

A letter of attestation should be provided confirming that the API and the starting materials and reagents used to manufacture the API are without risk of transmitting agents of animal spongiform encephalopathies.

27

3.2.S.2.4 Controls of critical steps and intermediates

Critical steps: Tests and acceptance criteria (with justification including experimental data) performed at critical steps identified in 3.2.S.2.2 of the manufacturing process to ensure that the process is controlled should be provided.

Intermediates: Information on the quality and control of intermediates isolated during the process should be provided.

The critical steps should be identified. These can be among others: steps where significant impurities are removed or introduced, steps introducing an essential molecular structural element such as a chiral centre or resulting in a major chemical transformation, steps having an impact on solid-state properties and homogeneity of the API that may be relevant for use in solid dosage forms.

Specifications for isolated intermediates should be provided and should include tests and acceptance criteria for identity, purity and assay, where applicable.

3.2.S.2.5 Process validation and/or evaluation

Process validation and/or evaluation studies for aseptic processing and sterilization should be included.

It is expected that the manufacturing processes for all APIs are properly controlled. If the API is prepared as sterile, a complete description should be provided for aseptic processing and/or sterilization methods. The controls used to maintain the sterility of the API during storage and transportation should also be provided. Alternate processes should be justified and described.

3.2.S.3 Characterization

3.2.S.3.1 Elucidation of structure and other characteristics

Confirmation of structure based on e.g. synthetic route and spectral analyses should be provided. Information such as the potential for isomerism, the identification of stereochemistry or the potential for forming polymorphs should also be included.

Elucidation of structure

The MA application should include quality assurance (QA) certified copies of the spectra, peak assignments and a detailed interpretation of the data of the studies performed to elucidate and/or confirm the structure of the API. The QOS should include a list of the studies performed and a conclusion from the studies (e.g. if the results support the proposed structure).

For APIs that are not described in an officially recognized pharmacopoeia, the studies carried

out to elucidate and/or confirm the chemical structure normally include elemental analysis, infrared (IR), ultraviolet (UV), nuclear magnetic resonance (NMR) and mass spectra (MS) studies. Other tests could include X-ray powder diffraction and differential scanning calorimetry (DSC).

For APIs that are described in an officially recognized pharmacopoeia, it is generally sufficient to provide copies of the IR spectrum of the API from each of the proposed manufacturer(s) run concomitantly with a pharmacopoeial reference standard.

Isomerism/Stereochemistry

Where the potential for stereoisomerism exists, a discussion should be included of the possible isomers that can result from the manufacturing process and the steps where chirality was introduced. The identity of the isomeric composition of the API to that of the API in the comparator product should be established. Information on the physical and chemical properties of the isomeric mixture or single enantiomer should be provided, as appropriate. The API specification should include a test to ensure isomeric identity and purity.

The potential for inter-conversion of the isomers in the isomeric mixture, or racemization of the single enantiomer should be discussed.

When a single enantiomer of the API is claimed for non-pharmacopoeial APIs, unequivocal proof of absolute configuration of asymmetric centres should be provided such as determined by X-ray of a single crystal.

If, based on the structure of the API, there is not a potential for stereoisomerism, it is sufficient to include a statement to this effect.

Polymorphism

Many APIs can exist in different physical forms in the solid state. Polymorphism is characterized as the ability of an API to exist as two or more crystalline phases that have different arrangements and/or conformations of the molecules in the crystal lattice. Amorphous solids consist of disordered arrangements of molecules and do not possess a distinguishable crystal lattice. Solvates are crystal forms containing either stoichiometric or non-stoichiometric amounts of a solvent. If the incorporated solvent is water the solvates are also commonly known as hydrates.

Polymorphic forms of the same chemical compound differ in internal solid-state structure and, therefore, may possess different chemical and physical properties, including packing, thermodynamic, spectroscopic, kinetic, interfacial and mechanical properties. These properties can have a direct impact on API processability, pharmaceutical product manufacturability and product quality/performance, including stability, dissolution and bioavailability. Unexpected appearance or disappearance of a polymorphic form may lead to serious pharmaceutical consequences.

29

Applicants and API manufacturers are expected to have adequate knowledge about the polymorphism of the APIs used and/or produced. Information on polymorphism can come from the scientific literature, patents, compendia or other references to determine if polymorphism is a concern, e.g. for APIs that are not BCS highly soluble. In the absence of published data for APIs that are not BSC highly soluble, polymorphic screening will be

necessary to determine if the API can exist in more than one crystalline form. Polymorphic screening is generally accomplished via crystallization studies using different solvents and conditions.

There are a number of methods that can be used to characterize the polymorphic forms of an API. Demonstration of a non-equivalent structure by single crystal X-ray diffraction is currently regarded as the definitive evidence of polymorphism. X-Ray diffraction can also be used to provide unequivocal proof of polymorphism. Other methods, including microscopy, thermal analysis (e.g. DSC, thermal gravimetric analysis and hot-stage microscopy) and spectroscopy (e.g. IR, Raman, solid-state nuclear magnetic resonance (ssNMR)) is helpful to further characterize polymorphic forms. Where polymorphism is a concern, the applicants/manufacturers of APIs should demonstrate that a suitable method, capable of distinguishing different polymorphs, is available to them.

Polymorphism can also include solvation or hydration products (also known as pseudopolymorphs). If the API is used in a solvated form, the following information should be provided:

- a) Specifications for the solvent-free API in 3.2.S.2.4, if that compound is a synthetic precursor;
 - b) Specifications for the solvated API including appropriate limits on the weight ratio API to solvent (with data to support the proposed limits);
 - c) A description of the method used to prepare the solvate in 3.2.S.2.2.
- Particle size distribution

For APIs whose particle size distribution will have influence on FPP processability, stability, content uniformity, dissolution and bioavailability, specifications should include controls on the particle size distribution.

3.2.S.3.2 Impurities

Information on impurities should be provided.

Details on the principles for the control of impurities (e.g. reporting, identification and qualification) are outlined in the ICH Q3A and Q3C impurity guidelines. Discussion should be provided of the potential and actual impurities arising from the synthesis, manufacture or degradation of the API. This should cover starting materials, by-products, intermediates, chiral impurities and degradation products and should include the chemical names, structures

and origins. The discussion of pharmacopoeial APIs should not be limited to the impurities specified in the API monograph.

Refer: ICH Q3A: Impurities in New Drug Substances and ICH Q3C Impurities: Guideline for Residual Solvents

3.2.S.4 Control of the API

3.2.S.4.1 Specification

The specification for the API should be provided. Copies of the API specifications, dated and signed by authorized personnel (e.g. the person in charge of the quality control or quality assurance department) should be provided in the marketing authorization dossier, including specifications from each API manufacturer as well as those of the FPP manufacturer.

The FPP manufacturer's API specification should be summarized according to the table in the QOS template under the headings tests, acceptance criteria and analytical procedures (including types, sources and versions for the methods).

- a) The standard declared by the applicant could be an officially recognized compendial standard (BP, JP, Ph.Eur, Ph.Int. and USP) or a house (manufacturer's) standard.
- b) The specification reference number and version (e.g. revision number and/or date) should be provided for version control purposes.
- c) For the analytical procedures, the type should indicate the kind of analytical procedure used (e.g. visual, IR, UV, HPLC, laser diffraction), the source refers to the origin of the analytical procedure (BP, JP, Ph.Eur, Ph.Int, USP, in-house) and the version (e.g. code number/version/date) should be provided for version control purposes.

In cases where there is more than one API manufacturer, the FPP manufacturer's API specifications should be one single compiled set of specifications that is identical for each manufacturer. It is acceptable to lay down in the specification more than one acceptance criterion and/or analytical method for a single parameter with the statement "for API from manufacturer A" (e.g. in the case of residual solvents).

Any non-routine testing should be clearly identified as such and justified along with the proposal on the frequency of non-routine testing.

3.2.S.4.2 Analytical procedures

The analytical procedures used for testing the API should be provided. Copies of the in-house analytical procedures used to generate testing results provided in the PD, as well as those proposed for routine testing of the API by the FPP manufacturer should be provided. Unless modified, it is not necessary to provide copies of officially recognized compendial analytical procedures.

31

3.2.S.4.3 Validation of analytical procedures

Analytical validation information, including experimental data for the analytical procedures used for testing the API, should be provided.

Copies of the validation reports for the analytical procedures used to generate testing results

provided in the PD, as well as those proposed for routine testing of the API by the FPP manufacturer, should be provided.

Tables should be used to summarize the validation information of the analytical procedures of the FPP manufacturer for determination of residual solvents, assay and purity of the API, in section 2.3.S.4.3 of the QOS. The validation data for other methods used to generate assay and purity data in the PD can be summarized in 2.3.S.4.4 (c) or 2.3.S.7.3 (b) of the QOS.

The compendial methods as published are typically validated based on an API or an FPP originating from a specific manufacturer. Different sources of the same API or FPP can contain impurities and/or degradation products that were not considered during the development of the monograph. Therefore, the monograph and compendial method should be demonstrated suitable to control the impurity profile of the API from the intended source(s).

In general verification is not necessary for compendial API assay methods. However, specificity of a specific compendial assay method should be demonstrated if there are any potential impurities that are not specified in the compendial monograph. If an officially recognized compendial method is used to control API-related impurities that are not specified in the monograph, full validation of the method is expected with respect to those impurities.

If an officially recognized compendial standard is claimed and an in-house method is used in lieu of the compendial method (e.g. for assay or for specified impurities), equivalency of the in-house and compendial methods should be demonstrated. This could be accomplished by performing duplicate analyses of one sample by both methods and providing the results from the study. For impurity methods, the sample analyzed should be the API spiked with impurities at concentrations equivalent to their specification limits.

Refer ICHQ2: Validation of Analytical Procedures: Text and Methodology for more guidance

3.2.S.4.4 Batch analyses

Description of batches and results of batch analyses should be provided. The information provided should include batch number, batch size, date and production site of relevant API batches.

Copies of the certificates of analysis, both from the API manufacturer(s) and the FPP manufacturer, should be provided for the profiled batches and any company responsible for generating the test results should be identified. This data is used to evaluate consistency in API quality. The FPP manufacturer's test results should be summarized in the QOS.

32

For quantitative tests (e.g. individual and total impurity tests and assay tests), it should be ensured that actual numerical results are provided rather than vague statements such as "within limits" or "conforms".

A discussion and justification should be provided for any incomplete analyses (e.g. results not tested according to the proposed specification).

3.2.S.4.5 Justification of specification

Justification for the API specification should be provided.

A discussion should be provided on the inclusion of certain tests, evolution of tests, analytical procedures and acceptance criteria, differences from the officially recognized compendial standard(s), etc. If the officially recognized compendial methods have been modified or replaced, a discussion should be included.

The justification for certain tests, analytical procedures and acceptance criteria may have been discussed in other sections of the PD (e.g. impurities, particle-size distribution) and does not need to be repeated here, although a cross-reference to their location should be provided.

Refer ICH Q6A Specifications: Test Procedures and Acceptance Criteria for New Drug Substances and New Drug Products: Chemical Substances, for more guidance

3.2.S.5 Reference standards or materials

Information on the reference standards or reference materials used for testing of the API should be provided. Information should be provided on the reference standard(s) used to generate data in the PD, as well as those to be used by the FPP manufacturer in routine API and FPP testing.

The source(s) of the reference standards or materials used in the testing of the API should be provided (e.g. those used for the identification, purity, assay tests). These could be classified as primary or secondary reference standards.

A suitable primary reference standard should be obtained from an officially recognized pharmacopoeial source (BP, JP, Ph.Eur, Ph.Int, USP) where one exists and the lot number should be provided. Primary reference standards from officially recognized pharmacopoeial sources do not need further structural elucidation.

Otherwise a primary standard may be a batch of the API that has been fully characterized (e.g. by IR, UV, NMR, MS analyses). Further purification techniques may be needed to render the material acceptable for use as a chemical reference standard. The purity requirements for a chemical reference substance depend upon its intended use. A chemical reference substance

33

proposed for an identification test does not require meticulous purification, since the presence of a small percentage of impurities in the substance often has no noticeable effect on the test. On the other hand, chemical reference substances that are to be used in assays should possess a high degree of purity (such as 99.5% on the dried or water-/solvent-free basis). Absolute content of the primary reference standard must be declared and should follow the scheme:

100% minus organic impurities (quantitated by an assay procedure, e.g. HPLC, DSC, etc.)
minus inorganic impurities minus volatile impurities by loss on drying (or water content
minus residual solvents).

A secondary (or in-house) reference standard can be used by establishing it against a suitable primary reference standard, e.g. by providing legible copies of the IR of the primary and secondary reference standards run concomitantly and by providing its certificate of analysis, including assay determined against the primary reference standard. A secondary reference standard is often characterized and evaluated for its intended purpose with additional procedures other than those used in routine testing (e.g. if additional solvents are used during the additional purification process that are not used for routine purposes).

3.2.S.6 Container-closure system

A description of the container-closure system(s) should be provided, including the identity of materials of construction of each primary packaging component, and their specifications. The specifications should include description and identification (and critical dimensions with drawings, where appropriate). Non compendial methods (with validation) should be included, where appropriate.

For non-functional secondary packaging components (e.g. those that do not provide additional protection), only a brief description should be provided. For functional secondary packaging components, additional information should be provided.

The suitability should be discussed with respect to, for example, choice of materials, protection from moisture and light, compatibility of the materials of construction with the API, including sorption to container and leaching, and/or safety of materials of construction.

Primary packaging components are those that are in direct contact with the API or FPP. The specifications for the primary packaging components should be provided and should include a specific test for identification (e.g. IR).

Copies of the labels applied on the secondary packaging of the API should be provided and should include the conditions of storage. In addition, the name and address of the manufacturer of the API should be stated on the container, regardless of whether re-labelling is conducted at any stage during the API distribution process.

34

3.2.S.7 Stability

Refer Guidelines on Stability Requirements for Testing Active Pharmaceutical Ingredients (APIs) and Finished Pharmaceutical Products (FPPs)

3.2.P Finished pharmaceutical product (FPP)

3.2. P.1 Description and Composition of the FPP

A description of the FPP and its composition should be provided. The information provided should include:

Description of the dosage form

The description of the FPP should include the physical description, available strengths, release mechanism (e.g. immediate, modified (delayed or extended)), as well as any other distinguishable characteristics.

Composition

This is a list of all components of the dosage form, and their amount on a per unit basis (including overages, if any), the function of the ingredients, and a reference to their quality standards [e.g. Compendial monographs (BP, USP, JP, Ph. Eur etc) or manufacturer's specifications (IH)].

The tables in the QOS template should be used to summarize the composition of the FPP and express the quantity of each component on a per unit basis (e.g. mg per tablet, mg per ml, mg per vial) and quantity per batch. The individual ingredient for mixtures prepared in-house (e.g. coatings) should be included in the tables, where applicable.

All ingredients used in the manufacturing process should be included, including those that may not be added to every batch (e.g. acid and alkali), those that may be removed during processing (e.g. solvents) and any others (e.g. nitrogen, silicon for stoppers). If the FPP is formulated using an active moiety, then the composition for the active ingredient should be clearly indicated (e.g. "1 mg of active ingredient base = 1.075 mg active ingredient hydrochloride"). All overages should be clearly indicated (e.g. "contains 2% overage of the API to compensate for manufacturing losses").

The ingredients should be declared by their proper or common names, quality standards (BP, JP, Ph.Eur, Ph.Int, USP, in-house) and, if applicable, their grades (e.g. "Microcrystalline Cellulose NF (PH 102)") and special technical characteristics (e.g. lyophilized, micronized, solubilized, emulsified).

The function of each component (e.g. diluent/filler, binder, disintegrant, lubricant, glidant, granulating solvent, coating agent, antimicrobial preservative) should be stated. If an excipient performs multiple functions, the predominant function should be indicated.

• Description of accompanying reconstitution diluent(s)

For FPPs supplied with reconstitution diluent(s) that have been assessed and considered acceptable (registered) in connection with another product dossier, a brief description of the reconstitution diluents(s) should be provided.

For FPPs supplied with reconstitution diluent(s) have not been assessed and considered acceptable in connection with another product dossier, the information on the diluent(s) should be provided in a separate FPP portion ("3.2.P"), as appropriate.

- Type of container and closure used for the dosage form and accompanying reconstitution diluent, if applicable

The container-closure used for the FPP (and accompanying reconstitution diluent, if applicable) should be briefly described, with further details provided under 3.2.P.7 Container-closure system, e.g. "The product is available in HDPE bottles with polypropylene caps (in sizes of 100s, 500s and 1000s) and in PVC/aluminium foil unit dose blisters (in packages of 100s) (cards of 5 × 2, 10 cards per package)."

3.2.P.2 Pharmaceutical development

The Pharmaceutical development section should contain information on the development studies conducted to establish that the dosage form, the formulation, manufacturing process, container-closure system, microbiological attributes and usage instructions are appropriate for the purpose specified in the product dossier. The studies described here are distinguished from routine control tests conducted according to specifications. Additionally, this section should identify and describe the formulation and process attributes (critical parameters) that can influence batch reproducibility, product performance and FPP quality. Supportive data and results from specific studies or published literature can be included within or attached to the Pharmaceutical development section. Additional supportive data can be referenced to the relevant nonclinical or clinical sections of the product dossier.

Pharmaceutical development information should include, at a minimum:

- a) the definition of the quality target product profile (QTPP) as it relates to quality, safety and efficacy, considering for example the route of administration, dosage form, bioavailability, strength and stability;
- b) identification of the potential critical quality attributes (CQAs) of the FPP so as to adequately control the product characteristics that could have an impact on quality;
- c) discussion of the potential CQAs of the API(s), excipients and container-closure system(s) including the selection of the type, grade and amount to deliver drug product of the desired quality; and
- d) discussion of the selection criteria for the manufacturing process and the control strategy required to manufacture commercial lots meeting the QTPP in a consistent manner.

These features should be discussed as part of the product development using the principles of risk management over the entire life-cycle of the product.

3.2.P.2.1 Components of the FPP

3.2.P.2.1.1 Active pharmaceutical ingredient

The compatibility of the API with excipients listed in 3.2.P.1 should be discussed. Additionally, key physicochemical characteristics (e.g. water content, solubility, particle size distribution, polymorphic or solid state form) of the API that can influence the performance of the FPP should be discussed. For fixed-dose combinations, the compatibility of APIs with each other should be discussed.

Physicochemical characteristics of the API may influence both the manufacturing capability and the performance of the FPP.

3.2.P.2.1.2 Excipients

The choice of excipients listed in 3.2.P.1, their concentration and their characteristics that can influence the FPP performance should be discussed relative to their respective functions.

3.2.P.2.2 Finished pharmaceutical product

3.2.P.2.2.1 Formulation development

A brief summary describing the development of the FPP should be provided, taking into consideration the proposed route of administration and usage. The differences between the comparative bioavailability or biowaiver formulations and the formulation (i.e. composition) described in 3.2.P.1 should be discussed. Results from comparative in vitro studies (e.g. dissolution) or comparative in vivo studies (e.g. bioequivalence) should be discussed when appropriate.

If the proposed FPP is a functionally scored tablet, a study should be undertaken to ensure the uniformity of dose in the tablet fragments. The data provided in the PD should include a description of the test method, individual values, mean and relative standard deviation (RSD) of the results. Uniformity testing (i.e. content uniformity or mass variation, depending on the requirement for the whole tablet) should be performed on each split portion from a minimum of 10 randomly selected whole tablets.

37

In vitro dissolution or drug release

A discussion should be included as to how the development of the formulation relates to development of the dissolution method(s) and the generation of the dissolution profile.

The results of studies justifying the choice of in vitro dissolution or drug release conditions (e.g. apparatus, rotation speed, medium) should be provided.

Data should also be submitted to demonstrate whether the method is sensitive to changes in manufacturing processes and/or changes in grades and/or amounts of critical excipients and particle size where relevant. The dissolution method should be sensitive to any changes in the product that would result in a change in one or more of the pharmacokinetic parameters.

For slower dissolving immediate-release products (e.g. Q = 80% in 90 minutes), a second time point may be warranted (e.g. Q = 60% in 45 minutes).

Modified-release FPPs should have a meaningful in vitro release rate (dissolution) test that is used for routine quality control. Preferably this test should possess in vitro–in vivo correlation. Results demonstrating the effect of pH on the dissolution profile should be submitted if appropriate for the type of dosage form.

For extended-release FPPs, the testing conditions should be set to cover the entire time period of expected release (e.g. at least three test intervals chosen for a 12-hour release and additional test intervals for longer duration of release). One of the test points should be at the early stage of drug release (e.g. within the first hour) to demonstrate absence of dose dumping. At each test point, upper and lower limits should be set for individual units. Generally the acceptance range at each intermediate test point should not exceed 25% or 12.5% of the targeted value. Dissolution results should be submitted for several lots, including those lots used for pharmacokinetic and bioavailability or biowaiver studies. Recommendations for conducting and assessing comparative dissolution profiles can be found in the Guidelines on Therapeutic Equivalence Requirements.

3.2.P.2.2.2 Overages

Any overages in the formulation(s) described in 3.2.P.1 should be justified. Justification of an overage to compensate for loss during manufacture should be provided, including the step(s) where the loss occurs, the reasons for the loss and batch analysis release data (assay results).

Overages for the sole purpose of extending the shelf-life of the FPP are generally not acceptable.

3.2. P.2.2.3 Physicochemical and biological properties

Parameters relevant to the performance of the FPP, such as pH, ionic strength, dissolution, re-dispersion, reconstitution, particle size distribution, aggregation, polymorphism, rheological properties, biological activity or potency and/or immunological activity, should be addressed.

3.2.P.2.3 Manufacturing process development

The selection and optimization of the manufacturing process described in 3.2.P.3.3, in particular its critical aspects, should be explained. Where relevant, the method of sterilization should be explained and justified.

Where relevant, justification for the selection of aseptic processing or other sterilization methods over terminal sterilization should be provided.

Differences between the manufacturing process(es) used to produce comparative bioavailability or bio-waiver batches and the process described in 3.2.P.3.3 that can influence the performance of the product should be discussed.

The scientific rationale for the selection, optimization and scale-up of the manufacturing process described in 3.2.P.3.3 should be explained; in particular the critical aspects (e.g. rate of addition of granulating fluid, massing time, granulation end-point). A discussion of the critical process parameters (CPP), controls and robustness with respect to the QTPP and CQA of the product should be included.

3.2.P.2.4 Container-closure system

The suitability of the container-closure system (described in 3.2.P.7) used for the storage, transportation (shipping) and use of the FPP should be discussed. This discussion should consider, e.g. choice of materials, protection from moisture and light, compatibility of the materials of construction with the dosage form (including sorption to container and leaching) safety of materials of construction and performance (such as reproducibility of the dose delivery from the device when presented as part of the FPP).

The suitability of the container-closure system used for the storage, transportation (shipping) and use of any intermediate/in-process products (e.g. premixes, bulk FPP) should also be discussed.

3.2.P.2.5 Microbiological attributes

Where appropriate the microbiological attributes of the dosage form should be discussed, including, for example, the rationale for not performing microbial limits testing for non-sterile products and the selection and effectiveness of preservative systems in products containing antimicrobial preservatives. For sterile products the integrity of the container-closure system to prevent microbial contamination should be addressed.

Where an antimicrobial preservative is included in the formulation, the amount used should be justified by submission of results of the product formulated with different concentrations of the preservative(s) to demonstrate the least necessary but still effective concentration. The effectiveness of the agent should be justified and verified by appropriate studies (e.g. USP or Ph.Eur general chapters on antimicrobial preservatives) using a batch of the FPP. If the lower limit for the proposed acceptance criterion for the assay of the preservative is less than 90.0%, the effectiveness of the agent should be established with a batch of the FPP containing a concentration of the antimicrobial preservative corresponding to the lower proposed acceptance criteria.

3.2.P.2.6 Compatibility

The compatibility of the FPP with reconstitution diluent(s) or dosage devices (e.g. precipitation of API in solution, sorption on injection vessels, stability) should be addressed to provide appropriate and supportive information for the labelling.

Where a device is required for oral liquids or solids (e.g. solutions, emulsions, suspensions and powders/granules for such reconstitution) that are intended to be administered immediately after being added to the device, the compatibility studies mentioned in the following paragraphs are not required.

Where sterile, reconstituted products are to be further diluted, compatibility should be demonstrated with all diluents over the range of dilution proposed in the labelling. These studies should preferably be conducted on aged samples. Where the labelling does not specify the type of containers, compatibility (with respect to parameters such as appearance, pH, assay, levels of individual and total degradation products, sub-visible particulate matter and extractables from the packaging components) should be demonstrated in glass, PVC and polyolefin containers. However, if one or more containers are identified in the labelling, compatibility of admixtures needs to be demonstrated only in the specified containers.

Studies should cover the duration of storage reported in the labelling (e.g. 24 hours under controlled room temperature and 72 hours under refrigeration). Where the labelling specifies co-administration with other FPPs, compatibility should be demonstrated with respect to the principal FPP as well as the co-administered FPP (i.e. in addition to other aforementioned parameters for the mixture, the assay and degradation levels of each co-administered FPP should be reported).

Refer ICH Q8 guidelines: Pharmaceutical Development for more guidance

Note: For an established non sterile generic product, a product quality review may satisfy the requirements of sections 3.2.P.2.2.1 (a), 3.2.P.2.3 (a) of the PD and QOS (See Annex VIII)

3.2.P.3 Manufacture

3.2.P.3.1 Manufacturer(s) (name, physical address)

The name, address and responsibility of each manufacturer, including contractors, and each proposed production site or facility involved in manufacturing and testing should be provided.

40

The facilities involved in the manufacturing, packaging, labelling and testing should be listed. If certain companies are responsible only for specific steps (e.g. manufacturing of an intermediate) it should be clearly indicated. The list of manufacturers/companies should specify the actual addresses of production or manufacturing site(s) involved (including block(s) and unit(s)), rather than the administrative offices.

A valid manufacturing authorization for pharmaceutical production, as well as a marketing authorization, should be submitted to demonstrate whether that the product is registered or licensed in accordance with national requirements. Attach a WHO-type certificate of GMP.

Regulatory situation in other countries

The countries should be listed in which this product has been granted a marketing authorization (attach evidence for marketing authorization), this product has been withdrawn from the market and/or this application for marketing has been rejected, deferred or withdrawn. (Module 1, 1.10 Regulatory Status).

3.2.P.3.2 Batch formula

A batch formula should be provided that includes a list of all components of the dosage form to be used in the manufacturing process, their amounts on a per batch basis, including overages, and a reference to their quality standards.

The tables in the QOS template should be used to summarize the batch formula of the FPP for each proposed commercial batch size and express the quantity of each component on a per batch basis, including a statement of the total weight or measure of the batch.

All ingredients used in the manufacturing process should be included, including those that may not be added to every batch (e.g. acid and alkali), those that may be removed during processing (e.g. solvents) and any others (e.g. nitrogen, silicon for stoppers). If the FPP is formulated using an active moiety, then the composition for the active ingredient should be clearly indicated (e.g. "1 kg of active ingredient base = 1.075 kg active ingredient hydrochloride"). All overages should be clearly indicated (e.g. "Contains 5 kg (corresponding to 2%) overage of the API to compensate for manufacturing losses").

The ingredients should be declared by their proper or common names, quality standards (e.g. BP, JP, Ph.Eur, Ph.Int, USP, house) and, if applicable, their grades (e.g. "Microcrystalline Cellulose NF (PH 102)") and special technical characteristics (e.g. lyophilized, micronized, solubilized, emulsified).

3.2.P.3.3 Description of manufacturing process and process controls

A flow diagram should be presented giving the steps of the process and showing where

41

materials enter the process. The critical steps and points at which process controls, intermediate tests or final product controls are conducted should be identified.

A narrative description of the manufacturing process, including packaging that represents the sequence of steps undertaken and the scale of production should also be provided. Novel processes or technologies and packaging operations that directly affect product quality should be described with a greater level of detail. Equipment should, at least, be identified by type (e.g. tumble blender, in-line homogenizer) and working capacity, where relevant.

Steps in the process should have the appropriate process parameters identified, such as time, temperature or pH. Associated numeric values can be presented as an expected range. Numeric ranges for critical steps should be justified in section 3.2.P.3.4. In certain cases, environmental conditions (e.g. low humidity for an effervescent product) should be stated.

The maximum holding time for bulk FPP prior to final packaging should be stated. The holding time should be supported by the submission of stability data, if longer than 30 days. For an aseptic FPP, the holding time of the filtered product prior to filling should be supported by the submission of stability data, if longer than 24 hours.

Proposals for the reprocessing of materials should be justified. Any data to support this justification should be either referenced or filed in this section.

Provide a copy of the master formula and a copy of a manufacturing record for a real batch.

3.2.P.3.4 Controls of critical steps and intermediates

Critical steps: tests and acceptance criteria should be provided (with justification, including experimental data) performed at the critical steps identified in 3.2.P.3.3 of the manufacturing process, to ensure that the process is controlled.

Intermediates: information on the quality and control of intermediates isolated during the process should be provided.

Examples of applicable in-process controls include:

- (a) Granulations: moisture (limits expressed as a range), blend uniformity (e.g. low-dose tablets), bulk and tapped densities and particle size distribution;
- (b) Solid oral products: average weight, weight variation, hardness, thickness, friability, and disintegration checked periodically throughout compression, weight gain during coating;
- (c) Semi-solids: viscosity, homogeneity, pH;
- 42
- (d) Transdermal dosage forms: assay of API–adhesive mixture, weight per area of coated patch without backing;
- (e) Metered dose inhalers: fill weight or volume, leak testing, valve delivery;
- (f) Dry powder inhalers: assay of API–excipient blend, moisture, weight variation of individually contained doses such as capsules or blisters;
- (g) Liquids: pH, specific gravity, clarity of solutions;
- (h) Parenterals: appearance, clarity, fill volume or weight, pH, filter integrity tests, particulate matter, leak testing of ampoules, pre-filtration and/or pre-sterilization bio-burden testing.

3.2.P.3.5 Process validation and/or evaluation

Description, documentation and results of the validation and/or evaluation studies should be provided for critical steps or critical assays used in the manufacturing process (e.g. validation of the sterilization process or aseptic processing or filling).

A product quality review may be submitted in lieu of the information below.

The following information should be provided:

- a) A copy of the process validation protocol, specific to this FPP, that identifies the critical equipment and process parameters that can affect the quality of the FPP and defines testing parameters, sampling plans, analytical procedures and acceptance criteria;
- b) A commitment that three consecutive, production-scale batches of this FPP will be subjected to prospective validation in accordance with the above protocol. The applicant should submit a written commitment that information from these studies will be available for verification.
- c) Validation information relating to the adequacy and efficacy of any sterilization process (e.g. pharmaceutical product, packaging component should be submitted).

The process validation protocol should include inter alia the following:

- a) A reference to the current master production document;
- b) A discussion of the critical equipment;
- c) The process parameters that can affect the quality of the FPP (critical process parameters (CPPs)) including challenge experiments and failure mode operation;

43

- d) Details of the sampling: sampling points, stages of sampling, methods of sampling and the sampling plans (including schematics of blender/storage bins for uniformity testing of the final blend);
- e) The testing parameters/acceptance criteria including in-process and release specifications and including comparative dissolution profiles of validation batches against the batch(es) used in the bioavailability or biowaiver studies;
- f) The analytical procedures or a reference to appropriate section(s) of the dossier;
- g) The methods for recording/evaluating results; and
- h) The proposed timeframe for completion of the protocol.

The manufacture of sterile FPPs needs a well-controlled manufacturing area (e.g. a strictly controlled environment, highly reliable procedures and appropriate in-process controls). A detailed description of these conditions, procedures and controls should be provided.

The sterilization process should be described in detail and evidence should be provided to confirm that it will produce a sterile product with a high degree of reliability and that the physical and chemical properties as well as the safety of the FPP will not be affected. Details such as temperature range and peak dwell time for an FPP and the container-closure should be provided. Although standard autoclaving cycles of 121 °C for 15 minutes or more would not need a detailed rationale, such justifications should be provided for reduced temperature cycles or elevated temperature cycles with shortened exposure times. If ethylene oxide is used, studies and acceptance criteria should control the levels of residual ethylene oxide and related compounds.

Filters used should be validated with respect to pore size, compatibility with the product, absence of extractables and lack of adsorption of the API or any of the components.

For the validation of aseptic filling of parenteral products that cannot be terminally sterilized, simulation process trials should be conducted. This involves filling ampoules with culture media under normal conditions, followed by incubation and control of microbial growth. Results on microbial contamination levels should be provided.

Note: For an established generic product a product quality review may satisfy the requirements of sections 3.2.P.3.5 of the PD and QOS (Annex VIII).

Refer FDA Guidance for Industry Process Validation: General Principles and Practices for more guidance at: <http://www.fda.gov/downloads/Drugs/.../Guidances/UCM070336.pdf>

3.2.P.4 Control of excipients

3.2.P.4.1 Specifications

44

The specifications for excipients should be provided.

The specifications from the FPP manufacturer should be provided for all excipients, including those that may not be added to every batch (e.g. acid and alkali), those that do not appear in the final FPP (e.g. solvents) and any others used in the manufacturing process (e.g. nitrogen, silicon for stoppers).

If the standard claimed for an excipient is an officially recognized compendial standard, it is sufficient to state that the excipient is tested according to the requirements of that standard, rather than reproducing the specifications found in the officially recognized compendial monograph.

If the standard claimed for an excipient is a non-compendial standard (e.g. house standard) or includes tests that are supplementary to those appearing in the officially recognized compendial monograph, a copy of the specification for the excipient should be provided.

For excipients of natural origin, microbial limit testing should be included in the specifications.

For oils of plant origin (e.g. soy bean, peanut) the absence of aflatoxins or biocides should be demonstrated.

The colours permitted for use are limited to those listed in the "Japanese pharmaceutical excipients", the EU "List of permitted food colours", and the FDA "Inactive ingredient guide". For proprietary mixtures, the supplier's product sheet with the qualitative formulation should be submitted, in addition to the FPP manufacturer's specifications for the product including identification testing.

For flavours the qualitative composition should be submitted, as well as a declaration that the excipients comply with foodstuff regulations (e.g. USA or EU).

Information that is considered confidential may be submitted directly to TMDA by the supplier with reference to the specific related product. If additional purification is undertaken on commercially available excipients details of the process of purification and modified specifications should be submitted.

3.2.P.4.2 Analytical procedures

The analytical procedures used for testing the excipients should be provided where appropriate. Copies of analytical procedures from officially recognized compendial monographs do not need to be submitted.

3.2.P.4.3 Validation of analytical procedures

45

Analytical validation information, including experimental data, for the analytical procedures used for testing the excipients should be provided as in accordance to ICHQ6A.

Copies of analytical validation information are generally not submitted for the testing of excipients, with the exception of the validation of in-house methods where appropriate.

3.2.P.4.4 Justification of specifications

Justification for the proposed excipient specifications should be provided where appropriate.

A discussion of the tests that are supplementary to those appearing in the officially recognized compendial monograph should be provided.

Refer to ICHQ2A, ICHQ2B and ICHQ6A for more guidance

3.2.P.4.5 Excipients of human or animal origin

For excipients of human or animal origin, information should be provided regarding adventitious agents (e.g. sources, specifications, description of the testing performed and viral safety data).

The following excipients should be addressed in this section: gelatin, phosphates, stearic acid, magnesium stearate and other stearates. If from plant origin a declaration to this effect will suffice.

For these excipients from animal origin, a letter of attestation should be provided confirming that the excipients used to manufacture the FPP are without risk of transmitting agents of animal spongiform encephalopathies.

Refer:

■ ICH Q5A Viral safety Evaluation of Biotechnology Products derived from Cell Lines of Human or Animal Origin.

■ ICH Q5D Quality of Biotechnological Products: Derivation and Characterisation of Cell Substrates Used for Production of Biotechnological/Biological Products.

■ Q6B Test Procedures and Acceptance Criteria for Biotechnological/Biological Products.

3.2.P.4.6 Novel excipients

For excipient(s) used for the first time in an FPP or by a new route of administration, full details of manufacture, characterization and controls, with cross references to supporting safety data (nonclinical and/or clinical), should be provided according to the API and/or FPP format

46

3.2.P.5 Control of FPP

3.2.P.5.1 Specification(s)

The specification(s) for the FPP should be provided. A copy of the FPP specification(s) from the company responsible for the batch release of the FPP should be provided. The specifications should be dated and signed by the authorized personnel (i.e. the person in charge of the quality control and quality assurance departments) should be provided in the PD. Two separate sets of specifications may be set out: after packaging of the FPP (release) and at the end of the shelf-life. Any differences between release and shelf-life tests and acceptance criteria should be clearly indicated and justified.

The specifications should be summarized according to the tables in the QOS template including the tests, acceptance criteria and analytical procedures (including types, sources and versions for the methods).

Skip testing is acceptable for parameters such as identification of colouring materials and microbial limits, when justified by the submission of acceptable supportive results for five production batches. When skip-testing justification has been accepted, the specifications should include a footnote, stating at minimum the following skip-testing requirements: at minimum every tenth batch and at least one batch annually is tested. In addition, for stability-indicating parameters such as microbial limits, testing will be performed at release and shelf-life during stability studies.

Refer ICHQ3B, ICHQ3C, ICHQ6A for more guidance.

3.2.P.5.2 Analytical procedures

The analytical procedures used for testing the FPP should be provided. Copies of the in-house analytical procedures used during pharmaceutical development (if used to generate testing results provided in the PD) as well as those proposed for routine testing should be provided. Unless modified, it is not necessary to provide copies of officially recognized compendial analytical procedures.

Refer to ICH Q2 for more guidance.

3.2.P.5.3 Validation of analytical procedures

Analytical validation information, including experimental data, for the analytical procedures used for testing the FPP should be provided.

Copies of the validation reports for the in-house analytical procedures used during pharmaceutical development (if used to support testing results provided in the MA application) as well as those proposed for routine testing should be provided.

47

As recognized by regulatory authorities and pharmacopoeias themselves, verification of compendial methods can be necessary. The compendial methods, as published, are typically validated based on an API or an FPP originating from a specific manufacturer. Different sources of the same API or FPP can contain impurities and/or degradation products or excipients that were not considered during the development of the monograph. Therefore, the monograph and compendial method(s) should be demonstrated suitable for the control of the proposed FPP.

For officially recognized compendial FPP assay methods, verification should include a demonstration of specificity, accuracy and repeatability (method precision). If an officially recognized compendial method is used to control related substances that are not specified in the monograph, full validation of the method is expected with respect to those related substances.

If an officially recognized compendial standard is claimed and an in-house method is used in lieu of the compendial method (e.g. for assay or for related compounds), equivalency of the in-house and compendial methods should be demonstrated. This could be accomplished by

performing duplicate analyses of one sample by both methods and providing the results from the study. For related compound methods, the sample analysed should be the placebo spiked with related compounds at concentrations equivalent to their specification limits.

Refer to ICH Q2 for more guidance.

3.2.P.5.4 Batch analyses

A description of batches and results of batch analyses should be provided.

Information should include strength and batch number, batch size, date and site of production and use (e.g. used in comparative bioavailability or biowaiver studies, preclinical and clinical studies (if relevant), stability, pilot, scale-up and if available, production-scale batches) on relevant FPP batches used to establish the specification(s) and evaluate consistency in manufacturing.

Analytical results tested by the company responsible for the batch release of the FPP should be provided for not less than three batches of at least one commercial scale batch and two pilot scale batches. Copies of the certificates of analysis for these batches should be provided and the company responsible for generating the testing results should be identified.

The discussion of results should focus on observations noted for the various tests, rather than reporting comments such as "all tests meet specifications". This should include ranges of analytical results where relevant. For quantitative tests (e.g. individual and total impurity tests and assay tests), it should be ensured that actual numerical results are provided rather than vague statements such as "within limits" or "conforms" (e.g. "levels of degradation product A ranged from 0.2 to 0.4%"). Dissolution results should be expressed at minimum as both the average and range of individual results.

48

A discussion and justification should be provided for any incomplete analyses (e.g. results not tested according to the proposed specification).

Refer ICH Q3B, Q3C and Q6A for more guidance.

3.2.P.5.5 Characterization of impurities

Information on the characterization of impurities should be provided, if not previously provided in "3.2.S.3.2 Impurities".

A discussion should be provided of all impurities that are potential degradation products (including those among the impurities identified in 3.2.S.3.2 as well as potential degradation products resulting from interaction of the API with other APIs (FDCs), excipients or the container-closure system) and FPP process-related impurities (e.g. residual solvents in the manufacturing process for the FPP).

Refer ICH Q3B, Q3C and Q6A for more guidance.

3.2.P.5.6 Justification of specification(s)

Justification for the proposed FPP specification(s) should be provided.

A discussion should be provided on the omission or inclusion of certain tests, evolution of tests, analytical procedures and acceptance criteria, differences from the officially recognized compendial standard(s), etc. If the officially recognized compendial methods have been modified or replaced, a discussion should be included.

The justification for certain tests, analytical procedures and acceptance criteria (e.g. degradation products, dissolution method development) may have been discussed in other sections of the marketing authorization dossier and does not need to be repeated here, although a cross-reference to their location should be provided.

3.2.P.6 Reference standards or materials

Information on the reference standards or reference materials used for testing of the FPP should be provided, if not previously provided in "3.2.S.5 Reference standards or materials".

See Section 3.2.S.5 for information that should be provided on reference standards or materials. Information should be provided on reference materials of FPP degradation products, where not included in 3.2.S.5.

3.2.P.7 Container-closure system

49

A description of the container-closure systems should be provided, including the identity of materials of construction of each primary packaging component and its specification.

The specifications should include description and identification (and critical dimensions, with drawings where appropriate). Non-compendial methods (with validation) should be included, where appropriate.

For non-functional secondary packaging components (e.g. those that neither provide additional protection nor serve to deliver the product), only a brief description should be provided. For functional secondary packaging components, additional information should be provided.

Suitability information should be located in 3.2.P.2.

Descriptions, materials of construction and specifications should be provided for the packaging components that are:

- a) In direct contact with the dosage form (e.g. container, closure, liner, desiccant, filler);
- b) Used for drug delivery (including the device(s) for multi-dose solutions, emulsions,

- suspensions and powders/granules for such);
- c) Used as a protective barrier to help ensure stability or sterility; and
- d) Necessary to ensure FPP quality during storage and shipping.

Specifications for the primary packaging components should include a specific test for identification (e.g. IR). Specifications for film and foil materials should include limits for thickness or area weight.

Refer FDA Guidance for Industry Container Closure Systems for Packaging Human Drugs and Biologics for more guidance.

3.2.P.8 Stability

The purpose of stability testing is to provide evidence of how the quality of an API or FPP varies with time under the influence of a variety of environmental factors such as temperature, humidity and light. The stability programme also includes the study of product-related factors that influence its quality, for example, interaction of API with excipients, container-closure systems and packaging materials.

3.2.P.8.1 Stability Summary and Conclusion

The types of studies conducted, protocols used, and the results of the studies should be summarized. The summary should include, for example, conclusions with respect to storage conditions and shelf-life, and, if applicable, in-use storage conditions and shelf-life.

3.2.P.8.2 Post-approval Stability Protocol and Stability Commitment

50

3.2.P.8.3 Stability Data

Results of the stability studies should be presented in an appropriate format (e.g. tabular, graphical and narrative). Information on the analytical procedures used to generate the data and validation of these procedures should be included.

Refer Guidelines on Stability Requirements for Testing Active Pharmaceutical Ingredients (APIs) and Finished Pharmaceutical Products (FPPs)

3.2. REGIONAL INFORMATION

3.2.R1 Production documentation

Submit Batch Manufacturing Record (BMR) of a real batch manufactured within at most six months before the submission of the application.

MODULE 4: NON CLINICAL STUDY REPORTS

This chapter presents an agreed format for the organization of the nonclinical reports in the Common Technical Document for applications that will be submitted.

This guidance is not intended to indicate what studies are required. It merely indicates an appropriate format for the nonclinical data that have been acquired and provide references to other guideline which may be used for populating this format.

4.1 Table of Contents of Module 4

A Table of Contents should be provided that lists all of the nonclinical study reports and gives the location of each study report in the Common Technical Document.

4.2 Study Reports

The study reports should be presented in the following order:

4.2.1 Pharmacology

Refer ICH Guideline on Nonclinical Safety Studies for the Conduct of Human Clinical Trials and marketing authorization for Pharmaceuticals (M3) for the nonclinical safety studies recommended to support human clinical trials of a given scope and duration as well as marketing authorization for pharmaceuticals.

51

Refer ICH Guideline on Safety Pharmacology Studies for Human Pharmaceuticals (S7A) for the definition, objectives and scope of safety pharmacology studies. It also addresses which studies are needed before initiation of Phase 1 clinical studies as well as information needed for marketing.

Refer ICH Guideline on The Non-Clinical Evaluation of the Potential for Delayed Ventricular Repolarization (QT Interval Prolongation) by Human Pharmaceuticals (S7B) for a non-clinical testing strategy for assessing the potential of a test substance to delay ventricular repolarization. This Guideline includes information concerning non-clinical assays and integrated risk assessments.

4.2.1.1 Primary Pharmacodynamics

4.2.1.2 Secondary Pharmacodynamics

4.2.1.3 Safety Pharmacology

4.2.1.4 Pharmacodynamic Drug Interactions

4.2.2 Pharmacokinetics

4.2.2.1 Analytical Methods and Validation Reports (if separate reports are available)

4.2.2.2 Absorption

4.2.2.3 Distribution

4.2.2.4 Metabolism

4.2.2.5 Excretion

4.2.2.6 Pharmacokinetic Drug Interactions (nonclinical)

4.2.2.7 Other Pharmacokinetic Studies

Refer ICH Guideline on Pharmacokinetics: Guidance for Repeated Dose Tissue Distribution Studies (S3B) for guidance on circumstances when repeated dose tissue distribution studies should be considered (i.e., when appropriate data cannot be derived from other sources). It also gives recommendations on the conduct of such studies.

4.2.3 Toxicology

Refer ICH Note for Guidance on Toxicokinetics: The Assessment of Systemic Exposure in Toxicity Studies (S3A) for guidance on developing test strategies in toxicokinetics and the need to integrate pharmacokinetics into toxicity testing, in order to aid in the interpretation of the toxicology findings and promote rational study design development.

4.2.3.1 Single-Dose Toxicity (in order by species, by route)

4.2.3.2 Repeat-Dose Toxicity (in order by species, by route, by duration; including supportive toxicokinetics evaluations)

Refer The Committee for Human Medicinal Products (CHMP) Guideline on repeated dose toxicity for guidance on the conduct of repeated dose toxicity studies of active substances intended for human use.

Refer ICH Guideline on Duration of Chronic Toxicity Testing in Animals (Rodent and Non Rodent Toxicity Testing) (S4) for the considerations that apply to chronic toxicity testing in rodents and non-

52

rodents as part of the safety evaluation of a medicinal product. The text incorporates the guidance for repeat-dose toxicity tests.

4.2.3.3 Genotoxicity

Refer ICH Guidance on Genotoxicity Testing and Data Interpretation for Pharmaceuticals Intended for Human Use (S2) for specific guidance and recommendations for in vitro and in vivo tests and on the evaluation of test results. This document addressed two fundamental areas of genotoxicity testing: the identification of a standard set of assays to be conducted for registration, and the extent of confirmatory experimentation in any particular genotoxicity assay in the standard battery.

Refer the committee for medicinal products for human use (CHMP) guideline on the limits of genotoxic impurities for a general framework and practical approaches on how to deal with genotoxic impurities in new active substances. It also relates to new applications for existing active substances, where assessment of the route of synthesis, process control and impurity profile does not provide reasonable assurance that no new or higher levels of genotoxic impurities are introduced as compared to products currently authorized in the EU containing the same active substance. The same also applies to variations to existing Marketing Authorizations pertaining to the synthesis.

4.2.3.3.1 In vitro

4.2.3.3.2 In vivo (including supportive toxicokinetics evaluations)

4.2.3.4 Carcinogenicity (including supportive toxicokinetics evaluations)

Refer ICH Guideline on Need for Carcinogenicity Studies of Pharmaceuticals (S1A) for a consistent definition of the circumstances under which it is necessary to undertake carcinogenicity studies on new drugs. These recommendations take into account the known risk factors as well as the intended indications and duration of exposure.

Refer ICH Guideline on Testing for Carcinogenicity of Pharmaceuticals (S1B) for guidance on the need to carry out carcinogenicity studies in both mice and rats, and guidance is also given on alternative testing procedures which may be applied without jeopardizing safety.

Refer ICH Guideline on Dose Selection for Carcinogenicity Studies of Pharmaceuticals (S1C) for the criteria for selection of the high dose for carcinogenicity studies of therapeutics. The use of other pharmacodynamic-, pharmacokinetic-, or toxicity-based endpoints in study design should be considered based on scientific rationale and individual merits.

4.2.3.4.1 Long-term studies (in order by species; including range-finding studies that cannot appropriately be included under repeat-dose toxicity or pharmacokinetics)

4.2.3.4.2 Short- or medium-term studies (including range-finding studies that cannot appropriately be included under repeat-dose toxicity or pharmacokinetics)

4.2.3.4.3 Other studies

53

4.2.3.5 Reproductive and Developmental Toxicity (including range-finding studies and supportive toxicokinetics evaluations) (If modified study designs are used, the following sub-headings should be modified accordingly.)

Refer ICH Guidance on Detection of Toxicity to Reproduction for Medicinal Products & Toxicity to Male Fertility (S5) for guidance on tests for reproductive toxicity. It defines the periods of treatment to be used in animals to better reflect human exposure to medical products and allow more specific identification of stages at risk.

Refer committee for medicinal products for human use (CHMP) guideline on the need for non-clinical testing in juvenile animals of pharmaceuticals for paediatric indications for guidance on the need for, role and timing of studies in juvenile animals in the non-clinical safety evaluation of medicinal products for

paediatric use.

4.2.3.5.1 Fertility and early embryonic development

4.2.3.5.2 Embryo-foetal development

4.2.3.5.3 Prenatal and postnatal development, including maternal function

4.2.3.5.4 Studies in which the offspring (juvenile animals) are dosed and/or further evaluated.

4.2.3.6 Local Tolerance

Refer the Committee for medicinal products for human use (CHMP) guideline on Non-clinical local tolerance testing of medicinal products for recommendations on the evaluation of local tolerance to be performed prior to human exposure to the product. The purpose of these studies is to ascertain whether medicinal products are tolerated at sites in the body, which may come into contact with products as the result of its administration in clinical use.

4.2.3.7 Other Toxicity Studies (if available)

4.2.3.7.1 Antigenicity

4.2.3.7.2 Immunotoxicity

Refer ICH Guideline on Immunotoxicity Studies for Human Pharmaceuticals (S8) for the recommendations on nonclinical testing for immunosuppression induced by low molecular weight drugs (non-biologicals). It applies to new pharmaceuticals intended for use in humans, as well as to marketed drug products proposed for different indications or other variations on the current product label in which

the change could result in unaddressed and relevant toxicologic issues. In addition, the Guideline might also apply to drugs in which clinical signs of immunosuppression are observed during clinical trials and following approval to market.

4.2.3.7.3 Mechanistic studies (if not included elsewhere)

4.2.3.7.4 Dependence

4.2.3.7.5 Metabolites

4.2.3.7.6 Impurities

54

4.2.3.7.7 Other toxicity studies

4.2.3.7.7.1 Photosafety evaluation

A harmonized guideline on photosafety evaluation of pharmaceuticals is to be published through the ICH process.

For generic products are generally exempted in this module; however, in some cases such as changes in safety impurity profile, the safety assessment studies should be conducted.

For specific products

Refer ICH Guideline on clinical Evaluation for Anticancer Pharmaceuticals (S9) for information for pharmaceuticals that are only intended to treat cancer in patients with late stage or advanced disease regardless of the route of administration, including both small molecule and biotechnology-derived pharmaceuticals. It describes the type and timing of nonclinical studies in relation to the development of anticancer pharmaceuticals and references other guidance as appropriate.

Refer ICH Guidance on Preclinical Safety Evaluation of Biotechnology-Derived Pharmaceuticals (S6) for the pre-clinical safety testing requirements for biotechnological products. It addresses the use of animal models of disease, determination of when genotoxicity assays and carcinogenicity studies should be performed, and the impact of antibody formation on duration of toxicology studies.

Refer committee for medicinal products for human use (CHMP) guideline on Non-clinical development of fixed combinations of medicinal products for guidance on the non-clinical strategies to be considered when developing a fixed combination based on the different data available in order to support the safe human use as well as avoid unnecessary repetition of animal studies.

55

MODULE 5: CLINICAL STUDY REPORTS

5.1 Table of Contents of Module 5

A Table of Contents for study reports should be provided.

5.2 Tabular Listing of All Clinical Studies

5.3 Clinical Study Reports

Refer ICH Guidance on the Common Technical Document for the registration of pharmaceuticals for human use: Efficacy (M4E) for guidance on the content of this section.

Refer ICH guidelines for the structure and content of clinical study report (E3).

5.3.1 Reports of Biopharmaceutics Studies

5.3.1.1 Bioavailability (BA) Study Reports

5.3.1.2 Comparative BA and Bioequivalence (BE) Study Reports

For Generic product

Dear Sir/Madam,

Subject: Submission of Application Dossier(s) for Marketing Authorization of
<Product Name(s), [strength(s) of active pharmaceutical ingredient(s) and
dosage form(s)>

We are pleased to submit our Application Dossier(s) for a registration of human medicines
which details are as follows:

Name of the medicinal product(s):

Pharmaceutical form(s) and strength(s):

INN/active Pharmaceutical ingredient(s):

ATC Code(s):

You will find enclosed the submission dossier as specified hereafter:

CTD format, 2 soft copies documents format

CD rom; Summaries in word format and body data in PDF format

We confirm that all future submissions for this specific product will be submitted in this
same format

We confirm that the electronic submission has been checked with up-to-date and state-of-the-art antivirus software.

58

The electronic submission contains the following modules:

- Module 1: Administrative information and product information
- Module 2: Overview and summaries
- Module 3: Quality
- Module 4: Non clinical study reports
- Module 5: Clinical study reports

<The relevant fees have been paid.>

Yours sincerely,

.....

Annex II: Application Form

MODULE 1: ADMINISTRATIVE INFORMATION

1.0 PARTICULARS OF THE PRODUCT

1.1 Type of the medicinal product application

New

Generic

Extension application

Duplicate license

Renewal*

* If variation has been made, information supporting the changes should be submitted. See variation guidelines for registered medicinal products.

1.2 Proprietary Name

1.3 International Non-proprietary Name (INN) of the Active Pharmaceutical Ingredient (API)

1.4 Strength of Active Pharmaceutical Ingredient (API) per unit dosage form:

1.5 Name and address (physical and postal) of Applicant

(Company) Name:

Address:

Country:

Telephone:

Telefax:

E-Mail:

1.6 Name and address (physical and postal) of Local Technical Representative

(Company) Name:

Address:

Country:

Telephone:

Telefax:

E-Mail:

1.7 Pharmaceutical Dosage form* and route of administration*

* List of standard terms for dosage forms and routes of administration is available in the guidelines on submission of documentation for registration of human medicinal products

1.7.1 Dosage form:

1.7.2 Route(s) of administration (use current list of standard terms)

1.8 Packing/pack size:

1.9 Visual description

(Add as many rows as necessary)

1.10 Proposed shelf life (in months):

1.10.1 Proposed shelf life (after reconstitution or dilution):

1.10.2 Proposed shelf life (after first opening container):

1.10.3 Proposed storage conditions:

60

1.10.4 Proposed storage conditions after first opening:

1.11 Other sister medicinal products registered or applied for registration

1.11.1 Do you hold Marketing Authorization (s) of other medicinal product (s) containing the same active substance (s) in other countries?

If yes state; ■ Product name (s), strength (s), pharmaceutical form (s):

■ Partner States where product is authorized:

■ Marketing authorization number(s):

■ Indication(s):

1.11.2 Have you applied for Marketing Authorization medicinal product (s) containing the same active substance (s) in other countries?

■ Product name (s), strength (s), pharmaceutical form (s):

■ Indication(s):

1.12 Pharmacotherapeutic group and ATC Code

1.12.1 Pharmacotherapeutic group:

1.12.2 ATC Code: (Please use current ATC code)

1.12.3 If no ATC code has been assigned, please indicate if an application for ATC code has been made:

1.13 Distribution category: Controlled Drug POM Pharmacy Only OTC

General sale

(Applicants are invited to indicate which categories they are requesting, however, TMDA reserves the right to change and/or apply only those categories provided for in their national legislation)

1.14 Country of origin:

1.15 Product Marketing Authorization in the country of origin (Attach Certificate of Pharmaceutical Product from National Medicines Regulatory Authority). If not registered, state reasons

Authorized Withdrawn (by applicant after authorization)

2.0 DECLARATION BY AN APPLICANT

I, the undersigned certify that all the information in this form and accompanying documentation is correct, complete and true to the best of my knowledge.

I further confirm that the information referred to in my application dossier is available for verification during GMP inspection.

I also agree that I shall carry out pharmacovigilance to monitor the safety of the product in the market and provide safety update reports to the Tanzania Medicines and Medical Devices Authority.

I further agree that I am obliged to follow the requirements of the Legislations and Regulations 63 which are applicable to medicinal products.

I also consent to the processing of information provided by TMDA.

It is hereby confirmed that fees will be paid/have been paid according to the fees and charges regulations

Name:

Position in the company:.....

Signature:

Date:.....

Official stamp:.....

* Note: If fees have been paid, attach proof of payment

64

Annex III: Expert Declaration Form

The following is an example of a suitable declaration form:

Quality /Non-clinical / Clinical (delete those not appropriate)

I, the undersigned, declare that I have:

i. the suitable technical or professional qualifications to act in this capacity (for more information, refer to the enclosed curriculum vitae).

ii. fully examined the data provided by the applicant and have provided references to the literature to support statements made that are not supported by the applicant's original data. This report presents an objective assessment of the nature and extent of the data.

iii. provided a report based on my independent assessment of the data provided.

iv. based my recommendations, regarding suitability for registration, on the data provided herewith. I have considered the attached data and have recommended as to suitability for registration of the intended dose forms and presentations according to the proposed product information document.

I further declare that this expert report represents my own view.

Further, I declare the following to be the full extent of the professional relationship between myself and the applicant:

.....
.....
.....

etc.

2.3.P.7 Container Closure System

(a) Description of the container closure systems, including unit count or fill size, container size or volume:

Description
Unit count or fill size Container size
(including materials Strength
(e.g. 60s, 100s etc.) (e.g. 5 ml, 100 ml etc.)
of construction)

74

2.3.P.8 Stability

2.3.P.8.1 Stability Summary and Conclusions

(c) Proposed storage statement and shelf-life (and in-use storage conditions and in-use period, if applicable):

Container closure system Storage statement Shelf-life

2.3.P.8.2 Post-approval Stability Protocol and Stability Commitment

(a) Stability protocol for Primary stability batches (e.g. storage conditions (including tolerances), batch numbers and batch sizes, tests and acceptance criteria, testing frequency, container closure system(s)):

75

Parameter Details

Storage condition(s) (■C, % RH)

Batch number(s) / batch size(s) <primary batches>

Tests and acceptance criteria Description

Moisture

Impurities

Assay

etc.

Testing frequency

Container closure system(s)

(b) Stability protocol for Commitment batches (e.g. storage conditions (including tolerances), batch numbers (if known) and batch sizes, tests and acceptance criteria, testing frequency, container closure system(s)):

76

Parameter Details

Storage condition(s) (■C, % RH)

Batch number(s) / batch size(s) <not less than three production batches in each container closure system>

Tests and acceptance criteria Description

Moisture

Impurities

Assay

etc.

Testing frequency

Container closure system(s)

(c) Stability protocol for Ongoing Batches (e.g. storage conditions (including tolerances), number of batches per strength and batch sizes, tests and acceptance criteria, testing frequency, container closure system(s)):

Parameter Details

Storage condition(s) (■C, % RH)

Batch size(s), annual allocation <at least one production batch per year (unless none is produced that year) in each container closure system >

Tests and acceptance criteria Description

Moisture

Impurities

Assay

etc.

77

Parameter Details

Testing frequency

Container closure system(s)

2.3.P.8.3 Stability Data

(c) Bracketing and matrixing design for commitment and/or continuing (i.e. ongoing) batches, if applicable:

WRITTEN COMMITMENTS OF THE MANUFACTURER – for TMDA use

API

If applicable (primary stability study commitment):

The Applicant (or API manufacturer) undertook in writing (date of letter of commitment) to continue long-term testing of <INN of API> for a period of time sufficient to cover the whole provisional re-test period (period ending month/year) and to report any significant changes or out-of-specification results immediately to TMDA for the following batches :
<Batch numbers, manufacturing dates, batch size, primary packing materials>

If applicable (commitment stability studies):

Since stability data on three production scale batches were not provided with the application, the remaining number of production scale batches should be put on long-term stability testing. Any significant changes or out-of-specification results should be reported immediately to TMDA. The approved stability protocol should be used for commitment batches.

API option 1 – CEP

The Applicant provided a commitment in writing (date of letter of commitment) to inform TMDA in the event that the CEP is revised or withdrawn, and that revisions to the CEP will be handled as per variation guidelines. Note that revisions or withdrawal will require additional consideration of the API data requirements to support the dossier.

API option 2 – WHOAPI-CPQ

78

The Applicant provided a commitment in writing (date of letter of commitment) to inform TMDA in the event that the WHOAPI-CPQ is revised or withdrawn, and that revisions to the WHOAPI-CPQ will be handled as per variation TMDA Variation guidelines. Note that revisions or withdrawal will require additional consideration of the API data requirements to support the dossier.

API option 4 – full details in the PD (ongoing stability study commitment)

The Applicant undertook in writing (date of letter of commitment) a commitment regarding ongoing stability studies. Unless otherwise justified, at least one batch per year of the product will be included in the stability programme (unless none is produced during that year). The stability protocol will be that which was approved for primary batches (or the protocol was submitted for assessment). Out-of-specification results or significant atypical trends will be investigated. Any confirmed significant change or out-of-specification result will be reported immediately to TMDA. The possible impact on batches on the market will be considered in consultation with GMP inspection.

FPP

If applicable (primary stability study commitment):

The Applicant undertook in writing (date of letter of commitment) to continue long-term testing of < FPP reference number, trade name (INN of API), strength, pharmaceutical form> for a period of time sufficient to cover the whole provisional shelf-life (period ending month/year) and to report any out-of-specification results or significant changes immediately for the following batches :
<Batch numbers, manufacturing dates, batch size, primary packing materials >

If applicable (commitment stability studies):

Since stability data on three production scale batches was not provided with the application, the Applicant undertook in writing, (date of letter of commitment) to put the remaining number <e.g. additional two (2)> production scale batches of < FPP reference number, trade name (INN of API), strength, pharmaceutical form, primary packing material> on long-term stability testing. Any out-of-specification results or significant changes during the study will immediately be reported to TMDA. The approved stability protocol will be used for commitment batches.

If applicable (when the proposed largest commercial batch size is 200 000 units (x units) or less)

79

The Applicant undertook in writing (date of letter of commitment) to place the first three batches of any production size larger than x units on stability. The stability protocol will be that which was approved for primary batches (or the protocol was submitted for assessment). Out-of-specification results or significant atypical trends will be investigated. Any confirmed significant change or out-of-specification result will be reported immediately to TMDA.

Ongoing stability study commitment

The Applicant undertook in writing (date of letter of commitment) a commitment regarding ongoing stability studies. Unless otherwise justified, at least one batch per year of the product manufactured in every primary packaging type will be included in the stability programme (unless none is produced during that year). The stability protocol will be that which was

approved for primary batches (or the protocol was submitted and found acceptable). Out-of-specification results or significant atypical trends will be investigated. Any confirmed significant change or out-of-specification result will be reported immediately to TMDA. The possible impact on batches on the market will be considered in consultation with GMP inspection.

If applicable (validation of production batches)

Validation data on production scale batches of not less than three (3) consecutive batches of <FPF reference number, trade name (INN of API), strength, pharmaceutical form, primary packing material> was not provided with the application. Therefore, the Applicant submitted a written commitment (date of letter of commitment) that three consecutive production batches would be prospectively validated and a validation report—in accordance with the details of the validation protocol provided in the dossier— would be made available as soon as possible for evaluation by assessors or for verification by the GMP inspection.

Dear Sir/Madam,

Subject: Authorization to access Certificate of Suitability (CEP)

Reference is made to the above subject matter.

Consent is hereby granted to the Tanzania Medicines and Medical Devices (TMDA) to make reference to this company's Certificate(s) of Suitability (CEPs) [number(s)] for [API(s) name(s)] in the evaluation of applications relating to the registration of [medicine name(s)] submitted to TMDA by (applicant's name).

This consent does/does not** include authorization to supply information or extracts from or the whole of the data to:

(Name of company or individual)

The API is manufactured by:
(Names and addresses of all manufacturing sites and manufacturing steps carried out at site)

A formal agreement exists between the applicant of the medicine and the manufacturer of the API which ensures that information will be communicated between them and to TMDA before any significant change is made to the site of manufacture, manufacturing procedure or quality control specifications of the API. Except as permitted by the guidelines relating to changes to medicines, such changes will not be made to the API to be used in manufacture of the medicine destined to be distributed in Tanzania before written approval is granted by TMDA.

81

I understand that the consequences of failure to obtain approval for changes where approval is necessary may include de-registration and recall of batches of medicines.

Any questions arising from the TMDA's evaluation of this CEP should be forwarded to:

(Name and address)

Yours faithfully

Dear Sir/Madam,

Subject: Authorization to access Active Pharmaceutical Ingredient Master File

Reference is made to the above subject matter.

Consent is hereby granted to the Tanzania Medicines and Medical Devices Authority (TMDA) to make reference to this company's Active Pharmaceutical Ingredient Master File(s) for [API(s) name] in the evaluation of applications relating to the registration of [medicine name(s)] submitted to TMDA by the (applicant's name).

This consent does/does not** include authorization to supply information or extracts from or the whole of the data to:

(Name of company or individual)

The substance is manufactured by:
(Names and addresses of all manufacturing sites and manufacturing steps carried out at site)

A copy of the applicant's Part of the APIMF as specified in the Guidelines on Procedures for Evaluation of Quality of API has been supplied to the applicant.

A formal agreement exists between the applicant of the medicine and the manufacturer of the API which ensures that information will be communicated between them and to TMDA before any significant change is made to the site of manufacture, manufacturing procedure or quality

83
control specifications of the API. Except as permitted by the TMDA guidelines relating to changes to medicines, such changes will not be made to the API to be used in manufacture of the medicine destined to be distributed in Tanzania before written approval is granted by the TMDA.

I understand that the consequences of failure to obtain approval for changes where approval is necessary may include de-registration and recall of batches of medicines.

This APIMF (or data identical to that contained therein) has also been submitted to and approved by the regulatory authorities in (list of countries with stringent regulatory systems), and TMDA is authorized to request and refer to the evaluation reports of these agencies. TMDA is also authorized to exchange its own evaluation reports with these and other regulatory authorities.

Any questions arising from evaluation of this APIMF should be forwarded to:

{Name and address}

Yours faithfully

Name of API:
Name of API manufacturer:
■ Certificate of suitability to the European Pharmacopoeia (CEP):
■ is a written commitment provided that the applicant will inform TMDA in the event that the CEP is withdrawn and has acknowledged that withdrawal
■ of the CEP will require additional consideration of the API data requirements to support the dossier:
o ■ yes, ■ no;
■ a copy of the most current CEP (with annexes) and written commitment should be provided in Module 1;

- the declaration of access should be filled out by the CEP holder on behalf of the FPP manufacturer or applicant to TMDA who refers to the CEP; and
- summaries of the relevant information should be provided under the appropriate sections (e.g. S.1.3, S.3.1, S.4.1 through S.4.4, S.6 and S.7; see Quality guideline).
- Active pharmaceutical ingredient master file (APIMF):
- A copy of the letter of access should be provided in Module 1; and summaries of the

85

relevant information from the Open part should be provided under the appropriate sections; see Section 3.2.S in the Quality guideline.

- Active pharmaceutical ingredient pre-qualified by WHO

Provide evidence from WHO

- Full details in the PD:

Summaries of the full information should be provided under the appropriate sections; see Section 3.2.S in the Quality guideline.

2.3.S.1 General Information

2.3.S.1.1 Nomenclature

- (Recommended) International Non-proprietary name (INN):
- Compendial name, if relevant:
- Chemical name(s):
- Company or laboratory code:
- Other non-proprietary name(s) (e.g. national name, USAN, BAN):
- Chemical Abstracts Service (CAS) registry number:

2.3.S.1.2 Structure

- Structural formula, including relative and absolute stereochemistry:
- Molecular formula:
- Relative molecular mass:

2.3.S.1.3 General Properties

- Physical description (e.g. appearance, colour, physical state):
- Solubilities:
In common solvents:
Quantitative aqueous pH solubility profile (pH 1 to 6.8):

Medium (e.g. pH 4.5 buffer) Solubility (mg/ml)

Dose/solubility volume calculation:

- Physical form (e.g. polymorphic form(s), solvate, hydrate):

Polymorphic form:

Solvate:

Hydrate:

- Other:

86

Property

pH

pK

Partition coefficients

Melting/boiling points

Specific optical rotation

(specify solvent)

Refractive index (liquids)

Hygroscopicity

UV absorption maxima/molar

absorptivity

Other

2.3.S.2 Manufacture

2.3.S.2.1 Manufacturer(s)

- Name, address and responsibility (e.g. fabrication, packaging, labelling, testing, storage) of each manufacturer, including contractors and each proposed production site or facility involved in these activities:

Name and address Responsibility APIMF/CEP number (if including block(s)/unit(s)) applicable)

- Manufacturing authorization for the production of API(s) and, where available, certificate of GMP compliance (GMP information should be provided in Module 1):

2.3.S.2.2 Description of Manufacturing Process and Process Controls

- Flow diagram of the synthesis process(es):
- Brief narrative description of the manufacturing process(es):
- Alternate processes and explanation of their use:
- Reprocessing steps and justification:

2.3.S.2.3 Control of Materials

- Summary of the quality and controls of the starting materials used in the manufacture of the API:

87

Step/starting material Test(s)/method(s) Acceptance criteria

- Name and manufacturing site address of starting material manufacturer(s):
- Where the API(s) and the starting materials and reagents used to manufacture the API(s)

are without risk of transmitting agents of animal spongiform encephalopathies, a letter of attestation confirming this can be found in:

2.3.S.2.4 Controls of Critical Steps and Intermediates

(a) Summary of the controls performed at critical steps of the manufacturing process and on intermediates:

Step/materials Test(s)/method(s) Acceptance criteria

2.3.S.2.5 Process Validation and/or Evaluation

(a) Description of process validation and/or evaluation studies (e.g. for aseptic processing and sterilization):

2.3.S.2.6 Manufacturing Process Development

(a) Description and discussion of the significant changes made to the manufacturing process and/or manufacturing site of the API used in producing comparative bioavailability or bio-waiver, stability, scale-up, pilot and, if available, production scale batches:

2.3.S.3 Characterisation

2.3.S.3.1 Elucidation of Structure and other Characteristics

(a) List of studies performed (e.g. IR, UV, NMR, MS, elemental analysis) and conclusion from the studies (e.g. whether results support the proposed structure):

88

(b) Discussion on the potential for isomerism and identification of stereochemistry (e.g. geometric isomerism, number of chiral centres and configurations) of the API batch(es) used in comparative bioavailability or bioavailability studies:

(c) Summary of studies performed to identify potential polymorphic forms (including solvates):

(d) Summary of studies performed to identify the particle size distribution of the API:

(e) Other characteristics:

2.3.S.3.2 Impurities

(a) Identification of potential and actual impurities arising from the synthesis, manufacture and/or degradation:

(i) List of API-related impurities (e.g. starting materials, by-products, intermediates, chiral impurities, degradation products), including chemical name, structure and origin:

API-related impurity Structure Origin
(chemical name or descriptor)

(ii) List of process-related impurities (e.g. residual solvents, reagents), including compound names and step used in synthesis:

Process-related impurity (compound name) Step used in synthesis

(b) Basis for setting the acceptance criteria for impurities:

(i) Maximum daily dose (i.e. the amount of API administered per day) for the API, corresponding to ICH Reporting/Identification/Qualification Thresholds for the API-related impurities and the concentration limits (ppm) for the process-related impurities (e.g. residual solvents):

89

Maximum daily dose for the <x mg/day>

API:

Test Parameter ICH threshold or
concentration limit

API-related impurities Reporting Threshold

Identification Threshold

Qualification Threshold

Process-related impurities <solvent 1>

<solvent 2>, etc.

(ii) Data on observed impurities for relevant batches (e.g. comparative bioavailability or bioavailability, stability batches):

Impurity Acceptance Results (include batch number* and use**)
(API-related and Criteria
process-related)

* include strength, if reporting impurity levels found in the FPP (e.g. for comparative studies)

** e.g. comparative bioavailability or bio-waiver studies, stability

(iii) Justification of proposed acceptance criteria for impurities:

2.3.S.4 Control of the API

2.3.S.4.1 Specification

(a) API specifications of the FPP manufacturer:

Standard (e.g. Ph.Int., Ph.Eur., BP, USP, House)

Specification reference number and version

Test Acceptance criteria Analytical procedure

(Type/Source/Version)

Description

Identification

Impurities

Assay

etc.

90

2.3.S.4.2 Analytical Procedures

(a) Summary of the analytical procedures (e.g. key method parameters, conditions, system suitability testing):

2.3.S.4.3 Validation of Analytical Procedures

(a) Summary of the validation information (e.g. validation parameters and results for non-compendia methods):

(b) Summary of verification information on compendia methods

2.3.S.4.4 Batch Analyses

(a) Description of the batches:

Batch number Batch size Date and Use (e.g. comparative site of production bioavailability or biowaiver, stability)

(b) Summary of batch analyses release results of the FPP manufacturer for relevant batches (e.g. comparative bioavailability or bio-waiver, stability):

Test Acceptance Results

Criteria <batch x> <batch y> etc.

Description

Identification

Impurities

Assay

etc.

(c) Summary of analytical procedures and validation information for those procedures not previously summarized in 2.3.S.4.2 and 2.3.S.4.3 (e.g. historical analytical procedures):

2.3.S.4.5 Justification of Specification

(a) Justification of the API specification (e.g. evolution of tests, analytical procedures and acceptance criteria, differences from officially recognized compendial standard(s)):

2.3.S.5 Reference Standards or Materials

91

(a) Source (including lot number) of primary reference standards or reference materials (e.g. Ph.Int., Ph.Eur., BP, USP, in-house):

(b) Characterization and evaluation of non-official (e.g. not from an officially recognized pharmacopoeia) primary reference standards or reference materials (e.g. elucidation of structure, certificate of analysis):

(c) Description of the process controls of the secondary reference standard (comparative certificate of analysis and IR spectra against primary standard) :

2.3.S.6 Container Closure System

(a) Description of the container closure system(s) for the shipment and storage of the API (including the identity of materials of construction of each primary packaging component and a brief summary of the specifications):

Packaging component Materials of construction Specifications (list parameters e.g. identification (IR))

(b) Other information on the container closure system(s) (e.g. suitability studies):

2.3.S.7 Stability

2.3.S.7.1 Stability Summary and Conclusions

(a) Summary of stress testing (e.g. heat, humidity, oxidation, photolysis, and acid/base): and results:

Stress condition Treatment Results (e.g. including discussion whether mass balance is observed)

Heat

Humidity

Oxidation

Photolysis

Acid

Base

Other

(b) Summary of accelerated and long-term testing parameters (e.g. studies conducted):

92

Storage condition Batch number Batch Container closure Completed (and (■C, % RH) size system proposed) testing intervals

Summary of the stability results observed for the above accelerated and long-term studies:

Test Results

Description

Moisture

Impurities

Assay

etc.

(c) Proposed storage statement and re-test period (or shelf-life, as appropriate):

Container closure system Storage statement Re-test period*

* indicate if a shelf-life is proposed in lieu of a re-test period (e.g. in the case of labile APIs)

2.3.S.7.2 Post-approval Stability Protocol and Stability Commitment

(a) Stability protocol for Primary stability batches (e.g. storage conditions (including tolerances), batch numbers and batch sizes, tests and acceptance criteria, testing frequency, container closure system(s)):

Parameter Details

Storage condition(s) (■C, % RH)

Batch number(s) / batch size(s)

Tests and acceptance criteria Description

Moisture

Impurities

Assay

etc.

Testing frequency

Container closure system(s)

93

Parameter Details

(b) Stability protocol for Commitment batches (e.g. storage conditions (including tolerances), batch numbers (if known) and batch sizes, tests and acceptance criteria, testing frequency, container closure system(s)):

Parameter Details

Storage condition(s) (■C, % RH)

Batch number(s) / batch <not less than three production batches>
size(s)

Tests and acceptance criteria Description

Moisture

Impurities

Assay

etc.

Testing frequency

Container closure system(s)

(c) Stability protocol for Ongoing batches (e.g. storage conditions (including tolerances), batch sizes and annual allocation, tests and acceptance criteria, testing frequency, container closure system(s)):

Parameter Details

Storage condition(s) (■C, % RH)

Annual allocation <at least one production batch per year (unless none is produced
that year)in each container closure system >

Tests and acceptance criteria Description

Moisture

Impurities

Assay

etc.

Testing frequency

Container closure system(s)

2.3.S.7.3 Stability Data

(a) The actual stability results should be provided in Module 3.

94

(b) Summary of analytical procedures and validation information for those procedures not previously summarized in 2.3.S.4 (e.g. analytical procedures used only for stability studies):

2.3.P FINISHED PHARMACEUTICAL PRODUCT (FPP)

2.3.P.1 Description and Composition of the FPP

(a) Description of the FPP:

(b) Composition of the FPP:

(i) Composition, i.e. list of all components of the FPP and their amounts on a per unit basis and percentage basis (including individual components of mixtures prepared in-house (e.g. coatings) and overages, if any):

Component and Function Strength (label claim)
quality standard (and
grade, if applicable) Quant. per % Quant. per % Quantity per%
unit unit unit
<complete with appropriate title e.g. Core tablet, Contents of capsule, Powder for injection>

Subtotal 1
<complete with appropriate title e.g. Film-coating>

Subtotal 2
Total

(ii) Composition of all components purchased as mixtures (e.g.
colourants, coatings, capsule shells, imprinting inks):

(c) Description of accompanying reconstitution diluent(s), if applicable:

(d) Type of container closure system used for the FPP and accompanying
reconstitution diluent, if applicable:

2.3.P.2 Pharmaceutical Development

2.3.P.2.1 Components of the FPP

95

2.3.P.2.1.1 Active Pharmaceutical Ingredient

(a) Discussion of the:

(i) compatibility of the API(s) with excipients listed in 2.3.P.1:

(ii) key physicochemical characteristics (e.g. water content,
solubility, particle size distribution, polymorphic or solid state form) of the
API(s) that can influence the performance of the FPP:

(iii) for fixed-dose combinations, compatibility of APIs with each
other:

2.3.P.2.1.2 Excipients

(a) Discussion of the choice of excipients listed in 2.3.P.1 (e.g. their
concentrations, their characteristics that can influence the FPP performance):

2.3.P.2.2 Finished Pharmaceutical Product

2.3.P.2.2.1 Formulation Development

(a) Summary describing the development of the FPP (e.g. route of
administration, usage, optimization of the formulation, etc.):

(b) Information on primary (submission, registration, exhibit) batches including
comparative bioavailability or bio-waiver, stability, commercial:

(i) Summary of batch numbers:

Batch number(s) of the FPPs used in
Bioequivalence or biowaiver
Dissolution profile studies
Stability studies (primary batches)
<packaging configuration I>
< packaging configuration II>
<Add/delete as many rows as necessary>
Stability studies (production batches)
< packaging configuration I>
< packaging configuration II>
(Add/delete as many rows as necessary)
Validation studies (primary batches) if available
< packaging configuration I>
< packaging configuration II>

96

(Add/delete as many rows as necessary)
Validation studies (at least the first three
consecutive production batches)
or code(s)/version(s) for process validation
protocol(s)

(ii) Summary of formulations and discussion of any differences:

Component and Relevant batches
quality standard Comparative Stability Process validation Commercial
(e.g. NF, BP, bioavailability (2.3.P.1)
Ph.Eur, in-house) or biowaiver
<Batch nos. and

sizes> sizes> sizes> sizes>
Theor. % Theor. % Theor. % Theor. %
quantity quantity per quantity per quantity per
per batch batch batch batch
<complete with appropriate title e.g. Core tablet, Contents of capsule, Powder
for injection>

Subtotal 1
<complete with appropriate title e.g. Film-coating>

Subtotal 2
Total

(c) Description of batches used in the comparative in vitro studies (e.g. dissolution) and in the in vivo studies (e.g. comparative bioavailability or biowaiver), including strength, batch number, type of study and reference to the data (volume, page):

(d) Summary of results for comparative in vitro studies
(e.g. dissolution)

(e) Summary of any information on in vitro-in vivo correlation (IVIVC) studies (with cross-reference to the studies in Module 5):

(f) For scored tablets, provide the rationale/justification for scoring:

2.3.P.2.2.2 Overages

97

(a) Justification of overages in the formulation(s) described in 2.3.P.1:

2.3.P.2.2.3 Physicochemical and Biological Properties

(a) Discussion of the parameters relevant to the performance of the FPP
(e.g. pH, ionic strength, dissolution, particle size distribution, polymorphism, rheological properties):

2.3.P.2.3 Manufacturing Process Development

(a) Discussion of the development of the manufacturing process of the FPP (e.g. optimization of the process, selection of the method of sterilization):

(b) Discussion of the differences in the manufacturing process(es) for the batches used in the comparative bioavailability or biowaiver studies and the process described in 2.3.P.3.3:

2.3.P.2.4 Container Closure System

(a) Discussion of the suitability of the container closure system
(described in 2.3.P.7) used for the storage, transportation (shipping) and use of the FPP (e.g. choice of materials, protection from moisture and light, compatibility of the materials with the FPP):

(b) For a device accompanying a multi-dose container, a summary of the study results demonstrating the reproducibility of the device (e.g. consistent delivery of the intended volume):

2.3.P.2.5 Microbiological Attributes

(a) Discussion of microbiological attributes of the FPP (e.g. preservative effectiveness studies):

98

2.3.P.2.6 Compatibility

(a) Discussion of the compatibility of the FPP (e.g. with reconstitution diluent(s) or dosage devices, co-administered FPPs):

2.3.P.3 Manufacture

2.3.P.3.1 Manufacturer(s)

(a) Name, address and responsibility (e.g. fabrication, packaging, labelling, testing) of each manufacturer, including contractors and each proposed production site or facility involved in manufacturing and testing:

Name and address Responsibility
(include block(s)/unit(s))

2.3.P.3.2 Batch Formula

(a) List of all components of the FPP to be used in the manufacturing process and their amounts on a per batch basis (including individual components of mixtures prepared in-house (e.g. coatings) and overages, if any):

Strength (label claim)

Master production document

reference number and/or version

Proposed commercial batch size(s) (e.g. number of dosage units)

Component and quality Quantity per batch Quantity per batch Quantity per batch

Standard (and grade, if applicable) (e.g. kg/batch) (e.g. kg/batch) (e.g. kg/batch)

<complete with appropriate title e.g. Core tablet, Contents of capsule, Powder for injection>

Subtotal 1
<complete with appropriate title e.g. Film-coating>

Subtotal 2

Total

99

2.3.P.3.3 Description of Manufacturing Process and Process Controls

(a) Flow diagram of the manufacturing process:

(b) Narrative description of the manufacturing process, including equipment type and working capacity, process parameters:

(c) Justification of reprocessing of materials:

2.3.P.3.4 Controls of Critical Steps and Intermediates

(a) Summary of controls performed at the critical steps of the manufacturing process and on isolated intermediates:

Step Controls

(e.g. granulation, compression, coating)

2.3.P.3.5 Process Validation and/or Evaluation

(a) Summary of the process validation and/or evaluation studies conducted (including product quality review(s) where relevant) and/or a summary of the proposed process validation protocol for the critical steps or critical assays used in the manufacturing process (e.g. protocol number, parameters, results):

2.3.P.4 Control of Excipients

2.3.P.4.1 Specifications

(a) Summary of the specifications for officially recognized compendial excipients which include supplementary tests not included in the officially recognized compendial monograph(s):

2.3.P.4.2 Analytical Procedures

(a) Summary of the analytical procedures for supplementary tests:

2.3.P.4.3 Validation of Analytical Procedures

(a) Summary of the validation information for the analytical procedures for supplementary tests (where applicable):

100

2.3.P.4.4 Justification of Specifications

(a) Justification of the specifications (e.g. evolution of tests, analytical procedures and acceptance criteria, exclusion of certain tests, differences from officially recognized compendial standard(s)):

2.3.P.4.5 Excipients of Human or Animal Origin

(a) For FPPs using excipients without risk of transmitting agents of animal spongiform encephalopathies, a letter of attestation confirming this can be found in: (page and volume)
(b) CEP(s) demonstrating TSE-compliance can be found in: (page and volume)

2.3.P.4.6 Novel Excipients

For excipient(s) used for the first time in an FPP or by a new route of administration, full details of manufacture, characterization and controls, with cross references to supporting safety data (nonclinical and/or clinical), should be provided according to the API and/or FPP format.

2.3.P.5 Control of FPP

2.3.P.5.1 Specification(s)

Specification(s) for the FPP:

Standard (e.g. Ph.Int., BP, USP, House)

Specification reference number and version

Test Acceptance criteria Acceptance criteria Analytical procedure
(release) (shelf-life) (type/source/version)

Description

Identification

Impurities

Assay

etc.

2.3.P.5.2 Analytical Procedures

(a) Summary of the analytical procedures (e.g. key method parameters, conditions, system suitability testing):

2.3.P.5.3 Validation of Analytical Procedures

101

(a) Summary of the validation information (e.g. validation parameters and results):

2.3.P.5.4 Batch Analyses

(a) Description of the batches:

Strength and Batch size Date and Use (e.g. comparative batch number site of production bioavailability or biowaiver, stability)

(b) Summary of batch analyses release results for relevant batches (e.g. comparative bioavailability or biowaiver, stability):

Test Acceptance Results
criteria <batch x> <batch y> etc.
Description
Identification
Impurities
Assay
etc.

(c) Summary of analytical procedures and validation information for those procedures not previously summarized in 2.3.P.5.2 and 2.3.P.5.3 (e.g. historical analytical procedures):

2.3.P.5.5 Characterisation of Impurities

(a) Identification of potential and actual impurities:

Degradation product Structure Origin
(chemical name or descriptor)

Process-related impurity Step used in the FPP manufacturing process
(compound name)

102

(b) Basis for setting the acceptance criteria for impurities:

(i) Maximum daily dose (i.e. the amount of API administered per day) for the API, corresponding ICH Reporting/Identification/Qualification Thresholds for the degradation products in the FPP and the concentration limits (ppm) for the process-related impurities (e.g. residual solvents):

Maximum daily dose for the <x mg/day>

API:

Test Parameter ICH threshold or
concentration
limit

Degradation product Reporting Threshold

Identification Threshold

Qualification Threshold

Process-related impurities <solvent 1>
<solvent 2>, etc.

(ii) Data on observed impurities for relevant batches (e.g. comparative bioavailability or biowaiver):

Impurity Acceptance Results
(degradation product criteria
and process-related) <batch no.,
strength, use>

(iii) Justification of proposed acceptance criteria for impurities:

2.3.P.5.6 Justification of Specification(s)

(a) Justification of the FPP specification(s) (e.g. evolution of tests, analytical procedures and acceptance criteria, differences from officially recognized compendial standard(s)):

2.3.P.6 Reference Standards or Materials

(a) Source (including lot number) of primary reference standards or reference materials (e.g. Ph.Int., Ph.Eur., BP, USP, in-house) not discussed in 3.2.S.5:
103

(b) Characterization and evaluation of non-official (e.g. not from an officially recognized pharmacopoeia) primary reference standards or reference materials (e.g. elucidation of structure, certificate of analysis) not discussed in 3.2.S.5:

(c) Description of the process controls of the secondary reference standard (comparative certificate of analysis and IR spectra against primary standard) not discussed in 3.2.S.5:

2.3.P.7 Container Closure System

(a) Description of the container closure systems, including unit count or fill size, container size or volume:

Description Strength Unit count or fill size Container size
(including materials of
construction)

(b) Summary of specifications of each primary and functional secondary (e.g. foil pouches) packaging components:

Packaging component Specifications
(list parameters e.g. identification (IR))
HDPE bottle

PP cap
Induction sealed liners
Blister films (PVC, etc)
Aluminum foil backing
etc.

(c) Other information on the container closure system(s):

104

2.3.P.8 Stability

2.3.P.8.1 Stability Summary and Conclusions

(a) Summary of stress testing and results (e.g. photostability studies, cyclic studies, freeze-thaw studies):

(b) Summary of accelerated and long-term testing parameters (e.g. studies conducted):

Storage conditions (■C,
Strength and Batch size Container closure Completed (and
% RH) batch system proposed) test
number intervals

Summary of the stability results observed for the above accelerated and long-term studies:

Test Results
Description
Moisture
Impurities
Assay
etc.

(c) Proposed storage statement and shelf-life (and in-use storage conditions and in-use period, if applicable):

Container closure system Storage statement Shelf-life

2.3.P.8.2 Post-approval Stability Protocol and Stability Commitment

(a) Stability protocol for Primary stability batches (e.g. storage conditions (including tolerances), batch numbers and batch sizes, tests and acceptance criteria, testing frequency, container closure system(s)):

Parameter Details
Storage condition(s) (■C, % RH)
Batch number(s) / batch size(s)
Tests and acceptance criteria Description
Moisture
105
Parameter Details
Impurities
Assay
etc.

Testing frequency
Container closure system(s)

(b) Stability protocol for Commitment batches (e.g. storage conditions (including tolerances), batch numbers (if known) and batch sizes, tests and acceptance criteria, testing frequency, container closure system(s)):

Parameter Details
Storage condition(s) (■C, % RH)
Batch number(s) / batch size(s) <not less than three production batches in each container closure system>
Tests and acceptance Criteria Description
Moisture
Impurities
Assay
etc.
Testing Frequency

(c) Stability protocol for Ongoing batches (e.g. storage conditions (including tolerances), number of batches per strength and batch sizes, tests and acceptance criteria, testing frequency, container closure system(s)):

Parameter Details
Storage condition(s) (■C, % RH)
Batch size(s), annual allocation <at least one production batch per year (unless none is produced that year) in each container closure system >
Tests and acceptance Criteria Description
Moisture
Impurities
Assay
etc.
Testing frequency
Container closure system(s)

106

2.3.P.8.3 Stability Data

(a) The actual stability results should be provided in Module 3.

- (b) Summary of analytical procedures and validation information for those procedures not previously summarized in 2.3.P.5 (e.g. analytical procedures used only for stability studies):
- (c) Bracketing and matrixing design and justification for Commitment and/or Ongoing stability batches, if applicable:

2.3.A APPENDICES

2.3.A.1 Facilities and Equipment

- (a) Summary of information on facilities and equipment, in addition to the information provided in other sections of the submission: Not applicable.

2.3.A.2 Adventitious Agents Safety Evaluation

- (a) Summary of the information assessing the risk with respect to potential contamination with adventitious agents: Not applicable.

2.3.A.3 Excipients

- (a) Summary of the details of manufacture, characterization and controls, with cross references to supporting safety data (nonclinical and/or clinical) for the novel excipients: Not applicable. Novel excipients are not accepted in the Prequalification Programme. See quality guideline for definition.

2.3.R REGIONAL INFORMATION

2.3.R.1 Production Documentation

2.3.R.1.1 Executed Production Documents

- (a) List of batches (including strengths) for which executed production documents have been provided (e.g. comparative bioavailability or biowaiver batches):

2.3.R.1.2 Master Production Documents

- (a) The blank master production documents for each strength, proposed commercial batch size and manufacturing facility should be provided in Module 3.

107
